F. W. BURBIDGE, M.A. V.M.H.

AN

ILLUSTRATED WEEKLY JOURNAL

OF

Horticulture in all its Branches.

Founded by W. Robinson in 1871.

EDITED BY MR. E. T. COOK.

VOL. LXVI. CHRISTMAS, 1904.

LONDON.

Office: 20, TAVISTOCK STREET, COVENT GARDEN, W.C.

Published by HUDSON & KEARNS, 20, Tavistock Street, Covent Garden, W.C., and by
Messrs. GEO. NEWNES, Ltd., 7-12, Southampton Street, Strand.

— TO —

F. W. BURBIDGE, M.A.

THE SIXTY - SIXTH VOLUME OF "THE GARDEN"

Is dedicated.

MR. BURBIDGE, whose name is a household word in the world of flowers, was born at Wymeswold, Leicestershire, on March 21, 1847. His father—Mr. John Burbidge—was a farmer and fruit grower, and in childhood's days the son gained that love for horticulture which has dominated a useful and active life. Mr. Burbidge was educated by home study and in village schools, and was later a student of horticulture in private gardens and in the Chiswick garden of the Royal Horticultural Society, where he obtained in 1868 premier prizes and certificates at the examinations of that well-known horticultural centre. Mr. Burbidge also gained high honours in the examinations of the Society of Arts (1874), and from Chiswick entered the Royal Gardens, Kew, where his thoughts were directed to the acquirement of botany and horticultural science.

Mr. Burbidge has written many valuable works. The first to appear was "Domestic Floriculture" (1875); "The Narcissus," a monument of industry and classification (1875); "Cultivated Plants" (1877); Horticulture in Stamford's Series on "British Industries," in the same year; "The Gardens of the Sun, or Travels in Borneo and Sulu Archipelago" (1880); and "The Chrysanthemum" (1884-85), &c.

From the year 1873 to 1877 Mr. Burbidge was a member of the staff of THE GARDEN, but during 1877-78 visited Borneo, a journey fruitful in good results, many original drawings being made, dried specimens collected, and now popular plants introduced. The following, among others, were introduced by Mr. Burbidge from the tropics: *Nepenthes Rajah* (Mt. Kina Balu); *N. bicalcarata* (Lawas River); *Burbidgea nitida* Hook. f., new genus (Lawas River); *Cypripedium lawrenceanum* (mountains near Brunei); *Pinanga Veitchii* (forests, Lawas River); *Piptospatha insignis* and *Gamogyne Burbidgei* (both from Tawaran River); *Pothos celatocaulis* (Labuan); *Dendrobium Burbidgei* and *D. cerinum* (both from Sulu Archipelago); *Bulbophyllum leysianum* and *B. petreianum* (from the foot of Kina Balu, beside streams); *Phalenopsis Mariæ* (Sulu Islands); *Aerides Burbidgei*, rosy flowered (from Sulu).

Calceolaria Burbidgei (W. E. G.) was raised in the College Gardens, Dublin, in 1880 (= *C. Pavoni* × *C. fuchsifolia*). It is a useful plant, flowering nearly all the year, and especially during winter.

Mr. Burbidge has been Curator of the Trinity College Botanic Gardens, Dublin, since 1879, and his experience gained there has been willingly given to the horticultural press and Journals of the Royal Horticultural Society. An enthusiastic gardener and botanist, Mr. Burbidge has our heartiest wishes for years of health to carry on his horticultural work in the gardens which he has done so much to improve and make a centre for botanical research and horticultural practice in Ireland.

Mr. Burbidge is an Honorary Master of Arts of the Dublin University (T.C.D.) and Member of the Royal Irish Academy, a Victorian Medallist of Honour and Veitch Medallist, besides holding other honourable degrees.

INDEX.

A.

- Aberdeen Botanic Gardens, 218
 Abutilon vitifolium, 8
 Acacia baileyana, 95, 134; *racifolia*, 287
 Acalyphas, 60
 Acetylène, use of refuse of, 84
 Achillea mongolica, 23
 Aconitum Wilsoni, 220
 Adiantum farleyense falling, 84
 Aerides, 354
 Eschynanthus maculatus, 53
 Esculus indica, 54
 Ethionema pulchellum, 23
 Agapanthus umbellatus in the flower garden, 172
 Akebia quinata fruit, 254
 Allamanda grandiflora, 19
 Allamandas, 128
 Allium House in December, the, 380
 Alnus tree, the, 113
 Aloysia citriodora, 60
 Alpine and border flowers at Stirling, 89
 Alpine flowers, protection of, 286; garden congress at Naye, the, 160; Pinks, growing the, 55; plants, cultivation of, 7
 Amaryllis, 265; *Belladonna*, 180; *B. maxima*, 135; *B. purpurea* major, 219
 America, an English garden in, 386
 American blight, 79
 Amorphia canescens, 141
 Anemone alpina, 195; *fulgens*, 213; *japonica crispa*, 255; *J. Queen Charlotte*, 203; *J. rosea superba*, 259; *J. Whirlwind*, 291; *Pulsatilla*, 188
 Aconones, 352
 Angraecum infundibulare, 109
 Angulus, 354
 Annuals, flowers, 199; beautiful, 152
 Annuals as bedding plants, 263; half-hardy, in 1904, 171; hardy, some pretty, 104; some interesting, 362
 Anomoea cruenta, 120
 Anopteris glandulosa losing its leaves, 100
 Antirrhinum lilium giganteum, 34
 Antholyza paniculata major, 348
 Antirrhinum glutinosum, 223
 Aotus gracillima, 3
 Aphelandra chamoissoniana, 52
 Aphides or plant lice, 299
 Apple, a fine, Thomas Rivers, 202; Allington Pippin, 304; Beauty of Bath, 213, 228, 309; Bramley's Seedling, 299; Charles Ross, 304; Cornish Aromatic, 324; cuttings, striking, 340; growing, an experiment in, 302; harvest, the, 117; Hector Macdonald, 305; Isidore Dupont, 316; James Grieve, 180; King's Acre Bountiful, 304; Lady Sudeley, 163, 230, 263, 335, 359; Mabbott's Pearmain, 370; Miller's Seedling, 167; new, the Rev. W. Wilks, 250; Rival, 304; Rival and others, 335; Ribston Pippin, 290; Tom Putt, 256; Werder's Golden Reinette, 304; Worcester Pearmain in 1904, 239
 Apples, 210, 233; and Pears, 334; for profit, imported & English-grown, 301; the newer, 304; as cordon espaliers, 369; Cornish, 354; early, 136; for special purposes, selections of, 314; good orchard, 237; new, recently shown by Mr. Ross, 359; preservation of, by cold storage, 169; valueless, 185
 Apricot, Moor Park, 223
 Apricots, 28, 123, 233; falling, 197
 Aquilegia, hybrid, 69
 Arabis, the double, 53
 Arbor Vitæ hedge, 200
 Argemone grandiflora, 203
 Armagh, flowers from, 69
 Artichoke, globe, growing the, 98
 Artichokes, globe, 128, 265; Jerusalem, 78, 334, 340
 Arundo conspicua, 121, 297
 Asparagus, 232, 234; beds, forming, 346; destroyer, a, 100; forcing, 353; when to plant, 42; subulatus var. *gracilis*, 220
 Aster Finchley White, 238, 255; Perry's Favourite, 238
 Astilbe Davidi, 256
 Aubrietias, 328
 Auricula, the, July, 5; alpine Thetis, 397; in August, 88; in September, 154; in October, 228; in December, 379
 Autumn, the, 285; tints, 269
 Avenues, 85
 Azalea occidentalis, 31
 Azaleas for forcing, 334; Indian, 177

B.

- Baden-Baden, notes from, 71
 Balsam, an "American," 169
 Baoana, the, 145

- Bateson, Mr. William, F.R.S., 359
 Bean, runner, Lye's Favorite, 256
 Beans, French, 28, 158, 265; in late autumn, 386; long runner, 232
 Bedding plants, 366; propagating, 195; spring, 279, 333; summer, 94
 Beech hedges, 84
 Beetroot, 234
 Begonia Argus, 151; howringiana, 19; *Coralina*, 264; *Connt Zeppelin*, 120, 134, 236; *Gloire de Sceaux*, 264; *Gloire de Lorraine*, 79, 196, 313, 367; leaves diseased, 340; Mrs. Bertram Currie, 168; Washington, 120
 Begonias, 231; at Reading, 282; tuberous, 214, 279; Messrs. Blackmore and Langdon's, 248
 Belladonna Lily at Fortfield House, Terenure, County Dublin, 286
 Belladonna Lilies, 297
 Berberis Darwini, 173
 Berthamia fragifera, 256, 352
 Bethel, Mr. James, 339
 Biarrum or Ischarum eximium, 304
 Birch, Red or River, the, 327
 Border and alpine flowers at Stirling, 89; colour in the, 381; flower, colour arrangement in the, 408; mixed, colour in the, 209, 272, 290, 326, 345, 398
 Borders, herbaceous, 328, 333; mixed, 97
 Bougainvillea Maud Chettleburgh, 77
 Bourne mouth, a note from, 150
 Bourdarias, 79, 81, 313
 Bowling-green scorched by the sun, restoring a, 116
 Brassavola digbyana, 280
 Brava geminiflora, 108
 British Columbia, the climate of, 352
 British plants, uses of, 30, 72
 Broccoli, 265
 Brockwell Park, at, 319
 Broome Garden, round the, 32
 Browallia speciosa major, 196, 281
 Brussels Sprouts, 353
 Buddia variabilis veitchiana, 87, 220, 256, 287
 Bulb culture, 332; farming in Ireland, 217
 Bulbous plants for greenhouse and border, select, 234
 Bulbs, autumn and winter, 143; blue-flowered, of spring, 227; for the greenhouse, 257, 274; from Lowtham, 146; in grassland, planting, 328; in the mixed border, 223; remaining dormant, 39; summer and autumn flowering, some, 204, 221; suggestions for the grouping of, 256, 271; to be potted, 153, 246
 Bullace, the Langley, 302, 353
 Bulletin de la Société Française d'Horticulture de Londres, 129

C.

- Cabbage, 128, 265; spring, 28
 Cabbages, pricking out, 258
 Cacti, hardy, 176
 Ceanothus japonica, 54
 Caladium Ayrigites, 169
 Caladiums, 128, 265
 Calanthes, 331, 385; and *Dendrobium nobile* at Buxted Park, 375; deciduous, 233
 Calceolaria amplexicaulis, 100; cuttings, 233
 Calendar, a general, 210, 231, 249, 253, 275, 294, 328, 346, 368, 399
 Callirhoe, 408
 Calochort, new, 309
 Calycanthus floridus, 8
 Calystegia pubescens flore-pleno, 220, 254
 Camellias, 14; as wall plants, 231; some good, 236
 Campanula garganica alba, 107; hybrida Fergusonii, 192; isophylla alba and C. Mayi, 70; lactiflora, 108; muralis major, 18; patula, 57; persicifolia coronata alba, 6; p. Moerheimi, 70; portenschlagiana bavarica, 407; pulloides, 203, 255; pyramidalis, 172
 Canada and the schools, 168
 Cape Colony, thinning fruit in, 112
 Capex, the, 120
 Capsicum annuum var. *conoides*, 381
 Carnation, a white seedling, 102; Duchess of Fife, 384; Germania, 86; in the garden, the, 137; layering, 60; Lizzie McGowan, 396; Miss Audrey Campbell, 263; Mrs. Frank Shuttleworth, 18; Ruby Castle, 71; White Star, 400; winter, Dr. W. G. Grace, 359
 Carnations, 213; and Pinks for vases, 97; a note on, 359; at Edenside, 198; for winter flowering, 210; fragrant, 315; in a Lewes garden, 113
 Carnations, in the flower garden, 152; *Milmaison*, 94, 246, 351; *Marguerite*, 100; M., in November, 359; more fragrant, wanted, 281; some beautiful seedling, 101; tree, 43, 177; t., hybrid, 240; two new, 239
 Carpentaria californica, 98, 126; in the north of Scotland, 142
 Carpet bedding, 13
 Carrots, 44, 246
 Cassia corymbosa, 287; *marylandica*, 146
 Catalpa bignonioides, 205
 Cattleya howringiana, 129; *Harrisonae*, 79; *Mendellii* Pink Pearl, 30
 Caulidower, 314; Veitch's Autumn Giant, 199, 239; Veitch's selected early forcing, 95
 Cauliflowers, 110, 232, 234; autumn-sown, 281; planting, 258
 Ceanothus divaricatus, 8; *Indigo*, 187
 Cedars, Lebanon, our earliest, 140; the, 161, 178; on Mount Lebanon, the, 124, 178
 Celery, 44, 110, 265, 314; fly, the, 26; maggot, the, 116, 271; protecting, 340; some notes on, 159; Sutton's Superb Pink, 376
 Centaurea suaveolens, 83
 Cestrum aurantiacum, 397
 Chalk pit, flowers for a, 296
 Cherry, introduction of the, 134
 Cherries, 61, 333
 Chironia toribunda (ixifera), 52
 Chlidanthus fragrans, 34
 Choisy ternata, 3; in Scotland, 34
 Chrysanthemum Devonshire Cream, 288; early-flowering, Carrie, 219; Freedom, 325; Improved Masse, 256; Snowflake, 256; J. B. Duvoir, 256; *Veuve Clicquot*, 325; *Indicum*, 391
 Chrysanthemums, fragrant hardy, 368; French, 335; hardy, 321; Japanese, pleonometal blooms of, 375; Messrs. W. Wells and Co.'s, 336; new, at the National Chrysanthemum show at the Crystal Palace, 330; new Japanese, 335; notes on, 136, 307; Pompon, miniature flowered, 376; propagating, 367; seasonable notes, 198; staging large flowers of white early-flowering varieties, 207
 Cineraria stellata, 303
 Cinerarias, 79, 246
 Chrysanthemum Goacher's Crimson, 135; Harvest Home, 287; Kathleen Thompson, 331; Lemon Queen, 324; maximum King Edward, 281; Miss Elsie, 343; Mrs. Charles Davis, 343; new, R. Pemberton, 219; novelties at the Crystal Palace, 323; at the Horticultural Hall, 291; Ralph Curtis, 325; sports, 286; trials at Tamworth, 186
 Chrysanthemums, 101; a new yellow, 406; at Arundel House, Dumfries, 359; at Ballathie, Blairgowrie, 343; at Battersea Park, 323; at Dumfries, 300; at Keston and Lewisham, 367; at Swanley, 319; at the Royal Botanic Society's Gardens, 359; at Warren House, Stanmore, 323; border, 352; development of, 406; early-flowering, 120, 288; from a City garden, 240; new, 415; single, 415
 Chiroptelium Medusae, 314; picturatum, 314; *Thonarsii*, 314
 Cistus ladaniferus, 20, 142, 257
 City development, 401
 City garden, a, 325
 Clendon Park, Surrey, the Earl of Onslow's garden, 241
 Clematis davidiana, 203; grata, 365; *Hilarii*, 220; *Jackmanii* alba, 16; *montana*, 347; var. *niveus*, 271
 Clematises, some new hybrid, 74
 Clerkenwell, a flower show in, 118
 Clerodendron fallax, 119; fetidum, 199
 Cineranthus Dampieri, grafting, 184
 Climbers for fence, 200; hardy, for Argyllshire, 162; planting wall, 391
 Clivia leaves diseased, 340
 Clivia, rust on, 360
 Clydesdale fruit district, motor vehicles for the, 52
 Coccobloba grandifolia, 83
 Cochlioda noezhiana, 10
 Codonopsis ovata, 57
 Cologne cristata, 354
 Colax jugosus, 110
 Colchicum Bornmulleri, 157; giganteum, 245
 Colchicums, some good, 361
 Coleus, 27
 Coleuses, 177
 Colonial fruit, preserved fruits, and jams, show of, 239
 Colour in the garden, 334
 Conifers, 246
 Cordylus australis, flowers of, 60; indivisa, 296 i. Vera, 261

- Conservatory, baskets of plants in the, 10
 Coreopsis grandiflora superba, 244
 Cornflowers, 86
 Cornus Kousa, 54
 Cotoneaster angustifolia, 407; *horizontalis*, 409
 Cottage and allotment gardening, 135
 Crabs, new, and their value in the garden, 262
 Crassula coccinea in the open, 119; *falcata*, 180
 Crataegus, the, at Kew, 277
 Crocus pulchellus, 291
 Crocuses, wild, 224
 Crotons, 214
 Cucurbit growing under glass, 332
 Cucumbers, 28, 94, 158, 246, 298; autumn-fruited, 158; winter, 266, 352
 Cupressus lawsoniana erecta Allumii, 303
 Currant tree, black, diseased, 340
 Currants, red, as cordons, 299
 Cyanide as an insecticide, 232
 Cyclamen cilicium, 312; from seed, raising, 27; grubs in, 84; neapolitanum flowering without soil, 168
 Cyclamens, 60, 195
 Cyderland, in, 302, 374
 Cypella Herberti, 53
 Cypripedium F. K. Sander, 293; *insigne* and *vars.*, 233; i. at the Woodlands, 407; spectabile in the south of Scotland, 56
 Cypripediums, 142, 231
 Cymbidiums, two new, 141

D.

- Daffodil growing in England, 279
 Daffodils in Antrim Garden, 411; late planting of, 389; the seed time and harvest of, 37
 Dahlia, Cactus, Columbia, 262
 Dahlias, 28, 74, 84, 195; at Crawley, Sussex, 281; Cactus, 247, 325; for the flower garden, 326; single, 239, 280; lifting and storing, 279; from seed, 151; some good new, 222; work among the, 37
 Daisies, 10
 Danson, early, a valuable, 212; Shropshire, 210
 Danson's, 211; in 1904, 165
 Daphne Caeorum, 57
 Dean Hole, memories of, 218; the late, memorial to, 343
 Decoration, thoughts on Christmas, 421
 Delphiniums, seedling, 60
 Dendrobium atroviolaceum, 332; *brymerianum*, 61; *chrysanthum*, 44; *chrysotoxum* and *D. suavisissimum*, 44; *densilorum* and *thysiflorum* and *D. Farmeri*, 44; *formosum* giganteum and others, 332; noble and *Calanthes* at Buxted Park, 375; *Parishii*, 62; *Phalenopsis schroderianum*, 332; *primitivum*, 62; *spectabile*, 332; *Venus*, 61
 Dendrobiums, 159; deciduous, 62
 Desmodium penduliflorum, 224, 254, 255
 Dentzias for forcing, 391
 Diacrum bicoloratum (syn. *Epidendrum bicoloratum*), 9
 Dianthus Atkinsii, 6; *deltoides*, 224; giganteus, 122; *plumarius*, 269
 Digitalis obscura, 20, 53, 76
 Dimorphotheca Ecklonis, 81; in the open, 39
 Dingwall, Mr. George, 336
 Diosma capitata, 19
 Diostea juncea, 8
 Dipladenias and their culture, 298
 Doronicum plantaginifolium, 213
 Doryanthes Palmeri and offsets, 334
 Dracaena australis out of doors, 209
 Drought, some effects of the, 51
 Dundee Flower Market, 18
 Dusseldorf, International fruit show at, 134

E.

- East End flower shows, the Queen at, 52
 Echium, dye from, 303
 Echinus, some, 59
 Edgings in the kitchen garden, 201
 Edinburgh, public bowling greens in, 255
 Egg plant, the, 236
 Elder, as a nurse tree, the, 340; the scarlet berried, 76
 Elms, silver variegated, 343
 Endive, 13, 280; and Lettuce, 232
 Engineers, heating and ventilating, institution of, 303
 English Gardens, some, 371
 Eomecon chionantha, 291
 Epacris, 14

Epidendrum ciliare, 280
Epigea repens, 34
Ephypium delicatum, 375
Erenum, the, 376
Erenurus, 232; Bungei at Colchester, 150;
 robustus in Scotland, 289
Erica and *Epacris*, 265; *lusitanica*, 375

[JULY 2, 1904.]

EXHIBITION ROSES.

THE FORTHCOMING SHOW.

I NTEREST in exhibition Roses naturally centres round the National Rose Society's metropolitan show in the Temple Gardens, which this year takes place on Wednesday next, and from reports that reach me from north, south, east, and west there seems little doubt that, when the verdict comes to be delivered and judgment passed, the coming exhibition will be the best the society has had for many years. It is generally unwise to prophesy unless you know, but I will place before your readers extracts of letters that have reached me from some of our leading exhibitors and let them judge for themselves. For reasons unnecessary to mention, I give the districts my correspondents write from :

Hitchin.—"I do not think my Roses have ever looked better. A little rain would be beneficial perhaps, but at present only the surface is dry. The season is earlier than anticipated some months back, but Hybrid Perpetuals should be at their best by the 6th."

Colchester.—(1) "Our plants are looking splendid. The Roses that take the champion prize this year will be worth going a long way to see." (2) "Could not be better. The garden Roses are exceptionally promising. Some of the early sorts will be past their best, but there are plenty to choose from. All flowers are coming very perfect, and exceptionally good in colour."

South Esser.—"My trees are all right, and I am feeling very happy about the 6th. This will be a Nadaillac year if my own trees are any criterion."

Middlesex, North.—"All Roses round here are looking grand. I do not think mine were ever better, and T—'s are just as good."

Middlesex, South.—"Roses, especially Teas, promise well, though rather early, I think. Mildred Grant will take some beating this year, at any rate."

Surrey (Leatherhead and Reigate).—(1) "Every sign of a great year. I wish the Temple exhibition had been a week earlier. I am already cutting beautiful blooms." (2) "Excellent; am quite hopeful."

Worcestershire.—"The prospects are distinctly good. Our light soil wants rain. The weather has just suited the Teas."

Birmingham and the Midlands.—"Yes, I shall be at the Temple show, and I hope in good fighting trim."

It is seldom one gets such unanimous consensus of opinion as the above. The Roses will be there, at any rate. It is not too late to remind your readers who think of attending the show that if they want to see the Roses at their very best they must come early. This means purchasing a ticket a little more expensive; but there is still time to become a member. The subscription is only 10s. 6d., and this carries the privilege of three five shilling tickets, besides all the publications of the society, which are alone worth the money, plus a book on "How to Prune," which is now in course of preparation, and which will form the last word on this most important subject. The hon. secretary, Mr. E. Mawley, of Rosebank, Berkhamstead, Herts, will be glad to receive the name of any intending member. No introduction is necessary: simply name and address and a subscription of half a guinea or a guinea, the latter amount carries double the number of five shilling tickets.

The schedule for the show contains a lot of new features. Roses for every conceivable object will be exhibited—arches, pergolas, creeping Roses for slopes and rockwork, bedding Roses, garden Roses, and last, but not least, the Rose in its highest phase of possible beauty—that Rose *par excellence*, the exhibition Rose.

HERBERT E. MOLYNEUX.

Brantwood, Balham.

GARDENERS' ROYAL BENEVOLENT INSTITUTION.

THE annual festival of this praiseworthy charity was held on Tuesday last in the Whitehall Rooms of the Hotel Metropole, when Mr. Harry J. Veitch, the treasurer, presided. It was a memorable evening; the rooms were filled with gardening enthusiasts, who not only think of the practical work of the garden, but of those who labour to bring it to perfection. Ill-health is a heritage of both rich and poor. The rich can provide comforts to alleviate it, but the poor cannot, and it is for the poor the Gardeners' Royal Benevolent Institution was founded. A great effort has been made this year by Mr. Veitch to increase the funds of the charity, and it was an excellent thought of the committee to publish an illustrated and well-printed account of the institution. This pamphlet tells us that it was founded one winter's night in 1839 at the old Crown and Anchor Tavern in the Strand. It is interesting to know that the first chairman was Mr. George Glenny, and since that year over £100,000 have been collected. The first president was H.R.H. the first Duke of Cambridge, and in February, 1843, a paid secretary was appointed—Mr. Edward Cutler—whose untiring industry in the cause of the institution is fresh in mind. The institution has grown in influence, but it is unable to cope with all the distressed cases

that come before the committee. Although so large a sum was collected on Tuesday evening, it must be remembered that the demands upon those who are able to assist never relax. There are always applicants, and many must be refused the aid they so urgently require through insufficient funds. The history and aims of the institution are set forth in this booklet, and portraits are published of the patrons, Their Majesties the King and Queen, H.R.H. the Princess of Wales, and Her late Majesty Queen Victoria; the president, the Prince of Wales, the late Mr. Cutler, the Very Rev. Dean Hole, V.M.H., Sir Trevor Lawrence, Bart., K.C.V.O., V.M.H., Mr. Harry J. Veitch (the treasurer, and chairman this year), Mr. G. J. Ingram (the secretary), the late Mr. John Lee, and the three trustees (the Hon. Walter Rothschild, M.P., V.M.H., Mr. Bruno Schröder, and Mr. N. N. Sherwood, V.M.H.).

The list of those who have taken the chair includes the names of the Right Hon. John Johnson, Lord Mayor of London (1846), the Right Hon. Lord Ebury, the Right Hon. the Earl of Carlisle, Mr. Joseph Paxton, and again after a knighthood had been conferred upon him, the Right Hon. the Earl of Carnarvon, the Right Hon. the Earl of Ducie, Sir C. Wentworth Dilke, Bart., M.P., the Right Hon. Sir Robert Peel, Bart., the Right Hon. the Earl of Derby, His Grace the Duke of Argyll, K.T., His Highness the Duke of Teck, G.C.B., the Very Rev. S. Reynolds Hole, Dean of Rochester, the Right Hon. Lord Henry Gordon-Lennox, M.P., Alfred de Rothschild, Sir S. Morton Peto, Sir Trevor Lawrence, Bart., Robert Marnock, Serjeant Cox, H.R.H. the Duke of Connaught, K.G., the Right Hon. Lord Aberdare, the Right Hon. Sir J. Whittaker Ellis, Bart., M.P., Alderman Cotton, N. N. Sherwood, Leopold de Rothschild, the Right Hon. Joseph Chamberlain, the Right Hon. Lord Brassey, K.C.B., Baron Schröder, Sir Julian Goldsmid, Bart., M.P., His Grace the Duke of Fife, K.T., the Right Hon. the Earl of Lathom, G.C.B., the Right Hon. Lord Rothschild, Sir Oswald Mosley, Bart., His Grace the Duke of Portland, the Right Hon. Lord Llangattock, His Grace the Duke of Marlborough, and the Right Hon. the Earl of Warwick.

The early history of the institution should be read by all who are interested in charities, whether those organised to help distressed gardeners or otherwise, and the following extract from this booklet will show how greatly funds are needed to carry on the great work begun sixty-five years ago:—

"At the date of the Diamond Jubilee of Her late Majesty Queen Victoria, the invested funds of the institution amounted to nearly £30,000, yielding an annual income of about £860. No material addition has been made since, with the exception of the Victorian Era and Good Samaritan Funds, of which the derived income is applied to the special purposes for which they were founded. At that time there were 161 pensioners on the list, involving an annual outlay of nearly £3,000. Now (1904) there are 207 pensioners on the list, at an annual cost of £3,796, exclusive of rent of office and expenses of management. To provide for the sum expended in excess of the income from the invested funds, the committee have to depend on the life and annual subscriptions of members and the donations of the benevolent, sources of income always liable to fluctuation from year to year. And although there has been a gradual increase in

the actual income from year to year, coincident with this increase, the demands on the funds, especially during the past three years, have increased in an enormously greater proportion, so that the committee are no longer able to place on the pension list without election by votes candidates who have subscribed to the institution. Thus at the election in January, 1903, thirty-one of the applicants were unsuccessful, most of them subscribers in their more prosperous days, and several of them totally blind."

The dinner was held, as usual, in the Whitehall Rooms of the Hotel Metropole, and it is pleasant to know that there was a record attendance and a record subscription. The sum collected amounted to £3,500, and the chairman, Mr. Harry J. Veitch, who is also the treasurer, must have felt that his labours were rewarded. After the usual loyal toasts, Mr. Veitch proposed "Continued Prosperity to the Gardeners' Royal Benevolent Institution," and in the course of his remarks referred to the work that has been accomplished in the past, the great help of the auxiliary branches, and the munificent donation of £500 from Mr. N. N. Sherwood, who has also given a similar sum to the Royal Gardeners' Orphan Fund. He alluded to the investments, and mentioned that an adequate sum was necessary for paying the pensions. Mr. Veitch read many letters conveying the grateful thanks of those who were benefiting by the institution, but regretted deeply that so many were unsuccessful every year. Funds were necessary to place the applicants—all thoroughly deserving of sympathy—upon the funds. This toast was responded to by Mr. George Dickson, V.M.H., who also warmly commended the institution to those in a position to help it. "Horticulture in all its Branches" was proposed by Mr. J. Colman, D.L., J.P., and responded to by Mr. J. Gurney Fowler, treasurer of the Royal Horticultural Society. "The Health of the Chairman" was rapturously received, and was proposed by Mr. Arthur W. Sutton, J.P., V.M.H. He referred to the influence of Mr. Veitch in all things that promoted the welfare and happiness of those in adversity, mentioning incidentally that to-morrow (Wednesday) was the chairman's birthday.

The tables were beautifully decorated, and among the more important subscriptions were the following: The Chairman, 100 guineas; Mr. N. N. Sherwood, £500; Messrs. J. Veitch and Son, Messrs. Sutton and Sons, and Messrs. Rothschild and Sons, each 100 guineas; Arthur W. Sutton, 15 guineas for the Victorian Era Fund, and Leonard G. Sutton, 10 guineas for the Good Samaritan Fund; Mrs. H. J. Veitch, £26 5s.; W. L. Corry, £63; Leopold Salomons, J. Gurney Fowler, and Jeremiah Colman, £52 10s. each; Alfred Watkins, £38 17s. 6d.; Alderman Osman, £35; F. Cooper, £31 9s. 5d.; W. Robinson and R. Milligan Hogg, each £25; W. Crump, £23 5s.; H. Hicks, Manchester, £22 10s. 6d.; A. Porteous, £21 10s.; Messrs. Hurst and Son and A. G. Uatt, each £21; James Sweet, A. B. Wadds, and H. Parr, £20 each; G. Profit, £18 5s.; David W. Thomson, £16 13s. 6d.; H. J. Chapman, £16 11s.; George Harrow, £17 10s.; Herbert Hicks, 15 guineas; A. Mackellar, £16 17s.; Thames Bank Iron Company, 15 guineas; H. G. Cove, 13 guineas; James Hudson and John Heal, £12 12s. each; P. O. Knowles, £12; George Paul, £13 8s.; E. F. Hawes, 12 guineas. The following contributed 10 guineas each: Sir Trevor Lawrence, Bart., Alfred de Rothschild, Leopold de Rothschild, Lionel de Rothschild, Henry Jones, C. Czarnikow, W. E. Green, J. F. Gabriel, George Bunyard and Co., Barr and Son, S. Mortimer, W. Atkinson, C. Allen, proprietors of *Country Life*, H. J. Wimssett, W. Thompson, H. J. Adams, George A. Dickson, and T. M. Segar; Mr. J. Douglas, £10; Messrs. Veitch and Son, Exeter, 7 guineas; J. L. Woodroffe and N. F. Barnes, each 6 guineas; J. Willard, £6; W. Roupell, 7 guineas; and H. W. Nutting, £7 17s. The following contributed 5 guineas each: Sir Walter Smyth, Bart., Messrs. Edward Hudson, proprietors of *THE GARDEN*, E. T. Cook, T. L. Green, Francis Wellesley, Bruno Schröder, Walter Cobb, Carl Menyer, James Lee, Alfred Beit, W. Rapley, W. J. Nutting, Thomas Jones, W. J. Jefferies,

Protheroe and Morris, S. Osborn, Barr and Sons (additional), and W. Cutbush and Son. Messrs. Owen Thomas, W. Bain, R. Dean, and J. Ollerhead contributed 3 guineas each. The Reading and Worcester auxiliaries collected very large sums, and the amount forthcoming from Covent Garden friends was £497, making a total of £3,500.

The health of Mr. Ingram, the secretary, was warmly received. An interesting number in the programme of music was a song composed by Mr. Edward Sherwood, son of Mr. N. N. Sherwood, "Hope Long Deferred."

NOTES OF THE WEEK.

FORTHCOMING EVENTS.

July 2.—Sutton (Surrey) Rose Show.

July 6.—National Rose Society's Temple Show; Southampton (two days), Croydon, Hereford, Ealing, and Hanley (two days) Horticultural Shows; Ipswich Summer Show; Royal Botanic Society's Show; Beckenham Horticultural Society's Show.

July 7.—Norwich Horticultural Show; Chipping Norton and Walton-on-Thames Rose Shows.

July 9.—Windsor and Eton, Warminster, and Gloucester Rose Shows.

MR. HARRY J. VEITCH.

(Chairman of the Festival Dinner of the Gardeners' Royal Benevolent Institution, held last Tuesday.)

July 12.—Royal Horticultural Society's Holland House Show (two days); Wolverhampton Floral Fête (three days).

July 13.—Formby, Reading, Stevenage, Thornton Heath, and Harrow Rose Shows; Nottinghamshire Horticultural and Botanic Society's Show (two days).

July 14.—Weybridge Flower Show; Highgate Horticultural Society's Show; Bath, Eltham, Helensburgh, and Woodbridge Rose Shows; Portsmouth Rose Show (two days).

July 15.—Gresford and Ulverstone Rose Shows.

July 16.—Manchester Rose Show.

July 19.—Saltaire and Tibshelf Rose Shows.

July 20.—National Sweet Pea Society's Show at Crystal Palace (two days).

July 21.—Halifax Rose Show; National Carnation and Picotee Society's (Southern Section) Show.

July 22.—Handsworth Horticultural Society's Floral Fête (two days).

July 27.—Newcastle-upon-Tyne Summer Flower Show (three days); Cardiff Summer Show (two).

"The Garden."—Next week *THE GARDEN* will be largely devoted to Roses, and will contain illustrations showing beautiful ways of growing

Roses. There will be also a full report of the National Rose Society's exhibition to be held in the Temple Gardens on Wednesday next.

The Royal Gardeners' Orphan Fund.—We understand that the treasurer of this institution (Mr. N. N. Sherwood) has expressed his intention of giving the fund a special donation of £500.

University College, Reading.—The official opening of the garden of the horticultural department of University College, Reading, as described on page 14, was performed by the Right Hon. the Earl of Onslow, G.C.M.G., President of the Board of Agriculture and Fisheries, in perfect weather, in the presence of a numerous and distinguished company, on Midsummer Day. In honour of the occasion a garden party was given by Mr. and Mrs. Alfred Palmer. About four o'clock the company assembled in a large marquee to take part in the opening ceremony. After speeches by the chairman and the principal of the college, Lord Onslow declared the garden open, first making, in a long speech, sympathetic reference to its value and usefulness, and wishing it a successful career.

Meeting of early-flowering Chrysanthemum growers at Tamworth. For the fourth year in succession Mr. William Sydenham of Bolehill House, Tamworth, is inviting growers of the early-flowering Chrysanthemums to his trial of plants on Saturday, September 24 next. There is also to be a show, on the same day, of flowers cut from the open that have not been disbudded. Mr. Sydenham has spared neither pains nor expense in acquiring every known variety now in cultivation, and the display that may be anticipated on the date already mentioned will be very representative. The object of this trial of the early-flowering sorts is to demonstrate the value of the Chrysanthemum for the border. Much has been accomplished in recent years of which the flower-loving public know so little. The early-flowering Chrysanthemums are fast increasing in popularity, and many fine novelties appear each season. It is a matter for regret that in London so much apathy in popularising the early sorts is apparent, and that we have to look to a single enthusiastic cultivator in the Midlands to lead the way.—D. B. CRANE.

British Gardeners' Association.—The hon. secretary (*pro tem.*) of the British Gardeners' Association, Mr. W. Watson, Kew Road, Kew, asks us to state, on behalf of the committee of selection, that, owing to the pressure of correspondence and there being as yet no paid secretary to devote his whole time to the daily increasing work of the association, he hopes that intending members and others will excuse any delay there may be in answering their letters. Also that those interested in the association will render valuable assistance by applying for forms of application, &c., for distribution, or by sending him the names of qualified gardeners likely to join. Donations towards the £250 required for initial expenses will be welcomed, it being felt that, when the services of a paid secretary and offices are secured, the association will speedily be able to make its influence felt. The forms of application for membership are now ready and can be obtained by request.

Fremontia californica.—I see that Mr. Robinson in the "English Flower Garden" describes this shrub as scarcely hardy enough for the open air without protection. I have never protected it, and it certainly used to look unhappy after the spring frosts. But it is growing strongly on a south wall, has reached 15 feet, seems to intend to grow much higher, and has dozens of beautiful cup-shaped yellow flowers opening day by day.—E. R. BERNARD, *Salisbury*.

The National Potato Society.—Mr. J. W. Malden, a well-known Potato specialist of Ham, Surrey, has presented the National Potato Society with four dozen plants of Eldorado Potato for growth this year. Of these twelve have gone to Rothamstead, to be under the charge of the chairman, Mr. A. D. Hall; twelve to Mr. Redington of Leeds, Yorkshire; twelve to Mr. A. Dean,

Kingston, Surrey; and twelve to another county centre. All the plants were well rooted in 5-inch pots. Remembering the high prices asked for single plants, this present is a very valuable one. Mr. Malden is cultivating some 2,000 similar plants this season. With reference to the silver cup which it was last week mentioned Sir J. T. D. Llewellyn, president of the Potato Society, was offering for competition, the committee have agreed to make it an additional prize for the best competitive exhibit in the Crystal Palace show next October.

Rhododendron kamschaticum.—Flowering plants of this decidedly uncommon yet pretty little species of *Rhododendron* were noted among other rarities in the group contributed by Mr. G. Reuthe at the recent Temple show. It is essentially a shrub for the rockwork, flowering as it does when less than a foot in height; indeed, that would appear to be about its limit in this respect, though it is somewhat spreading in growth. The leaves are hairy, ovate in shape, 1 inch or a little more in length, while the comparatively large flowers are about $1\frac{1}{2}$ inches across and of a deep rosy purple colour. In general appearance they suggest those of the Himalayan *Rhododendron lepidotum*. Occurring as it does throughout the northern regions of both hemispheres, *R. kamschaticum* has a wide geographical distribution, and, as might be expected, the plants and flowers show a certain amount of variation. The plants shown at the Temple were from the neighbourhood of Lake Baikal.—T.

Choisya ternata.—This is a valuable shrub where it thrives well; it evidently does so in the garden of Lord Alverstone at Winterfold, Cranleigh, as may be seen from the accompanying illustration. The bush represented is some 12 feet through, and an exceptionally fine specimen. In Surrey and Berkshire the *Choisya* does remarkably well; it appears to appreciate a warm and sheltered nook and fairly light, cool soil. In exposed and northern gardens this shrub requires protection, but the wealth of fragrant flowers and rich green leaves well repay any trouble taken to ensure its welfare.

Rose Clio.—What a splendid Rose this is for vigour of growth and freedom of flowering! It seems to do well whatever the season; for a town garden I know of no Rose that is more satisfactory. As a standard it grows well, and bears bunches of

flowers, all of which, although they are so numerous, seem to develop properly. The flesh pink blooms are borne on strong shoots, and, although they do admirably as vase flowers, it seems a pity to cut the shoot, as there are so many buds together in various stages of development, some so small that they would not open in water; the stalks of individual blooms, however, are so short as to render them of little use when cut. Unless therefore one has plenty of plants and can afford to cut the whole shoot, and so sacrifice some buds, this Rose must be admired in the garden alone. Etienne Levet as a bush does splendidly in the town garden also. It grows freely, and produces flowers of perfect form.—A. H. P.

Notes on Lilies.—Of numerous Lilies planted last year in a town garden it may be of interest to mention those which have done best this first season after planting, and of possible help to others. *L. davuricum grandiflorum*, as might have been expected, has grown well and flowered abundantly. Its rich orange red blooms have been a bright picture for two or three weeks. *L. Hansonii*, too, has done well. The two bulbs planted have both grown and both produced buds, although, unfortunately, those on one plant damped off when about half-developed. The others have opened, however, and the rich yellow, black spotted blooms are much admired. *Lilium elegans* (dwarf) have all grown, and some six out of twelve bulbs put in have produced their solitary flower, which, however, makes up in size and colouring what is lacking in quantity. *L. pyrenaicum* bloomed well, and of two bulbs of *L. pomponium* one has produced three blooms, while the other made growth but has not flowered. What a beautiful Lily this is with its deep scarlet turn-cap flowers and pretty small grey leaves! *L. chalcedonicum* began to grow, it got about 3 inches high and then died away. Several bulbs of this species did exactly the same, but I am told that in the first year after planting *L. chalcedonicum* often does this. I have no doubt that it will make its appearance in due course next year. *L. washing-tonianum* and *L. colchicum*, although they have not made vigorous growth, are showing buds. *L. pardalinum* and *L. superbum* both are coming into flower; several of the buds have damped off through no apparent cause, while others remain quite healthy. *L. Batemanniae* and *L. canadense* made growths

about 1 foot high, but these are dying away without showing signs of flowering. *L. Brownii* has proved disappointing, some bulbs made growth and some did not, but now there are signs of none. This Lily seems to me to be very capricious; at least I have never been able to make it grow well in a town garden. It has flowered well one season and then disappeared altogether. *L. Martagon*, of course, has succeeded, so has *L. longiflorum*. *L. auratum*, and several varieties of *L. speciosum*, notably *L. s. melpomene*. But finest of all, so far as growth is concerned, is *L. tigrinum giganteum*, a clump of a dozen bulbs promises to make a grand display when in flower. All these Liliaceae were planted this year, some in January and some in April, in a poor loamy soil with which leaf-soil and silver sand were intermixed.—H. P. A.

Primula obconica alba.—A group of this *Primula* in Messrs. Veitch's exhibit at the Temple show was greatly admired, for though we have had *P. obconica* for several years, I have never before met with so near an approach to a pure white. Most of the plants showed a certain tinge of colour, and whether any of them were absolutely pure could not be detected in the poor light that prevailed at the time of my visit. At all events with such a marked advance towards a white *Primula obconica*, an absolutely pure variety seems well within the bounds of possibility, and when that comes it will render this species even more popular than it is at the present time, for despite the fact that handling the plant causes irritation to the skin it is now very largely grown.—T.

Caterpillars on Gooseberry bushes.—Besides the various methods detailed by Mr. Wythes on page 426 to combat the larva of the Currant or Gooseberry moth, a good deal may be done towards lessening this pest by destroying all the perfect insects that can be met with, and if this is carried out before the eggs are deposited each female one that is killed represents a cluster of caterpillars the less. The detection and capture of the perfect insect is an easy matter, as it is very distinct in character, its general appearance being well expressed by the popular name of Magpie moth, for the white wings are marked with numerous blackish spots or blotches. Added to this its flight is very slow and hesitating, so that no great amount of exertion is necessary to capture a considerable number where they are at all plentiful.—T.

Leptospermum scoparium.—The *Leptospermums* form a very pretty class of free-flowering shrubs, all of which are natives of Australia. They need, except in especially favoured districts, the protection of a greenhouse, though in the extreme west they do well out of doors. The hardiest is, I think, that at the head of this note, which grows wild in New Zealand as well as in Australia. The dried leaves have before now been used as Tea, the plant itself being known as Captain Cook's Tea Tree. It forms a freely branched shrub, whose slender shoots are clothed with small narrow leaves, and just now are thickly studded with pinkish blossoms. Most of the species, through all of which runs a strong family likeness, have white blossoms. Potted in a mixture of peat, loam, and sand they give but little trouble, provided they are sheltered in a structure from which frost is just excluded in the winter. They belong to the Myrtle family, and if the leaves are crushed between the fingers they give off a fragrance. Throughout the summer months these *Leptospermums* may be placed out of doors.—T.

Aotus gracillima.—Among greenhouse plants of a shrubby character that flower during the spring months those belonging to the order Leguminosae are strongly represented. Charming though this *Aotus* is when in flower, it cannot be called popular, for it is rarely met with in gardens, though kept in stock in most nurseries (and they are now very limited) where hard-wooded plants are still grown. It is a free-growing shrub that well merits the specific name of *gracillima*, as its shoots are long and slender, often reaching 3 feet or nearly so in length in a single season, if the plant has been cut back hard after flowering. These shoots are thickly clothed with small narrow leaves, from the axils of which flowers are freely

CHOISYA TERNATA IN LORD ALVERSTONE'S GARDEN AT WINTERFOLD, CRANLEIGH.

produced. They are yellow and crimson in colour, and so numerous that in a good specimen the long graceful shoots are transformed into golden wands. It is a native of Australia, whence it was introduced just sixty years ago, and its cultural requirements are much the same as those needed by the bulk of what are popularly known as New Holland plants, that is, a soil principally composed of good fibrous peat and sand, firm potting, careful attention to watering, and a greenhouse temperature. —H. P.

Laburnum Adami.—A great deal of interest centres round this plant, especially during flowering time, and as regularly as June comes round we hear of its freaks with an extremely varied collection of suggestions as to the cause of its variable character. This year the *Scotsman* published a series of letters (9th, 10th, and 11th ult.) about the flowering of this tree, and, judging from them, a number of large specimens are to be met with in Scotland. In some of these notes the recognised authentic history of its origin is given, while in others the guesses made at the cause of purple and yellow blossoms being borne on one and the same tree at the same time are remarkable. One gives the reason "that the colour is transmitted from a Copper Beech which grows near." This is either a joke or lamentable ignorance. The tree is extremely interesting, and has been much studied by scientific men both in the past and at present. Loudon describes *L. Adami* in his "Encyclopedia of Trees and Shrubs," and gives its origin as follows: "The purple *Laburnum* is a sport from a bud of *Cytisus purpureus* inserted in *C. (Laburnum) alpinus*, in 1825, by D. Adam, a nurseryman at Vitry, near Paris. The flowers are of a reddish purple, slightly tinged with buff, and are produced in pendant spikes 8 inches or more long. A few years after this sport originated it was found that it had a strong tendency to return to the original kinds, and that from one bud or graft branches were produced of the true *Cytisus purpureus*, of the true *Laburnum* (either the alpine or the common, according to which of these may have been chosen as the stock), with yellow flowers, and of the purple *Laburnum*." This character, which Loudon mentioned upwards of sixty years ago, holds good now, and the peculiar part is that one can never be certain that the same characters will be developed two years in succession. It is a common thing to get the yellow and purple *Laburnum*-shaped inflorescences on the one plant, but it is much rarer to have the foregoing, and in addition shoots of apparently typical *Cytisus purpureus*, with its tiny leaves and small purple blossoms. Two trees at Kew have borne three distinct sorts of growth, foliage, and flowers this year, while a third plant of the same age and planted at the same time has had one sort only. So far it appears as if good seeds will be borne by the branches bearing yellow flowers and by the branches of *Cytisus purpureus*, while the true *L. Adami* flowers do not appear to be setting seed, a few pods only have not dropped off, and these are not swelling. So far we are unaware as to whether seeds sown from *C. Adami* have produced plants having the same peculiarities as the parent. If anyone has tried it a record of the result would be of interest. Mr. W. Low, in writing about this plant, asks whether *C. purpureus* is hardy. It is, and could be obtained from some good nurseryman who makes a speciality of trees and shrubs.

THE FLOWER GARDEN.

PLAGIANTHUS LYALLI AT HOME.

ONCE read in THE GARDEN that this small tree was hardy in England as far north as London if grown against a south wall, but I am of opinion that it ought to prove hardy nearly everywhere in the Old Country. When I mention the conditions under which it grows in its native habitat I think many will agree with me. In the beginning of February last I made a trip across the Southern Alps from Lake Te Anau,

by way of McKinnon's Pass to Milford Sound, and during that journey I had an opportunity of seeing this tree thriving under very trying circumstances. Te Anau is a grand sheet of water, lying nearly 700 feet above sea level, and having an area of 130 square miles. Our starting point for our walk was the head of the lake, whither we proceeded by steamer from the foot, and, unfortunately, the day was wet, so the mountains surrounding the lake were hidden by clouds; but when we reached Glade House, the little hostelry on the Clinton River, the masses of cloud began to break, and the rocky summits of the mountains now and again peered through the enshrouding mists. As Glade House was crowded, we decided to move on to Mid Camp, a stopping-place some six miles up the narrow valley of the Clinton. Our way lay through Birch Forest, as the trees, which are Beeches, are misnamed by the colonists, chiefly *Fagus Menziesii*, with some *F. fusca* and an occasional *Totara* (*Podocarpus Hallii*); but along the banks of the river and in open glades, which ever and anon occurred where some brawling stream joined the river, or where in times long gone by some huge landslide had crashed into the bush from the mountain side, we first met the *Plagianthus Lyalli*.

It was past flowering, but the branches were hung with unripe seeds, and showed how profuse the flower had been. In due course we reached Mid Camp, where there are three rough huts erected by the Government—one for ladies, another for men, and a third which served the purposes of kitchen, storeroom, and dining-room, with a separate apartment for the guides' bunks. It had been showery all the way, and we were glad to get ourselves dried at a roaring wood fire. The huts stood on the edge of the forest in one of the glades mentioned, and we found growing all round them bushes of *Aristotelia fruticosa* in full fruit, some of them quite bright with their abundance of coral pink berries. Here we were glad to find a pair of wekas or Maori hens (*Ocydromus australis*), a familiar active brown rail that once was common all over the country, but now has been nearly exterminated by the stoats and weasels, foolishly turned out by the Government to cope with the rabbit pest. The *Aristotelia* mentioned must be hardy enough to grow at least in the south of England, and though from its small foliage it is hardly worth a place in the shrubbery, yet if it berried in cultivation anything like those we saw it would be a decided acquisition. Next day our way led through similar country till we reached Mintaro huts, where we dined. It was still showery, and had turned cold. The summits of the mountains visible through the openings in the bush were powdered with newly-fallen snow. We had now reached an elevation of some 2,000 feet, and were close to the foot of the pass.

We soon left the Birch trees behind, and entered a region where the *Plagianthus* reigned alone, and we were delighted to find it still in flower. The showers changed from rain to snow, and as we began the final ascent to the saddle it was snowing heavily. The *Plagianthus* trees continued some way up the mountain side, but the flowers presented a very forlorn appearance as they hung in dripping wreaths from their parent boughs. Indeed, as their whiteness rivalled that of the falling snow, they almost looked like snowflakes caught in some mysterious fashion, left hanging from the branches. As we ascended the snow became heavier, and before we reached the summit there was a depth of more than 6 inches of snow under foot. We were well pleased to

begin the descent from the highest point, which is 3,400 feet above sea level, and to hurry down the western side to the Beech huts, which have an altitude of only 840 feet, where we found a more genial atmosphere.

Next morning was fine, and we strolled along to the Sutherland Falls, the highest waterfall in the world, where a large stream comes leaping down the mountain side a sheer distance of 1,904 feet. The drenching spray descended like rain for a considerable distance from the foot of the fall, round which for a large area almost the only vegetation was coarse, wind-swept grass, which bent before the breeze caused by the falling waters. Our onward way led down the valley of the Arthur River to Milford Sound, a magnificent fiord surrounded by grand, awe-inspiring mountains, some bush clad, others, such as Mitre Peak, too steep to afford roothold to any but the most stunted bushes on its lower steep, while Mount Pembroke carries a gleaming glacier in its bosom.

The track from Beech huts to Milford was of a character somewhat similar to that on the other side of the range, but the vegetation was richer. Ferns were more plentiful, from occasional groups of Tree Ferns to filmy Ferns enwreathing the tree stems, including the beautiful *Trichomanes reniforme*, while filling the interval were other species; and we passed banks covered with the lovely double Crape, or Prince of Wales' Feather Fern (*Todea superba*). This Fern we had seen on the other side of the pass as well. On our way back we had fine weather, and found the snow all gone from the pass. As we climbed the western slope, and got above the bush, we found the *Plagianthus* trees in full flower, and none the worse for the severe storm they had so recently passed through.

Now it must be remembered that the beginning of February here corresponds to the beginning of August in the Northern Hemisphere, and I think that any plant which will come scatheless through a heavy snow-storm in the beginning of August has some claims to be considered hardy. It appears to be most accommodating in its habits also, for though its natural habitat is the upper edge of the bush line, it occurs right down to sea level in the sounds, or fiords, where a few trees may be found overhanging the water, and numbers of young seedlings grow amongst the stones about the mouths of creeks. At the higher levels it is quite deciduous, while lower down it is all but an evergreen. When we left the *Plagianthus* groves below us, our track traversed a shrubby region, where the grey bushes of *Olearia moschata* were in full bloom.

This shrub should be as hardy as *I. Haastii*, which appears to be a favourite at home, and while its bunches of white Daisy flowers would have a more effective setting in foliage of a darker hue, the silvery sheen of its leaves makes it a distinct and pleasing bush even when not in flower. Here, too, were growing several *Veronicas*, both of the whipcord and leafy varieties, the only one I found in flower being *V. grandiflora*. I had met with both *V. Lyallii* and *V. Catarractae* in the stony water-courses in the Clinton Valley. Above the scrub the mountain side was covered with *Celmisias* of several species, all past flowering, and the round, dark leaves of the *Ranunculus Lyallii*, from amidst which rose innumerable seed stems, so that one could picture what a glorious sight it must have been when the flowers were in bloom. All this had been hidden by the

snow when we were going, as well as many more lovely and interesting mountain plants growing between their larger neighbours. Amongst the latter was *Senecio Lyallii*, which was also past its best, though a few belated bunches of its pretty yellow flowers were still to be seen, and after a considerable search I found a plant of the white-flowered variety. *Wahlenbergia saxicola* still displayed a few of its pale blue bells, and *Gentiana pleurogynoides* was sending up its stems crowned with bunches of nearly opened white blossoms. As I was gathering plants I heard a noise like thunder, and looking upwards I saw a large avalanche which had broken away from the Jervois Glacier come crashing down the precipitous mountain-side like a mighty waterfall. From near the summit of the pass we were able to look down 2,500 feet to the Beech huts we had left in the morning, and which lay right below us, while Mount Hart and Balloon Peak towered into the clear sky above us. All along the track on the lower lands the soil and gravel thrown up in its formation were carpeted with low-growing plants. Here *Nertera depressa* was studded with its bright berries, there *Pratia angulosa* had still a few flowers, but its flowering season was nearly over, and many of its fruits were ripe. In open places *Acænas* were met with, and in one dampish spot the perfume told it was a creeping *Mentha* I was crushing under foot, and there were many others. For a plant lover it was a most enjoyable trip, nor were other interests lacking.

On the pass we saw a couple of Keas (*Nestor notabilis*), the destructive sheep-killing parrot, and while in the bush we occasionally saw their cousin, the Kaka (*Nestor meridionalis*), but, strange to say, only one or two parrakeets (*Platycercus Novæ Zealandiæ*) were seen, though only a few years ago these birds were very abundant. We saw tracts of the nocturnal parrot, the Kakapo (*Stringopos habroptilus*), and a few of our handsome wood pigeons (*Carpophaga Novæ Zealandiæ*). The tame bush robin (*Petroica albifrons*), once so numerous and friendly that if one sat down anywhere in the bush a robin would immediately come into view, and, gradually hopping nearer, would perhaps alight on the foot of the watcher, was very scarce, though as friendly as ever. The harsh cry of the long-tailed cuckoo (*Endynamis laitensis*) was the dominant bird note, but the warble of its foster parent, the yellow head or native canary (*Orthonyx ochrocephala*), was heard chiefly in the *Plagianthus* groves, and the cheep of the active tailless tiny little rifleman was constantly heard as they hurried and scurried among the branches and up the trunks of the trees. But I am wandering far from my subject, so shall say nothing more about the birds, nor shall I say anything about the scenery, except this, that I do not think there are many places in the world where the same combinations of sylvan loveliness and mountain grandeur are to be found. A globe-trotting English lady and gentleman whom we met on our way told us they were charmed with what they had seen, and had never beheld scenery they liked better. They were apparently entitled to speak with authority, as they had just come from Japan, where they had walked some

FOXGLOVES AND FERNS IN THE GARDEN OF DR. LIONEL BEALE, F.R.S., WEYBRIDGE.

200 miles through the most picturesque localities. They had also been in the Himalayas, and were familiar with Switzerland. Notwithstanding these digressions I think I have shown that *Plagianthus Lyallii* should be hardy in England. A. BATHGATE.

Dunedin, New Zealand.

A SURREY WOODLAND GARDEN.

POOR soil beneath giant specimens of Scotch Fir would hardly seem to be the most desirable spot to grow plants successfully, yet the garden at Weybridge of Dr. Lionel Beale, F.R.S., is thus situated, and of the many good things it contains Dr. Beale has on several occasions written in THE GARDEN. Last year an illustration was given of a splendid plant of *Chamerops excelsa*, that has been growing out of doors there for many years.

One or two other good specimens of this Palm may also be seen there, as well as numerous Bamboos, an extensive collection of Ferns and evergreen shrubs, and such plants as Japanese Maples, Azaleas, Rhododendrons, Lilies of the Valley, Foxgloves, Camellias, Roses, Hellebores, Lilliums, Leucojum, and bulbous plants. As shown in the accompanying illustration, Ferns and Foxgloves luxuriate in this shady retreat. Dr. Beale and his gardener have made dells here and there, which are clothed with the foliage of Ferns, from whose shelter now peep the bells of Foxglove and Campanula or the yellow cups of Lilliums, while in early spring they are whitened with Snowdrops and Hellebores, or, later, are blue with Scillas. *Aristolochia Siphon* has clambered to the top of a large tree, clothing the trunk with its bold handsome foliage, Camellias thrive beneath the huge

bushes of Rhododendrons. The banks of the grassy walks that honeycomb this woodland garden are smothered with Ferns, and Saxifrages peep out at one from here and there; in short, there are features of interest and delight at almost every turn. Few would have made such an oasis of poor, dry, woodland ground as Dr. Beale has done, and the best of all, perhaps, is that this garden is as full of interest and has a certain beauty, too, in winter as in summer.

THE AURICULA—JULY.

THE plants are still resting, and although but little change may be perceptible, still active root-growing is going on, and should be encouraged. Water carefully and see that the soil does not become sodden. Admit as much air as possible to the cold frames, and protect from the sun by shading.

SEEDLINGS.

Every grower of the Auricula should strike out a line of his own and endeavour to produce seedlings. Some may do so simply for amusement and gratification, some from motives of gain, others from a spirit of rivalry, and some from a desire for fame in wishing to have their names registered as raisers of new varieties—all most commendable in their way; but the primary object of the enthusiastic cultivator should be not to rest content with the Auricula world as he found it, but take care on leaving it to add better flowers than provided by his predecessors. The first step in raising seedlings is to select strong vigorous young plants as seed bearers. The pips are prepared for seedlings by taking away from the flowers, at the earliest possible stage, the anthers of each pip, and exposing the pistil ready to receive the

pollen, which is conveyed by a camel's-hair pencil from the variety selected for cross-fertilisation. A green edge should, of course, be crossed with another green edge, and the same with grey, white, and selfs. Some advocate sowing the seed as soon as ripe in July, others wait till the early spring, at the end of January or February. Whichever plan is adopted every care must be taken to prevent growth of moss, which will prevent the young seedlings coming through and cause great disappointment. As a prevention of this evil a solution of lime water should be used, made by fresh unslaked lime and water. As the water will not take up the lime in quantity injurious to plant life, it is not possible to make it too strong. Fill a 4-inch or 4-inch pot with the soil ordinarily used for potting a collection of Auriculas. Add an inch or so more finely sifted for the seed-bed. After levelling and pressing down give a watering of the lime water above mentioned before sowing. Sow the seed evenly and thinly, and cover slightly with fine soil. Place in a well-shaded cold frame, cover each pot with a piece of glass, and water carefully when required. As soon as the young seedlings show their rough leaves prick off round the edge of small pots, and again as soon as the small seedlings touch, work up each seedling into a 3-inch pot, and shift again into larger pots as the growth progresses.

For the general collection, keep a sharp lookout against a small maggot which draws together with a slight cobweb the inner leaves and punctures the heart of the plant, and leads to destruction unless destroyed. Wage constant warfare against the aphid or green fly by fumigating whenever necessary with XL All vaporising liquid. W. SMITH.

NOTES ON HARDY PLANTS.

HARDY FLOWERS FOR CUTTING.

THE note in a recent issue as to the hardy flowers available for cutting from the middle until the end of May suggests a weekly continuation of the same, because I believe there are many gardeners who would be only too glad to welcome a goodly supply of outdoor flowers at all seasons of the year when it is possible to secure them. Aquilegias are at their best, and are among the flowers that may be cut with little regret for their loss. They are short-lived on the border, but stand very well in water. Pyrethrums are also at their best, and old-established clumps are furnishing a very fine display. Flowers from this source can be cut to any length up to 3 feet, and the recent rains have so well started the plants that back blooms are forming on many of the stems. German Irises are available in variety nearly 3 feet long, or for smaller vases the top blooms can be taken off, and the first flowers of the Spanish section were cut on June 1. On the same date the first flowers of the Iceland Poppies were ready from seed sown in February. It is worth noting in connexion with these that the seedlings are decidedly earlier than old plants remaining on borders from last year. Very good sprays of Lily of the Valley are still forthcoming from a north-west border, a site that also gives us late Spanish Irises and many other flowers equally useful. Roses on walls are at their best, and heavy cuttings are made of the old Gloire de Dijon, Safrano, Waltham Climber, and Homère. So far as material for large vases in the shape of flowering shrubs is concerned, there is no season of the year when there is a greater wealth of bloom than early in June, for, besides Rhododendrons and Azaleas, most of the deciduous flowering shrubs are now at their best. I do not think the great merit of the newer varieties of these are sufficiently recognised. Such things, for instance, as the large-flowered form of Philadelphus and the new Weigelas

are very fine. Also in evergreens a good word must be added for *Choisya ternata*, one of the loveliest shrubs in cultivation and a charming button-hole flower. I do not know how it will do on cold stiff land, but, given light warm soil, it should always have a place against a wall or in some sheltered corner. E. B. C.

DIANTHUS ATKINSONI.

This is one of the most brilliantly coloured of all the family, and very striking in the border or in pots in the early summer months. There is always some difficulty in securing compact bushes, as, owing to its profuse flowering, cuttings are not very freely produced. For this reason it is well to reserve a few plants for stock, not allowing them to flower. Where the plant has already flowered cut away the spikes forthwith, that cuttings may be secured as early as possible.

PRIMULA SIKKIMENSIS.

WHEN well grown this is one of the best of the genus, particularly of those coming in the summer months. It is essentially a moisture-loving species, and one also that, so far as gardeners are concerned, should be treated as though it were a biennial. The plant may also be grown in shady beds, where the soil is ever moist and cool, even if not wet. With plenty of moisture the plant becomes vigorous and produces a fine umbel of drooping yellow blossoms on stems 2 feet high. A group of two or three dozen plants is very pleasing in flower in the middle of June.

CAMPANULA PERSICIFOLIA CORONATA ALBA.

This useful border perennial is now very showy, the larger tufts producing several spikes of pure white blossoms. These latter are more attractive than those of the ordinary white form, because of the cup-and-saucer-like arrangement of the flowers. All the white forms of this group are especially good for the border or for cutting, and are always neat and attractive in habit. The large-flowered form *C. p. a. grandiflora* is particularly effective in a large group and most serviceable in pots. All the kinds are easily increased and well repay good cultivation.

THE ROSE GARDEN.

TWO YELLOW HYBRID TEAS.

HERETO some of the best golden-yellow Roses, both in the Teas and also the Hybrid Teas, have been sadly wanting in vigour. One especially grand variety was *Souvenir de Mme. Levet*, but, unfortunately, it is tender. I should say a fortune awaits the raiser who can produce a Rose of this colour with the growth, size, and freedom of *Caroline Testout*. The two varieties I desire specially to direct attention to in this note are *Friedrich Harms* and *Franz Deegen*. The former is of a colour much resembling *Souvenir de Mme. Levet* and *Goldquelle*, but it is apparently of a more robust constitution than either. I do not say it is so vigorous as one could desire, but it is an advance in the right direction. *Franz Deegen* I have not yet seen outdoors. Under glass it is much valued by florists: the pale yellow colour, with a deep golden-yellow centre, make it most useful for cutting. P.

ROSE GARDENIA.

ALTHOUGH one of the first of the hybrids obtained from *R. wichuraiana*, this beautiful variety is still one of the best. Just now upon a four year old plant there are some 300 or 400 buds, which, when developed, will be quite as large and of a similar tint of canary yellow to the Tea Rose *Mme. Chedane Guinoisseau*. These Roses require a deep root-run of good loam, and should be given a few tree-stumps to scramble over. They are full of healthy

vigour, the buds being set off by glistening leaves. A variety which resembles *Gardenia* is *Alberic Barbier*, but the buds are of a paler tint and the expanded flowers nearly white. No one should miss an opportunity of adding both these to their collection, and, if they have a few spare Briar stocks, insert a few buds on these with the tallest stems. They make perfect weeping trees, and are fitting companions to *Dorothy Perkins*, *Euphrosyne*, *Aglaia*, and such like. P.

ROSES AT KEW GARDENS.

ABOUT the end of June and early in July Rose growers would be well repaid by a journey to these famous gardens. Here one may see the various types used in the best ways. For instance, that charming, if somewhat too fleeting, Rose *Caroline Pillar* is in perfection in the dell garden, making a mass of its brilliant blossoms, with a background of tall Pines. Hard by is a belt of the Dawson Rose in its tender pink and profuse bloom. These, of course, will be over by the time named, but an inspection of the bank of *Crimson Rambler* and *Flora* would alone be worth a visit early this month. A special feature at Kew are the beds of such Roses as *Una*, *Electra*, *Morletti*, *Royal Scarlet*, and *Mrs. Anthony Waterer*. No one can form any idea of their beauty. This liberal massing of one kind could only be employed in large gardens or public parks, but the effect produced should not be allowed to pass unnoticed by all who can see them. Doubtless a modification of this bold bedding could be arrived at by a judicious mingling of sorts that are similar in growth and that would flower almost simultaneously. But the main point to aim at is perfect and unrestricted freedom for the growth. Nature here is almost entirely triumphant. The plants are planted, and after this, beyond cutting out old wood, they are allowed to grow as they like, with the result that we find perfect sheaves of blossom.

What a fine Rose *Una* is for this bold bedding, and I might suggest an edging of *Royal Scarlet*. *Morletti* was magnificent at the time of my visit. It is the only Boursault worth growing with the exception of *Calypso*, which I have only seen at Kew. It is a fine large flower of a paler tint than *Morletti*. Apparently we should call the latter *Mme. Sancy de Parabere* if priority of naming counts for anything. To obtain the best effects from this massing the Roses should flower somewhat at the same time, and before planting time I propose to arrange a list as a guide.

The gravel walk by the rock garden has some fine arches of Roses spanning it. These arches are some 12 feet high, 14 feet wide, and about 20 feet apart. A very wise arrangement is the mingling of *Clematis montana*, *Honeysuckles*, &c., to run up with the Roses. This provides a denser clothing of the iron supports, which, by the way, consist mainly of gas piping. Personally, I do not care for iron of any description as a Rose support, but apparently the authorities at Kew have found it answer well. On these arches will be found some of the choicest and best for the purpose. Tea *Rambler* promises to be a charming addition. I was surprised not to find *Dorothy Perkins* or *Waltham Rambler*. Surely every garden will soon have these two lovely Roses. With the advent of perpetual-flowering ramblers, which seem close upon us, arches of this description will be an enduring feature of the garden. I thought that a few old tree-stumps could have been introduced for supporting one or two of the specially beautiful *wichuraiana* Roses such as *Gardenia*, *Jersey Beauty*, *Alberic Barbier*, and *Ruby Queen*.

Another special feature at Kew is the pegging down system. A bed of *Clio*, that grand flesh-white Hybrid Perpetual, will soon be a lovely picture. Each plant had two or three long shoots pegged down, and produced some thirty to forty trusses of flower. There was no sense of crowding, but the bed was an almost even surface of growth, and the effect when this bed is in full bloom will be very beautiful. Even that rigid-growing Rose *Her Majesty* was treated in the same manner, and the branches were studded with buds. I do not know that I should advocate this method

with Roses of the latter type, but with such free-blooming sorts as Clio it is a great advantage to obtain a mass of bloom upon fairly dwarf growths. To obtain without pegging the same amount of blossom from Roses such as Clio we should not only need to plant closer, but also be content with rather tall bushes. P.

CULTIVATION OF ALPINE PLANTS.

(Continued from page 448.)

RAISING ALPINES FROM SEED.

FEW words may be in place here about raising alpine plants from seed; for constant succession is necessary, the duration of their life in cultivation being, for many obvious reasons, which need not be discussed here, far shorter than in their native home. Reproduction from seed, where seed can be obtained, ensures the healthiest and finest growth, and there is no better way of getting seed than in saving it yourself. In several cases the first hint I have had that a plant has ripened fertile seed has been the recognition of a seedling near the parent, and this experience has taught me always to look carefully for seed after the flowering of rare specimens. I need not say, therefore, that I disapprove of the practice of cutting off flower-heads as soon as they wither; in some cases the seed-head is nearly as ornamental as the flower, but I have before said that discretion must be used even in this, as seedlings of some things are troublesome from their number. When ripe seed is gathered I recommend its being sown at once. It is then more likely to come up quickly, and as all such plants as we grow on rockeries are better sown in pans, there is seldom difficulty in keeping small seedlings through the winter. The greatest enemy we have in the process is the growth of lichen, the worst being the *Marchantia* or *Liverwort* fungus, which completely chokes tender growth. A coating of finely sifted burnt earth on the surface, and a piece of flat glass laid over the pan, especially if no water is used for them unless it has been boiled, reduces this trouble to a minimum. But sowings of choice and rare seed should be carefully watched, and the fungus picked off at the first appearance. Many alpine plants seem never to make seed in cultivation, and must be reproduced by division or cuttings. The skill required to do this varies greatly with different subjects; where a shoot can seldom be found more than half an inch long, as in the case of two or three hybrid alpine Pinks, the striking needs delicate manipulation. Other things grow very slowly, though not long-lived, and a constant succession from cuttings must be ensured. Some of the terrestrial Orchids, such as Bee, and Fly, and Spider, excellent subjects for rockery, we must be contented to keep as long as they choose to live, as they seem never to increase in cultivation at all, though they may flower well year after year. But there are not a few plants which refuse to be tamed, and from the time they are planted in our gardens seem always to go from bad to worse, and are never presentable in appearance for two seasons together. Of these I may instance *Gentiana bavarica* and *Eritrichium nanum*, which I believe no skill has ever kept in cultivation without constant renewal, and which perhaps are never likely to repay the trouble of trying to keep them alive on an English rockery. In all alpine gardening there will be, even where equal skill is exerted,

different degrees of success, according to the surrounding conditions; and it must not be expected that the same soil and treatment which keep a hundred rare alpine plants in perfect health at Edinburgh will be equally fortunate at Kew.

FRAMES FOR ALPINES.

This paper would not be complete without saying something about the use of frames in alpine gardening. Where the area of rockery is considerable, a cold frame should be assigned for keeping up the supply of plants for it—cuttings and seedlings—in pots. The best treatment of these plants in winter has been much discussed in gardening journals. I may say that I think all attempts to imitate natural conditions, such as snow and long rest, by unnatural means are mistakes. During warm winters mountain plants will grow, and must be allowed to grow, and to keep them unnaturally dark or dry when growing is fatal to their health. Even in severe frosts air must be given abundantly in the daytime, and the frames must not be muffled up. Stagnant air, whether damp or dry, is their worst enemy; but if the weather is warm enough to set them growing, they may easily die for want of moisture. I will not say more than this, for experience is the best guide, and everyone thinks he can manage his frames better than his neighbour, but of the use of frames for flowering alpine plants in pots I must add a few words. There are certain very early-flowering alpine plants upon which a mixture of admiration and lamentation is bestowed at the end of every winter. Their flowers are often beautiful in a treacherous fortnight at the beginning of February, and are suddenly destroyed by a return of winter in its severest form. I may mention, amongst others, *Saxifraga burseriana* and *sancta* and their near relatives and hybrids, *Primula marginata* and *intermedia*, *Androsace carnea*, *Chamaejasme*, and *Lagereri*, several dwarf species of *Alyssum* and *Iberis*, and there are a good many more. Pots or pans containing these may be grouped together in an open sunny spot, and plunged in sand or coal-ashes in a rough frame made for them, so that the lights may be not more than 3 inches or 4 inches above the pots. These lights should be removed in the daytime when the weather is fine and air should be admitted, according to the temperature, at night. Such a sheet of elegant beauty, lasting, if well arranged, through February, March, and April, may be obtained in this way that I often wonder why amateurs attempt to flower early alpine plants in any other fashion. With me April is the earliest month in which I can expect to have anything gay on the open rockery without disappointment. I am obliged to disfigure the slopes with sheets of glass and handlights to preserve through winter at all *Omphalodes Luciliae*, *Onosma tauricum*, *Androsace sarmentosa*, and others which cannot endure winter wet, and the real pleasure of the rockery begins when the frame alpine plants are waning. I recommend those masses of covered pots in early spring to all cultivators of alpine plants.

ALPINES ON WALLS.

I promised to speak of alpine plants on walls, and that shall end my say. A few years ago I was driving through Dorking, and I noticed a smooth and by no means ancient brick wall covered, above the reach of boys' hands, with *Erinus alpinus*. Rough stone walls I had often seen well clothed with alpine plants, but from that time I became aware that there is hardly any garden wall, of whatever material, of which the parts otherwise bare might not be made ornamental with flowers. I do not suggest that such things should supersede climbing Roses

and wall fruit, but how often we see bare walls on which nothing is grown at all! The capabilities of rough stone walls for growing mountain plants are very great. Falls of *Aubrietia* and *Iberis*, groups of *Saxifragas*, and similar subjects may make many a corner gay instead of bare. Some very pretty things I grow on walls which have defied all my attempts to cultivate them elsewhere. I may specify *Lychnis Lagasce*, a fragile evergreen plant of shrubby growth easily multiplied by seed, which alternate snows and thaws generally crush up, but in this way it continues to thrive, and is covered during early summer with crimson flowers.

I have now come to the end of my subject, and only add that I have made a careful selection of 150 or so alpine plants suited for English rockeries in a list given as an appendix, from which all coarse growers are excluded.

ROCK PLANTS SUITABLE FOR ENGLISH GARDENS.

<i>Acantholimon venustum</i>	<i>Hypericum repens</i>
<i>Achillea tomentosa</i>	" <i>nummularium</i>
" <i>Clavennae</i>	<i>Iberis saxatilis</i>

TREES AND SHRUBS.

ABUTILON VITIFOLIUM.

THE Vine-leaved Abutilon (*A. vitifolium*), with its large, cup-shaped, lilac-blue flowers and cordate leaves, which in the autumn assume a golden tint, is hardy in Ireland and the south of England, but should have protection from frost. It was introduced from Chili in 1837. The fact of its not being a fast grower, together with its doubtful hardiness, probably largely accounts for its restricted culture in English gardens. The accompanying illustration shows this Abutilon at its best. The Abutilon walk at Chaddlewood, the Devonshire residence of Mr. G. Soltan-Symons, is 200 yards long, and there are over 200 plants, which are from 6 feet to 15 feet in height. When in full bloom they are a beautiful sight. Mr. Soltan-Symons says that he has had Abutilons in the garden for a great many years, and he has never lost any from frost or snow.

CEANOTHUS DIVARICATUS.

BLUE-FLOWERED shrubs are not plentiful in gardens, and of the few that exist most are included in the genus *Ceanothus*. Unfortunately, most species of *Ceanothus* are rather tender, and to have them at their best in the neighbourhood of London they must be planted against a wall, and even then in very severe winters they are badly cut. Of the hardier sorts *C. divaricatus* makes by far the largest plant. In the open ground at Kew a bush 18 feet or so high, with the same diameter, is now—mid-June—in full flower and makes a distinct feature among other shrubs. It is a Californian plant, furnished with a large head of twiggy branches clothed with dark evergreen glossy leaves, which are oval in shape and 1½ inches long. The flowers are small and blue, and arranged in dense axillary clusters. The blossoming period extends from the end of May until the end of June. When planting it is not advisable to give very rich soil, or strong rank wood will be formed, which is liable to injury from frost. Cuttings of half-ripe shoots root readily during summer if kept in a close case. W. D.

DIOSTEA JUNCEA.

THIS is a curious and rare hardy shrub, closely related to the scented *Verbena* (*Lippia citrifolia*), *Lippia* being, in fact, one of its numerous synonyms. At Kew there are two large specimens growing in a shrubbery near the Filmy Fern house, and these two have been smothered in flowers for the last fortnight, and now (June 17) they look as if they will remain in good condition for at least another ten days. It is found wild in the Chilean and Argentine Andes at an elevation of

from 3,000 feet to 5,000 feet. At Kew it forms a large bush, 16 feet or 18 feet high, with a short trunk and a few strong main branches. The branches are clothed with numerous thin broom-like shoots, which are semi-pendulous. The leaves vary from 1 inch to 1½ inches in length, and are narrow, with serrated margins. The flowers are very small and white, with a lilac tinge. They are arranged in dense axillary and terminal spikes an inch or so long. The plant, both in and out of flower, has a very distinct appearance, and is worth extended cultivation. W. DALLIMORE.

RHODODENDRONS IN HYDE PARK.

THE annual display of standard Rhododendrons in Hyde Park from Mr. Anthony Waterer's extensive nursery at Knap Hill is this year a very beautiful one. It was at one time thought that these shrubs would only thrive in peat soil, and from a cultural point of view it may be well to put on record the fact that experience has shown otherwise, for it is now found that Rhododendrons and other American plants succeed in almost any soil that does not con-

fine shape; *Fastuosum flore-pleno* bears immense trusses of double flowers, which are a beautiful mauve. That fine old sort *Lady Eleanor Cathcart*, pale rose, spotted chocolate, was well represented; so, too, were *Michael Waterer*, crimson, spotted, fine; *Mrs. John Walter*, light centre, edged pink; *Kate Waterer*, rose, yellow centre, very showy; *Mrs. Charles Leaf*, rose, light centre, beautiful and distinct. QRO.

CALYCANTHUS FLORIDUS.

(CAROLINA ALLSPICE.)

I HAVE never seen this plant flower so profusely or for so long a time as it has done this year, and though it is not so showy as some of our flowering shrubs, yet it deserves a place in the garden for its aromatic scent and the brilliant golden tint of the leaves in autumn. When fully grown it makes a large spreading bush, 8 feet to 10 feet high, and of about the same diameter. The branches are of a dull brown colour, the secondary branches growing nearly or quite at right angles to the main ones, giving the plant a curiously angular

appearance in the winter, after the fall of the leaves. The flowers are borne singly from nearly every node of the previous year's wood, and consist of three whorls of strap-shaped fleshy petals of a reddish brown colour. They appear throughout June, and are not very showy, but have a strong scent somewhat resembling that of *Magnolia fuscata* or *Kalosanthus coccinea*. The scent is most noticeable when the sun is shining, and is more pleasant at a few yards' distance than it is close at hand. The leaves are 2 inches to 3 inches long, broadly ovate, entire, pubescent beneath, and covered with short, prickly hairs on the upper surface. They turn to a bright golden-yellow colour in the autumn. One curious point about this plant is the fact that, while the living wood when bruised has very little scent, the dead wood has a spicy, fragrant and very pleasant smell when crushed in the fingers. The plant is a native of the South United States, and can be grown in any garden soil provided it is not too stiff. It is easily propagated by layers.

Bayshot, Surrey.

J. CLARK.

COLOURED PLATE.

PLATE 1264.

A GROUP OF IRISES.

SHOWN in the accompanying plate are four Irises, two of them wild Irises, the other two hybrids or crosses of man's making, all belonging to what is known as the *Juno* section of the genus. All the members of this section are bulbous, but they differ from other bulbous Irises, such as the Spanish Iris (*I. Xiphion*), in having "store" roots persistent after flowering,

A WALK OF ABUTILON VITIFOLIUM IN THE GARDEN OF MR. SOLTAU-SYMONS, CHADDLEWOOD.

in having several coats to the bulb instead of a few, and in bearing often more flowers than two, and in the foliage being, as a rule, broad, not linear. I think myself that it is a mistake to treat both these sections of bulbous Irises, taken together as a separate genus, under the name *Niphion*, as is done by some; this will be found on experience to lead to trouble. It is better in my opinion to treat both sections as belonging to the genus *Iris*, and to call one section the *Niphion* section, and the other, the one with which I am dealing now, the *Juno* section. The two natural wild Irises shown in the plate are *I. tubergeniana* and *I. willmottiana* both introduced from the central parts of Asia by Messrs. Tubergen. Both are very closely allied to *I. caucasica*, and, indeed, it is only by minor characters, such as points in the form of the outer petals, &c., that they can be distinguished from it. Some systematists might insist that they are only varieties of that species, but to the gardener they are quite distinct plants.

Both, like *I. caucasica*, are dwarf plants, with at most a short stem, and in this differ clearly from the allied group of *I. orchioides*. *I. tubergeniana* is yellow in colour, and *I. willmottiana* is blue, or, rather, white flaked and splashed with blue. Both flower earlier than *I. caucasica*; but this, though it may seem to the gardener at first sight an advantage, is really, so far as the reputation of the flowers themselves is concerned, a disadvantage. When they bloom out of doors, in the dull windy days of March, their delicate beauty is spoilt. I did not recognise what a delicately charming plant is *I. willmottiana* until I grew it in the calm repose of a cold greenhouse.

I. sind-pers and *I. purp-pers* are both crosses, due to the skill and care of Messrs. Tubergen. These names, of course, are very odious, but they are useful in telling at once the parentage. It is a pity that in this world the useful and the beautiful are so often disjoined.

I. purp-pers is a cross obtained by fertilising with the pollen of the typical *I. persica* the plant known as *I. persica* var. *purpurea*. I believe this to be the case, but I cannot lay my hands on my notes. Perhaps the typical *I. persica* was pollinated with the purple plant, in which case the name should be *I. pers-purp*. Purists would I suppose call this plant a cross, not a true hybrid, the latter term being confined to the result of mixing true species. This does not weigh very heavily on my mind, since this

purple form of *I. persica* seems to me quite as much (or as little) worthy of a specific name as several other Irises of the *persica* group, such as *I. Heldreichii* and others.

This *persica* cross or hybrid is a charming flower, the peculiar greenish white and almost black blue-purple of the typical *I. persica* being overcome by the red-purple of the other parent. It is free flowering, early flowering, and, though not absolutely robust, is more enduring than most forms of the *persica* group.

I. sind-pers is a cross between two plants, which, though both belonging to the *Juno*

than that of the mother, which it resembles in its blue colour, though the pollen of the *I. persica* has made itself felt in the orange crest and in some other points.

The great feature of the plant is its robust character and its splendid flowering powers. It opens at the same time, or even before the pollen plant, and some considerable time before its other parent: and even a few bulbs planted together produce a mass of beautiful blue sheen, which rejoices the eye and makes one believe that winter is really over, even when one has to wrap up in a thick coat in order to go out and look at it. It is to my mind one of the greatest treasures in the early spring garden.

M. FOSTER.

Ninewells, Shetford.

ORCHIDS.

LAELIA PURPURATA
QUEEN ALEXANDRA.

ALTHOUGH this lovely new Orchid was not put before the Orchid committee of the Royal Horticultural Society at the Temple show for certificate, it is none the less worthy of special notice. It was in the group shown by Messrs. William Bull and Sons, Chelsea, and met with universal appreciation. The sepals, petals, and lip are pure white, and the throat yellow, an association that invariably goes to make a beautiful flower. It is the only white variety of *Laelia purpurata* that has yet flowered in this country, although thousands of the type are imported annually.

WORK FOR THE WEEK.

DIACRIUM BICORNUTUM (SYN. *EPIDENDRUM BICORNUTUM*).

This is perhaps the best of the *Epidendrums*, and now its needs are being better known it should become more popular. The flowering season is now passed, growth will soon be active, and the necessary potting should be accomplished forthwith, using a compost of two parts fibrous peat, two parts sphagnum, and one part leaf-soil, with a liberal sprinkling of coarse sand and small crocks. Rhizomes provide a splendid drainage, filling the receptacles to the depth of one-half. I give preference to ordinary pots for their culture. Plants with many old pseudo-bulbs attached should be radically treated if the life of the plant is to be prolonged and good results attained. When the new growths from the leading bulbs are about 1 inch high the latter should be cut away, retaining as many as possible of the roots attached. Pot each severed piece up separately; the parent plant need not be disturbed till new growth is in evidence. I consider this treatment necessary with

LAELIA PURPURATA VAR. *QUEEN ALEXANDRA*. (Reduced one-half.)

A beautiful flower, with white sepals, petals, and lip, and yellow throat, shown by Messrs. William Bull and Sons at the Temple show.

group, are somewhat far apart within the group. *I. sindjarensis*, which bore the ovule, is an early-flowering *Juno*, with several fairly large more or less light blue flowers borne on a stem 1 foot or so in height. The well-known *I. persica* which supplied the pollen bears a single sessile flower. The result is intermediate between the two. The bulb bears three or even four flowers, but these are sessile, or nearly so. The flower is large, even larger

one-half. I give preference to ordinary pots for their culture. Plants with many old pseudo-bulbs attached should be radically treated if the life of the plant is to be prolonged and good results attained. When the new growths from the leading bulbs are about 1 inch high the latter should be cut away, retaining as many as possible of the roots attached. Pot each severed piece up separately; the parent plant need not be disturbed till new growth is in evidence. I consider this treatment necessary with

any plants that have more than four pseudo-bulbs. It greatly increases the stock, and instead of the plants deteriorating we find increased vigour, even after being allowed to flower and carry seed pods. A warm and shady corner in the stove Orchid house should be given, and when in active growth copious supplies of water are needful. At no season do the plants require a dry treatment; frequent overhead spraying are beneficial during the bright parts of the year. From one old plant in 1901 we now have eleven fine healthy pieces that give flowers of good quality, and I question if this treatment had not been given whether by this time we should have had a plant at all. When Orchids have got the reputation of always dying after being in this country a few years, it would be well to experiment and find out a new way of killing them, then perhaps we might find, if only by accident, the treatment they require when grown under our artificial conditions.

COCHLIODA NOZZLIANA.

This beautiful species is perhaps one of the most talked of Orchids at the present moment, now it has been proved to be a most valuable parent in hybridising, and it will without doubt be in great demand. Its culture is simple, and it is well worth growing. Many plants are now in flower with us, and others are growing freely and in a proper condition to be potted should they require it. Potting is best done when the new growths are well started, taking no notice of the time of year. A suitable compost consists of two parts fibrous peat, two parts sphagnum, and one part leaf-soil mixed together, with a good sprinkling of coarse sand and small crocks. Pot lightly, keeping the compost low enough to allow of a top-dressing of sphagnum. Ordinary pots with three holes for suspending are the most suitable receptacles, half-filling them with rhizomes. The roots have a very great liking for this mode of drainage, so in using pots more can be given than when the old-time shallow pans were used. Suspend them from the roof of the Odontoglossum house, spraying them freely overhead on bright days. Those newly potted will not require much direct watering for some time, providing they are well sprayed. Established, well-rooted plants that are growing freely, or those in flower or about to flower, will take copious supplies of water at this season.

W. P. BOUND.

Gatton Park Gardens, Reigate.

THE INDOOR GARDEN.

BASKETS OF PLANTS IN THE CONSERVATORY.

A FEW well-furnished baskets suspended in the conservatory always produce a pleasing effect, and if the house is large and lofty the baskets should be of proportionate size. Strongly made wire baskets are the most suitable, and if plainly and neatly made they will answer every purpose without any superfluous ornamental work. Though certain plants are better adapted for this work than others, the list of those commonly employed might be considerably extended. A well-grown plant of *Plumbago capensis* has a pleasing effect when the branches are trained over the sides of the basket so as to completely envelop it, and if the plants are well furnished with branches before they are placed in position, the covering up of the wire-work may be effected at once. For filling large baskets several plants can be used in each to make an immediate effect. The white variety is nice for a change. For summer flowering the *Achimenes* in variety has a pretty effect, but a considerable number of bulbs will be required to fill a large basket. It is best to start the plants in pans in heat, and when they are 2 inches or 3 inches high place them in the basket in such a manner that not only the top, but the sides and bottom also may be furnished. The baskets, of course, will be lined with moss, and the bottom will be furnished with plants before much soil has been placed in the baskets, the sides being filled in and the basket

filled with soil concurrently. After the baskets are filled, if they could be suspended in a house rather warmer than the conservatory for a few weeks, the plant will do better. *Tropaeolum Ball of Fire* is the best of this family for basket-work, and healthy young plants, several being used in each basket, soon become effective, and are of a lasting character. In a light house they will continue in good condition, with a little pinching and tying, all winter. Harrison's Musk I have found very useful in summer, and there are few yellow flowering plants in proportion to other colours. I have tried *Thunbergia alata*: it is a rather pretty creeper, and when strong plants are used so as to cover the basket at once it is not without merit. The only drawback is its liability to the attacks of red spider. I think the great charm of these baskets is to have somewhat frequent changes. When the baskets, filled with the same varieties of plants are constantly occupying the same positions they become monotonous. *Cobaea scandens variegata* has a charming effect suspended in a lofty house. I have used it in conjunction with *Fuchsias* and tuberous *Begonias*, the *Cobaea* forming the drapery. The Wax, or Honey Plant as it is sometimes termed (*Hoya carnososa*), is very pretty in a basket when well done. Of course, large-sized specimens must be used to give immediate effect, and this remark applies to nearly all basket plants. A very pretty effect may be made by planting Ivy-leaved *Geraniums*, two distinct colours, *Mme. Crousse*, soft rose, and *Joan of Arc*, double white; the former should be planted round the sides and trained over, and the double white used to form a substantial group in the centre. *Petunias* are nice for a change. I like the singles best for basket-work, and give the preference to those having striped or blotched flowers as furnishing more variety, though this is a matter of taste, and those having fancies may freely indulge them. *Lophospermum scandens* is a very pretty creeping plant for draping a large basket, its long drooping shoots when well furnished with blossoms producing a very pleasing effect. This is commonly treated as an annual, but it need not necessarily be so, as under glass it has a perennial character. To obtain early plants, an old specimen may be kept through the winter to yield cuttings in spring, which for basket-work I have found better than seedlings. For early spring perhaps one of the prettiest plants for a basket or a series of baskets is the *Cape Cowslip*, or *Lichenalia*. The baskets need not be replanted annually. The best time to plant is when the growth is about an inch long, so as to reach through the moss with which the bottom and sides of the basket are lined. To furnish a basket well a considerable number of bulbs will be required, but when once a stock has been got together they will be a joy for ever, as no plants are more easily managed. After flowering, the baskets of bulbs may be placed in a corner somewhere till the growth has ripened and then be transferred to the open air, as the passing showers will tend to keep the bulbs fresh—absolute dryness for a long period being, I think, injurious. Epiphyllums of various shades of colour are very effective basket plants for a warm conservatory in winter and early spring. To obtain a good bloom water should be withheld for a time after the growth is completed. An amateur friend the other day complained of his plants not blooming well, and on enquiry I found pretty well the same system of watering had been kept up all the year round, and consequently the growth did not ripen, and so flower-buds did not form. They flower best when starved just a little in the matter of potting. When a basket is well furnished nothing is required in the way of renewal for several years, but just before the flowers begin to open a little stimulant may with advantage be given in the water for a change. The creeping growth used for clothing the sides and bottom of the baskets may be selected to form a contrast with the plants used to fill in the centre. *Sedum carneum variegatum* is very pretty. For draping baskets of purple *Achimenes*, &c., *Tradescantia zebrina* and *T. vittata* are useful. *Panicum variegatum* is very nice for summer work, but requires a warm house to keep it effective in winter. The same may be said of *Cissus discolor*, which must be taken back to the stove when the

nights get cold. Tea Roses are not commonly grown in baskets, but they will succeed very well if the soil is pressed firmly about their roots, and with some of the growth tied over the sides of the basket the effect is very good. E. H.

CORRESPONDENCE.

(The Editor is not responsible for the opinions expressed by correspondents.)

DAISIES.

(TO THE EDITOR OF "THE GARDEN.")

SIR,—A note (page 404) concerning the uncommon occurrence, in a wild state, of the prolific Daisy is interesting, and is fully borne out by those who keep a look out for such variation from normal types. Daisies revel in retentive soils, and where this peculiar variety is most likely to be found and where it has been noticed to occur is in rich pasture land. Of the garden Daisies the prolific variety, the Hen and Chickens, is the only contrary member that has to be dealt with, for it is often difficult to get it well bloomed with flowers radiating from the parent head in the profusion and with the neatness shown in illustrations. It is, however, sometimes seen in fine condition, especially in good soils and damp situations. When it does indifferently a large proportion of the "chickens" do not leave the "wings," so to speak, of the "mother," and then the plant has little to recommend it in a garden. *Bellis perennis prolifera* has usually pink flowers, but there are rare varieties that depart from this colouring. The pretty *Aucuba-leaved Daisy* is seldom found outside gardens. One solitary tuft was noticed in the grass last spring not far from Edinburgh, and its surroundings did not point to the possibility of its having strayed from a garden. Sometimes the wild Daisy is destitute of ray florets, but this condition is not nearly so common with this plant as with the May-weed (*Matricaria inodora*). Among other variations met with the entirely red or pink-rayed Daisies are elegant and uncommon in a wild state. Of these single Daisies there are many varieties. Some are grown here, and massed together they produce a pretty effect. It is one with deep red petals that is known as the Alpine Daisy, and a similar variety is catalogued nowadays by several firms as *Bellis sylvestris*. The true *Bellis sylvestris* is blue-flowered—an enlarged form of our Daisy with minor alterations. I noticed it in the garden turf at Rome and elsewhere, its flower stems rising to nearly twice the height of those of *Bellis perennis*. It is a Southern European plant. *Bellis annua* is another southern plant, smaller than the common Daisy, but similar in appearance. Among the garden double Daisies there is now a fair variety of colouring. New whites are hardly wanted, but pleasant shades of pink and reds are always welcome. An attractive deep coloured Daisy is Dresden China, although its flowers are small; while Alice, raised by the Misses Hopkins at Knutsford, is a good example of a pink quilled. One of the great charms of Daisies is their natural way of rising here and there among the blades of grass. Sheets of Daisied turf are attractive in the wilder portions of the garden, however undesirable they may be for the lawn. The single and double garden Daisies look delightful when naturalised in the same way as their wild congener. Open grassy spaces in pleasure grounds, where the grass is kept fairly short, are suitable spots in which to sow seeds of these coloured varieties. One of the best ways is to sow the ground with a mixture of grass and double Daisy seed, as this prevents any crushing out of the garden Daisies ere they start to take good hold. Many composites are liable to be looked upon as Daisies. Of course the blue Daisy is a true Daisy, but there is little of it blue. Its name is *Bellis rotundifolia* var. *cerulescens*; its home, Algeria. Like other southern Daisies, it sometimes disappears during our winters, as do the tiny Bellums that do best on sunny slopes of the rock garden. They possess no particular merit. The alpine Daisies of some are found in *Aster alpinus*

and its varieties, while the genus *Erigeron* contains several Daisy-like flowers. Such are *Erigeron hyssopifolius* and others, while *Vittadenia australis* is the pretty Australian Daisy.

Edinburgh.

D. S. FISH.

THE NEWER PEACHES.

[TO THE EDITOR OF "THE GARDEN."]

SIR,—As pointed out in your issue of the 18th ult., it is a matter for wonder why the newer sorts of Peaches raised and distributed by Messrs. Rivers are so slow in becoming popular and more freely planted. Their Early Rivers' and Cardinal Nectarines have now become established everywhere. Their introduction marked such a gain in time that no one can wonder how eager was the desire to plant, and I cannot but think that if the merits of the newer Peaches were brought more prominently forward they would enjoy a wider patronage. Peach culture is conducted so much under glass, conducing to a limit rather than an extension of purchase, because, once established, they continue for so long a period in a profitable state. The American sorts, Waterloo and Alexander, have lost much of their former prestige through a proneness to drop the buds when only gently forced. Their loss is not so much felt, because Amsden June, a Peach similar in size, colour, and quality, is so much more dependable. If Duchess of York supersedes this in all-round quality, then certainly growers should be made fully acquainted with its merits, for the early Peach is distinctly a much desired fruit. Naturally the higher price reasonably expected for a new fruit would be a cause of waiting, but remembering the absurd prices paid for the newer Potatoes now in fashion there ought not to be any hesitation in paying a price for what will ultimately prove a better thing. The recognition paid them by the Royal Horticultural Society should be ample evidence of their worth, but, as "A. H. P." says, new Peaches appear to be much neglected. Messrs. Rivers stand almost alone in the effort to effect improvement in Peaches and Nectarines. There are, it must be admitted, many among standard varieties of both fruits that owe their origin to the skill and enterprise of Messrs. Rivers, fruits that it would seem almost impossible to supersede in their varied qualities. Are not the trade somewhat at fault in that these new Peaches find so few patrons? One may peruse many fruit catalogues without finding them by name, and it cannot be denied that a reminder at the right moment makes all the difference in the possible selection, and especially in the case of new or unfamiliar sorts. There are so many nurserymen who stock such a limited selection of these trees that some gardeners who might plant are debarred because of the difficulty of procuring them. In the early and late sections the introduction of new varieties would be the most valued, because in the main crops there are so many really excellent varieties. A gain in earliness, size, and colour are all points to be desired, and apparently aimed at by hybridists of the day, and, as "A. H. P." says, the new Peaches are deserving of trial.

W. S.

EXCESS OF HAULM IN PEAS.

[TO THE EDITOR OF "THE GARDEN."]

SIR,—It is an experience of some time that Peas are shorter than usual, and I note that Mr. Wythes records the fact in his notes on Peas (page 426) as affecting the dwarf varieties. My experience does not coincide. I find some sorts have grown higher. For instance, some that usually need but 2½ feet stakes, this time have gone 5 feet, and would have grown still more if the leaders had not been stopped. Eclipse, Express, Gradus, Thomas Laxton, Veitch's Earliest Round, and Fidler's Early Marrow all developed the same trait, the only exception being found in the dwarf and excellent Pea Excelsior. This, singularly enough, maintains its catalogued height, though occupying a portion of the border where others outgrew their stakes. It is not easy to understand these discrepancies. The moist state of the soil accounts no doubt for their upward tendency, and while there has been a fair proportion of sunny

days there have been no extremes of heat to hinder growth. It may be that the soil is more fully charged with chemical food, due to the abundant rains and soil moisture dating from the early period of 1903 and continuing ever since. Whatever the cause certainly Peas give abundant promise of a large yield, at any rate where slugs have been less persistent in their ravages. Peas suffer much from the damage by slugs, but when once above their reach progress was rapid. I am able to bear out what Mr. Wythes says of May Queen, both from personal experience and observation. I recently saw some wonderfully vigorous rows on the point of being ready for gathering; these, like our own, had much exceeded their usual height limit. We find a gain in time of maturity when comparisons are made between the stock sown in pots indoors and that grown from the first outside. There is always an anxious enquiry for the first dish of Peas, which stimulates the gardener to make what advance circumstances allow with glass accommodation. Even given these cultural aids there are gardens in which Peas can be obtained quicker with simple outdoor culture alone.

W. STRUGNELL.

NURSERY GARDENS.

MESSRS. V. N. GAUNTLETT,
REDRUTH.

ABOUT the middle of May, during a short visit to Cornwall, I took the opportunity of spending a few hours at Messrs. Gauntlett's most interesting nursery. The firm makes a speciality of hardy plants from Japan and elsewhere, and has imported many novelties, some of which are of high merit. In practically every good garden in the south-west plants from Messrs. Gauntlett's nursery are to be seen, but their main trade, which shows a yearly increase, is done with the midlands, where hardness is essential. Tender things suited to Cornish gardens are also kept in stock, and, seeing that the nursery is not in a favoured part of the county and is much exposed to the wind, the healthy and vigorous appearance of these is somewhat remarkable; but even at Redruth severe frosts are exceptional. With very few exceptions all the subjects hereafter mentioned were growing unprotected in the open ground.

Of Andromedas all the known species were represented, including *A. cassinæfolia*, *A. speciosa pulverulenta*, and the fine *A. (Pieris) formosa*, of which the best specimen in the south-west, a splendid shrub 20 feet in height, is at Pentillie Castle. *Arbutus canariensis*, a very handsome tree, was in excellent health, while of Bamboos a very large collection was to be seen. Messrs. Gauntlett have been at pains to procure every known species. I was shown a large clump of *Bambusa palmata* that was planted out from a 6-inch pot five years ago, and now measures 23 feet through. Among the Brooms *Cytisus austriacus axillaris*, *C. scoparius variegatus*, and a dwarf form of *C. albus* were noticeable, while in the rock garden I saw two New Zealand Broom-like plants in good health, namely, *Carmichaelia australis* and *Notospartium Carmichaeliae*. A very large-flowered Laburnum was *C. L. Vossii*. The fiercely-thorned, yellow-flowered *Casalpinia japonica*, a common shrub in Cornwall; *Carpenteria californica*, also in most gardens; *Callistemon coccineum*, usually wrongly entitled *Metrosideros*; the queen of the Camellias, *C. reticulata*; *Castanopsis chrysophylla*, with leaves having a golden reverse, and many *Cisti*, amongst which were *C. alyssoides*, *C. salvifolius*, and *C. rosmarinifolius*, the latter a small bush, with white flowers three-quarters of an inch in diameter, were inspected. A fine plant of the lovely Lily-of-the-Valley Tree (*Clethra arborea*), which flourishes in the open in many south-western gardens, attracted attention, as did *Citharexylum reticulatum* (the Fiddle Wood), of which the finest specimen that I know is in the gardens at Abbotbury Castle; the very rare *Crossosoma californica*, *Banksia quercifolia*, and *Crinodendron Hookeri*

syn. Tricuspidaria hexapetala, hung with cherry-crimson blossoms.

Of Buddleias the handsome *B. Colvillei*, *B. japonica* (with pale blue flower racemes 2 feet in length), *B. insignis*, and *B. variabilis* were represented, while among the Thorns *Crataegus rivularis*, bearing greenish white flowers in the spring and large orange berries in the autumn, was distinct. Of the Dogwoods *Cornus florida* was noted, and of *Cotoneasters* *C. pannosum*, as were *Clerodendron foetidum*, *C. trichotomum*, *Coronilla Emerus* (5 feet by 6 feet), *Corokia buddleoides*, and *C. Cotoneaster*, *Desfontainea spinosa*, *Daphniphyllum glaucescens*, *Drimys Winteri*, many *Deutzias*, among which the dwarf *D. kalmiaeflora* and *D. carminea* were very pretty; *Distylium racemosum*, a hardy evergreen from Japan, bearing small scarlet flowers along its shoots; and *Disanthus cercidifolius*, of the Witch Hazel family, also from Japan, whose red and orange autumnal colouring is marvellously beautiful, and which should be in every garden.

A fine young tree of the brilliant-flowered *Embothrium coccineum* had been bent down and the ends of its branchlets layered, numbers of healthy layers being present. Mr. Gauntlett informed me that he had discontinued raising seedlings, as these rarely gave satisfaction, being so apt to die off. Of *Elaeagni* I was shown *E. Frederici*, with cream-coloured leaves, having a narrow green margin; *E. longipes*, *E. macrodonta*, and *E. umbellatus*. *Edwardsia grandiflora* and *E. microphylla*, largely grown in Devon and Cornwall, were present, as were the handsome *Elæocarpus reticulatus* and *Eucyphia pinnatifolia*, grand in many Cornish gardens. *Euphorbia Sibthorpi* was in bloom, and had been in flower for two months. *Enkianthus formosus*, a shrub with flowers resembling an *Andromeda*, was said to be fine in its autumn colouring, while *Euonymus fimbriatus* is remarkable for the crimson tint of its young leaves, which at a little distance have the appearance of flowers, and *E. alatus* has curious four-sided twigs. The Canadian Mayflower (*Epigaea repens*) is grown in quantity. The rarely-seen Jalap Plant (*Exogonum purga*) is kept in stock, and about thirty species of *Eucalypti* are grown. The rare shrub *Feijoa sellowiana* was inspected, as were healthy specimens of the handsome *Fremontia californica*, a shrub that has the unfortunate habit of sometimes dying off suddenly when it attains a large size. The North American *Gordonia Lasianthus*, which bears white flowers 4 inches across, was well represented, as were *Grevillea alpina*, *G. sulphurea*, and *G. rosmarinifolia*. The Witch Hazel family included *Hamamelis mollis*, *H. arborea*, *H. japonica*, and *H. zuccariniana*, and among the many *Hydrangeas* were *H. scandens*, *H. aspera*, and *H. radiata*. Some 10,000 plants of *Iris laevigata* (Kämpferi) are grown and show robust health in dry ground. Among the Hollies was the Himalayan *Ilex diphyrena*, and the pretty shrubs *Illicium religiosum* and *I. floridanum* were well grown. The dark crimson *Kalmia Pavardi* was striking, and *K. angustifolia* in full bloom very pretty. *Laurus regalis*, *L. camphora*, and *L. glandulosa*, valuable for their scented leaves; *Leptospermum*, pretty flowering shrubs growing to a height of 20 feet in the south-west; and *Lomatia ferruginea*, a handsome Chilean shrub much like *Grevillea robusta* in foliage, which I have met with in some gardens, were noted, as were the *Magnolias*, which comprised *M. Campbelli*, *M. Lemoii*, *M. Fraseri*, *M. hypoleuca*, *M. macrophylla*, *M. glauca*, *M. parviflora*, and the commoner species.

Maclura aurantiaca (the Osage Orange), bearing fruit 5 inches in diameter, was seen, as was a bush of *Medicago arborea* 5 feet high in flower; *Mitella coccinea*, just showing its scarlet buds; *Myoporum laetum*, with leaves spotted with minute transparent dots; *M. parviflora*, good plants of the New Zealand Forget-me-not (*Myosotidum nobile*), and under glass the rare climber *Mutisia decurrens*, a plant very hard to procure. The nurseries contain a good collection of *Olearias*, including *O. nitida*, which was in flower at the time of my visit, bearing branching racemes of white blossoms half an inch in diameter, with leaves 3 inches by 2 inches, white on the reverse, a healthy little bush of *O. insignis* coming into flower. This is a very rare shrub which I have only met with in three

STEM OF AN OLD APPLE TREE THREE YEARS AFTER GRAFTING.

private gardens, and Mr. Gauntlett told me that he was at present unable to supply it. *Olearia Fosteri*, *O. macrodonta*, *O. nummularifolia*, *O. stellulata*, *O. furfuracea* syn. *ferruginea*, and *O. argophylla*, with Musk-scented leaves, more generally known as *Aster*. *Olea fragrantissima rubra* and *Osteomeles anthyllidifolia*, with fragrant white flowers and *Acacia*-like foliage, were noteworthy.

In the grounds was a fine tree of *Paulownia imperialis*, while of Tree Peonies there was a collection of about 10,000 and a large assortment of herbaceous varieties. *Pernettyas* included the Mexican *P. ciliaris*. *Philadelphys* were well represented, *P. Falconeri*, bearing double waxy white flowers, being very uncommon. The charming *Philesia buxifolia*, with *Lapageria*-like blossoms, was noted, as was a large 10-foot bush of *Piptanthus nepalensis* in full flower. Of *Pittosporums* there was a representative collection; *Plagianthus Lyalli*, from New Zealand; *Polygonum Cookii*, far exceeding *P. sachalinense* in height, and attaining a stature of over 22 feet; *Pomaderris apetala*, bearing white, *Ceanothus*-like flowers; *Pterocarya caucasica*, the beautiful *Poinciana Gilliesii*, and *Pyrus thianshanica* were examined, as were the flowering Cherries, *Prunus pseudo-Cerasus Manoga* having large, double, pale flesh flowers turning to white, twice the size of those of *Watereri*, while *P. sinensis rosea plena* was very pretty. *Rhododendrons* were to be seen in quantity, the new

including the salmon-pink *V. Gauntletti* and the crimson *V. Redruth*, and the latter *V. Awafuki*, *V. Sieboldi*, *V. sinense*, *V. macrocephalum*, and *V. plicatum*. Of Water Lilies fifty-three species and varieties are grown. The old though still uncommon *Nanthoceras sorbifolia* was in evidence, and amongst conifers I noticed a seedling *Abies bracteata* from Southern California. S. W. F.

THE FRUIT GARDEN.

FRUIT CULTURE AT THE MANSE, BRACEBRIDGE, LINCOLN.

IT may be said that few men can have experienced the realisation of an ideal so completely in forming and planting a garden as has the Rev. Charles C. Ellison, of Bracebridge, near Lincoln. Mr. Ellison, a near neighbour and friend of Dean Hole when he was Vicar of Causton, became early imbued with a deep love for gardening, and he began Rose culture some forty years ago. His subsequent acquaintance with the late Dr. Hogg, Pearson of Chilwell, and Speed of Chatsworth, led to a similarly intense interest in hardy fruit culture. Mr. Ellison commenced

in no half-hearted manner to prove for himself the merits of varieties of fruits and methods of culture as were advocated by both rosarians and fruit growers in the early sixties. So well thought out were his plans and so quick was he to see and prompt to seize an opportunity, and so constant his perseverance, that he lived to be complimented by Dean Hole as possessing the most beautiful little Rose garden in England, and Dr. Hogg often expressed his high appreciation of the experimental fruit garden. The Rose garden has been described as a little one, yet it contains 3,500 Rose trees, 400 of the newer varieties, particularly of the Hybrid Teas, having been recently planted. Nor is the fruit garden a large one, yet it contains 1,600 trees, mostly Apples, Pears, and Plums, though not in 250 varieties, as at the time when it was inspected by Dr. Hogg and won his high commendation. As a matter of fact, the area of the whole garden is small, some four acres altogether.

This little manse garden is entirely unconventional. It is a garden of many features and not a few surprises. Passing along the grassy paths, through avenues of fruit trees or banks of Roses, the visitor finds something to admire or discuss with his host and guide at almost every step. Like all really able men, he is always willing to listen to anyone who can give him a hint that may be helpful; but, if you advance a theory that is at all new, he will not take it as gospel at once, but put it to the test of practice, for, whilst being acutely logical, he is a stern utilitarian.

Mr. Ellison's experience in transforming an old ridge and furrow grass field of some forty years ago into the present delightful garden has on many occasions proved the truth of an expression of another great amateur gardener, who, on the occasion that the Right Hon. Joseph Chamberlain presided at a meeting of the Gardeners' Royal Benevolent Institution, described gardening, in his belief, as "the most unselfish of pleasures, for it is enjoyed the most in the largest company, and, unlike some other amusements to which our race is prone, it inspires no evil passions, inflicts no pain, and causes injury to no man, either in his health, his character, or in his estate." Mr. Ellison is clearly of the same belief, for one of his observations to a garden lover is conclusive, namely, "as no one knows better than yourself, there are a thousand pleasures in the possession of a beautiful garden, but the greatest pleasure of all is the privilege of sharing that pleasure with a host of flower-loving friends and neighbours."

How many thousands of persons have enjoyed this annual feast of Roses over a series of years it would be hard to say. It is not unusual for Mr. Ellison to issue over 1,000 invitations at a time, and meetings and conferences of various kinds are held in the garden. Gardeners have a day to themselves, a day of real enjoyment to them. Mr. Ellison has been for many years president of the Lincoln Gardeners' Association.

It is not often that one meets an amateur gardener in whom are combined the qualities of the true lover of gardening with intimate knowledge of its principles and its practice, and who cultivates not by deputy, but is a working gardener. Each tree or bush has been planted under Mr. Ellison's supervision, and the pruning and cultivation of every specimen, whether fruit tree or shrub, has been controlled by him. He has certainly helpers in the garden, men who have grown grey in his service. Advocates of the ultra-extension system of hardy fruit culture in small gardens would be horrified to see the Apple, Pear, and

Plum trees; perfect specimens, many of them, 25 feet high and thirty or more years old, and, although planted closely together, are well furnished to the ground with fruit-bearing wood and carry abundant crops. They were delightful pictures, masses of beautiful flowers, when we saw them last spring. It would surprise many fruit-growers to find with how little ceremony Mr. Ellison cuts down a tree which does not give him satisfactory returns, and how quickly by grafting it is made to produce fruits of a sort more to be desired. We reproduce an illustration of a tree the third year after grafting, and also of one of the many avenues of fruit trees. Other objects of interest are the wall fruits, the pergolas, the beautiful dell and water garden surrounded with Roses, deciduous and evergreen trees, and planted with the choicest Water Lilies. Mr. Ellison is a lover of birds, and rather than destroy them because they give trouble when fruit is ripe bush fruits are protected by a structure of iron posts and rails, covered over with wire netting, high enough for an ordinary person to stand upright in. These erections will last a lifetime with care, and as they are portable they can be moved, if necessary, from one part of the garden to another. It is surprising they are not in more general use.

The following is a list of varieties of fruits that do best in the Manse garden and may be interesting to many:

Apples.—Warner's King, Bramley's Seedling, Duchess of Oldenburg, Lane's Prince Albert, Cox's Orange Pippin, Worcester Pearmain, Gascoyne's Scarlet, Newton Wonder, and Bismarck are very promising.

Peas.—Williams' Bon Chrétien, Marie Louise, Maréchal de la Cour, Conference, Clapp's Favourite, and Beurré de Capiaumont.

Plums.—Victoria, Prince Englebert, Czar, Monarch, Jefferson, and Bleeker's Scarlet.

GARDENING OF THE WEEK.

KITCHEN GARDEN.

PEAS.

A SOWING of these should be made at once for the latest supplies. In the northern counties it is almost useless sowing Peas after this date, unless we are favoured with better weather in the autumn than we have had these last few years. Peas sown on June 20 last year in this district failed to fill, and were of little use. It is not advisable to give a selection of sorts. Those that are found suitable to the district are the ones to grow. A variety named Ameer did well here last year from a sowing about the end of June. It is necessary to choose an open piece of ground for this sowing exposed to full sun. Rows of late Peas should not be sown together, but from 10 feet to 20 feet apart, to enable them to get full sun and plenty of air. The intervening spaces may be planted up with Cauliflower, Cabbage, or other crops. Some varieties fill and ripen more quickly than others, and these should be selected for this sowing. Many of the finer Marrow-fat Peas have come up rather thinly this year, and unless the ground is in good heart crops will be poor. Where ground is light and rain required a good watering should be afforded in the evenings, and then a mulching of decayed manure applied.

ENDIVE.

This vegetable is often of great service in the autumn when Lettuce becomes scarce. Seeds should be sown now in shallow drills 1 foot apart. Select a shady border that has been well manured. Thin out the plants to 6 inches apart. If sown early this vegetable is liable to run to seed. A second sowing should be made in July or early August for lifting into frames for winter use.

MULCHING.

A spell of dry weather seems to have set in with high, cold winds. Ground has a baked and dry appearance, and the growth of many crops is slow. In many gardens little time can be spared for watering, and mulching has to be resorted to. In very light and sandy soils it is a necessity. Beans and Peas are two crops that are greatly benefited if well mulched. Cauliflower should be carefully watched during dry weather or the crops may be lost. If possible let a thorough watering be first given, then a mulch of hotbed or Mushroom bed manure, and if these are not to be had the grass from the mowing machine may be used. This is also useful for placing between the lines of Carrots or any crops that require plenty of moisture at the roots.

HERBS.

This border should be inspected, and where the growth is poor it should be noted. This is a good time to make a planting of Mint. Young growths with roots may be pulled up and set out in a prepared bed. Tarragon may also be treated in this way. Chives if not much used should be cut over frequently to ensure a supply of young growths. Herbs sown in May may be thinned out where too thick, and where failure to germinate has occurred a sowing should be made in heat.

THOMAS HAY.

Hoptoun House Gardens, N.B.

FLOWER GARDEN.

THE bedding out is now finished, and so far as possible the utmost neatness should prevail in all parts of the flower garden. The mowing should be kept well in hand. The flower beds should be carefully edged to keep a rigid outline, and the surface of the soil frequently hoed. Tuberous Begonias will be the better for a mulching. Trailing plants will require to be pegged down, as by so doing the allotted space will be more quickly covered and many plants will emit roots, and so grow and flower more freely. Standard Fuchsias and Heliotropes must have the strongest shoots pinched to ensure an evenly balanced head. These and other tall plants should be tied securely or a sudden squall will irretrievably ruin them.

CARPET BEDDING

will require constant attention in the shape of pinching and regulating and removing the flowers from the various Cotyledons (Echeverias), &c., which are used as foliage plants. The showery weather has been very favourable for bedding plants, which are rooting quickly and becoming well established. And while watering will not entail nearly so much labour as in some seasons, it is as well to bear in mind that such plants as Begonias, Lobelia cardinalis, Dahlias, &c., require plenty of moisture for their full development, and the borders along the base of the walls not only do not receive the full benefit of the showers, but also

have to support sufficient vegetation to cover the wall space as well as the border itself, and should have frequent applications of water.

THE ROCKERY.

This department also requires a deal of attention. The ripened foliage of many early flowering bulbs, &c., should be cleared away. Recently planted alpinists, &c., in pockets which are at all overhung by boulders or plants will require frequent waterings until they become established.

TREES AND SHRUBS.

Many deciduous trees and shrubs, with golden or variegated foliage, occasionally revert wholly and frequently in part to the original green-leaved type from which they sprang. The variegated Negundo is an illustration of the former reversion, and in such cases, for fear of causing an undesirable gap, it is often necessary to let the tree or shrub remain. But where the reversion is but slight the green branches should be rigorously suppressed. The golden Elder is also an offender in this respect. With this decorative shrub the young growths should be kept frequently pinched, and they will, as a result, assume a more brilliant colour and retain that colour until later in the autumn than otherwise would be the case. A. C. BARTLETT.

Pencarrow Gardens, Bodmin.

FRUIT GARDEN.

PEACHES AND NECTARINES.

THE early forcing of the same trees of Peaches and Nectarines year after year is a severe tax upon them. When all the fruit is cleared the house should be ventilated to the fullest extent, and if possible the roof lights should be removed. Cut

FRUIT WALK IN THE MANSE GARDEN, BRACEBRIDGE, Lincs.

out all useless wood and any that has borne fruit and can be replaced by young shoots, endeavour to keep the foliage clean by daily syringings and occasional applications of quassia water. Do not allow the trees to become dry at the roots. Dryness at this season is often a cause of so many buds falling in the spring when the houses are closed for forcing. Give frequent applications of liquid manure to all trees that require it, and keep the laterals pinched. Houses where the fruit is ripe should be kept cool with plenty of air night and day, as by this means good colour and high flavour are secured. Go over the trees daily and gather carefully all fruits that are ready and place in a cool airy room.

SUCCESSION HOUSES.

In these houses the fruits are now swelling fast and must be well supplied with weak liquid manure and thoroughly syringed twice daily with soft water. Give plenty of air and full exposure to the sun to fruits approaching ripeness, closing the house for about two hours after syringing on bright afternoons. Afterwards admit air by the top and front ventilators for the night.

LATE HOUSES.

The fruit in these houses should now be well thinned, the shoots tied down, and the laterals kept pinched. The borders inside and out should be mulched with good stable manure and never allowed to become dry. Give free ventilation and syringe as for successions. Young trees should be carefully disbudded in the early stages of their growth. All gross shoots should be stopped to encourage an even flow of sap over the whole tree.

FIGS.

As soon as the second crop of fruits is gathered from the early trees thoroughly cleanse the latter and endeavour to keep the roots active by well watering and syringing the trees for some time to come. Later trees in full bearing will require liberal feeding.

TOMATOES.

Now is a good time to make a fresh planting of Tomatoes for autumn use. Seeds should also be sown in 'gentle heat for winter. Grow the plants in a light position to encourage firm and moderate growth. Pinch out all laterals as they appear and plant out in a light house facing south in a moderately rich compost of loam, wood ashes, and mortar rubble, with a sprinkling of bone-meal. Winter Beauty and Frogmore Selected are two excellent varieties, and free setting for winter use. *Impney Gardens, Droitwich.* F. JORDAN.

INDOOR GARDEN.

EPACRIS.

PLANTS that were cut back late after flowering and were given the accommodation of a close pit to encourage them to break are now making good progress, and in order to promote a sturdy and short-jointed growth gradually increase the admission of air until they will bear complete exposure, especially at night-time. Even those plants that have been repotted have got a good root-hold of new soil, and they also will bear with impunity the increased admission of air. The influence of a parching hot sun is not congenial to the satisfactory development of growth, so that a thin shade during the hottest part of the day should be given. Although syringing the plants once or twice daily will encourage the development of growth, it is never so firm and of such a satisfactory character as when it is developed with little or no syringing, but with keeping their surroundings cool and well moistened. From the moisture they absorb during the night when the lights are off the plants will derive the greatest benefit. The greatest possible care should be exercised in watering these plants, as an over, as well as an under, supply will soon work ruin.

ERICAS.

These require very similar treatment to the first-named, except that as they absorb less moisture greater care in applying water to their roots is necessary, whilst the greater density of growth and foliage demands that syringing be very lightly done.

CAMELLIAS.

Whether in pots or planted out, too much attention to syringing cannot be given whilst growth is being made, but immediately it is completed and the flower-buds begin to form syringe very lightly and only once a day; but sprinkle water freely about the paths, stages, and surroundings of the plants generally. Never allow the soil in the pots or in the borders to approach dryness or the result will be serious, and to produce that dark green colour in the foliage give their roots an occasional dose of soot water, together with liquid made from sheep manure.

RICHARDIA ETHIOPICA AND ELLIOTTIANA.

Whilst very excellent results can be obtained by growing these plants from year to year in pots, it is certainly advisable occasionally to take off singly a few of the weak offsets with a portion of root attached, and these plant out in well-prepared shallow trenches, in a similar way to Celery. This will tend to keep up the general health and vigour of the stock, whilst those plants that are grown for a year or two in pots will flower well with a confined root space, and will, in consequence, be useful for decorative work. Do this at once, and give the plants in either case a chance of becoming established before October. *Richardia elliottiana* produces a grander effect when cut and put into vases, and it will last longer in good condition. The plant is easily raised from seed, and good plants that will flower may be produced, with good culture, in two to three years. Fertilise one or more of the flowers and allow them to form seeds, which by October next will ripen and be ready for sowing to produce a stock of young plants. J. P. LEADBETTER.

READING UNIVERSITY COLLEGE GARDENS.

UNIVERSITY COLLEGE, Reading, has now become an important horticultural training centre, and on Friday of last week inaugurated its very fine practical gardens. What was formerly Messrs. Sutton and Sons' Portland Road Nursery, with other land adjoining kindly given by the chairman of the garden committee, Mr. Alfred Palmer, came into the possession of the college authorities some two years since, and a year ago they obtained the services of a thoroughly practical gardener in the person of Mr. Charles Foster, and also appointed a special garden committee, of which body such eminent horticulturists as Messrs. Martin John, Herbert and Leonard Sutton, J. Wright, V.M.H., and G. Stanton of Park Place, Henley, are members. The scientific director of the department is Mr. Frederick Keeble, M.A. Under this capable authority the gardens in every part now present an appearance that reflects the highest credit upon all concerned. The weather on the 24th ult. was very delightful when the Earl of Onslow, President of the Board of Agriculture, supported by many visitors, attended a garden party generously arranged by Mr. and Mrs. Alfred Palmer on their lawn adjoining the gardens. Having very closely inspected the gardens, Lord Onslow declared them open.

There are at present in the department seventeen garden students of both sexes, and of this number sixteen sat and obtained certificates at the recent Royal Horticultural Society's examination. These students have no intention to enter the unduly crowded home garden labour market. Two will become market fruit growers, two go to the Colonies, four enter florist's establishments, and in other ways disperse themselves satisfactorily. The gardens have the advantage of retaining all the glass houses formerly used by Messrs. Sutton, and in these great quantities of Tomatoes in pots are capably grown and splendidly fruited. In some are Melons and Cucumbers in various stages of growth, all first-rate. Also Vines, fruit trees in pots, flowers of various descriptions, especially Roses, Carnations, and Begonias; indeed, there seems to be no useful phase of gardening wanting such as students may practice with advantage. A good quarter of tree and bush fruits has also been planted, and in the open vegetables are in really superb condition. Better Peas, Beans, Onions, Carrots, Lettuces, Cauliflowers, Potatoes, and other crops cannot be seen in the best gardens of the kingdom. All the spare produce is marketed. So great is the gardens' produce reputation locally that Reading traders readily take all that can be sold. In every department the practical work seen evidences fully the immense advantage of sound practical training over that which is merely theoretical or so-called scientific. That the visitors to the gardens on the 24th ult. doubtless fully realised. Theoretical and scientific instruction forms an important element in the students' work. That department is especially under Mr. Keeble's supervision, and is well done. Many illustrations of the nature of the scientific training given, especially in relation to insect and fungoid pests, influence of light on plant growth, the life history of plants, and other allied subjects were arranged in various houses, sheds, and tents. The weather was fairly fine during the day. Speeches of much interest to the large number of visitors assembled were made in a tent, and the aims of the collegiate gardens warmly commended. Everyone who saw the gardens must have left with the conviction that they did fair to make a striking impression on horticultural progress.

SOCIETIES.

ROYAL HORTICULTURAL SOCIETY.

DRILL HALL MEETING.

THE last meeting of the Royal Horticultural Society in the Drill Hall, Buckingham Gate, was held on Tuesday last. After the Holland House show on the 12th and 13th inst. the meetings will be held in the New Horticultural Hall in Vincent Square. Hardy flowers made a grand display on Tuesday, and indoor flowers, Orchids, and fruit were also well shown. The fruit committee gave awards of merit to two new Strawberries—one from Messrs. Laxton, the other from Messrs. James Veitch. In the afternoon M. Viviani Morel gave a lecture upon the "Hybridisation of Roses."

ORCHID COMMITTEE.

Present: Mr. Harry J. Veitch (chairman), Messrs. James O'Brien, de B. Crawshaw, Norman C. Cookson, H. Ballantyne, Walter Cobb, James Douglas, Jeremiah Colman, J. G. Fowler, W. A. Biley, F. A. Rehder, H. T. Pitt, A. A. McBean, F. W. Ashton, G. F. Moore, William Bolton, W. Boxall, J. Wilson Potter, H. A. Tracy, W. H. White, H. Little, and H. M. Pollett.

Messrs. Sander and Sons, St. Albans, exhibited some well-grown plants of *Laelio-Cattleya*, as *L.-C. Martineti* var., *L.-C. Acis*, *L.-C. Aphrodite*, *L.-C. blechyleyensis*, *L.-C. Duchesnei*, and *L.-C. canhamiana* var. *Acineta Barkeri*, *Thunia micholitziana*, and *Dendrobium superbum*, too, were well shown. Silver Flora medal.

Messrs. James Veitch and Sons, Limited, Chelsea, exhibited some beautiful *Laelio-Cattleyas*, among them were *L.-C. Aphrodite* alba, *L.-C. exoniensis*, *L.-C. welliana*, *L.-C. vesta*, *L.-C. Martineti*, *L.-C. eximia*, *L.-C. canhamiana*, *L.-C. c. alba*, *Cattleya Mossie* var. *Wagneri* and *Subralia Veitchii*, both white, the former with orange-yellow throat, and the latter with lemon-yellow throat, were two other lovely flowers in Messrs. Veitch's group. Silver Banksian medal.

A most interesting collection of *Masdevallias* was exhibited by the Hon. Walter Rothschild, Tring Park, Tring (gardener, Mr. Dye). Some of them were showy, while others had inconspicuous flowers, but all were most interesting. There were numerous hybrids among them. *Dina venosa* with rosy pink blooms was also shown from Tring Gardens. Botanical certificates were given to *Cryptophoranthus Lehmannii* and *Saccolabium gracile*. Silver Flora medal.

Messrs. Hugh Low and Co., Bush Hill Park, Enfield, in their group of Orchids showed *Cattleya Mendelii*, *L.-C. canhamiana*, *L.-C. hippolyta*, *L. tenebrosa*, *Phalenopsis leucorrhoda*, and *P. rimestadiana* all well flowered. C. Mendelii had sixteen and *L.-C. canhamiana* seven flowers. Among others were *L.-C. arnoldiana*, *Oncidium leucociliatum*, *Masdevallia melanoxantha*, *Lycaste Deppei*, and *Cattleya intermedia* alba. Silver Banksian medal.

M. Ch. Vynsteke, Loochristi, Belgium, exhibited some very fine *Odontoglossums*—forms of *O. ardentissimum*, *O. harriso-crispum* (the ground colour palest green), *O. merinicum* (white ground, heavily marked with rich chocolate-red), *O. concinnum*, and *O. bellatulum*.

Mrs. Ernest Hills, Red Leaf Gardens, Peoshurst (gardener, Mr. George Ringham), was given a silver Banksian medal for a group of finely flowered *Miltonia vexillaria*. The plants were examples of the best culture.

Norman C. Cookson, Esq., Oakwood, Wylam-on-Tyne (gardener, Mr. Chapman), exhibited *Odontoglossum crispum* Britannia, a flower with broad rounded petals, each marked with a large blotch of purple-brown. Mr. Cookson also showed *Cypripedium* 10 x vexillarium.

Lycaste tricolor (albino form) with greenish sepals, white petals and lip, was shown by J. Bradshaw, Esq., The Grange, Southgate, N. (gardener, Mr. Whitelegge).

C. H. Feiling, Esq., Southgate, N. (gardener, Mr. H. Stocking), exhibited *Scuticaria Dodgeana*.

A cut raceme of *Odontoglossum coronarium* was shown by J. T. Bennett-Poe, Esq., Holmwood, Cheshunt (gardener, Mr. D. Jones).

F. Wellesley, Esq., Westfield, near Woking, showed *Cattleya Mossie* var., *L.-C. Pallas* Westfield var., and *L. boothiana* x *L.-C. gravesiana*.

NEW ORCHIDS.

Cattleya Mossie alba *Tracy's variety*.—A very beautiful flower, with pure white sepals and petals and lip and yellow throat. It is of splendid form, the petals large and wide, and the lip frilled. From Mr. H. A. Tracy, Twickenham. Award of merit.

Laelio-Cattleya dominiana *Tring Park variety*.—A large handsome flower, with rosy purple sepals and petals and unusually deep velvety purple lip. The throat is lighter and veined with yellow. From the Hon. Walter Rothschild, Tring Park, Tring (gardener, Mr. Dye). Award of merit.

FRUIT COMMITTEE.

Present: Mr. George Bunyard (chairman), Messrs. Joseph Cheal, T. W. Bates, S. Mortimer, Alex. Dean, E. Beckett, Thomas Coomber, George Kelf, H. Markham, P. C. M. Veitch, Henry Parr, J. Willard, George Wythes, H. Somers Rivers, and A. H. Pearson.

Mr. T. Coomber, The Hendre Gardens, Monmouth, exhibited thirteen very good fruits of the Queen Pine-apple, the largest fruit having thirteen rows of pips. They were well coloured and in perfect condition. Mr. Coomber also showed excellent fruits of Royal Sovereign, The Laxton, and Leader Strawberries. Silver-gilt Knightian medal.

Messrs. Laxton Brothers, Bedford, exhibited some very fine Strawberries, which comprised several quite new varieties, as well as a splendid lot of The Laxton, the result of a cross between Royal Sovereign and Sir J. Paxton, a Strawberry that is famous for its good quality and heavy cropping, Laxton's Supreme (Dr. Hogg X Monarch) and Bedford Champion, the result of a cross between two seedlings derived from Scarlet Queen X John Ruskin and Noble X Sir J. Paxton respectively. This latter is a large, roundish fruit of good scarlet colour, and very handsome. Another variety,

Laxton's Reward, received an award of merit, and is described under "New Fruits."

A collection of Melons was exhibited from the Horticultural College, Swanley. Both green and white flesh varieties were shown, but none gained an award.

Fruits of the Papaw (Carica Papaya) were shown by Mr. James Epps, jun., Norfolk House, Beulah Hill, Upper Norwood. They were grown by him at Norwood. The fruits are said to have a delicious flavour. Those sent had been on the tree since October last. Cultural commendation.

Strawberry Leader was well shown by Messrs. Henry Cannell and Sons, Swanley. They also sent a box of Pea King Edward; the pods were gathered from plants raised from seed sown in the open the second week in March.

NEW FRUITS.

Strawberry Laxton's Reward.—A large fruit of cock's comb shape, crimson-scarlet in colour, the result of a cross between Royal Sovereign and British Queen. The flavour, while reminding one of a good deal of that of Royal Sovereign, has been improved by the influence of British Queen, and what promises to be a grand garden Strawberry has resulted. From Messrs. Laxton Brothers, Bedford. Award of merit.

Strawberry The Alake.—This new variety is the result of a cross between Frogmore Late Pine and Veitch's Perfection. The fruits are deeply ribbed, and some are very large; the colour is dark scarlet. From the fruiting sprays shown this is evidently a very free-bearing Strawberry. From Messrs. James Veitch and Sons, Limited, Chelsea. Award of merit.

FLORAL COMMITTEE.

Present: Mr. W. Marshall (chairman), Messrs. C. T. Druey, H. B. May, R. Dean, James Hudson, W. Howe, R. Hooper Pearson, J. Green, W. Bain, Amos Perry, Charles Jefferies, R. W. Wallace, Charles E. Pearson, R. C. Notcutt, William Cuthbertson, Charles E. Shea, W. P. Thomson, E. H. Jenkins, W. J. James, C. Blick, George Paul, J. W. Barr, E. T. Cook, J. Jennings, and George Gordon.

The group of Streptocarpus from Lord Aldenham, Elstree (gardener, Mr. E. Beckett), numbering some 200 plants, was one of the leading features of the exhibition. The plants were, we need hardly say, splendidly grown and one mass of bloom. Some of the plants were quite specimens, and gave ample proof—if such were needed—of the value of these plants in general decoration. The group extended throughout the entire length of one table, and in the great variety embraced pink in many degrees, from the nearly or quite self colours to those with stripes in greater or lesser degree. Other shades of colour included pure white, and this with faint markings, puce, and shades of carmine and rose, varying shades of blue and violet, distinctly grouped from the royal purple or deep violet, and so on. In the more delicate shades flesh was remarked, and here again faint or pronounced lines of rose marked the throat of the blossoms. A very distinct type was a batch of white with dark violet-purple throat, which rendered the plants very conspicuous. It would be interesting, and to many instructive, to see these plants again at a later date, and thus demonstrate their greater value by profuse and continuous flowering. Silver-gilt Flora medal.

Another important group was that of Crotons from Mr. H. B. May, Edmonton. Some new ones are Alexandric Regalis, with red stema and petioles and gold and green leaves, very graceful; edmontensis, orange and crimson, highly promising as a table plant; Unique, a variety with twisted leafage, dark green and yellow; and Mrs. H. B. May, a most elegant kind, with slightly twisted leaves flecked with gold, and with golden midrib. Silver-gilt Banksian medal.

Sweet Williams and English Irises in variety came from Messrs. Veitch and Sons, Limited, Chelsea. In the former the Auricle-eyed strain was prominent, the trusses large, the eye pronounced and well defined. These are usually of a taller growth. In the mixed strain crimson, scarlet, salmon, and velvet crimson were all represented. The Irises, too, were a most representative lot, white, blue, violet, and other shades being freely shown. One kind named Rose Pertuosa is distinct by reason of the flakes of rose on a white ground. Silver Flora medal.

Messrs. John Peed and Sons, West Norwood, S.E., had a small group of hardy alpine and cut herbaceous flowers, with Roses and Begonias also in the cut state. Small rock plants in boxes were also shown, the Roses and Begonias arranged on either side.

A somewhat exceptional exhibit was that of early Gladiolus in pots from Messrs. R. and G. Cuthbert, Southgate, N., by whom a well-flowered group was staged. In this way the plants are much more effective and impart some idea of their garden value. Of the kinds exhibited we noted rosea maculata, with its very distinct blotch on the three lower segments; Blushing Bride, with rose-carmine blotch; Lord Grey, pink, the white blotch margined with rose; Insignis, rose-scarlet; and Peach Blossom, delicate flesh. Bronze Flora medal.

Mr. Charles Turner, Slough, had an interesting collection of cut Pinks. Laced and self forms were freely shown. We name Mr. Lakin, pure white; Her Majesty, white; Snowflake, also white; with Aurora, Boiard, Empress of India, Maggie, Bertha, and Mrs. Dark among the laced kind. Dianthus fragrans Little Gem is a small double-flowered kind, and Ladham's Pink is the best in this colour. Pheasant Eye is a dark-eyed variety with fringed petals.

Mr. M. Prichard, Christchurch, Hants, had many good things in a group of hardy cut flowers. We make mention of Astrantia carniolica, with pink sepals and large showy heads; Peonias and Potentillas in capital form; Campanula Moorheimii; Lysimachia velutina, large yellow; Lilium Martagon album; Iris Kuepferi in variety; I. Delavayi, a deep violet tone; I. cuprea, a bronzy hued flower; Rosa brunoniana, very beautiful, white and single; Coriaria japonica, very charming; Iris aurea, Crambe cordifolia, Day Lilies, hybrid Dianthus, Crinum capense, and others were included in this exhibit. Bronze Flora medal.

Messrs. Barr and Sons, Covent Garden, had a large and showy group of hardy flowers, in which Peonies, Delphiniums,

and English Irises were prominent features. The Irises and Peonies were excellent and in much variety. Very bold and telling, too, the tall spikes of the Larkspurs, of which Thomas Tilbrook, purple, with white eye, were conspicuous. Ixias in charming array, Heucheras in plenty, with elegant plumes, Eryngiums, and Lupinus were all good in this group. The arrangement, too, was excellent. Silver Banksian medal.

A mixed group of plants and flowers from Messrs. W. and J. Brown, Peterborough, contained Roses, Heliotropes, zonal Pelargoniums, and the showy Verbena Miss Willmott. Pelargonium Fire Dragon and The Countess, pink, are of the so-called Cactus type.

Messrs. J. Cheal and Sons, Crawley, had an interesting group of cut sprays of shrubs and trees in company with hardy flowers. We noted Philadelphus Lemoinei erecta, Philomis fruticosa, Robinia hispida, Potentilla fruticosa, with Weigela, many forms of Oak, Hydrangea, Kalmia latifolia, very fine, Ozothamnus thyrsoideus, Deutzias, and Olearia macrodonta, a very distinct species, with small Aster-like flowers, were among the best.

A group of hybrid Begonias, single and double, and mostly drooping in habit, came from F. Lloyd, Esq., Coombe House, Croydon (Mr. E. Mill, gardener).

Messrs. J. Laing and Sons, Forest Hill, brought a small group of Gloxinias, generally of an excellent strain, Messrs. Ladhams, Shirley, near Southampton, contributing hardy flowers in the cut state. In this latter some excellent Pinks were seen. A. W. Pearce, white; Favourite, pink, dark base; Rosy Gem; E. Ladhams; Elsie, deep rose; and Florence, white, dark base, are all good. Scabiosa caucasica Perfection and Astrantia carniolica were also noted.

Palms, Crotons, Alocasias, Caladiums, Dracaenas, Malmaison and other Carnations were contained in a group from Messrs. J. Laing and Sons, Forest Hill. Many Palms were in the background, and other things suited to general decoration. Silver Banksian medal.

Messrs. Paul and Son, The Old Nurseries, Cheshunt, had a very fine lot of garden Roses. Especially good and showy were Reine Olga de Wurtemberg, a fine pillar Rose; The Lion, crimson, single; Mme. Perney, apricot yellow; Macrautha, single; L'Idéal, very charming; Gustave Regis, with its long shapely yellow buds and blossoms; Rosa Mundi, single, striped; Papa Gontier, quite rich in colour; Frau Karl Druschki, excellent; W. A. Richardson; Mme. Ravary, very beautiful in form and colour; Una, a most beautiful single cream; Boule de Neige, an old double white; and Dawn, a lovely semi-double pink, like huge saucers, were among the best in an extremely fine representative lot. Silver Flora medal.

Some fine cut spikes of Delphiniums came from Messrs. G. Bunyard and Co., Maidstone, Kent, whose firm also contributed some capital Roses.

Border and Malmaison Carnations were from Messrs. Low and Co., Enfield.

The Delphiniums from Messrs. Kelway and Sons, Langport, made a rich display of colour. Bold in spike, rich and varied in the blue, violet, and azure tones that predominate, these are certainly among the best of June flowering plants. We noted Britannia, Athos, Lord Avebury, St. Paul, Sacramento, Norah Fuson, light blue, white eye; Aurora, deep violet; Ceto, metallic shade; Maculay, azure blue, etc. Gaillardias were also fine. Silver Banksian medal.

Messrs. W. Cuthbush and Son, Highgate, set up a brilliant lot of Malmaison and other Carnations. Duchess of Westminster, pink; Robert Burns, red; Lady Hermonie, salmon; Trojan, white, very fine; Nell Gwynne, white Malmaison; and Maggie Hodgson, crimson Malmaison, are some of the best. Palms and Bamboos were employed in the background. The same firm had a fine group of hardy plants. Rhododendron hirsutum was finely in flower, and Inula Bigelowii is a fine yellow composite valuable for its early flowering. Silver-gilt Banksian medal.

A fine lot of Crotons, Aralias, Caladiums, and Palms were grouped in excellent fashion near the door, and with handsome specimens of Dracaena russelliana a fine display was made. The group which came from Mr. Russell of Richmond had for a margin Caladium argyrites. Silver Flora medal.

Rose Zephirin Drouot, a fine pillar or climbing variety, was well shown by Mr. Upton of the Guildford Hardy Plant Nursery.

Tufted and fancy Pansies were largely exhibited by Messrs. Dobbie and Co., Rothesay. We take Meteor, yellow; Mary Robertson, soft yellow; Edie, white centre, with broad violet margin; Archie Grant, rich violet; Mrs. McPhail, rose-mauve; Charles Jordan, blue; Admiral of the Blues, and Dr. Macfarlane of the Maggie type are some of the best. The Pansies, too, were of exceptional merit. Quite a number of Cactus Dahlias were shown, some two dozen vases being occupied by the flowers. Silver Flora medal.

The hardy flowers from Mr. Amos Perry, Winchmore Hill, were very fine. Gaillardias, Potentillas, double white Rockets, Geum Helfreichi, Perry's variety of Phlox canadensis, Gillenia tridactyla, Heucheras, Lilium pomponium, L. colchicum, L. Martagon, Philomis russelliana, Ostrowskia magnifica, Ixias, Morioa longifolia, Gentiana lutea, Calochortus in variety, Campanula Merhami, and Iris aurea were all very fine. The hardy Water Lilies, too, were very beautiful and in great variety. Silver Flora medal.

Cupid Sweet Peas in some twenty-one varieties were shown by Messrs. Cannell and Sons, Swanley, the plants having been grown in the open air. As an exhibit of these pigmy kinds it is much the best we have yet seen, and almost all shades of colour are represented in them. For example, Firefly, Beanty, flesh; Captain of the Blues, Mauve Queen, Her Majesty, rose; Alice Eckford, flesh; Chamberlain, a striped variety; and Primrose were some of those noted. Silver Banksian medal.

Many fine Malmaison Carnations in a large group were from Messrs. Low and Co., Enfield, while a large batch of Verbena Princess of Wales, a self purple kind, was staged by Messrs. Cuthbush and Son.

Mr. R. C. Notcutt contributed a large group of hardy cut flowers, in which the English Irises were conspicuous. Other plants of note were Crinum capensis, Cephalaria tartarica,

yellow; Phlox Penge, one of the suffruticose group; and the large Papaver Lady Roscoe.

A very interesting lot of plants from Messrs. Veitch and Sons, Limited, Chelsea, included Jacobinia magnifica pohliana, Begonia Washington, crimson-scarlet; some fine Streptocarpus in white and blue; Kalanchoe flammea, Galax aphylla, and Lobelia tenuior, all excellent. Cornus Kousa, white, is a very distinct form. Silver Flora medal.

Messrs. W. Bull and Sons, Chelsea, showed English Irises in a very representative group that included the best sorts.

Messrs. Benjamin R. Cant and Sons, the Old Rose Gardens, Colchester, had Roses in excellent condition and in great variety. Very conspicuous was the new pillar Rose Maharajah, with brilliant crimson flowers almost velvety in texture. Not only is this large and very handsome, but the flowers, which are nearly single, are produced in great quantities; some of the blossoms were nearly 5 inches across. Other sorts were Bessie Brown, Edward Mawley, Frau Karl Druschki (very fine), Mildred Grant, Nance Christy (a seedling Hybrid Tea with fine pink flowers), the handsome Ben Cant, and many more. Silver-gilt Banksian medal.

Very fine was the exhibit of hardy flowers from Messrs. Wallace of Colchester. Ixias, very beautiful and in abundant variety; such Lilies as the white Martagon, many beautiful Irises, the ever-welcome Calochortus, Peonies, and fine Campanulas were among the more important in a capital lot. A distinct and showy Monspur Iris is Lord Wolseley, a clear well-defined blue shade predominating. Silver-gilt Banksian medal.

AWARDS.

Philadelphus Lemoinei maculatus.—This is not only a good addition to flowering shrubs, it is a decided break in the genus. The flowers are white with a heavy purplish stain at the base, which renders the plant very conspicuous. The flowers are produced in dense columnar spikes. A very showy and striking plant. Exhibited by Sir Trevor Lawrence, Dorking (Mr. Bain, gardener), and by Mr. M. Prichard, Christchurch, Hants. First-class certificate.

Delphinium Normanhurst.—A very handsome variety with metallic and azure-blue flowers, which the large white centre renders highly attractive. The individual flowers are very large, and the entire spike well filled and handsome in the extreme. From Messrs. Kelway and Son, Langport. Award of merit.

Carnation Joan.—A border variety of good size, and of a pleasing shade of soft creamy yellow. Exhibited by Sydney Morris, Esq., Wretham Hall, Thetford, Norfolk. Award of merit.

Delphinium Mrs. J. Bradshaw.—A distinct type with hooded flowers, that would suggest a possible parentage with D. cashmerianum. The variety, however, is said to be a seedling from King of Delphiniums. The flowers are of good size, pale blue, and borne on extended pedicels, which gives the variety a welcome distinctness of character. From Mr. J. Bradshaw, The Grange, Southgate, N. Award of merit.

Pinguicula magna rosea.—A pretty variety of a very old umbelliferous plant, that will be welcome in the cut state or in the border. The flowers are of pinkish rose, small individually, and freely produced for a long period. From Mr. M. Prichard, Christchurch, Hants. Award of merit.

Cotton Mrs. H. B. May.—A neat and pretty variety, the long, linear, drooping leaves slightly twisted and fringed with gold, a distinct line of the same colour extending down the centre of each leaf. A most useful type for table decoration. From Mr. H. B. May, Edmonton. Award of merit.

An award of merit was also granted to the strain of Cupid Sweet Peas exhibited by Messrs. Cannell and Sons, Swanley.

KINGSTON DISTRICT GARDENERS' SOCIETY.

THE first ordinary meeting of this newly-formed Mutual Improvement Society was held in the Kingston Technical Institute on the evening of the 10th ult. Councillor T. Lyne, chairman of the Borough Education Committee and hon. sec. to the Front Flower Gardens Committee, presided. There was a good attendance of members. Mr. E. H. Jenkins, F.R.H.S., of Hampton Hill, was unanimously elected president, and Mr. F. G. Shipway, F.R.H.S., an amateur gardener of Kingston, was made vice-president. Mr. A. Dean is chairman of the committee, and Mr. J. T. Blencowe of Eastcott Gardens, Kingston Hill, secretary. Mr. Dean read a letter from Leopold de Rothschild, Esq., granting permission for the members to visit his gardens at Gunnersbury Park and House about August 11, which was gratefully acknowledged and will be largely availed of. Mr. Jenkins, who had before him a large collection of hardy flowers, kindly sent by Messrs. Barr and Sons, Long Ditton, and Messrs. W. Cuthbush and Sons, Highgate, then had a pleasant chat about the various examples staged, which greatly interested his audience and enabled his profound knowledge of hardy plants to be admirably evidenced. Mr. A. Dean read a paper on "The Gardening Art," which also was listened to with much interest. The actual work of the society will commence in October next, when it is hoped that a room in the new Borough Museum may be at the disposal of the members.

SCOTTISH PANSY AND VIOLA ASSOCIATION.

THE first monthly meeting was held in the Religious Institution Rooms, Buchanan Street, Glasgow, on the 22nd ult. for the purpose of awarding certificates to such new Pansies and Violas as might be deemed worthy. There was a good attendance, and many interesting varieties passed before the committees. The awards were as follows:—Fancy Pansies: First-class certificate to Mrs. Q. MacFadyen, yellow edged (Dobbie and Co.). Certificates of merit to Jessie L. Arbuckle, white edged (Kay); Provost Thomson, bronze colour (Kay); Mrs. W. Sinclair, lemon edged (Dobbie and Co.); and Mary E. Wallace, yellow edged (Dobbie and Co.). Show Pansies: Certificates of merit to Provost Thomson, dark self (Kay); and James Stirling, primrose self (Dobbie and Co.). Violas: Certificates of merit to Edie, an improved Butterfly (Dobbie and Co.); and Criffie Smith, in the way of Dr. MacFarlane (Dobbie and Co.). The next meeting will be held on the 13th inst.

RICHMOND HORTICULTURAL SHOW.

The thirtieth annual flower show of the Richmond Horticultural Society was held on Wednesday last in the Old Deer Park, and was favoured with delightful weather. Competition was keener than has been the case for some years. The groups of plants and Roses were the best features. Vegetables, too, were well shown. Many special prizes were given by local supporters of the society for a great variety of exhibits.

PLANTS.

For a semi-circular group of plants, Mr. James Lock, Otlands Lodge Gardens, Weybridge, was first with a bright display, in which plants of graceful habit were largely used; second, Mr. H. E. Fordham, Twickenham, with a very pretty arrangement; third, Mr. William Vause, Leamington.

For a smaller group, Sir Frederick Wigan, Bart., East Sheen (gardener, Mr. Want), was first with a very attractive display; second, Mr. Hicks, gardener to C. M. Bartlett, Esq., East Sheen; third, Mr. William Vause, Leamington. Mr. Want took the first prize for specimen Ferns. Mr. W. Vause, Mr. W. A. Cook, and Mr. Want were first, second, and third respectively for specimen Palms. Those from Mr. Vause were very good plants.

Out of doors Mr. L. R. Russell and Messrs. W. Fromow and Sons, Chiswick, displayed hardy shrubs.

ROSES.

Forty-eight Roses, distinct, three blooms of each: First prize, with Gunnersbury Challenge Cup, Messrs. R. Harkness and Co., Hitchin, with a display of uniformly good blooms. Duchess of Albany, Kaiserin Augusta Victoria, Maman Cochet, Frau Karl Druschki, Lady Fitzwilliam, and Mrs. John Laing were the best. Messrs. B. R. Cant and Sons, Old Rose Gardens, Colchester, were second, and their exhibit also contained many fine blooms. Bessie Brown, White Lady, Mrs. Mawley, and Frau Karl Druschki were very good. Messrs. D. Prior and Son, Colchester, were third. Mrs. W. J. Grant being very fine. Messrs. Frank Cant and Co., Braiswick Nursery, Colchester, were fourth, Lady Roberts being conspicuous on their stand. There was one more exhibitor.

Twenty-four Roses, distinct: First, Messrs. D. Prior and Son, Colchester, Frau Karl Druschki and Mildred Grant being their finest blooms; second, Messrs. Paul and Son, Cheshunt, with Mrs. John Laing and Frau Karl Druschki as the best blooms; third, Mr. George Mount, Canterbury. There were several other exhibitors.

Twelve Roses, distinct, three blooms of each: First, Messrs. B. R. Cant and Sons, Old Rose Gardens, Colchester, with some excellent blooms, notably of Ulrich Brunner and Mildred Grant; second, Messrs. D. Prior and Son, Colchester; third, Mr. George Mount, Canterbury.

Twelve Hybrid Perpetual Roses (one variety): First, Messrs. Harkness and Co., Hitchin, with very fine Mrs. John Laing; second, Messrs. B. R. Cant and Sons, Colchester, with good Frau Karl Druschki; third, Messrs. D. Prior and Son, Colchester, with Mrs. John Laing.

Twelve Tea Roses (one variety): First, Messrs. Frank Cant and Co., Braiswick Nursery, Colchester, with White Maman Cochet; second, Messrs. B. R. Cant and Sons, Old Rose Gardens, Colchester, with Mrs. E. Mawley; third, Messrs. D. Prior and Son, with the same variety.

Twenty-four Roses, distinct (amateurs): First, Rev. J. H. Pemberton, Havering-atte-Bower—Mrs. Sharnan Crawford, Marquise Litta, Maman Cochet, and Mrs. John Laing were among the best of a good lot; second, W. C. Romaine, Esq., Old Windsor (gardener, Mr. Guttridge), with Mildred Grant, Mrs. J. Wilson, and G. Harkness as the best blooms; third, Mrs. Salem Cross, Cowley, Uxbridge.

Twelve Roses, distinct (amateurs): First, Rev. J. H. Pemberton, with splendid Bessie Brown, Mildred Grant, Frau Karl Druschki, and others good; second, G. Moules, Esq., Bedford Road, Hitchin, with very good blooms of Frau Karl Druschki, White Maman Cochet, and others; third, F. Wellesley, Esq., Westfield, Woking (gardener, Mr. W. Hopkins).

Twelve Roses (district exhibitors only): First, Miss Biddulph, Petersham (gardener, Mr. A. Dean); second, Mr. C. Want, Clare Lawn Gardens; third, J. B. Hilditch, Esq., Richmond (gardener, Mr. Meaton).

Mr. James Lock, Otlands Lodge Gardens, Weybridge, was first for dinner-table decorations, using Orchids; Miss Cole, Feltham, with salmon-pink Carnations, was second; and Mrs. Salem Cross, Cowley, third, with Roses.

Miss Cole was first in a similar class (lady amateurs only) with a charming decoration of white Shirley Poppies and deep rose Sweet Peas.

Messrs. Perkins and Sons, Coventry, were first for a basket of Roses, Miss Cole second, and Mrs. A. Allum, Petersham, third.

Sweet Peas were well shown, H. Compton, Esq., Eastcott, Kingston Hill (gardener, Mr. W. Blencowe), being first for six distinct varieties.

FRUIT AND VEGETABLES.

Collection of fruit: First, Mr. Justice Swinfen Eady, Otlands Lodge, Weybridge (gardener, Mr. Lock), with good dishes of Peaches, Strawberries, &c., Black Hamburgh and other Grapes; second, the Earl of Dysart, Petersham (gardener, Mr. Conway), Peach Dr. Hogg being good.

Three bunches of black Grapes: First, Mr. James Lock, Otlands Lodge Gardens, with good Madreshead Court; second, Mr. G. Thompson, Hattonhurst Gardens, Hounslow; third, Mr. W. Lintott, Marden Park Gardens, Caterham.

Three bunches of white Grapes: First, Mr. James Lock, with good Foster's Seedling; second, Mr. W. Lintott, with the same variety; third, Mr. W. A. Cook, gardener to Colonel Simpson, Shirley House, Croydon.

Mr. Conway was first for a dish of Strawberries, Mr. Thompson for Peaches, and Mr. Lock for Cherries.

Mr. Beckett, Aldenham House Gardens, won the first prize for a collection of vegetables (prizes by Carter and Co.); Mr. Conway, Ham House Gardens, Petersham, being second; and Mr. Bentley, Cedar Court Gardens, Roehampton, third.

Mr. W. A. Cook, Shirley House Gardens, Croydon, was first for a smaller collection, and Mr. Bentley second.

NON-COMPETITIVE EXHIBITS.

Messrs. W. and J. Brown, Stamford, Roses, &c.; L. R. Russell, Richmond, alpinas; George Jackman and Son, Woking, Roses, Sweet Peas, and other hardy flowers; T. S. Ware, Limited, Feltham, tuberoses, Begonias, the doubles being very fine; John Peel and Son, West Norwood, Gloxinias, both plants and cut blooms; W. Spooner and Son, Woking, Roses; Amos Perry, a large display of hardy flowers in great variety; Maurice Prichard, Christchurch, hardy flowers; William Jeeton, group of Palms, Lilies of the Valley, Hydrangeas, Liliums, &c.; William Thompson, Richmond, group of Palms, Spiraeas, &c.; Wills and Segar, South Kensington, handsome foliage plants in variety and Erica ventricosa magnifica; L. R. Russell, Richmond, Crotons, Caladiums, Dracenas, &c., all finely coloured; Mrs. H. L. Wardo, Petersham (gardener, Mr. A. Allum), a delightful group of Canterbury Bells; Hugh Low and Co., Egham, Malmaison Carnations, Vines in pots, &c.; J. Bruckhaus, Twickenham, Palms, Liliums, &c.; Sir F. Wigan, Bart., Clare Lawn, East Sheen (Orchid grower, Mr. W. H. Young), a group of choice Orchids, including the unique Zygopetalum reclinatum; T. S. Ware, Limited, Feltham, a charming bank of Roses, Sweet Peas, and miscellaneous hardy flowers; Earl de Grey, Coombe Court, Kingston (gardener, Mr. J. Smith), Roses in vases; and Wright Brothers, Richmond, rustic garden seats, &c., were the non-competitive exhibitors.

ANSWERS
TO CORRESPONDENTS.

RULES FOR CORRESPONDENTS.

Questions and Answers.—The Editor intends to make THE GARDEN helpful to all readers who desire assistance, no matter what the branch of gardening may be, and with that object will make a special feature of the "Answers to Correspondents" column. All communications should be clearly and concisely written on one side of the paper only, and addressed to the EDITOR OF THE GARDEN, 5, Southampton Street, Strand, London. Letters on business should be sent to the PUBLISHER. The name and address of the sender are required in addition to any designation he may desire to be used in the paper. When more than one query is sent, each should be on a separate piece of paper.

Names of plants.—C. H. Fernide.—1, Noella Nahonand; 2, Reine Marie Henriette.—R. G. B.—The cut-leaved Alder (*Alnus glutinosa laciniata*). It is a variety of the common Alder which has been cultivated for many years, but we are not aware that it has occurred anywhere in a wild state.—C. E. F.—The *Lonicera* is *L. involucrata*, and the *Jasmine* is *Jasminum revolutum*.—G. Heath.—1, *Cattleya Mossiae*; 2, *Verbascum phoeniceum*; 3, *Bambusa Fortunei variegata*; 4, *Selaginella uncinata* (syn. *S. cecilia*).—R. de la Haye.—Orange Ball Tree (*Buddleia globosa*)—J. T. H.—The light and dark purple *Rhododendrons* are both *R. ponticum*; the pink is a hybrid of *R. ponticum*, of which there are a great many unnamed sorts. The other specimen is *Magnolia soulangeana*.—David Howell.—*Muskwood* (*Olearia argophylla*).—E. P. Le Feuvre.—*Scrophularia nodosa*; *Polemonium reptans*.—J. M. D.—1, *Samiraga Genua*; 2, *S. Andrewsii*; 3, *S. cuneifolia*.—*Capitata Thordii*.—1, *Isis spuria* var. *notha*; 2, *I. versicolor*; 3, *Hemantus coccineus*; 4, *Syringa Emodi*; 5, *Helichrysum peltatum*.

Tomato leaves scorched (T. LESTER).—The Tomato leaves are undoubtedly scorched, and not diseased. You do not say whether the plants are out of doors or under glass, but we presume the latter. If this is the case, the scorching is most probably due to defective ventilation. It seems almost as if the early morning sun had shone upon the leaves when they were covered with moisture; air had not been left on the house during the night, or had not been given early enough in the morning.

Mushrooms (PERPLEXED).—I have very carefully examined the samples of Mushrooms and soil, but I cannot find anything to account for the Mushrooms not coming to perfection. I was unable to detect any insects or fungi. The spawn did not look healthy, and I cannot help thinking that perhaps the beds are worn out. Can this be the case? I should not have thought that the proximity to the stove-hole could have been the cause, but so much depends on the amount of fumes which reach your house that it is impossible for anyone at a distance to speak positively.—G. S. S.

Rose leaves diseased (G. M. A. B.).—Your Rose leaves are attacked by the Rose black spot fungus (*Actinomyces rosea*). The best remedy is to pick off the affected leaves and burn them. When the leaves fall in the autumn they should be collected and burnt. Spraying with fungicides which contain copper as soon as the buds open in the spring will check the disease, which is a very common one.—G. S. S.

Hollies injured (A. NORMAN DUGDALE).—A very common pest on Hollies. The best remedy is to spray finely with a solution of Blinell's Paris Green, 1oz. to ten gallons of water. This should be done earlier in the year, before the caterpillars have done so much injury. Paris Green is an arsenical poison and requires careful usage. The mixture should be kept well in motion whilst being used, so that the Paris Green does not settle towards the bottom, and the proportions named strictly adhered to.

Iris, &c. (CONSTANT READER).—*Iris tenax*, *I. watsonia*, *I. missouriensis* (*I. tolimiana*), and *I. douglasiana* succeed well when planted in a raised bed fully exposed to the sun. The soil should be a sandy loam, and the best time

for planting is in April. *I. missouriensis* will stand more moisture than the others, but does almost equally well under the same conditions. *I. Milesii* will not stand a severe winter in the open bed, but at the foot of a south wall or sheltered corner in loam, and with a south exposure, it is perfectly happy. *I. Delavayi*, *I. prisniatica*, and *I. tridentata* require more moisture and will do in boggy ground or on the edge of a pond under the same conditions as *I. sibirica*.

Foxgloves (E. C. CLOUGH).—In all probability the sowing was made too late in the year and the plants were not sufficiently advanced to flower this summer. If no flowering spike is now apparent, the flowering of the plants will most likely be deferred to next year. To obtain flowering plants in any given year the seeds should be sown late in summer, planted into permanent or flowering positions in the autumn or spring ensuing, to make full growth during the summer and flower the following year. That is to say, sow the seeds after ripening in 1902, replant to flowering position, if large enough, the same autumn; allow a full season's growth during 1903, to obtain the best flowering examples in the early summer of 1904.

Double white Violet (E. C. CLOUGH).—We do not think you can plant a better kind than *Comte de Brazza*, also called Swanley White. The flower is large sized and free, the growth neat and compact. It is now late for planting out, unless you obtained freshly established pot plants of large size. Even though you obtained only ordinary sized plants, these would give ample stock in the ensuing autumn for another year. Early April is about the best time for planting such things, in ground well prepared during winter. The position should be somewhat shaded from hot sun, the soil rich and deep.

Clematis Jackmani alba (W. S.).—The flower is undoubtedly that of *Jackmani alba*. This is a very variable variety, the blooms sometimes coming single, at times semi-double, and at other times single and semi-double at the same time. The early blooms are also often tinged with purple, while the later ones are quite white. We should imagine that the plant alluded to, having been established eight years, had got on its own roots, and in moving the plant a portion with a breaking eye was left behind, and is what has now come up, but it is singular that the old plant should have borne single white flowers, and that this year both should be semi-double and tinged with purple.

TRADE NOTE.

HARTLEY AND SUGDEN'S "WHITE ROSE" BOILER.

"WHITE ROSE" is the name given by Messrs. Hartley and Sugden, Halifax, to a new cast-iron Sectional Boiler, which is the result of careful study, repeated practical experiments, and expert scientific knowledge. The special formation of flues, the proportionate grate area, and the quality and even thickness of the metal have all been thought out with a view to obtain a reliable and durable boiler. Messrs. Hartley and Sugden have added a new boiler to their foundry with the most recent appliances and machinery, and no expense has been spared to enable them to produce a boiler unequalled for economy of fuel, durability, rapidity of circulation, and convenience for the stoker. This boiler is made in sections, each 6 inches wide, and carefully machined and finished, so that each part is interchangeable and will fit accurately one to the other; the flow and return connections between sections are made with cast-iron push taper nipples. The sections are held in position, after they have been drawn together, by short bolts having a right and left-hand thread; this method has been found from experience to be more reliable than the single long bolt. The fire-brace are of the ordinary English pattern, and chilled on the face. Any part of the bars or bearers can easily be replaced without disturbing the boiler. The smoke-box is fitted with a removable cap, so that the chimney may be taken off vertically or horizontally; the damper is fixed in this box, and may be drawn out to right or left side. The fittings are all made specially strong, and cannot possibly be broken with fair usage; all hinges, door catches, and knobs are malleable, and fitted in a special manner to the boiler.

MR. R. LEWIS CASTLE (Gold Medallist of the Fritters Company, and nine and a half years manager of the Duke of Bedford's Experimental Fruit Farm) is open to an engagement in any capacity where long practical commercial experience, together with a scientific study of horticulture, is requisite. Address: Ridgmont, Aspley Guise, Bedfordshire.

The New Horticultural Hall will be opened by his Majesty the King on Friday, the 22nd inst.

The Neill Memorial Prize.—The council of the Royal Caledonian Horticultural Society has awarded the Neill Memorial Prize to Mr. R. P. Brotherston, gardener to the Earl of Haddington, Tynninghame, Prestonkirk, N.B. The Neill prize is awarded biennially to a practical gardener who has performed meritorious services to horticulture, and consists of the interest on a capital sum of about £400, invested as a memorial to the late Patrick Neill. The award to Mr. Brotherston will be a highly popular one among the gardeners of Scotland, as well as in the wider circle acquainted with Mr. Brotherston's literary horticultural work.

THE GARDEN

No. 1703.—Vol. LXVI.

[JULY 9, 1904.]

FRUIT CROPS AND INSECT PESTS.

NEVER were the prospects of a good fruit year brighter than in the spring of 1904. Fruit trees of all kinds and in all places were covered with bloom, and no sharp frosts came to upset the prospects of heavy crops. But disappointment has followed the fair promise at the outset, and while some fruits—such as Pears, for instance—may be described as almost a failure, there is hardly a case in which the results have been completely satisfactory. Whatever may be the cause of the partial and, in some cases, entire failure, there can be no doubt that insect pests are in a measure responsible, for never of late years have fruit growers had such a plethora of enemies to fight against. It is not easy to understand why this should be, for in these days a knowledge of the habits of the common enemies of fruit is spread broadcast by various means and the market is flooded with insecticides and appliances, but in spite of all this insects flourish and multiply, and the damage they do seems to develop as the years roll on. Some say that our seasons have got out of order and the mild winters experienced of late years have been helpful in preserving injurious insect life, but, whether this be so or not, there is no ignoring the fact that the damage done by fruit pests this year is very serious.

When the drying easterly winds were blowing in early June hordes of aphids appeared, and, taking possession of stone fruit trees, such as Plums, Damsons, and Cherries, they crippled the young shoots, twisted up the leaves, checked the growth, and were doubtless the cause of many of the fruits falling. In Pear-growing districts that tantalising little pest known as the midge was early on the war-path, and to its agency the wholesale falling of the fruit at an early stage may be attributed. One has only to make a cursory examination of Apple trees to find traces of the ravages of the deadly winter moth caterpillar, and the time is not far ahead when Apples will commence to fall before they are fully ripe through being bored with the grub of the codlin moth.

Turning to bush fruits, tales of woe come from areas where Gooseberries are largely grown, telling of the devastation caused by caterpillars, which have stripped the bushes of their foliage. Nor is the caterpillar the only enemy of Gooseberry growers, for the dry weather has been conducive to the spread of

the Gooseberry mite, a tiny insect belonging to the red spider family, which infests the foliage, causing it to fall, and often bringing about the death of old bushes. Aphides have crippled the shoots of Red and White Currants, and those who failed to pinch out the points of the growths before the insects made headway will have sticky and dirty fruit. Our attention was recently directed to a plantation of Black Currants which was infested with aphids. Most of the leaves had shrivelled up and fallen off, leaving the bunches of fruit hanging on the stems and exposed to the blistering effects of the sun.

There can be no doubt about the unsatisfactory character of this state of affairs, but the all-important question is the remedy. Nature protects her own, and it is hopeless to expect that insect foes can be obliterated entirely, but the damage done might be lessened considerably by more co-operation on the part of growers. Many of the latter are fully alive to the necessity of fighting insect pests, but it is discouraging for a man to spend time and money in protecting his crops if his neighbour does nothing at all. The day is surely coming when there must be some combined efforts in fruit-growing areas in order to prevent the serious damage done by insects. At one time it was not considered necessary to spray Kentish Hops to keep down blight, but now every grower recognises that this is absolutely essential, and on some of the large farms elaborate machinery has been put down at great expense for this purpose. So long as the present haphazard method goes on, and one grower makes honest attempts to keep down insect pests while another does nothing, the present unsatisfactory state of affairs will assuredly continue.

Another common mistake is that of letting the enemy get established before any destructive measures are adopted. We have already mentioned the damage done by aphids amongst Plums, Cherries, and other crops, and everyone knows the marvellous rapidity with which these insects increase. Unfortunately, we have a philosophical way of watching the increase of aphids and then bemoaning the damage instead of dealing with the evil when it first appears, at which time its depredations can be checked by pinching out the points of the shoots in some cases, and in others by applying a simple insecticide. A spraying apparatus does not cost a great deal, and there ought to be one in every establishment where fruit is grown. As for insecticides they can be readily

made at home or be purchased in a prepared form ready for application. More winter attention is also wanted, and if people would only realise the importance of keeping the stems and bark of trees free from obnoxious moss growths by applications of a caustic alkali solution when growth is dormant, there would be far less need for washing and spraying after growth begins.

No art or magic will ever help fruit growers to get rid of the common insect foes which cause so much damage, and the only things are watchfulness and perseverance. To these may be added co-operation in the common interest, for until there is a better system of combination in the destruction of insect pests the trouble experienced this year will continue.

EVENING IN THE GARDEN.

"The sun has long been set,
The stars come out by twos and threes,
The little birds are piping yet
Among the bushes and trees.
There's a cuckoo and one or two thrushes,
And a far-off wind that rushes,
And a sound of water that gushes,
And the cuckoo's sovereign cry
Fills all the hollow of the sky.
Who would go parading
In London and masquerading
On such a night in June,
With that beautiful soft half moon,
And all the innocent blisses
Of such a night as this is?"

It is evening in the garden, and there is no sound of rushing life, of haymaker's scythe, or gardener's busy hands. The silence is broken only by the soft sighing of the summer breeze among the Elms that border the garden, and by an occasional rustle in the shrubbery where the thrushes and blackbirds have gone to rest. Even the persevering cuckoo's note is hushed, but the sparrows twitter faintly among the creepers. From a lonely thicket comes the soft passionate voice of the nightingale, and in the field close by a partridge calls from her nest among the tall grass. A tiny nightjar passes silently overhead and bats hover to and fro among the trees. It is at this hour that the garden is almost at its best, I think; and Victor Hugo must have thought so when he wrote, "*C'est Dieu qui fait la nuit plus belle que le jour.*"

To-day is the longest day in the year, and certainly there seems a much lengthier twilight than yesterday. Since the sun slowly sank an hour or so ago, a ball of flame in the glowing sky, the flowers surely give out more scent and are inspired with stronger life than they possessed even during the radiant day. In the Rose garden glorious La France, Allan Richardson, and Bouquet d'Or lift their sweet heads and dainty buds, and some cherished

three year old trees are putting forth their first flowers. The herbaceous borders are a medley of scents—Tobacco plants, old-fashioned Lupins, white and yellow, Sweetbriars, and Lilies, a mass of colour even in this dim light. I walk round the herb garden, absently pulling a sprig of Lavender or Rosemary and a leaf of Balm. I tread among the snow from the flowering Acacia on the lawn and the Ilex leaves that fall so persistently this time of year.

A tiny ringdove which has fallen from the nest or pushed out by a too impatient mother, flutters at my feet, and hides itself among the Ferns in the rockery. The Calvary Thorn tree, a mass of white blossom, looks ghostly in the dusk. No bird will roost beneath its spreading branches or feed on the attractive red berries with which it is decorated in autumn. Only the bees do not seem to have any feeling on the subject, and all day long the air is filled with their cheerful hum as they seek for honey among the blossoms of the Calvary Thorn. The sky is gorgeous with changing lights, deep crimson shading to purple and orange. A bank of fine weather clouds and a red afterglow promise well for the morrow. "Red at night is the shepherd's delight."

As I walk the darkness deepens, for even the longest day must have an end. Stars creep out in the opal sky, and the moon, bright angry, emerges clear and cold through a fleecy cloud that passes slowly to windward.

Beyond the garden gate, and approached through the ghostly shrubbery, is a field of waving Oats, flecked with golden Mustard, and a belt of tall Firs stand out sharply against the horizon, where miles of lonely forest stretch into the far distance.

A shining silver ribbon marks where the river winds through pastures down to the sea. The river banks are bordered by trees that slope to the water's edge and dip their waving branches into the cool water. Can one tell the future from the sky as the ancients did, and hope or despair from the signs read in the heavens? If so, to-night should portend a rosy future, and there is a feeling of peace in the air.

Alas! one cannot stay all night in the garden, even in midsummer, unless one is lucky enough to be born a Romany and live happily in a caravan under the greenwood tree, amid the fresh winds of Heaven, and as I write the distant bell from the abbey tells the hour, and it is time to leave my evening garden.

DOROTHY HAMILTON DEAN.

NOTES OF THE WEEK.

FORTHCOMING EVENTS.

July 9.—Windsor and Eton, Warminster, and Gloucester Rose Shows.

July 12.—Royal Horticultural Society's Holland House Show (two days); Wolverhampton Floral Fête (three days).

July 13.—Formby, Reading, Stevenage, Thornton Heath, and Harrow Rose Shows; Nottinghamshire Horticultural and Botanic Society's Show (two days).

July 14.—Weybridge Flower Show; Highgate Horticultural Society's Show; Bath, Eltham, Helensburgh, and Woodbridge Rose Shows; Portsmouth Rose Show (two days).

July 15.—Gresford and Ulverstone Rose Shows.

July 16.—Manchester Rose Show.

July 19.—Saltaire and Tibshelf Rose Shows.

July 20.—National Sweet Pea Society's Show at Crystal Palace (two days).

July 22.—Opening of the New Horticultural Hall, Vincent Square, by His Majesty the King.

Royal Horticultural Society.—The next show of this society will be the great summer flower show, to take place, by the kind permission of the Earl and Countess of Ilchester, at Holland House, on Tuesday and Wednesday next, after which the new Exhibition Hall, built to commemorate the centenary of the society, will be used for future fortnightly shows. These fortnightly shows commenced nearly 100 years ago by Fellows exhibiting objects of interest at the general meetings of the society then held in Gerrard Street. In 1820 they were removed to Regent Street, by which time the shows had increased and were organised on much the same lines as the present day. They were afterwards transferred to the society's garden at South Kensington, whence, on the site being surrendered in 1887, they were again moved, and have for the last seventeen years been held at Buckingham Gate. At the general meeting of Fellows held on the 28th ult., Mr. George Bunyard announced from the chair that His Majesty the King had graciously consented to open the society's new Exhibition Hall, in Vincent Square, on Friday, July 22, on which occasion it was hoped that he would be accompanied by Her Majesty the Queen and several other members of the Royal Family. Among the seventy-one new Fellows elected were Sir Patrick Playfair, Captain T. G. Whistler, Lord Elphinstone, Colonel Maitland Hunt, Lieutenant-Colonel W. Horatio Harfield, Sir Robert N. Hensley, Lord Inverclyde, Lady Knowles, Mr. Horace C. Monro, C.B., and Rear-Admiral Sir B. Milne, Bart. A paper on the "Hybridisation of Roses," by M. Vivand Morel, was read, in which he gave a short *resumé* of the history of hybridisation, with several practical hints to be followed by Rose growers. He pointed out that it is still possible to obtain good new varieties, and even to create new sections, on only one condition, that is no longer to trust to chance as a guide in seed saving. He added it was from working without discernment that many raisers of seedlings have so often obtained the same varieties, hardly to be distinguished from one another, but when a series is exhausted it is useless to endeavour to obtain endless new varieties from it.

National Dahlia Society.—A meeting of the committee of the above society will be held, by kind permission of the Horticultural Club, in the Club Room at the Hotel Windsor, Victoria Street, S.W., on Tuesday, the 26th inst., at 2 p.m. The chief business will be the election of judges for the London exhibition.—P. W. TULLOCH, *Hon. Secretary*.

The largest Rhododendron ponticum in Wales.—Mr. Mitchell, Glyn Celyn, Brecon, sends a photograph of this well-known Rhododendron. It is considered the finest specimen in South Wales, being 50 yards in circumference and 10 feet in height, and leafy to the ground level. Mr. Mitchell writes: "As far as I can find out it is about fifty years old, and is growing in a strong and heavy loam inclined to clay."

The raisers of Rhododendron Pink Pearl.—Messrs. John Waterer and Sons, The American Nursery, Bagshot, Surrey, write: "We notice in your leading article in THE GARDEN of the 25th ult. that you say 'We probably owe Pink Pearl to the late Mr. J. H. Mangles.' Surely, seeing that we were the raisers of this variety, the credit should have been given to us." We hasten to correct any wrong impression that may have been conveyed by our remarks.

Three good Verbenas.—These old-fashioned flowers are very attractive in the summer garden, and varieties of distinct and rich colouring may now be had which make a bed of them much more effective than used to be possible. It is unnecessary to do more than mention the rich pink variety Ellen Willmott, for everyone who grows Verbenas now grows this one. King of Scarlets is a new sort that has been shown a good deal lately, and as striking in its particular colouring as the popular one just mentioned. King of Scarlets is well named, for it produces flowers of intense scarlet. It is recommended for bedding and particularly for pot culture; it is very free blooming. Princess of Wales is another Verbena of distinct

and striking appearance. Messrs. William Cutbush and Son, Highgate, showed a large group of it at the last Drill Hall meeting. The dark green leaves with crinkled edges and the beautiful purple flowers associate well and combine to make a plant that is sure to become popular for bedding and also for pot culture. With these three varieties and Queen of Whites, the finest of the white Verbenas, producing splendid trusses of bloom, it may be said that one would have the four best Verbenas that are now to be obtained.—A. H. P.

Hemerocallis fulva maculata.—This is now in full flower, whereas the *Hemerocallis fulva* is just over. Mr. Sprenger received this new variety from the late Padre Giraldi, Shen-shi, China, and Professor Baroni, Florence, has named it as *fulva maculata*. It is quite distinct from the common European *fulva*. The whole plant is taller, stronger, the flowers are more numerous, and the colour is brighter and the petals broader. This variety will certainly find favour for the border. I never saw seed capsules on *H. fulva*, but the *fulva maculata* has borne seeds here, and the next time I hope to tell your readers about some new hybrids of it. There are seedlings from *H. fulva maculata* and *H. Thunbergi*, *H. aurantiaca* major and *H. citrina*, and *vice versa*.—WILLIAM MULLER, *Naples*.

Erodium pelargoniflorum.—This *Erodium*, a small plant of which I received from my friend Mr. Arthur Goodwin last year, is certainly a wonderful bloomer. My plant commenced to flower soon after it became established in its new quarters, and continued to bloom until the end of November. It kept growing all the winter, and on the last day of February opened the first of its new crop of flowers. Since that date it has been in profuse bloom, and, although numberless seed-vessels are formed, will apparently continue in flower for many weeks. This plant is now over 3 feet across. The flowers, though not individually very striking, have a pretty effect in the mass, and the great length of time through which the plant is in bloom renders it especially valuable.—S. W. F.

Campanula muralis major.—This *Campanula*, which is also known by the name of *C. portenschlagiana* major, is one of the best of the Bell-flowers for covering spaces in the rock garden or for rough stone edgings. It is a marvellous bloomer, coming into flower in the late spring, being at its best in early June and continuing to flower for many weeks, often perfecting a second crop of autumnal bloom. Last Christmas I sent flowers of this *Campanula*, picked from the open, for the Editor's table. This *Campanula* appears absolutely indifferent to soil and exposure, though it does not flower quite so freely in a shady site as in a sunny one, but I have seen it doing well under both conditions, and have noticed it the picture of health growing in pure rubble and also in heavy loam inclining to clay.—S. W. F.

Carnation Mrs. Frank Shuttleworth.—This is a very fine rose-coloured self Carnation, raised by Mr. W. C. Modrae, The Gardens, Old Warden Park, Biggleswade. It is an excellent grower, produces grass and flowers freely. The latter are large and full, the petals stout, smooth, and shell shaped; it is an addition to both the exhibition and border groups. Uriah Pike having been one of the parents, it is pleasantly fragrant. I believe it is being distributed by the raiser.—R. D.

Dundee Flower Market.—The flower market in Craig Street, Dundee, the recent opening of which was reported in THE GARDEN at the time, has proved remarkably successful. One end is occupied with fixed stalls, let by the year, while a portion is fitted up with stands let daily, the understanding being that regular stand holders should have the preference for the one they generally occupy. The stalls at the end are occupied by such leading Dundee firms as Messrs. Storrie and Storrie, Messrs. Thyne and Paton, and Messrs. Harley and Sons, and some of these occasionally take up a stand as well. A proposal made by Messrs. Storrie and Storrie that the corporation should erect a conservatory at the market, which they offer to rent, is under consideration, and if agreed to would probably improve the character of the market and trade.

Begonia bowringiana.—According to the "Dictionary of Gardening" this *Begonia* is synonymous with *B. lacinata*, a native of Nepal and Southern China, and introduced from there in 1858. The description, however, does not seem to apply to *B. bowringiana* as shown by Messrs. Sander last year at Ghent, and more recently at the Temple show. It is a bold-growing plant, forming a decided stem perhaps 2 feet in height, and furnished with leaves which rival the finest forms of *B. Rex*. The individual leaves of *B. bowringiana* are about 18 inches long, and nearly the same in width. The upper surface is velvety green of varying shades, while the midrib and veins being of a clear bright red stand out very prominently from the rest of the leaf. The under sides, too, are of a uniform bright red tint, richer in colour than in most *Begonias*. Not only is this *Begonia* valuable for its intrinsic merit, but it has been already employed for hybridising purposes, and in conjunction with varieties of *B. Rex* has yielded some beautiful and distinct forms, two of which—His Majesty and Our Queen—attracted much attention when exhibited at the Drill Hall on October 27 last. On that occasion each of them was given an award of merit.—H. P.

Allamanda grandiflora.—Though this *Allamanda* has been in cultivation for the last sixty years or so, and it is certainly one of the most distinct and beautiful of the genus, it has for some reason or other become very rare in cultivation, so much so, indeed, that very few nurseries are able to supply it. At Kew it is just now flowering freely, and the blossoms at once arrest attention by reason of their great beauty and distinct shade of lemon-yellow. Compared with such as *A. Hendersoni*, the species under notice is of a dwarf, compact habit, the slender shoots being clothed with small, thin leaves, while a succession of flowers is kept up for a considerable time. It may be grown as a rafter plant in a small or medium-sized structure, or, if preferred, as a loose-growing bush. Perhaps the scarcity of this *Allamanda* is to a certain extent accounted for by the difficulty attending its propagation or, rather, its successful culture, for, while cuttings are not at all difficult to strike, they seldom grow in a satisfactory manner. This may be obviated by grafting upon one of the vigorous growers, such as *A. Schottii*, with which a union is readily effected, and the after culture gives no further trouble. *Allamanda grandiflora* is, like most of the other cultivated species, a native of Brazil, whence seeds are said to have been sent by the collector Gardner in 1836, from which plants were raised and in time distributed.—H. P.

National Chrysanthemum Society's annual picnic.—The annual picnic and outing will, by the kind permission of Miss A. A. de Rothschild, take place at Waddesdon Manor, Bucks. The date fixed for the picnic is Tuesday, the 19th inst., and the cost, inclusive of railway fare to and from Baker Street, conveyance to and from Waddesdon Station to the Manor, dinner and tea, will be 10s. 6d. Ladies are specially invited. The company will be conveyed to Waddesdon Manor Station by the Metropolitan Railway, from Baker Street Station, No. 2 platform, at the time set forth on the annexed programme. Dinner and tea will be provided at the Five Arrows Hotel, which is close to the entrance gates. Note.—Accommodation will be provided for ladies at the hotel. The gardens and grounds of Waddesdon Manor are of a very attractive character, and advantage should be taken of this opportunity to inspect them. Should any be disposed to walk, there is a footpath across the fields to Waddesdon Manor, distance about one mile or so. The entrance to the fields is close to the railway station. The programme will be as follows: 10.15 a.m.—Assemble at Baker Street Station, platform No. 2. 10.25 a.m.—Special train leaves for Waddesdon Manor Station, calling at Finchley Road at 10.30, Harrow at 10.45, and Rickmansworth at 10.55, also calling at these places to set down on the return journey. 11.40 a.m.—Train reaches Waddesdon Manor Station, from which conveyances will carry the party to the Five Arrows Hotel. 1 p.m. sharp.—Dine at

the Five Arrows Hotel. During the afternoon there will be an inspection of the gardens and grounds. 5 p.m.—Tea will be provided at the Five Arrows Hotel. 6 p.m.—Go as you please. 7.20 p.m.—Conveyances leave the Five Arrows Hotel for return journey. 7.50 p.m.—Train leaves Waddesdon Manor Station for Baker Street.—RICHARD DEAN, V.M.H., *Randolph Road, Ealing, London, W.*

Diosma capitata.—There were so many subjects to engage the attention of visitors at the Temple Show, and owing to the crowd few had an opportunity of closely inspecting them, that it is possible few noticed the flowering specimens of this hard-wooded greenhouse plant in the interesting collection staged by Messrs. W. Bitchin and Son of the Hassocks Nurseries, Sussex. It is a charming plant for the greenhouse, dwarf and compact in growth, blooming with remarkable freedom. It can lay claim to some fragrance, and it lasts a long time in bloom. The plant bears the name given at the head of this paragraph at the Hassocks nurseries, where it is regarded as a very old subject, but I cannot find it in plant catalogues. Perhaps it may now be included among the *Pimeleas*. It throws up numerous heads of lavender-coloured flowers of a pleasing shade, and it makes a model subject for pot culture. Cuttings are made of the young growths when 1 inch or $1\frac{1}{2}$ inches in length; they are inserted in 6-inch pots filled with a sandy compost and covered with a bell-glass; they root in about three months, and then are potted singly in $2\frac{1}{2}$ -inch pots in a compost formed of peat and sharp sand. These young plants are stopped a time or two, then repotted as required, and grown on into bushy examples. Three year old plants will produce one hundred heads of bloom. It is more compact in growth than *D. ericoides*, with quite a *Pimelea*-like habit. Certainly a delightful plant for those who can cultivate it.—R. DEAN.

Blue Tufted Pansies.

—For the last two or three years more attention has been given by certain raisers to the introduction of a better lot of blue Tufted Pansies than has been the case for a long time. When looking through the list of catalogued sorts recently I was struck with the dearth of really good blue varieties. Some of the existing sorts are of a good and striking colour, but when the question of habit is considered and the quality of the flowers, too, is looked into, it is astonishing how far they fall short in this respect when compared with Tufted Pansies of other colours. The near future has many good things in store for us, but until they have been distributed it is almost useless to refer to them individually. There are several good sorts, however, of which but little is known, and although they are not a true shade of blue, they are near that colour. Jackdaw is a new sort, of a pretty heliotrope blue, with a bright yellow eye and rayless. The flowers hold themselves up well, and they are freely

developed on a sturdy habit. Blue Tit, a pretty little mauve-tinted blue flower, is charming. The plants are small in the first instance, but ultimately make beautiful tufts, literally covered with flowers. Duncan, introduced in 1901, is a fine bedding sort. The colour may be described as deep bluish purple, and most effective. The plant has a splendid constitution. Admiral of the Blues, in a spray, as seen at the Temple show, is beautiful. It is a deep blue and rayless. As a bedding sort, however, it cannot be highly recommended, as its habit is poor. A pretty pale mauve-blue is John Quarton. It is a good bedding plant, and was in fine form a few days ago in Mr. William Sydenham's garden at Tamworth. A miniature-flowered sort is Pigmy. This is a heliotrope blue flower with a rich yellow eye. The plant has a splendid constitution and a good habit. I recently saw this variety used as an edging to a long bed down the

CLIMBING AIMEE VIBERT OVER WILLOWS.

whole length of a carriage drive, and the effect was very fine.—D. B. CRANE.

The Scotch Laburnum.—Among flowering trees the Laburnum holds a foremost position. The common one (vulgar) is abundant, but the one under notice is not, judging by the few one sees; many planters are not acquainted with it. By planting both sorts the period of blooming can be lengthened from two to three weeks. I have been impressed with this for several years, where both sorts are growing side by side. Now, in the last half of June, the Scotch kind is just at its best, while the common one has been over nearly a fortnight. In grounds at some distance from the house nothing is more charming than a large mass backed by other evergreens. I often think this and many other of the strong growing flowering trees are not used so freely as they ought to be to brighten the landscape. Often a few could be

ROSE OVER AN OLD ESPALIER.

added when planting groups, &c., placing them near the outside, e.g., a highly coloured Apple, wild Cherry, Thorns, red Chestnut, or white Acacia. This Laburnum is somewhat stronger growing, has shining foliage, and the racemes of flowers are longer. Some consider it rather shy blooming. This is not so in our grounds. While writing I may suggest to those desirous of continuing the flowering season that they plant Laburnum in a north situation, this retards it.—J. CROOK.

Littonia modesta.—The introduction of the beautiful *Gloriosa rothschildiana*, which attracted so much attention at the Temple show, will doubtless serve to call attention not only to the *Gloriosas*, but also of their near allies. One of these is the above-mentioned *Littonia modesta*, a native of Natal, whence it was introduced about fifty years ago. It passes the winter in a dormant state, during which time the soil should be kept quite dry, and in spring the curiously shaped tubers must be shaken from the old compost and repotted. In a warm greenhouse or intermediate temperature if the soil is kept slightly moist they will push up slender succulent shoots, which quickly lengthen and soon acquire a climbing habit, supporting themselves by slender tendrils. The flowers, produced singly from the axils of the leaves, are drooping, bell-shaped, 2 inches or so across, and of a bright orange colour. Individually they do not last long, but a succession is kept up for some time. A near ally of the above is *Sandersonia aurantiaca*, also a native of Natal, and introduced about the same time as the preceding. This is a slender twiner, but of a less pronounced climbing habit than the *Littonia*, while the flowers are broadly urn-shaped and bright orange-yellow.—H. P.

Digitalis obscurus.—A plant given to me under this name is now in flower. It is 3 feet in

height, and its numerous flower-spikes, with two branches at the base, are about 15 inches in length. The flowers, which are orange, edged with chestnut, are 1 inch in length and three-quarters of an inch across the mouth. The leaves are rather over 6 inches in length and half an inch in breadth, and are smooth and shiny on both surfaces. I can see no account of the plant, and find that it is not mentioned in the "Kew Hand List." I had thought from its name that it might be synonymous with *D. ambigua*, but the leaves of that plant are described as being downy beneath. It is not a strikingly handsome plant, but is interesting, and has a quiet charm of its own.—S. W. FITZGERBERT.

Cistus ladaniferus.—It is, as far as I know, impossible to procure the type of this plant with pure white flowers, though a few years ago, while journeying by rail from Algier to Ronda in Spain, I saw many hundreds of plants in full flower close to the line. The variety of *Cistus ladaniferus* named *maculatus* is, I believe, in commerce, but is hard to obtain. Most nurserymen catalogue it, but grow *Cistus cyprius* under that name. Both have white flowers with

maroon-carmine blotches near the bases of the petals, but the flowers of *C. ladaniferus* are larger and are borne singly at the ends of the shoots, while in *C. cyprius* several are produced at the extremity of each shoot. *Cistus ladaniferus maculatus*, true, has a splendid flower. I have just measured one that is slightly over 5 inches across, the pure white crepe-like petals set off by the dark, carmine-edged blotch being very beautiful.—S. W. F.

ROSES OVER OLD TREES.

SOME of the best Roses for covering old fruit trees are the following. The soil in this garden (Thames Valley, Berkshire) is very light, and it is taken out to a depth of 18 inches. This brings one to a bed of chalk. I then mix up the following compost: Two parts of rich loam, one part well-decayed horse manure, one part of good road sand, and to every load two barrowloads of old mortar rubble and one barrowload of wood ashes are added. I find all the Tea and Hybrid Tea Roses do exceedingly well and flower profusely. A large quantity of climbing Roses are grown on old fruit trees. A hole is taken out about 3 feet square and filled in with the same compost as for the dwarf Roses. This gives them a good start, and I have no hesitation in saying that climbing Roses cannot be grown in a better way to show their effectiveness than by allowing them to ramble over old worn out fruit trees. Some of the Roses have only been planted two and a half years, but they are now 20 feet high, and almost cover the branches. They occasion

no further trouble beyond the winter pruning. The best climbers for trees, according to my experience, are the following: The first to flower here is *Carmine Pillar*: this has a clear carmine flower and beautiful foliage. The next best is the lovely *Mme. Alfred Carrière*, which is never without flowers from the early part of June till October. The *Dawson Rose* is excellent for trees. My next best is the little *Thalia*. I have it growing on an old standard Apple tree, and its flowers very much resemble the Apple blossom. In June *Dundee Rambler* is a good Rose for running over an old tree. We also grow *Euphrosyne*, *Electra*, *Paul's Single White*, *Rève d'Or*, and *Gloire de Dijon*, all of which do well. One other Rambler I must not forget, namely, *Dorothy Perkins*, which is the best of all pink Rambler Roses for a south wall. The beautiful *Fortune's Yellow* grows and flowers well here. It is planted on the house and sheltered from the west by a very large bay window, it has covered a space 30 feet square in less than three years. *Grüss an Teplitz* makes a good pillar Rose, and shows its deep red flowers much better than when grown as a bush.

The following Roses are excellent for massing: *Anna Olivier*, *Dr. Grill*, *Marie van Houtte*, *G. Nabonnand*, *Jules Finger*, *Princesse de Sagan*, *Viscountess Folkestone*, *Caroline Testout*, *Papa Gontier*, *Hon. Edith Gifford*, *Antoine Rivoire*, *Killarney*, *Liberty*, *Mrs. W. J. Grant*, *Marquise de Salisbury*, *Mme. Chedane Guinoisseau*, and for a long border the pink *Chinas* and *Lavender* make a charming effect. A bed of the little *Polyantha Rose* is always interesting. I find the following varieties make a very good mixture: *Etoile d'Or*, *Mme. E. A. Nolte*, *Perle des Rouges*, and *Marie Pavie*. S.

SOME OF THE NEWER ROSES AT DROPMORE.

DURING the past five years many good Roses of all sections have been added to our lists, and the present season having so far been most favourable for their growth we may reasonably hope to see many of the varieties well exhibited at the forthcoming shows. English raisers have within the time named given us by far the largest number of what are likely to prove varieties of sterling merit. Any new Rose introduced by such growers as Messrs. Alexander Dickson and Sons of Newtownards, Messrs. Benjamin Cant and Sons, Messrs. Frank Cant and Co. of Colchester, Messrs. W. Paul, and Paul and Son, is a sufficient guarantee that a good variety may be expected. Taking the

HYBRID PERPETUALS

first, pride of place must be given to that excellent white variety

Frau Karl Druschki, sent out in 1900 by Mr. P. Lambert. This is by far the finest white Hybrid Perpetual: the flower is snow-white, petals shell-shaped, and it builds up into a perfect exhibition bloom. This variety must be well treated, so that a strong growth is made, otherwise it will come rather thin.

Ben Cant (B. Cant and Sons, 1902).—This Rose has proved somewhat disappointing here. Last season the blooms were thin, but it has made much better growth during this season, and the buds are promising. The colour is crimson, with darker shading.

Mrs. Cocker (Cocker and Sons, 1899).—This is an excellent variety of a soft pink colour. The flower is full, and the growth of the plant all that can be desired. A really good Rose.

Rosslyn (A. Dickson and Sons, 1900).—This is a sport from the well-known *Suzanne Marie Rodocanachi*. The colour is a beautiful shade of rosy flesh, but up to the present time I have not seen a really good flower of it. There is also another sport from the first-named variety named *Marie Corelli*, sent out by Mr. Prince of Oxford.

HYBRID TEAS.

New varieties in this section are more numerous. Messrs. Alexander Dickson of Newtownards, who have raised so many good Roses, have given us many splendid additions during the time named. Foremost amongst them I would place

Bessie Brown, which is too well known to need description here.

Duchess of Portland (1901).—This has proved disappointing here. The growth is poor, and several plants have died, but those who have seen the beautiful flowers exhibited by the firm will not willingly give up trying to grow it.

Lady Moyra Beauclerc (1901).—I think this will prove a splendid exhibition Rose in good seasons. The growth is fairly vigorous. The flowers come singly, and are of a lovely silvery rose shade. They are of the much desired pointed shape, and last well. A most attractive Rose.

Mildred Grant (1901).—Visitors to Rose shows who have seen the glorious flowers of this Rose are always charmed with it. In the hands of our best growers it is a grand variety, but it will not succeed with all growers. It is quite an exhibition Rose.

Liberty (1900).—A splendid Rose for bedding and massing, also for pot culture. It is not quite large enough for exhibition. The flowers are brilliant crimson, and of the same shade as Mrs. W. J. Grant.

Papa Lambert (P. Lambert, 1899).—This is a good grower, but the flowers fail to open well. The colour is deep rose. It wants a favourable season, and is promising well this year.

Robert Scott (R. Scott and Sons, 1901).—This is a good Rose. Growth and foliage excellent, and the flowers are of large size and open well. Colour light pink; of excellent form and substance. A really good Rose.

Edith D'ombrain, *Alice Lindsell*, and *Alice Grahame* have not yet flowered here, but all seem likely to prove acquisitions to this class.

TEAS.

Boadicea (W. Paul and Son, 1901).—This promises to be a good addition to the exhibition Teas. The growth is vigorous and free, the flower of good size, pink in colour, shaded in the centre to deep rose. The flower lasts well.

Lady Roberts (Messrs. F. Cant and Co., 1902).—A sport from that excellent variety *Anna Olivier*, and similar to it, but differs in colour. In the sport this is of a peculiar but very beautiful shade of coppery red. A good Rose in all respects.

Mrs. E. Mawley (A. Dickson and Sons, 1899).—This variety is now well known, and has all the qualities that go to make up a perfect Tea Rose. One of the very best.

Mrs. B. Cant (1901).—A variety of strong growth, and a good autumnal bloomer suitable for planting in the Rose house or on south walls; colour deep rose.

Souvenir de Pierre Notting (Souper and Notting).—A beautiful variety. The colour of the flowers is a lovely shade of apricot. A well-developed bloom rivals a typical flower of *Maréchal Niel* in size. It is quite worthy of the gold medal awarded to it by the National Rose Society.

GARDEN ROSES.

These now claim a place in all gardens where Roses are grown, and now that their requirements are better understood very fine effects are produced by planting them in suitable positions, such as in masses in the wild garden or for covering arches, pergolas, and bowers.

Electra, sent out by Messrs. J. Veitch and Sons, is an excellent variety; the flowers are yellow, and in large terminal trusses. A most desirable variety.

The Lion (Paul and Son).—This has crimson flowers and is a very fine pillar Rose. The single Wallflower from the same firm is a splendid variety for hedges and pillars; the flowers are rosy crimson. This does well on a bank.

Blush Rambler (Benjamin Cant and Sons, 1903).—This is a beautiful pillar Rose, and suitable for positions where it can have plenty of room. The colour is blush-pink; it is as free as *Crimson Rambler*. It received a gold medal from the National Rose Society in 1903. These and many others are all worthy of extensive cultivation where room can be found for them. Whilst writing of garden Roses I would like to recommend to lovers of this type an old favourite here—*Mme. Alfred Carrière* (Hybrid *Noisette*), sent out by Schwartz in 1879. It is an excellent Rose for pillars. The flowers are large, white, with a yellow base. No Rose that I am acquainted with has such a delicious scent, and is almost perpetual in flowering. Another old variety I can recommend is

Gloire des Rosomanes (Hybrid *China*).—The flowers are deep crimson and produced in large

clusters; it is excellent for exposed positions. I have several times cut excellent flowers from this variety at Christmas.

CHARLES PAGE.

Dropmore Gardens, Maidenhead.

THE ENEMIES OF THE ROSE.

THE following revised notes by that excellent rosarian and hon. secretary of the National Rose Society were contributed to "Roses for English Gardens," but they are of sufficient importance to reprint in THE GARDEN.

There is scarcely any other plant which is attacked by so many or such persistent enemies as the Rose. Strange to say, writers on Rose culture, in enumerating these, invariably omit to mention the most potent enemy of all, and that is, adverse weather. It is not only that these adverse weather conditions often inflict more serious and lasting injuries than all the other enemies of the Rose put together, but they are also indirectly responsible for the worst attacks from insect and other pests. Taking all classes of Roses together, there is perhaps no climate in the world so favourable to their perfect development as that of the British Isles, and, provided seasonable weather could always be depended upon, these islands would be a perfect paradise for the rosarian. Unfortunately, this is far from being the case, as more or less unseasonable weather must be regarded in this country as the rule rather than the exception, and consequently he is kept in a continual state of anxiety as to what unfavourable climatic changes his favourites may next be called upon to encounter. No doubt one reason for these anxieties is due to the fact that most of our cultivated Roses are only half-hardy plants,

A PAVED GARDEN OF ROSES (BERKSHIRE).

and therefore peculiarly susceptible to all kinds of unfavourable weather influences.

Frosts.—These may be divided into two classes—the winter frosts and the spring frosts. Against the former the protection provided cannot well be too complete, whereas very moderate means will mostly be sufficient to ward off injuries from spring frosts; and yet against the ill effects of these spring frosts there is practically no remedy, unless it be syringing or spraying the frosted foliage with water very early in the morning in order to thaw it before sunrise. For at that season it is not so much the damage done by the frost itself that has to be guarded against as the sudden thawing of the frozen leaves by the sun shining on them. Of course, the reason why spring frosts are so difficult to deal with as compared with winter frosts is that in the one case the plants are clothed with delicate young foliage, whereas in the winter it is only necessary to protect the lower portion of the leafless and well-ripened shoots.

Early in December all the dwarf or bush Roses, whether Hybrid Perpetuals, Hybrid Teas, Teas, or Noisettes, &c., should have the surrounding soil in the beds drawn over the centre or crown of the plants to the height of several inches. In other words, they should be earthed up like Potatoes. This earthing up is generally confined to the Teas, but no amateur will regret having given his other dwarf Roses this extra attention should the winter prove unusually severe, for there are comparatively few varieties which will be found at pruning time after such a winter with perfectly sound wood even within a few inches of the surface of the beds.

Standard Roses are less easily protected. Bracken, cut in September before it has become brittle, should be secured to the heads; or a more effectual protection may be afforded the standard Teas by first drawing the shoots of the plant together and then lightly thatching the head with Straw or Bracken fastened above it to a firm stake, with one or more ties lower down, as may be necessary to prevent the Straw or Bracken from being blown aside in high winds. Tender wall Roses, such as *Maréchal Niel*, are best protected by fastening over them some fine cotton netting, or by placing Bracken, small sprigs of Fir, or other light evergreens, among the branches.

Drought.—In dry weather it will be well to give all the plants a good watering (at least half a gallon to each Rose) once a week, either with clear water or weak liquid manure. On the following day the beds should be hoed to keep a loose surface, which will be of the greatest help in preventing the soil beneath from becoming quickly dry again. Another plan is to give each plant a thorough watering with clear water and then to cover over the surface of the beds with a mulching or covering of half-decayed manure. The objection to a mulching, which should never be applied before June, is that many consider it unsightly, and the birds are sure to scratch among it and so scatter the manure over the grass or other paths between the beds.

Insect pests.—Against the foregoing and other adverse weather influences the Rose grower is to a great extent powerless, whereas insect pests, if attacked with promptness and perseverance, can, as a rule, be readily subdued. The great thing is to watch for their appearance and at once proceed to destroy the first comers, and when this is done to continue to harass the enemy until the attack has entirely ceased. It is, as a rule, only when any insect pest has been allowed to obtain a firm footing that there need be any difficulty in getting rid

of it. Good culture is a great help, as well nourished and healthy plants do not suffer so much from insect and other attacks as those that are ill-fed and weakly. The only remedy against all the larger insects that attack the Rose, like caterpillars, grubs, beetles, sawflies, &c., is hand-picking; whereas the smaller ones, like green fly, thrips, red spider, &c., may be best kept in check by syringing. Where Roses are largely grown, a knapsack spraying-pump will be found very useful in distributing and spraying insecticides and fungicides.

Grubs and caterpillars.—The Rose maggot and several other equally destructive leaf-rolling grubs and caterpillars are generally the first pests to attack the Rose in the spring. They will be found curled up in the young foliage, and must be sought for every few days and crushed between the thumb and finger, or much damage will be done. This is not a pleasant occupation, but unfortunately there is no other remedy except it be to pinch off the affected leaves and afterwards burn them or throw them into a strong solution of salt and water.

The next enemy to appear will be the frog-hopper or cuckoo-spit, a little pale green or pale yellow frog-like insect, which will be found hidden in the centre of a small patch of froth deposited either in the axils of the leaves or on the leaves themselves. This, again, must be hunted out and destroyed by means of the thumb and finger, or removed with a small brush and deposited in the salt and water solution before mentioned.

The boring grub.—Holes will be often noticed in the tops of the stems of standard Roses; these are made by this pith-boring grub. As a preventive the ends of standard Roses should be painted with "knotting" at planting time, and the same precaution should be adopted with the standard stocks. If the holes have been already made, a piece of copper wire thrust sharply down them will destroy the grubs; a little putty is used to close the holes afterwards. The same grubs also occasionally pierce the shoots of Roses, and seem especially fond of those made by standard Briar stocks. In this case, as soon as observed, the hollow ends of the shoots should be squeezed until firm wood is met with, and then cut off. In this way the boring grub will be crushed, and the affected part of the shoot removed.

The Rose aphid or green fly.—In some seasons these enemies of the Rose are very numerous and troublesome, and if not frequently destroyed increase very rapidly. Most exhibitors keep green fly under entirely by the skilful use of the thumb and finger. This only shows how easily such pests may be kept in check, if attacked directly they make their appearance and never afterwards allowed to congregate in any great numbers. Occasional sharp syringing with a garden engine with clean water will be found in most cases sufficient. Should this, however, prove ineffectual, the following well known remedy may be used instead. Take two ounces of quassia chips and boil them in a gallon of water, adding a tablespoonful of soft soap before the mixture becomes cold. Or one of the many insecticides in the market may be tried, keeping strictly to the directions supplied with the bottle.

Thrips.—These tiny creatures often injure Rose blooms in hot and dry weather, especially those of the Teas, by giving the petals a brown and bruised appearance. Spraying or syringing with clean water is the best remedy to employ, even at the risk of spoiling some of the existing blooms.

Red spider.—This is another dry weather enemy, and so small as not to be detected with

the unaided eye. It generally attacks the lower sides of the leaves, and if not kept in check causes them to fall from the plant prematurely. The same remedy as for thrips is advisable. Crimson Rambler, when grown in hot or confined positions, is rather subject to this pest. In dealing with large plants like this it will be found a good plan to use a small watering pot with a fine rose, and each evening in dry weather to wet both sides of the leaves by swinging it sharply up and down and across the climber.

Fungoid pests.—*Mildew.*—Of all the insect and fungoid enemies of the Rose this is, as a rule, the most troublesome to deal with. It appears as a white mould on the foliage, and if not promptly dealt with will quickly spread from one plant to another over the whole collection. It occurs at all seasons, but principally in autumn, when, if not checked, it will prevent the plants from flowering as freely as they otherwise would. Flowers of sulphur is a sure preventive, but each attack must be dealt with on its first appearance, and the application repeated until a cure is effected. A very simple way of applying the sulphur is by shaking it lightly over the affected plants by means of a fine muslin bag the first calm evening after the mildew is detected. This remedy is even more effectual if applied while the dew is still on the foliage in the early morning. Although only the upper surface of the leaves are dusted over it will be found in practice that the action of the sun will vaporise the sulphur and cause the surrounding atmosphere to be impregnated with it. Instead of the muslin bag I now use the "Ideal" Powder bellows, as the sulphur is more quickly and effectually distributed over the plants. These bellows can be obtained of Messrs. W. Wood and Son, Wood Green, London, N. The price is 7s. 6d. Syringing or spraying with the following liquid will also prove effectual, more especially if the under side of the leaves can be wetted with it. To make this mixture half an ounce of potassium sulphide should be dissolved in a gallon of hot water, which should be well stirred as the sulphide of potassium dissolves; when cold the liquid will be ready for use. Warm days followed by cold nights are the most frequent causes of this pest, also a close, muggy atmosphere.

Red rust or orange fungus.—This is much more variable than mildew, and in many gardens is seldom if ever seen, while in others, particularly those on hot and dry soils, it is frequently very destructive to the foliage in the autumn. On its first appearance a few sulphur-coloured spots will be noticed either on the leaves or shoots. In the next stage it increases and becomes a bright orange, ultimately turning black. There is no practical remedy for this fungus, as unlike mildew it vegetates inside instead of on the surface of the foliage.

MOSS ROSES.

"ARE they grown now?" is the question often put to me, and I have to confess that their popularity has waned, although it would not be correct to say they are altogether overlooked. How can anyone slight these pretty and hardy Roses, the very touch of whose leaf, stem, or flower leaves behind a delightful fragrance? Where can we find a more quaintly beautiful Rose than the crested Moss or the snowy whiteness of *Blanche Moreau* peering through a shield of olive green moss? Then there is the handsome, elongated, mossy bud of the *Common Pink*, and the dense growths and abundant blossoms of its rival, *Gracilis*. Little Gem and the *Moss De Meaux* are two miniature Moss Roses which never fail to obtain admirers. Another

beautiful Moss Rose is White Bath, perhaps even more pure in colour than Blanche Moreau. These varieties are the best of the true Moss Roses. There are many others, and some of them good. P.

NOTES ON HARDY PLANTS.

LINARIA ALPINA.

I GROW many of the Toad-flaxes, but this has always been my especial favourite. From early summer until late autumn the deep purple orange-lipped flowers glow on the wall tops amid the glaucous grey of the spreading foliage, and tiny seedlings spring up around in the chinks of the masonry and along the edges of the gravel paths. The old plants live sometimes through the winter and sometimes disappear; but their death is of no moment, as they are succeeded by seedling plants, and this *Linaria* is perhaps best treated as an annual. Curiously enough, this plant and another lovely little annual, *Ionopsidium acaule*, sometimes suddenly die out of gardens where they have seeded and flowered annually for many years. I am very fond of both the *Ionopsidium* and this *Linaria* for growing beneath Tea Roses. Now and then I scatter seed of both broadcast over the garden, and such seedlings as result are allowed to remain, since they injure nothing and are charming when they appear in unexpected places.

S. W. FITZHERBERT.

GLADIOLUS VINULUS.

THIS exceedingly pretty little *Gladiolus* is now in flower. It precedes *G. Colvillei*, The Bride, by a week or ten days. In Nicholson's "Dictionary of Gardening" it is given as a synonym for *G. vittatus*, the flowers of which are stated to be "pink with darker stripes, anthers purple, stem 8 inches to 12 inches high." This is evidently not the plant that I have under the name of *Gladiolus vinulus*, the flowers of which are pure white, with rich carmine markings on the lower petals and the anthers white. My plants are 22 inches in height and bear from four to six blooms, which are 2 inches across on the scape. All who have seen the flowers have been unanimous in admiring them. S. W. F.

ACHILLEA MONGOLICA.

THIS, to my mind, is one of the very best of the Yarrows or Milfoils. A native of Siberia, it is perfectly hardy, and its single white flowers, about three-quarters of an inch across, are produced in prodigal profusion long before the other species have commenced to flower. Through the whole of May and the early part of June this *Achillea* has been covered with bloom. The flowers are most valuable for cutting, as their purity of colour and simplicity of form render them especially appropriate for indoor decoration. For this they are far superior to the flowers of *Achillea Ptarmica* flore pleno The Pearl, so largely grown. This species is a very rapid grower, and if not staked will cover a space 4 feet square in two years. The height of the flowering stems is 2 feet, and the plant is easily increased by division. S. W. F.

ÆTHIONEMA PULCHELLUM.

THIS is one of the prettiest of the whole family of *Æthionemas*, and is now a charming sight on a sunny rock border, where its numerous racemes of flesh-coloured flowers rising above the narrow, glaucous foliage have a very pleasing effect. It is one of the more lately introduced of the race, but proves one of the hardiest as well as the most handsome of the family. I have had my plants three years, during which time they have spread considerably, but are now in danger of being overrun by a vigorous mass of *Androsace lanuginosa*, which is overstepping its rightful boundaries. *Æthionemas* are found in open, sunny spots in mountain ranges in Asia Minor and Europe, and in

the garden the natural conditions of their habitat should be reproduced as far as possible.

S. W. F.

OLEARIA NITIDA.

THIS New Zealand shrub has been in flower with me, and when it attains fair dimensions will, I think, be a decorative object. The small white Hawthorn-like blossoms are about half an inch across and borne freely on loose branching racemes. The leaves are 3 inches in length and 2 inches in breadth, deep green on the upper surface and silvery white beneath. The plant was, I believe, introduced into this country in 1886, but the largest specimen I have seen of it was under 5 feet in height. S. W. F.

ROSE NOTES.

FELICITE PERPETUE IN BUSH FORM.

A SINGLE plant of this fine old Rose, some 10 feet high and 24 feet in circumference, is now beginning to open its neat little flowers. Even recent additions to the fast growing groups cannot surpass the old *Félicité Perpetue*, and it is really the best one to mingle with *Crimson Rambler*, as they blossom practically at the same moment. Although I would not plant this Rose to grow in bush form instead of as a climber, yet there are occasions when such a plan is useful. For odd corners or to cover a heap of tree stumps such a Rose as this is invaluable, and when in flower is like a huge snowball. The treatment I adopt as regards pruning is to cut away a few of the oldest growths soon after flowering, then the new growths have time to fill up the vacancies. To form a round or conical bush the growths are brought gradually around or bent over, but some shoots are allowed a certain freedom, thus removing any suspicion of artificial training. A few shovelful of manure thrown around the base once a year and a canful or so of liquid manure just before the buds open are all the extra attention the plant receives. There are many other Roses well adapted for this mode of culture and training, but none can surpass *Félicité Perpetue*. One can but wish that raisers will soon give us a perpetual flowering form. P.

SULPHUREA TEA-SCENTED.

This charming Rose is proving one of the most valuable additions to the sulphur-yellow varieties that we have had for many years. In fact I may say there is no sort that has given so much satisfaction both for its exquisite colour and shapely buds and for the almost beet-coloured foliage and vigorous growth. When massed the general effect of this Rose is white, but on close inspection the stiff petalled buds are of a pure sulphur-yellow, and they are so prettily formed that I am persuaded market growers would find this Rose a useful one. P.

MME. ALFRED CARRIERE.

I planted this Rose in the autumn of 1902 on an old espalier Pear tree; it has grown all over the tree and bears hundreds of perfect flowers. It flowers all the summer and late autumn. Mme. Alfred Carrière is one of the best Roses for growing on old fruit trees. J. S.

ROSES ON DEAD PEAR TREES.

There is no better way of showing the beauty of a climbing Rose than the above. I planted *Carmine Pillar* and Mme. Alfred Carrière in the autumn of 1902; they have both done remarkably well. The *Carmine Pillar* is planted against a dead pyramid tree, and it has now reached the top, a height of 20 feet, and is at the present time a perfect mass of flowers. These have a beautiful effect in the orchard. J. S.

SOLEIL D'OR.

This Rose deserves praise for its profuse blooming and golden colour, deepening into a heart of ruddy gold, and for its delicious perfume. R.

FORTUNE'S YELLOW.

This is one of the best of the early Roses, and if given a suitable aspect no other variety that can

be grown out of doors will give better results; an eastern or western aspect suits it best. I have now a large plant in perfect health that has been under my charge more than thirty-two years. It is growing against a west wall, and at the time of writing (June 13) it is covered with flowers, all of which are of a delicate rich colour. I have also a large plant against an east wall. Here the colour of the flowers is quite as fine. I never protect the plants in any way, the frost often cuts back the long unopened shoots, and this is all the pruning required. A good mulch with rotten manure suits it well, and a plentiful supply of water in dry weather. This Rose does equally as well either on its own roots or worked on the Briar. This is also one of the best early Roses we have for decorative purposes, and when set up with the tips of the current year's growth of copper-leaved Beech it is very beautiful. T. B. FIELD.

ROSES AT BASTON MANOR.

CARMINE PILLAR.

This has been shown recently in various collections of cut Roses, and although very pretty when gathered, it is only when seen growing that a full estimate of its real value can be made. When recently going through the gardens at Baston Manor, Hayes, Kent, I saw it growing naturally among the lower branches of an old tree. The colour was very bright as seen from the rock garden, the long, spreading branches being covered with the rich carmine flowers.

CRIMSON RAMBLER.

At the time of my visit this was not quite out in flower, but it is planted in various positions, some plants over an archway were covered with large trusses of buds, and in a short time will make a brilliant display. Several large bushes on the stems of old trees were quite as promising. In some positions this Rose runs too much to growth and does not ripen its wood properly, but here planted on a slope with a south aspect it is perfectly at home, making growth, which never fails to mature and flower well the following season.

MME. D'ARBLAY.

This belongs to the Musk Roses, and grown on a pergola produces masses of its delicate flesh pink blooms. These were not open at the time of my visit, but the flowering branches were well advanced, and a little later on will be covered with a wealth of flowers. Mr. Pascoe, the gardener, tells me that this Rose is a great favourite.

COUPE D'HEBE.

This fine old Rose is another favourite. One large bush, which had a good many of its fragrant blooms open, was making good growth. Mr. Pascoe told me that the tree had been growing in its present position for upwards of fifty years, and the only evidence of its great age was the old, gnarled stem. A. H.

THE MERITS OF OWN-ROOT ROSES.

FOR the working amateur there is no more delightful branch of Rose culture than that of growing them on their own roots. True, it needs patience, but, like most good things, such Roses are worth waiting for, and, once established, they do not soon wear out. There is nothing more easy and simple, provided one sets about it in the right way. In August and September Rose cuttings may be put in out of doors in semi-shade, with their bases resting on sand, and many of them will root freely without more ado. This is the roughest and readiest plan, no doubt, of increasing any particular variety, but it often answers well. Many a good Rose bush has been raised with no greater trouble than this; but there are other and surer methods. All through the year some Rose cuttings are to be

found in my propagating case in one stage or another of development. No artificial or bottom-heat is ever used. The case, of which the top and sides are all glazed, merely stands in an unheated greenhouse, and the even temperature, without drought or draught, suits most cuttings admirably. These are put into small pots, either singly or three together, in pure sharp sand, and kept moist, but not wet. Should the case be full, as it often is, the pots go under bell glasses set on damp sand, which are lifted daily and carefully kept clear of the moisture which condenses on the glass. The cuttings which succeed best are generally those taken off with a heel. If a flower has been cut from the shoot not long before, so much the better, for usually the wood is then just in the right condition for striking. In three weeks or thereabouts it is well to examine the state of the cuttings, which can easily be done without much disturbance. If their bases show signs of a callus they are safe, and are sure to put out strong white fibres very shortly. If, on

the other hand, there should be the least decay, there is nothing for it but to throw them away and try again. Rooted cuttings are shifted singly into larger pots as they require it. When strong enough they stand out of doors for a time, but receive the shelter of a frame or unheated orchard house during the winter. Their ultimate destination, however, in this garden is mainly for flowering in tubs -- a delightful plan for Roses on their own roots, for they can be returned to garden quarters when their beauty for the time being is over. Only yesterday a dozen or more splendid flowers, though past their best, were cut from a Catherine Mermet grown in a tub, where it has been for two seasons, and there are more buds to open. The mother plant was struck, a good many years ago, in water in a little brown jug set on a sunny greenhouse shelf, one of my first experiences in the pleasant art of Rose growing.

The beginner should try his 'prentice hand with the old-fashioned pink China Roses, for these root easily and quickly. For tubs nothing can be more charming. They are useful, besides, for a variety of purposes, and are never out of place. The tubs may be set on a low terrace wall or ranged along a broad garden path; in fact, there is no end to the value of these serviceable Roses grown in this portable fashion, for they go on flowering until November, or even later. They respond well to the extra attention of being under glass during winter, but are hardy enough to stand out of doors, if more convenient, in any sheltered spot that can be found for them.

Tea Roses, Noisettes, Bourbons, and Chinas of most sorts strike freely under the above treatment. Crimson Rambler roots readily from "eyes" in the spring, and probably other Roses of that class will do the same with equal freedom.

It is only fair to confess that some Roses do not succeed at all upon their own roots, but one gains one's experience by failure as much as by success. It is doubtful whether any owner of a garden thoroughly enjoys his Roses who is unable or unwilling by personal effort to undertake the trouble of cultivating them.

K. L. D.

THERE is much to be said in favour of own-root Roses, and very little against them. No one who has seen the luxuriant growth of an own-root Rambling Rose can ever desire any other. How freely the new growths break from the base, compelling the cultivator to cut away the old wood to make way for the new, and by so doing keeping the plant in a youthful

large plants to start with. If a little patience were exercised there would in the end be better results. Provided the soil is well prepared, an own-root plant, if thoroughly healthy and possessing an abundance of fibrous roots, will make remarkable progress in a very short time, even though small at first.

To anyone possessing a hot, dry soil, own-root plants are by far the best to plant. Procure well ripened pot-grown plants in May or September. Plant carefully and mulch with decayed leaves and old Mushroom-bed manure, and there will be no disappointment as to the result. Then if a severe winter does come, and top growths are injured, it is very comforting to know the plants will break again from beneath the ground.

We often read of mildew and its antidote, but I believe if own-root plants were more grown there would be less mildew, which so sadly mars the most beautiful rosery. Then, again, how well adapted own-root plants are for cultivating upon shallow benches under glass.

The possibility of controlling and feeding the myriads of fine roots which such plants produce near the surface is evident. I had the pleasure of seeing a number of such Roses last autumn, and the growth the yearling plants had made, aided by liberal applications of bone-dust, was remarkable. Where the mistake has been made is in the insertion of weakly cuttings.

Nothing but the best wood, with healthy foliage, should be put in as cuttings. Then we may expect quality of plant and blossom. Early spring is the best time to insert cuttings, either plunging the cutting pots

ROSES OVER A STONE WALL.

flowering condition. I am persuaded we shall sooner or later find that Rose plants upon their own roots will be chiefly grown. Perhaps this will be more especially the case with bedding or massing Roses, also those for hedges, and all that are grown in the free rambling way, draping and garlanding trees, pillars, and arches with their wreaths of blossom. We shall not then find, as is now too often the case, strong growths of the stock flourishing instead of the desired variety. I saw recently a wall partly covered with the De la Grifferaie Rose, a variety of *R. multiflora*, much used as a stock for the Dijon Roses. Now this stock is all very well in its place, that is, the wild garden; but to give up a wall to its culture is simply a waste of valuable space. Where suckers like this do intrude I usually bud them with other good sorts, but I should never think of allowing them to obtain possession at the expense of the cultivated variety. To avoid this taking place one must plant own-root Roses. Unfortunately, there is a desire for extra

in bottom-heat upon a hot-bed or in the propagating frame. Should neither be available, pits with hot-water pipes could be used, standing the pots upon slates placed over the pipes and plunging the pots in leaves. Roses may be freely struck outdoors in early September. A piece of land trenched the year before, and which has had a light crop since, is an ideal spot. This should be situated well in the open, but sheltered from north and east. Insert cuttings about 8 inches long, bury them fully 6 inches in the ground, and stand the ends upon some sand or other gritty material. Cuttings also root freely if placed under bell glasses during July. The cuttings are made from similar wood to that used for budding. Retain foliage and insert in very sandy soil. Shade the glasses and sprinkle the foliage at intervals of one hour during bright sunshine for the first ten days. Raising own-root Rose is a very interesting practice, and it is to be hoped that it will be carried out with enthusiasm in the future. PRACTITIONER.

ROSA POLYANTHA AND VARIETIES.

IN the years to come we shall, I have no doubt, look back upon the introduction of *Rosa polyantha* as a great boon. Botanists make *R. polyantha* a variety of *R. multiflora*. There is, however, a great difference.

Many of the varieties of *R. multiflora*, such as *De la Griferaie*, *Laura Davoust*, and *Crimson Rambler* are double. The true *R. polyantha* has immense and dense clusters of white single Blackberry-like blossoms that are so abundantly produced as to give the plant a marvellous decorative character for a few weeks. To see this fine Rose in its glory one should plant it where its branches may fall outward and overhang a rockery or some old roots or stumps of trees. It is also a grand plant for the wild garden. When we receive a beautiful acquisition like this one is apt to wish that the season of flowering were more prolonged. Perhaps it is not too much to expect that our hybridisers will eventually endow this tribe with a perpetual flowering character, as they have with the dwarf forms.

If so their value cannot be overestimated. We have seen how amenable they are to cross-fertilisation. In *Aglaia Herr Lambert* has given us a glorious rampant and hardy climber, yielding immense clusters of double yellowish white blossoms. This was achieved by using *Reve d'Or* as a pollen parent. In like manner the pink Rambler (*Euphrosyne*) and white Rambler (*Thalia*) were obtained by crossing *R. polyantha* with the low growing *Polyantha Mignonette* and *Paquerette* respectively, so that we may reasonably look forward to some fine novelties in this direction—if not

perpetual, at least we shall obtain some brilliant colours. A single crimson or scarlet of this type would be much appreciated. Doubtless many readers of *THE GARDEN* had the pleasure of visiting Kew Gardens last month when so many beautiful species were in bloom. They will not have forgotten the grand masses of *Rosa polyantha simplex*, to give it the correct name, growing in the beds and also in the Rose

In 1886 M. Bernaix introduced a most showy single white Rose, namely, *R. polyantha grandiflora*. Judging from the waxy texture of the petals and the purity of the blossom, this variety has much of *R. indica* in its constitution, and its rather tender nature also points to this conclusion. Few single Roses have been more glorious this summer, and it has appeared in almost every collection of garden Roses at our shows. The real beauty of this and kindred Roses is seen when they can be thoroughly isolated. A space of 25 square feet will be none too much to allow for one specimen grown in a natural manner. Just now such a plant is beautiful, although flowerless. The fine thick stems, some 2½ inches in circumference, are a rich mahogany colour, and the growths long and arching. The shiny foliage, not unlike that of *R. sinica*, although not equal to it in glossiness, is no small attraction, contrasted as it is with the dark coloured wood.

A very charming kind, intermediate between the two already mentioned, is *R. polyantha Thunbergi*. It resembles in blossom a variety known as *Moschata himalaica*. It is chiefly remarkable for its wealth of golden stamens. I have not tried it under the same conditions as *R. polyantha*, but if it would blossom as profusely when allowed to grow as a huge bush as does the type this kind would be of no small interest and value to lovers of single Roses. All three sorts named bear bunches of small globose fruit of an orange shade of colour.

A variety that always commands admiration when found blossoming profusely (as it will do if allowed to become established) is *Claire Jacquier*, introduced by M. Bernaix, two years later than *R. p. grandiflora*.

Here, again, we have not that absolute hardness we should like, so that in planting a

ROSA MULTIFLORA (POLYANTHA) SIMPLEX. (From a photograph by Miss Willmott.)

dell. In the latter place it was grouped most naturally and in close conjunction to the delicate pink Dawson Rose, another hybrid of *R. polyantha*, a variety, by the way, that is worthy of more extensive cultivation, especially for covering old tree stumps or growing in the front of shrubberies.

sheltered spot should be allotted. Provision must be made for its wondrously rapid growth or it will quickly suffocate everything else around. I consider *Aglaia* will be more grown than the latter, because of its greater hardiness, and really there is little difference in the flowers: perhaps those of *Claire Jacquier* are more richly shaded with orange yellow.

PHILOMEL.

WORD-PHOTOGRAPHS OF A JAMAICA GARDEN.

I.

ROUGH stone steps ascending. On the left a dry wall waist high, decreasing in height as the steps ascend. A vigorous sweet-leaved *Geranium* fills the bottom corner, where another wall meets this one at right angles. It is planted on top of the wall, and hangs down, completely hiding it. Towards the end of the second step the wall escapes from this leafy covering, and shows Boston Fern at its base, and in the courses Ivy-leaved Toad-flax in flower dropping down to meet it. On the level top of the low wall fibrous-rooted *Begonias* of several sorts, making a display of graceful small flowers, white and red. Others conspicuous for their leaves: *B. olbia*, glowing with ruddy underside, the face of matchless tints of lustrous green; *B. nualica*, and one with mottled leaves like *Cyclamen*. Behind, the gorgeous ever-flowering *B. rubra*, erect, strong-caned. In and among all these the salmon variety of *Impatiens Sultanii*, and in the background pure white *Petunia* and orange Day Lilies. Coming forward to the path again at the fifth step, *Stachys coccinea*, covering the wall for a breadth of two steps, hanging over and encroaching on the pathway. Overhead an Ostrich-feather Palm (*Chrysalidocarpus*), whose stems, covered with bloom and coloured like a half-ripe Greengage, alone come into the picture.

II.

A circular dipping-tank with fat goldfish. Ferns and *Cyprus* around it, except at the two dipping places. Through it runs a copious rill, emerging as a fall below. I stand rather below the tank, and look over it to a patch of salmon *Impatiens* mirrored in the water. It is under a Richardson Rose. Both are always in flower. To

WHITE CABBAGE BUTTERFLY.

the left, on ground sloping steeply upward, a breadth of handsome two year old Lavender, through which push *Hippeastrums* (creamy pink), Bermuda Lilies, and white Vines. Behind this *Plumbago capensis*, just below which is a mass of white *Petunias*, and a few Carnations of palest pink. Slightly raising the eyes so that the tank is

almost lost comes the low-toned brown-pink roof of Cedar shingles, far behind which, high up the hill, is an Oleander, white, with a suspicion of warm tinging, tall and magnificently flowering, and behind that again the noble native Pampas Grass (*Cyperium saccharoides*) at the very top of the garden.

III.

A wall thigh high. A rill of water runs along its top. The bed behind is slightly depressed, and thus kept constantly moist. The English Water Forget-me-not lines the rill and spreads backward among Arum Lilies. Behind these, where the ground is drier, Spider Lilies (*Hymenocallis caribaea*), backed by a masoned wall waist-high of handsome grey stones, Ferns and Ivy-leaved Toad-flax in the crevices. White Verbenas straggle among the Lilies, strong-growing, but hardly holding their own against *Tropaeolum lobbianum* of palest yellow (Moon-light), which is repeated again on the wall below the rill. Two or three of these *Tropaeolums* are planted in the path. A short pergola, where path and rill make a right-angled turn, is covered with a dense growth of *Solanum Wendlandii* and *Allamanda Schottii*. This is known as the blue-and-yellow corner.

Port Royal Mountains (2,000 feet).

INSECT PESTS.

THE CELERY FLY (TEPHRITIS ONOPORDINIS).

GRUBS of this fly injure the leaves of Celery, Parsnips, and other umbelliferous plants by feeding on the interior substance of the leaves; the leaves of these plants towards the end of the summer often have a withered and blighted appearance, which is caused by the action of the grubs working their way between the skins of the leaves. On holding one of the leaves so that the light shines through it the position of the grub is easily seen. The grubs may be found in the leaves from the middle of June until the beginning of December. If the attack is noticed when the leaves are young, a firm pinch, but not hard enough to injure the leaf, will kill the grub. Later on, when the injury is more extensive, the entire leaf had better be cut away and burnt, as it is of little use then, and will only decay before the others.

There is more than one brood of this insect, so that it is most desirable to prevent the grubs of the first brood from undergoing their transformations. No insecticides have been found of any use in killing the grubs, but spraying or syringing with some soapy insecticide when the flies are wanting to lay their eggs is useful in preventing their doing so. The difficulty is to know when to make the application, for the flies may be found from the beginning of June until the end of July. When full grown the grubs bury themselves in the ground and become chrysalides. After the crop has been taken off, the upper part of the soil should be buried as deeply as possible, so as to render it impossible for the flies to reach the surface when they leave their chrysalides. Every bit of the crop that is left should be burnt. The fly is a pretty little brown insect with brilliant green eyes; it measures nearly half an inch across the wings, which are clouded with yellowish brown markings.

WHITE CABBAGE BUTTERFLIES.

(*PIERIS BRASSICAE* AND *P. RAPAE*.)

THE caterpillars of these two common butterflies, besides attacking Cabbages of various kinds, Cauliflowers, Turnips, &c., are very destructive to the leaves of Mignonette, *Tropaeolums* of various kinds, and Horse-radish. When plants are in-

fest, pick them off by hand, unless the pests are very abundant, when the plants might be sprayed with paraffin emulsion or salt and water, or Pyrethrum powder might be sprinkled into the heads of Cabbages. The butterflies may be caught in nets. The chrysalides may often be found on posts or palings, and under the eaves of outhouses, and should always be destroyed. These butterflies are too well known to require description, and the two species may be easily distinguished from one

THE CELERY FLY.

1. The Celery Fly (*Tephritis onopordinis*). 2. Grub. 3. Chrysalis.

another by their unequal size. The Cabbage butterfly is considerably larger than the other, measuring about 3 inches across the wings when fully expanded, while the Turnip butterfly is not more than 2 inches. The caterpillars of the former species when full grown are $1\frac{1}{2}$ inches in length, of a pale blue or green colour above and yellow on the under side, there being down the middle of the back a yellow stripe. There are various black spots, dots, and hairs scattered over the body. The caterpillar of the Turnip butterfly is about 1 inch long and of a dull green colour, with a yellow stripe down the back and one on either side; it is so covered with short hairs as to be quite velvety.

SOME WICHURAIANA ROSES FOR DWARF PILLARS.

IT seems almost impossible to exhaust the ways of growing *wichuraianas*. They are employed as weepers, as trailers upon banks, for low hedges, and also for pergolas, &c., but I am not sure that I have seen them advocated for use in restricted pillar form in large beds of Teas, Hybrid Teas, or Chinas. If anything the vigour of these Roses is embarrassing, but it is not at all necessary to allow more growths than seem advisable. What I now advocate is to plant a few of these *wichuraiana* Roses as dot plants, supporting the growths by a slender stake from 3 feet to 4 feet high. A valuable feature of the group is their inclination to flower well down to the ground, so that, though pruned back, one does not lose the blossom thereby. The growths should be cut back to the top of the sticks and kept tied upright. Any growths that spring from the base and which are not required may be cut away.

The various sorts if pruned in the manner indicated will be a mass of blossom from base to summit, and many of the varieties resemble Tea Roses in their colouring and fragrance. I can especially recommend *Alberic Barbier*; the lovely canary yellow buds and large Lamarque-like open flowers make it a most useful variety. On one plant $2\frac{1}{2}$ feet high I counted twenty full-sized blossoms, and there were several buds to unfold. How pretty such a variety would appear planted in conjunction with, say, *Marquise de Salisbury* or *Camoens*. Some varieties of this group are rather later in blooming than others; for instance, *Dorothy Perkins* is not yet out, so that this should be planted in a bed with one that is fairly continuous in flowering. The varieties named below blossomed this year about the second week in June, so that they are very suitable for planting with early Roses. One of the best is *René André*, saffron and orange-red; Paul

Transon, large clusters of rose and pink blossoms, double, and sweet; Gardenia, fine yellow, double; Jersey Beauty, single, cream; and Ruby Queen, quite a large Rose of a delightful ruby-carmine colour, with a distinct white base to the petals. For a similar purpose the following Rambler Roses bloom freely as 3 feet high plants, namely, Electra, Leuchstern, Thalia, Euphrosyne, Psyche, and Claire Jacquier. P.

MR. CHARLES TURNER'S NURSERY AT SLOUGH.

THE Rose is invading the garden in no uncertain fashion, and it is welcome. It brings a fresh and wholesome sweetness wherever it is placed, and as the years pass by this invasion will become more general still, as the worth of varieties for pillars and hedges is more widely recognised. These thoughts occurred to mind when looking through the collection of garden Roses in the nursery of Mr. Charles Turner at Slough. This group is together and comprises the garden varieties and hybrids which delighted us in childhood days and those recently acquired by French and English raisers. There is the old Moss with its pink flowers hiding in a veil of green, there the rosy Celestial coquetting with the crimson Grüss an Teplitz, and peering above all the wonderful pillars of the wichuraianas, wreathed in flowers and filled with a rare fragrance. It is rather of Roses for hedges we would now write, and the remarkable crimson Damask raised by Mr. Turner suggested these simple notes. It is an ideal Rose to form a low hedge, the growth bushy and strong, the leaves of a pleasant shade of green and in part hidden by flowers that for brilliancy of colouring and profusion force themselves on the most listless observer. They are single, 5 inches wide, and bright crimson, a shade of colour without the purple tinge of the old Damask, and very sweet. The large flaunting petals assert themselves above the leaves to show their beautiful colour, that seems to have drunk in the rays of a summer sun. Psyche, a seedling from Crimson Rambler, is, as the illustration of it suggests, an excellent hedge Rose, and of course Crimson Rambler is in all places and in all forms in this nursery. A hedge of it is a bewildering glare of crimson trails of colour, like tongues of flame, and, whether the shade is liked or not, there is no question that Turner's Crimson Rambler is one of the most remarkable Roses that have been introduced during recent years. Against this a hedge of Purity is a refreshing relief. This is almost a perfect hedge Rose, the flowers white, as the name suggests, sweetly scented, and they burden every shoot—a Rose fair to look upon, though not too well known. The Penzance Briars were in great force, Amy Robsart, Anne of Geierstein, Jeannie Deans, Lady Penzance, Lord Penzance, Meg Merrilees, the Japanese Roses, Lucida plena, Persian Yellow, Sinica Anemone, and many others too well known to record.

The wichuraiana hybrids were smothering many tall poles with their wonderful growth. We think the queen of this group is René André. The flower is described as half-double in books and catalogues, but it is really more than this, and the colouring is soft yellow shaded with salmon-red, a peculiarly beautiful association, and the fragrance is strong and sweet. It is a climbing Rose to make a note of for autumn planting. Alberic Barbier, Auguste Barbier, Jersey Beauty, Pink Roamer, and Dorothy Perkins were all represented. The Rose for all gardens is Dorothy Perkins. It is an American

introduction, a cross between wichuraiana, the type, and Mme. Gabriel Luizet, the flowers double, shell-pink in colour, and very sweet. It is a Rose for pergolas, running over old trees, arches, and similar places. Carmine Pillar was a mass of colour, and we noticed also Aglaia, Ards Rover, Electra, and Leuchstern of the newer Roses, and a host of old favourites, such as Ruga, Aimée Vibert, Mme. Alfred Carrière, Rêve d'Or, Alice Grey, Dundee Rambler, the Boursault Morletti, thoresbyana, and splendens. It is refreshing to see these fine Roses in so great a variety, the Roses that filled the old gardens of England with their fragrance and colour.

There is the same completeness in the collections of dwarfs and standards of all groups of the Hybrid Teas. We were shown in full beauty Antoine Riviere, Aurora, Florence Pemberton, Killarney, Liberty, and Rosamane Gravereaux, which is a soft rose-coloured flower and vigorous in growth. Among the newer Teas are Comte Amédée de Foras, which has yellow flowers touched with salmon and pink, a very promising variety; Lady Roberts, Mme. Antoine Mari, Mme. Jane Dupuy, and Mme. Jules Gravereaux, which is delicate salmon in colour. In these days of Tea, Hybrid Tea, and

GARDENING OF THE WEEK.

INDOOR GARDEN.

RAISING CYCLAMEN FROM SEED.

WITHIN the next few days the first batch of seeds will be sown, and the second from three to four weeks later. From the earliest sown we have for years obtained the best success. The seeds are slow to germinate, unless they are new and of one's own saving, in consequence of which the young plants raised from seeds that are sown late have little opportunity to make progress before the dull, dark days of late autumn. The leaf-stalks of the young seedling plants then become drawn and unable to support a well-developed leaf, while the bulbs also fail to develop properly.

Placing the young plants near the glass, and affording them all the light possible, keep the leaf-stalks short and ensure the satisfactory development of both bulbs and leaves. Sow the seeds in pans or pots, half filling these with crocks for drainage; over this put a layer of moss, and then

HEDGE OF ROSE PSYCHE.

choice Roses there is some danger in the fine Hybrid Perpetuals being overlooked, but we should be sorry to lose sight of flowers that possess so much interest and charm. Mr. Turner has large wreaths of Captain Christy, Captain Hayward, Mme. Gabriel Luizet, Mrs. John Laing, Mrs. R. G. Sharman Crawford, Ulrich Brunner, and other leading varieties whose names are household words in the domain of flowers.

More might have been written of this famous nursery in the time of Roses. The collection here is one of the most famous in England. Visitors to the Royal Horticultural Society's show in the Temple Gardens in May, and to the National Rose Society's display in July, will have pleasant recollections of Mr. Turner's exhibits. Roses in pots form a great feature at Slough, and in May these are in perfection.

At the moment of writing the Pinks, for which this nursery is famous, are in flower. Among them were the laced varieties and the pretty double Little Gem form of Dianthus fragrans. We wish more of the Pinks kept their petals within the calyx,

some of the rougher portion of the compost, and finally fill to within 1 inch of the top with that portion of the compost that has been passed through a quarter of an inch sieve. Equal parts of light loam and leaf-soil and a little coarse sand form a capital compost. Before sowing the seeds soak the soil with water applied through a fine rose. Sow the seeds thinly and press them well into the soil, being careful afterwards not to cover them too deeply. The final watering should be given through a fine rose, and the pans afterwards placed in a close, moist position, and in a temperature of 65° to 70°. Shading from strong sunlight is necessary until the young plants are well through the soil.

COLEUS.

Cuttings inserted now will strike root readily, and will soon grow into useful sized plants (which should be kept in small pots) for decorative work during the months of August and September. Strong, high-coloured shoots can be obtained now as cuttings from specimen plants. Insert them singly in 2½-inch pots and place them in a close propagating frame, or plunge them in a hot-bed

among cocoanut fibre, and afford them shade from the midday sun.

WINTER-FLOWERING PELARGONIUMS

are now being removed to their flowering pots. Put them back for a few days in the cold frames, which are kept close; air being admitted, and gradually increased, until later the lights are removed altogether. At this time much care in giving water is needed. A few of the earlier potted may be ready for placing on a bed of sand or ashes in the open, the plants in this case being given plenty of space for the proper circulation of air about them. It is a good plan to make provision for placing lights temporarily over them in the event of continued wet weather.

J. P. LEADBETTER.

Tranby Croft Gardens, Hull.

KITCHEN GARDEN.

FRENCH BEANS.

THE last sowing of the season may now be got in. It is of little use sowing after this date in the northern counties. Choose a south exposure and good land. If the seeds are steeped a few hours in water several days will be gained, as in dry weather germination is slow. Sow in rows 18 inches apart, and when the plants come up give water in dry weather, as this sowing must be hurried on to ensure fruit before the cold nights set in. A sowing about a fortnight hence should be made in pots, standing them out of doors till early in September, when they may be placed in a cool house. Inspect growing plots of Beans, and thin the plants again where they seem too thick.

SPRING CABBAGE.

It is well to be in good time with this most important vegetable. Most gardeners sow at a fixed date that is found to suit their locality. By sowing rather early this leaves time for a second sowing should accidents happen. From the 12th to the 20th of this month is a suitable time for the first sowing. Sow on a light, open border exposed to the sun, as rapid growth is necessary. The seeds may be sown broadcast, and should be coated with red lead or securely netted, chaffinches being very destructive to Cabbage seeds. Many fine sorts of Cabbage for thus sowing are now on the market. Ellam's Early or Edinburgh Market are both most suitable varieties, quite hardy and turning in very early.

SHALLOTS.

Where these are now ripe they should be lifted and laid out thinly on wooden boards to dry. Care must be taken not to pull them up too soon; the foliage will be a safe guide. The clusters may be left as they have grown, dividing them when quite dry. Store afterwards in a cool, airy room. Garlic may be treated in the same manner, but may need to be left in the ground for some time yet.

ONIONS.

Now that the weather has become hot and dry a careful watch must be kept. Transplanted Onions do not seem so liable to the attacks of the fly as those sown in the open in March. Give the plot a dressing of soot and some good fertiliser, hoeing it in with the Dutch hoe. If the fly has already made its appearance the affected plants should be pulled up and destroyed. If the bulbs of spring planted Onions seem to be rather deep in the soil some should be drawn away. Liberal dressings of manure and soot are necessary for this class of Onions if extra large or exhibition roots are required.

Hoptoun House Gardens, South Queensferry, N.B. THOMAS HAY.

FLOWER GARDEN.

THE seedling plants of such spring bedding subjects as Wallflowers, Silene, &c., are now sufficiently large to be lifted from the seed beds and transplanted. This work should be done before the young plants become drawn and weak, else when the planting season comes round they will not be sufficiently large for the purpose. Transplanting at this time of the year entails a check to the

growth, but if the nursery beds are well dug and a thorough watering given after planting new roots will soon be made and growth recommence. If any particular Polyanthus were marked for seed-saving these should have an occasional watering, and the seed may be sown as soon as ripe.

MIGNONETTE.

At the time of writing there has been practically no rain for a fortnight, and the hot, dry weather has every appearance of continuing. If such should prove to be the case all the Mignonettes sown in sunny positions will quickly be exhausted, and a sowing in a moist spot, such as under a north wall, will produce an acceptable supply of this fragrant and indispensable flower. Sweet Peas which were sown in the autumn are now flowering freely, and require longer sticks, which should be slender but strong. All seed-pods should be closely removed, and a good mulching will save a deal of labour in watering and give better results.

NARCISSUS.

The Pheasant's Eye and other varieties of Narcissus have now ripened their foliage, and if lifting is considered to be necessary it should be done forthwith. If the bulbs are to again occupy the same place deep digging and heavy manuring will be essential. When replanting especial care should be taken with the double Pheasant's Eye to keep the bulbs at a medium depth, for if planted at either extreme, blindness is almost sure to be the result.

DAHLIAS.

Although a row of Dahlia stakes is a very unsightly object, it is not wise to delay the staking too long, for gusty weather, and at times even a heavy fall of rain, is sufficient to wreck many of the finer plants. Tying should be done firmly, taking care not to enclose any of the leaves. The Dahlia delights in and repays for copious waterings and frequent applications of weak manure water. If large flowers are required disbudding must be practised, but due allowance must be made for the depredations of earwigs. The dwarf bedding Dahlias, such as the brilliant Rising Sun, will not, of course, require either staking or disbudding. The variety named is most valuable for filling a large bed where bright colour is required.

FLOWERING SHRUBS.

As they pass out of flower any little attention these may require in the way of staking or pruning should be given. Unless they receive an occasional pruning plants of the larger-flowered Philadelphus become very thin. The Weigelas (Diervilla) will stand severe pruning.

A. C. BARTLETT.

Pencarrow Gardens, Bodmin.

FRUIT GARDEN.

MELONS.

PLANTS in pits and frames which are carrying heavy crops of fruit require liberal supplies of liquid manure. A light top-dressing of loam and some quick-acting fertiliser will also help them, unless the plants are making too much growth, when no artificial manure should be given. Very little water will be required when the fruits are approaching ripeness, especially if the roots have a deep bed of fermenting material to root in, and liquid manure must be withheld altogether or the flavour will be impaired. Only sufficient water should be given to keep the foliage from flagging. Do not hurry the fruits at the finish, as much air and little moisture are necessary to obtain good flavour. Keep all laterals pinched off Melons growing in frames, and so give the main leaves full exposure to light. Syringe and close the frames early on bright afternoons, care being taken not to syringe the plants overhead in wet or unfavourable weather. Raise the fruits by placing on inverted flower-pots, and place fresh fermenting material round the frames of later Melons as required for keeping up the heat necessary to finish the fruits. Where late Melons are required, and good houses are at command with plenty of top and bottom-heat, a late sowing should now be made of some quick growing and early maturing variety.

Veitch's Late Perfection is an excellent variety for late work, and Hero of Lockinge is always good. Plant out in soils recommended in previous calendars, and allow the plants a little more space to obtain good healthy foliage. Give a night temperature of 70° to 75° and 85° by day, with free ventilation on bright days.

CUCUMBERS.

Cut away any old growth from Cucumbers that show signs of weakness through overcropping. Top-dress with loam, leaf-mould, and some well-rotted manure. Applications of weak liquid manure and occasional sprinklings of Thompson's Vine Manure will be beneficial. Seeds sown now for autumn fruiting will save the winter plants; the latter may be grown more sturdily and cropped lightly until the fruits are required.

APRICOTS.

Finally thin the fruits of these as soon as they have finished stoning, and do not allow the trees to carry too heavy a crop. Remove all badly placed fruits, or any likely to be damaged by the wire or nails, and untie the shoots where necessary. Syringe the trees every afternoon, and give them a good soaking of water when thinned, afterwards mulching them with horse manure according to the vigour of the trees. Peaches and Nectarines must be finally thinned, leaving the fruits evenly distributed over the whole tree; remove a few leaves or push them back to fully expose the fruits to the sun.

CORRESPONDENCE.

(The Editor is not responsible for the opinions expressed by correspondents.)

DECADENCE OF PINE-APPLE CULTURE.

[TO THE EDITOR OF "THE GARDEN."]

SIR,—Having charge of one of the comparatively few private British gardens in which the Pine-apple is still cultivated. "H. A. P.'s" note upon this subject was of interest to me. I fully agree with your correspondent that it is a pity that the culture of this fruit has so greatly gone out of practice, and can confirm his remarks about the flavour of foreign-grown fruits as compared with those ripened in British gardens. This is undoubtedly owing to the fact of imported fruit being necessarily gathered before perfectly ripe, for it is said that those left to ripen upon the plants are of excellent quality. The smooth-leaved Cayenne is, I believe, the principal if not the only variety grown abroad for exportation, owing probably to its excellent keeping and travelling properties, and this variety, even when grown to a high degree of perfection in our hot houses, cannot be said to compare favourably in point of flavour to a good Queen, especially when the latter is matured during the summer. The Cayenne is a most desirable winter fruiter, and together with Charlotte Rothschild more easily affords a successional supply than the Queen variety.

There exist many wrong opinions respecting the culture of the Pine-apple, one of these being that it is excessively expensive to produce as compared with other fruits. The following particulars will perhaps help to dispel this error. During the present time (June, 1904) we are cutting fairly good Queen Pine-apples from a small house, cut from plants raised from suckers inserted in December, 1902. Thus ripe fruits are being cut from plants seventeen to eighteen months old, and as the plants are arranged slightly less than 2 feet apart a considerable weight of fruit is produced in a comparatively limited space. Houses for Pine culture need not be of large dimensions, and provided the pathways are sunken, so that the beds in which the Pine plants are plunged or planted, are on a level with the surrounding ground, it does not take more than an ordinary amount of artificial heat to maintain a proper degree of warmth. As

an addition to the dessert the Pine-apple is invaluable, a large table arranged in the usual elaborate way is not complete without this noble fruit. T. COOMER.

Hendre Gardens, Monmouth.

THE PEAR GNAT MIDGE.

[TO THE EDITOR OF "THE GARDEN."]

SIR,—This has made its appearance in quantity, and I am afraid it will ruin the prospects of a splendid crop of fruit. For the benefit of those who have not had experience of this destructive insect, I should like to give a short description of the appearance of the Pears which are affected. My suspicions were first raised by noticing so many badly formed fruits, many of these were contracted, and in other cases had large swellings or excrescences. Upon cutting them open I found a number of small brownish grubs or maggots. A few days later I noticed that many of the Pears had the appearance of being scorched on one side and that many had fallen. I at once referred to Miss Ormerod's handbook of insects, and there I found an illustration of the insect and affected fruit. It is stated that the winged insect pierces holes into the flower buds before it opens, and lays ten or twelve eggs, the eggs are very quickly hatched in warm weather, and the grubs begin to eat their way into the fruit, on which they feed until the latter is completely destroyed and falls. At the rate the fruit is falling here, not one will be left in a few days' time. I am having these collected and placed in the fire as fast as they fall. It will be noticed that syringing is of very little use, as the mischief is already done; neither do I think anything could have been done earlier in the season by syringing. Had I have known that this insect existed in these gardens, and the little history I have gathered from Miss Ormerod's manual, I would have moved all the soil from beneath the trees during the autumn and winter, for this seems the only thing to do. When the fruit falls to the ground the insects crawl out and enter the soil and form a cocoon, from which they emerge early in the spring and begin their work of destruction. As this insect has the power of flying considerable distances every gardener should endeavour to destroy as many as possible. A dressing of kainit or muriate of potash is recommended as being destructive to this insect in the cocoon stage.

Cirencester.

T. A.

THE PERNICIOUS SPARROW.

[TO THE EDITOR OF "THE GARDEN."]

SIR,—During the past spring I have noted in the pages of THE GARDEN the customary complaints of the mischief wrought by the house-sparrow, but have regretted to remark that many of the writers appeared almost apologetic in their condemnation. It cannot be too widely recognised that the house-sparrow is a pest, and that the interests of all connected with the land, be they farmers, gardeners, or labourers, lie in the direction of its extermination. Many there are, doubtless, who think that though the sparrow does harm in one direction, he does good in another. To those I would recommend the perusal of a little book, entitled "The House-Sparrow," by Mr. W. B. Tegetmeier and the late Miss Eleanor Ormerod, published in London five years ago by Vinton and Co. At the time of its publication it was exhaustively and appreciatively reviewed in these columns. The authors, who have earned the respect and confidence of the zoological and agricultural worlds, lay before their readers the result of an exhaustive enquiry into the harm done by the sparrow, from evidence collected from all parts of the United Kingdom and abroad. We learn that the amount of grain consumed annually by sparrows in the British Isles "may be estimated, without fear of exaggeration, at from one to two millions sterling in value." A case is quoted where, in a locality that formerly abounded in cornfields, Wheat culture has been entirely given up on account of the increase of sparrows. Many instances are given of the damage done to gardens by this bird. The Rev. W. Wilks, hon. sec. of the Royal Horticultural Society, states that in January, 1898, "the

sparrows cleared off all the bloom buds on the Gooseberries at the society's garden, and attacked the Plums in February," and adds, "our superintendent despairs of any crop at all." Numerous cases are mentioned of the wholesale destruction by the sparrow of Crocuses, Primroses, Polyanthus, Violets, Lobelias, Lettuces, Green Peas, and Red Currant and other fruit buds.

One of the greatest evils of the sparrow infestation, but an evil likely to be overlooked by the non-observant, is the driving away of insect-eating birds. The adult sparrow is not an insect-eater, one of many proofs of this fact being that at Washington, U.S.A., at a time when the city trees were seriously infested by four species of insects, only two insects were found in the crops of 300 sparrows killed for dissection. I know villages which the martins have now entirely deserted owing to the sparrows appropriating their nests year after year. Last year I found sparrows tearing the top off a wren's nest, the broken eggs being on the ground below. This year a spotted flycatcher's nest has been appropriated by these birds and used as a platform for straw. The substitution of one bird for another may appear a matter of small moment to many, but the birds driven away spend every hour from dawn till twilight in the capture of insects in our gardens and around our dwellings, whereas the sparrow is useless as an insect-destroyer. He will eat Gooseberry buds but not the Gooseberry caterpillar. The following is a summary of a table drawn up after the contents of the stomachs of 694 sparrows were examined.

"About 75 per cent. of an adult sparrow's food during its life is corn of some kind. The remaining 25 per. cent may be divided as follows: Seeds of weeds, 10 per cent.; Green Peas, 4 per cent.; beetles, 3 per cent.; caterpillars, 2 per cent.; insects which fly, 1 per cent.; other things, 5 per cent. In young sparrows not more than 40 per cent. is corn, while about 40 per cent. consists of caterpillars, and 10 per cent of small beetles."

In the preface of "The House-Sparrow" Mr. Tegetmeier writes: "It is a remarkable fact that there is not one eminent, practical ornithologist of the present day in England or elsewhere who advocates the protection of the sparrow." The late Lord Lilford, *facile princeps* in ornithology, who at one time took a lenient view of the sparrow's delinquencies, in later years entirely changed his opinion and wrote: "I consider that every bird-catcher who confines his operations strictly to the taking of sparrows is a benefactor, and should be subsidised by the parish authorities." The book to which I have drawn attention can scarcely fail to carry conviction to any reader's mind, and to render him an advocate of a determined and sustained attempt to abate the sparrow plague.

S. W. FITZHERBERT.

THE FRUIT GARDEN.

NEW STRAWBERRIES.

AT the last meeting of the Royal Horticultural Society the fruit committee gave awards of merit to two new Strawberries—Laxton's Reward and The Alake, shown by Messrs. Laxton Brothers, Bedford, and James Veitch and Sons, Limited, Chelsea. Both are large, handsome varieties, and are evidently of

good flavour also, otherwise it is safe to assume they would not have been recognised by the committee. Laxton's Reward could hardly have a better parentage—Royal Sovereign and British Queen, the former, perhaps, the best all round Strawberry we have, and the latter generally recognised as the best flavoured. The new fruit is cock's comb shape and crimson-scarlet in colour. The flavour reminds one a good deal of that of Royal Sovereign, but it is modified and improved in this respect by British Queen. If Laxton's Reward proves as vigorous and free bearing a Strawberry as Royal Sovereign it ought, with its superior flavour, even to supplant the latter, which is, without doubt, grown more than any other variety, both in private and market gardens. Messrs. Veitch's new Strawberry, with its up-to-date name The Alake, is the result of a cross between two varieties of excellent flavour, Frogmore Late Pine and Veitch's Perfection, one of the parents of the latter being, if I remember rightly, Waterloo.

The fruits are deeply ribbed, and some are very large; the colour is dark scarlet. I have not tasted it, but with two varieties of such

NEW STRAWBERRY LAXTON'S REWARD. (Natural size.)

(Shown by Messrs. Laxton Brothers, Bedford, before the Royal Horticultural Society on June 28, and given an award of merit.)

delicious flavour for its parents, this new comer can hardly fail to be rich and sweet. Messrs. Veitch showed a number of fruiting sprays, which would seem to indicate that fruits are produced very freely.

There have not been many new Strawberries shown before the Royal Horticultural Society during the last three or four years that have either received first-class certificates or awards of merit. Perhaps it is that many of the old sorts are so good and gardeners find them so satisfactory that they disregard new introductions, and thus the latter fail to find a market, and few raisers take much trouble in the matter. As a matter of fact practically all the new Strawberries recognised by the fruit committee of the Royal Horticultural Society during the last few years have been shown by Messrs. James Veitch and Laxton Brothers. It may be of interest briefly to mention those new Strawberries which have thus been honoured since 1903.

The first on the list is Trafalgar (Laxton), the result of a cross between Latest of All and Frogmore Late Pine. It is of very good flavour and free growth. At the time (June,

1900) of its first public appearance it was thus reported upon: "Will become a standard variety on account of its free growth and splendid flavour." Next is The Laxton (Laxton), which received a first-class certificate in June, 1901. Its parents were Royal Sovereign and Sir Joseph Paxton. Everyone still speaks highly of this Strawberry, both for its heavy cropping and its good flavour. It is also recommended as good for forcing. One grower wrote of it: "I have never seen a heavier cropper, and it will certainly become a great market variety." Givon's Late Prolific (raised and exhibited by Mr. William Peters, gardener to Mr. H. P. Sturgis, Givon's Gardens, Leatherhead), was given an award of merit in July, 1902. This is a large, handsome late fruit, almost oblong in shape, of deep scarlet colour, the result of a cross between Waterloo and Latest of All. The Khedive (Veitch) received an award of merit in July, 1902. Two varieties of proved excellence were its parents—British Queen and Lord Suffield. It is under medium size, long, deep red, and of first-class flavour. It was recommended as very good for preserving. Last on the list is The Roydon, a variety that received an award of merit on September 29, 1903, a very late date for a Strawberry to be at its best. The parentage was not stated. The fruit is large and of deep crimson colouring, with probably Waterloo as one of its parents.

It would be very interesting to hear from those who have tried all these new varieties, and to know if they have come up to the expectations formed of them. Sometimes a new fruit proves of no value, and in that case it often falls out of cultivation, but it also happens that a good new fruit does not become widely known; there are many gardeners who never hear of it. That may be the case with some of the Strawberries I have mentioned, so that if correspondents having tried them would send their experience it could hardly fail to be of interest.

I have often wondered why such an excellent Strawberry as Countess has not played a greater part in the production of new varieties. It is of delicious flavour, attractive appearance both in colour and form, and I have always found it to grow well. Dr. Hogg is another splendid sort that has not been largely

used by the hybridist, although I notice that in some of Messrs. Laxton's new varieties this is one of the parents. H. P. A.

ORCHIDS.

CATTLEYA MENDELII PINK PEARL.

CATTLEYA MENDELII is one of the most beautiful summer flowering species, but owing to the comparative scarcity in its native home new and distinct varieties have been by no means common during the last few years. Under the above name, however, Mr. Bradshaw, of The Grange, Southgate, has a form which is certainly worthy of a premier position, by reason both of its beauty and unusual colouring. The plant has flowered this season for the first time, and not being very strong the flowers, though ideal in contour, can hardly have reached their maximum size. The sepals and petals are well proportioned, firm in substance, and pitched well forward; soft, glistening white, overlaid with the merest tinge of rose, excepting on the midribs of the petals, which toward the bases are quite white. The lip has, for a Cattleya, a most extraordinary colour, the whole of the front lobe, including the heavily frilled border, being a rich crushed strawberry tint. On either side at the entrance to the throat are two bright, ochre yellow suffused areas, passing into pure white as they meet the frilled border, while extending from beneath the column, and merging into the coloured portion of the lip, are radiating, interrupted lines of a reddish hue. On the external surface the tube is quite white, save where the yellow areas show through. With the above Cattleya was a splendid form of Lælio-Cattleya C. G. Rœbling, the hybrid derived from Lælia purpurata alba and Cattleya gaskelliana var. The plant in The Grange collection is part of the original which flowered first with Messrs. Sander and Sons, of St. Albans. Although several plants have since flowered, the first is supposed to be the finest variety, and certainly, judging by the flowers under description, it would indeed be difficult to surpass. In general shape the flowers are not unlike those of a fine Cattleya gaskelliana, but much larger, the lip more elongated; and the Lælia parent is evident in the "set" of the sepals and petals, which appear white at a distance, but in reality are of a light blush lilac shade, the petals beautifully waved and undulated on their edges. The broad, expanded lip is not only remarkable for its size, but is most conspicuous from

the extreme brilliancy of colouring. The front lobe is of a vivid crimson-purple, heightened by magenta, the colour terminating in an irregular line at the entrance to the throat, where it is met by clear golden yellow, which occupies the greater part of the surface, but passes into white on the upper edges of the tube. Beneath the column a number of branching hair-like lines radiate towards the front lobe.

The whole of the lip is bordered by a beautiful purple tinged, convolute white frill nearly a quarter of an inch wide, adding a charming finish

to the flower, which further has the delicate scent characteristic of Cattleya gaskelliana.

ARGUTUS.

WORK FOR THE WEEK.

ODONTOGLOSSUM ROSSI MAJUS.

THESE have now passed through their season of rest and new growth is starting, offering the most favourable time to renovate and give fresh material to any that need it. A good compost consists of two parts fibrous peat, two parts sphagnum, and one part leaf-soil, mixed together with some coarse sand and small crocks. Pans are generally used, but there is not sufficient depth for the roots, which are many and large considering the smallness of the plant, so that ordinary pots that have holes for suspending are the best receptacles. They should be half filled with chopped rhizomes. Pot moderately firm, and surface with sphagnum. The roof of the cool Orchid house provides suitable quarters. They will not require much water for some time—just enough to maintain the compost moist. When the growths have made progress and the new roots have entered the fresh material copious supplies will be beneficial. Spray the plants well from now until the autumn unless the days are wet and cold, and when the flowering season again comes round the effect of good culture will be apparent. *O. aspersum* and *O. Cervantesii* are two beautiful small Orchids that may now be seen to as regards potting, &c., and generally treated in the same way as the foregoing.

ODONTOGLOSSUM GRANDE, *O. INSLEAYI*, AND *O. SCHLIEPERIANUM*.

The new growth is now sufficiently forward to enable the necessary potting or resurfacing being carried out, using the same compost as for the above, and again using ordinary pots with a rhizome drainage. In repotting cut away old back bulbs, not retaining more than two behind each leading one. This is most important to their well-being; if many poor bulbs are retained rapid deterioration will soon be in evidence. If the above treatment is carried out the plants will often show signs of marked progress. I prefer a slightly warmer house than the ordinary cool house in which to cultivate them; a very suitable one is the cool intermediate, choosing the coolest part of that. Water should be carefully applied till the growths show signs of swelling at the base. From that period till full development well-rooted plants will take liberal supplies. W. P. BOUND.

Gatton Park Gardens, Reigate.

BOOKS.

La Mosaiculture Pratique.*—Whatever may be the various opinions of our readers on the subject of carpet bedding, it is a matter beyond all question that our friend M. Albert Maumené is eminently qualified to discourse upon such a subject. M. Maumené is a horticulturist, as a journalist, and as an author has a very wide experience, and the fifth edition of his book now under notice is ample proof of the high esteem in which his writings are held on the other side of the Channel. Several of his books on floriculture have been awarded high distinctions in France, *L'Art Floral à Travers les Siècles* and *L'Art du Fleuriste* being not the least important of them. In "*La Mosaiculture Pratique*" we have a bulky little manual of over 400 pages, that tells the reader almost everything he is likely to want to know concerning carpet bedding and kindred subjects. Two coloured plates and 216 figures in black and white, most of them designs and plans for every season of the year, embellish the work with a profusion not often to be found in a French gardening treatise. Many of these are accompanied by appropriate lists of plants to be used in these floral compositions. A brief survey of M. Maumené's work is all we can give in the space at our command. In all there are sixteen chapters, the principal ones

* "*La Mosaiculture Pratique*." By Albert Maumené. Librairie et Imprimerie Horticoles, 84, bis rue de Grenelle, Paris.

NEW STRAWBERRY THE ALAKE. (Natural size.)

(Shown by Messrs. James Veitch and Son, Limited, on June 28, and given an award of merit by the Royal Horticultural Society.)

being on the history of carpet bedding, æsthetic considerations, application of carpet bedding for winter, spring, summer, and autumn, various kinds of mosaiculture, colours, designs, propagation, carpet bedding abroad, &c. The ground over which the author travels is considerable, and he apparently leaves but little further to say on the subject. Although tastes differ in this phase of gardening more perhaps than in any other, yet when we remember that the author is a Frenchman we are not surprised to find many of the designs much more attractive than some of those employed by American gardeners in the parks and public gardens in the States. Anyone, knowing French or not, who has to execute work of this description might easily find in M. Maumené's treatise something in the way of a hint, to be acted upon either in its entirety or subject to slight modification, according to the exigencies of the case or individual taste. The book is neatly printed in clear type, is stitched in parchment paper wrappers, and generally got up in good style. The price at which it is published, viz., 3 francs, will inevitably ensure it a large sale.

Manuel du Champignoniste, professionnel et amateur.*—We wonder sometimes what the French cuisine would be like if there were no Mushrooms. Both here and in France books on this tasty esculent are numerous, but the one recently published by M. Cauchois claims to be somewhat more comprehensive in its scope than any of its predecessors. In style and get up generally the book is uniform, with most of the recent gardeniog works published by the Librairie Horticole. It contains about 200 pages, and has thirty-two illustrations in black and white explanatory of the text. The author qualified, both from practical and theoretical points of view, as an eminent Mushroom cultivator, gives his readers very ample instructions in the art of producing Mushrooms in a variety of ways. In the course of twenty-four chapters everything connected with the subject seems to be dealt with, botanical, historical, and cultural; diseases, animal and insect pests, remedies, underground culture, a lengthy chapter on the manures to be used, the making of the beds, &c., are points that are all dealt with *in extenso*. Gathering the crop and placing the same on the market for sale follow in proper sequence, and then recipes for the preserving of Mushrooms are among many other items of information supplied. An excellent index is supplied, and the book will no doubt be useful to those of our Continental friends and colleagues who are interested in the art of raising edible fungi of the Mushroom family.

THE EDITOR'S TABLE.

WE invite our readers to send us anything of special beauty and interest for our table, as by this means many rare and interesting plants become more widely known. We hope, too, that a short cultural note will accompany the flower, so as to make a notice of it more instructive to those who may wish to grow it. We welcome anything from the garden, whether fruit, tree, shrub, Orchid, or hardy flower, and they should be addressed to The Editor, 3, Southampton Street, Strand, London.

AN INTERESTING COLLECTION OF FLOWERS.

From Grayswood Hill, Haslemere, Mr. B. E. C. Chambers writes: "I am sending you per this post a miscellaneous collection of flowers now in bloom here in the open for your table, viz.: *Cornus brachypoda*, tree 20 feet high; *Athrotaxis doniana* (fruit); *Buddleia Colvillei*, shrub 12 feet high; *Spiræa bracteata*; *Cornus Kousa*, shrub well covered with its white bracts—a better doer than *Cornus*

florida, which has produced very few bracts this year; *Viburnum tomentosum* var. *plicatum*; *Coriaria japonica* (berries); *Magnolia Watsoni*, planted in 1894, and which has flowered every year since 1896, *not* against a wall; *Azalea indica* variety, from Yokohama, a most profuse bloomer, and quite dwarf; *Kalmia angustifolia* var. *rubra*; *Chionanthus retusus*, the Chinese Fringe Tree; *Iris Douglasi*, likes sun; *Phlomis fruticosa*, makes a large bush; *Zygadenus muscatolicum*, said to poison flies, and wish it would do so. I hope the specimens will reach you in good condition, though some of the flowers have been cut some days."

[A most interesting collection of flowers, comprising several that are but little grown. The *Viburnum* was very fine.—Ed.]

NEW PINKS FROM MESSRS. B. LADHAMS.

Messrs. B. Ladhams send from their nurseries, Shirley, Southampton, a boxful of their beautiful perpetual flowering Pinks, all of which are of their new race. The great feature of these novelties is that they flower more or less continuously, blooming even into October, and the plants are for the most part sturdier than the older Pinks. The range of colouring is more extended, and the fragrance stronger. There are self, rose-pink, white with purple lacing, fringed and otherwise, pure whites, rose, and many other shades; a very charming set, and we hope Messrs. Ladhams will continue their interesting work of extending the season of one of the most welcome of summer flowers.

THE LAXTON STRAWBERRY.

Messrs. Laxton Brothers, Bedford, send fruits of The Laxton Strawberry, the first fruits of which were gathered outdoors on the 14th ult. The fruits are of delicious quality, a fresh piquant flavour suggestive of British Queen, rich in colour, and very firm. The fruits sent to us were gathered from plants put in during November. We have nothing but praise for so fine a fruit in appearance and in flavour.

THREE GOOD HONEYSUCKLES.

Mr. T. Smith sends from Newry "three good North American Honeysuckles." They are *L. pubescens* (hirsuta), with rosy purple buds and light yellow flowers, *L. Sullivani* with pale yellow flowers, and *L. glauca*, orange-brown.

SOME OLD-FASHIONED FLOWERS.

Miss Hopkins, Mere, Knutsford, Cheshire, writes: "I send you a few old-fashioned flowers for your table. I think the double white Rocket and the *Lychnis viscaria splendens* fl.-pl. very useful to grow, and especially for cut flowers. We are almost dried up here, being on a light sandy soil." Miss Hopkins also sent flowers of *Lilium monadelphum szovitziaum* and an old unnamed Irish Rose.

ROSE COMTE BOBRINSKY.

Mr. Field, Ashwellthorpe Gardens, near Norwich, sends flowers of this old-fashioned but beautiful Rose with the following note: "One but seldom meets with it now in gardens, and nurserymen do not catalogue it. I find it mentioned but once in 'Rivers's Rose Amateurs' Guide,' published in 1866, and there it is classed among the decorative climbing Roses. In shape the flower is not quite equal to some of our best Roses, but the colour is exquisite. With me it does best on its own roots, is perfectly hardy, and blooms from June until the end of August. All who love Roses should have at least one plant of the fine old garden variety Comte Bobrinsky."

[A dark crimson fragrant Rose. Not a sort to lose sight of.—Ed.]

AZALEA OCCIDENTALIS.

This beautiful Californian Azalea seems to be still so little known that I send a few flowers in order to remind readers of THE GARDEN of its

existence. Every garden that has a light or peaty soil grows the hardy Ghent Azaleas, but the beautiful *occidentalis* seems always to be forgotten. It flowers three weeks later than the others, and is accompanied by its fresh green polished leaves. The white flowers, often handsomely blotched with pale yellow, vary a good deal in size, as you will see by the blooms enclosed. The scent is even sweeter and more powerful than that of the earlier Azaleas.—G. J.

HOSE-IN-HOSE *MIMULUS LUTEUS*.

Mr. R. Dean of Hounslow sends flowers of his brightly coloured Hose-in-hose form of *Mimulus luteus* Golden Queen. Such a *Mimulus* as this is worth planting in cool not over-dry spots in the garden for the sake of brightness and freedom. Mr. Dean sends the following note: "I am sending you a few flowers of my *Mimulus luteus* Hose-in-hose Golden Queen. It is quite hardy, wonderfully floriferous, the plants being of vigorous growth, and as it does not produce seeds it flowers until quite late in the year. I have a large bed of it in my Primrose nursery at Hounslow, which is a mass of brilliant yellow. Hose-in-hose forms sometimes appear among our ordinary strains of *Mimulus*, but they are not quite infertile, though they produce very few seed grains. All my efforts to induce Golden Queen to produce seeds have failed."

FLOWERS FROM WINCHMORE HILL.

Mr. Amos Perry writes: "I have much pleasure in sending you a few flowers of my new *Phlox canadensis*, Perry's variety. I consider it one of the greatest acquisitions we have had in hardy plants for many years. It has been in full flower in the open since May 14, and will be in flower for at least another month. It has a far more vigorous constitution and the flower is a better colour than the old variety. It grows fully 18 inches high, and the flowers are on stiff wiry stems. Some of the heads have been 8 inches and 10 inches through. *Gypsophila repens monstrosa* is another fine hardy plant, and when better known will be grown by everyone. It has been in flower now fully three weeks. It makes a pretty dense bush, literally covered with flowers, and for table decoration is invaluable. *Heuchera rosea*, I contend, is one of the finest of the whole of the *Heucheras*. It is remarkably free flowering, and flowers at least six weeks longer than any other variety I know. It is one of my seedlings raised here about six years ago, and every year it is one of the features of my nursery."

[Three very beautiful garden flowers.—Ed.]

NURSERY GARDENS.

STRAWBERRIES AT BEDFORD.

MESSRS. LAXTON BROTHERS, The Nurseries, Bedford, have now a reputation second to none other as raisers of Strawberries. Probably no variety put into commerce since Sir Joseph Paxton was sent out has helped to that reputation so greatly as Royal Sovereign, practically the Strawberry of the day. But there are many others of the firm's raising that are widely grown, such as Fillbasket, Latest of All, Monarch, Leader, Trafalgar, Climax, and, not least, the recently introduced The Laxton, a variety of exceptionally high quality, and this list might be largely added to. The members of the firm in devoting themselves to the Strawberry in this way have great faith in the possibilities of this fruit, and think that there is still great room for improvement, as also for its production over a much longer season. That progress is slow is certain, but such slowness may be regarded as indicative of permanent improvement. During the twelve years Messrs. Laxton have been established at Bedford they have made no less than 900 separate Strawberry crosses. Naturally to test all these some three or four years, to make from them

* "Manuel du Champignoniste, Professionnel et Amateur." By A. Cauchois. Paris: Librairie Horticole, 84, bis rue de Grenelle.

their final selections and to put those selections into commerce, has been a great undertaking. But while the favoured selections have been very few—hardly one per thousand—the rejections have been many. Hence it is evident that the raising of new varieties of Strawberries opens up no very promising field of enterprise in a pecuniary sense.

There were many acres of Strawberries fruiting when a party of critics was invited to inspect them on the 1st inst. They found the Bedford soil stiff and dry, yet the plants were carrying grand crops of superb fruit. Naturally attention was chiefly devoted to seedlings, of which there were several hundreds on trial, and so good were all that the work of selecting the best was most difficult. Those most in favour were Bedford Champion, a huge cropper, fruits fine, round, perfectly coloured, deep scarlet, flesh firm, succulent, and pleasantly flavoured; should make a popular market variety. This variety has for its grandparents Noble, Sir Joseph Paxton, Scarlet Queen, and John Ruskin, a couple of selected seedlings being the immediate parents. A variety of great excellence which received an award of merit unanimously at the Drill Hall on the 28th ult. is the product of crossing Royal Sovereign and British Queen. The fruits are richly flavoured, somewhat pointed in form, of a deep red colour, and abundantly produced in midseason. The Bedford is another named seedling soon to be sent out. It has robust protective leafage, as, indeed, have all the selected varieties, is a great cropper, and has firm, handsome, conical fruits of high quality. The parents were Sir Charles Napier and Latest of All. Another most interesting variety is named Laxton's Latest. This seems to be without exception the latest ripening of all summer Strawberries: it should be of great value on retentive soils in helping to prolong the fruiting season. The parents were Latest of All and a late seedling. Not a fruit was ripe when then seen, but it is evidently a great cropper and very robust. Climax, from Waterloo and Latest of All, has just been put into commerce, and is a fine flavoured and delicious variety. The Laxton had done well, but was nearly over.

Messrs. Laxton by no means limit themselves to varieties of their own raising; they use every known good one as parents, and have even utilised alpine, Hautbois, perennials, and even the original Chilian and other species. But they hold that this starting afresh from original forms is but travelling over long-trodden ground, and that it is best to keep on working with the best forms of to-day. So irrepressible is the hybridising faith that crosses have been effected with marked success between Raspberries and the Loganberry, among Gooseberries, Currants, &c., and even the Plum and Apricot have been crossed, as products showed. After seeing the Strawberries the party were driven to Old Warden Park, Biggleswade, the singularly beautiful residence of Colonel Shuttleworth. Mr. Modrae, the gardener, acted the host for his employer with the utmost liberality.

MISCELLANEOUS.

ROUND THE BROOME GARDEN.

BATH has had a lovely spring, and gardens are earlier than their wont. In the Botanical Garden there are some good new things, and the work of extending the rockwork always goes steadily on; but there seem small traces of deterioration here and there, due, no doubt, to the incessant rain of last season, which must have impoverished the soil on all raised beds or banks. A little planting of *Erinus alpinus*, both in the purple and white forms, for example, is neither so good in growth nor blossom as it might be, and other of the small alpine, as *Geranium argenteum*, look a trifle starved. The *Ramondia pyrenaica* is flowering poorly, and so is the lovely *Cistus florentinus*, while the glorious bush of *Choisya ternata*, that was quite a feature on one bank, seems to have been cut down to half size.

To make up for these criticisms unstinted praise must be given to the Japanese Maples, which personal experience leads me to say are not easy to grow on Bath soil; but here they are magnificent, especially the bright red ones. So are the various *Viburnums*, all thrifty bushes of ample yet handy size, absolutely massed with blossom, whether grown on the border banks or on the turf. *Viburnum tomentosum*, with its thickly grouped flowers, like small white rounded *Hydrangea* heads, and *V. rugosum*, are two that no one seeing them here could fail to admire. *Raphiolepis japonica*, a smallish, neat, rounded shrub, with flowers resembling *Choisya ternata* and leaves red tinted on the reverse, is particularly good; and so is *Fraxinus Mariesii*, a light growing treelet about 6 feet high, with large feathery white flower panicles.

The double white Lilac Mme. Lemoine is in grand flower, almost hiding its leaves. This is a lovely thing for a grassy bank, or the lawn, with its sweet, long trusses. *Deutzia parviflora*, nearly over, is pretty, but not so good as the commoner *D. gracilis*. I did not see any of the newer *Deutzias*, as *D. carminea*, which is really a very beautiful shrub, and as I lately saw it was a perfect bouquet of large double flowers, thick along its slender twigs, and deliciously rosy flushed. It is one of those things which is usually very disappointing for the first year or two after planting, and then bursts upon one, in good bloom, as truly exquisite. *Cytisus scoparius variegatus* is flowering splendidly and is a fine bush, but to some tastes it appears like *C. scoparius* with a leaf disease, and is therefore unattractive, like some other choice variegated plants.

Ceanothus veitchianus, trained to the iron railings of the garden, which run along the turf, looked exceedingly well, and gives an object-lesson in a very good way to make ugly things pretty. The *Ceanothus* is well suited, to judge by its vigour and the freedom of its flowering, and the railing loses all its ungainliness by being the right thing for its purpose. Clematis takes up the tale, and also looks and does thoroughly well on the railing, which is about 4 feet high. *Cytisus purpureus* is in good bloom, but I have seen a better form, with larger flowers of clearer colour. *Maianthemum convallaria* is flourishing exceedingly, and looks very pretty on the shady side; so does a showy, lanceolate-leaved, free-growing plant with abundant white flowers labelled—as a little distance, it is true, and whether or not the label is its actual property seems uncertain—*Epilobium mexicanum*.

Polygonum capitatum, with red and green tomentose leaves, low growing, and covered with small, waxy pink balls of flower, is decidedly pretty in colouring. One *Meconopsis Wallichii* suggests that someone might give the garden a packet of the seed, obtainable for 1s., from which this lovely plant is easily raised. *Meconopsis nepalensis*, also a singlet, is barking a *Ramondia*, upon which it encroaches. *Senecio alpinus*, a small, lilac *Erigeron*-like flower, is rather pretty, and so is *Primula ciliata* and *coccinea*, with flowers built like *Dodecatheon*, of a dull pink, and smooth leaves. *Caltha biflora*, so beautifully planted in a tiny mud-pond in the deep hollow of a flat stone, looks well and healthy, and twice as big as last year. The red *Sempervivum triste* on the sunny Saxifrage rockery is now a good large patch, and strikes an uncommon note, enhanced by the sharp white of *Achillea umbellata* close by. *Limnanthes Douglasii*, used as a ground plant under a round-headed *Prunus spinosa*; the low-toned leaves and flat, five-petalled, faded, scarlet flowers of *Papaver piosum*; and some *Mimulus cardinalis* at the foot of a big grey rock, fronted by *Erica herbacea* out of flower, were all good bits of colour effect. *Ranunculus aconitifolius*, which is weedy and over-stalked ordinarily, was well banked up on a rockery with *Iberis* in flower, and looked pretty thus. By the bog garden one good *Eremurus* spike tells well, making one wish it twenty, and the uncommon *Erodium absinthoides* is interesting. It has greyish green Ferny foliage, grows closely, about 3 inches to 4 inches high, and is sparsely covered with small, pinkish flowers, not at all showy, but neat and pretty. M. L. W.

EEL WORMS.

COMPLAINTS occasionally reach me as to the destructive character of this pest in gardens, and especially in the cases of Cucumbers, Tomatoes, and Carnations; other plants are also subject to their attacks. "Eel worms belong to a group of nematoid worms (*Tylenchus*), which infest the roots and other parts of various plants, but their life histories are but imperfectly known. They are colourless, microscopically small creatures, like eels in miniature, and often do an incredible amount of harm on account of their numbers. Cucumbers, Tomatoes, and other plants are often destroyed by these worms, which penetrate their roots from the soil, causing them to develop swellings, in the cavities of which the pest lives and deposits its eggs, increasing at an alarming rate" (*Gardener's Assistant*). They do much injury to Carnations, causing the appearance of what is known as "gout," the symptoms of which are manifested by large whitish or livid patches on the leaves chiefly at or near the collar of the plant. It is generally held that the worms are derived from the soil, they force an entrance to the stems of the plants, lay their eggs, which, when hatched, produce worms which eat their way upwards, and in the case of the Carnation produce the livid patches referred to.

The difficulty lies in finding a remedy. It is said that the worms in the soil can be readily destroyed by the application of some caustic material, but nothing, it is feared, can be applied to the affected parts of the plants without killing them outright. Burning the plants is generally recommended as the only means for the extirpation of the nematoids and the removal of the soil in which the plants are growing. As soon as there are evidences of the presence of the worms in the plants burning should be at once resorted to.

R. D.

ONOSMA TAURICUM.

THIS is an effective rock plant when in good health and flowering freely, but often proves difficult to grow satisfactorily. Still, at times it may be seen in the best of health under conditions that would appear to be unfavourable to its well-being. A few years ago I saw a number of plants growing in a perfectly flat bed in heavy loam inclining to clay in a Devon nursery. These plants were flowering profusely and were the picture of health, but one would never think of treating the *Onosma* in this way in one's own garden. A plant that I have is growing in road-grit in an elevated position overhanging a rock, but last year did not produce a single flower-spike, and I feared that it would not outlive the winter. This year, however, it has taken a new lease of life and is throwing up over sixty flowering growths, the earliest of which have already expanded some of their blossoms. S. W. F.

OBITUARY.

MR. ALEXANDER SCLATER.

MR. ALEXANDER SCLATER, who died on the 23rd ult. at the comparatively early age of forty-eight, was a well-known man in Edinburgh horticultural circles. Serving his apprenticeship with Messrs. Thomas Methven and Sons of Edinburgh, Mr. Sclater afterwards was for some time with the firm of Messrs. R. B. Laird and Sons, but re-entered the employment of Messrs. Methven to occupy the position of principal shopman in their Princes Street establishment. He managed their seed department for twenty-eight years, and his services were held in the highest estimation by his employers and their many customers of all classes. As a member of the council and as a vice-president of the Scottish Horticultural Association he did good service to gardening, and in all the spheres he took an interest in he was a general favourite. Mr. Sclater had been suffering from illness for some time, but it was only within the last three months or so that it became acute. His funeral, which was largely attended, took place at the Grange Cemetery, Edinburgh, on the 25th ult.

THE TEMPLE ROSE SHOW.

THE ANNUAL EXHIBITION OF THE NATIONAL ROSE SOCIETY.

THE twenty-eighth annual exhibition of the National Rose Society was an unqualified success. At the moment of going to press we are unable to say whether the society gains in wealth—we hope so; but at least it has shown that when summer behaves itself, and the year is a Rose year, there is nothing pleasanter in July than a morning ramble through the big tents in the Temple Gardens when the National Rose Society is holding high festival. A pathetic interest attaches to the show this year—the President, the very Rev. the Dean of Rochester, full of years and honour in the world of flowers, lies on a bed of sickness. Many expressions of sympathy with the aged pioneer of this society were heard in the crowded tents, and, of course, we hope that once again this keenest of rosarians and most enlightened of men may see the brilliant display of flowers in the leafy and historic Temple Gardens.

The show of 1904 will be remembered as one of the finest on record. It was refreshing after the miserable display of last year, for which the season was responsible, but even in this year of grace the southern growers complained sadly that the sunshine of June had forced their Roses along with a pace so rapid that there was no holding in before July 6, and the northern growers scored. Messrs. Harkness won the champion trophy and the great contest for first place in the class for seventy-two distinct varieties, with Messrs. B. R. Cant, the Old Rose Nurseries, Colchester, second. These classes are on conventional lines. They are reminiscent of Rose shows many years ago, but, fortunately, the National Society's devotion to the queen of flowers is not conservative. It has proper reverence for the show bloom as such, but wisely recognises that those who delight in gardens of Roses want something beyond this—Roses to garland pillars and pergolas, and that will bring colour and fragrance wherever they are placed. It is pleasant to chronicle a class for arches of Roses to show the beauty of the more modern varieties for this purpose, and the bunches of old-time Roses, the flowers for which our forbears were grateful, recall the great advance that has taken place in recent years in raising Roses that bring a fresh joy to the English border and woodland. We were pleased to see the Moss Rose well shown, and that throughout the exhibition there was a desire to preserve these favourites of the past by encouraging their presence in the

present exhibition. Rose macrantha was everywhere, a pure delight in soft rose and white, and the Sweet Briars, the Penzance and others brought to mind the great work that has been accomplished by those who do not call themselves professionals. A few blacking bottles reminded one of the shows fifteen years ago, when these were the popular receptacles for Daffodils and other spring flowers. We hope the secretary will prevent a Rose being exhibited except in a decent bowl or vase.

The dinner-table decorations were charming, and the awards justly given. The first prize was won by Mrs. J. B. Langton of Hendon, with a very simple arrangement of soft pink flowers, and Miss O. G. Orpen second, with white and rose colours. Beautiful flowers of the Killarney Rose were staged by Mrs. H. E. Molyneux in the vase class, and gained first award, the competitors numbering thirteen.

The gold medal Rose of the year was the beautiful Hybrid Tea Dean Hole from Messrs. Alexander Dickson of Newtownards. We wish the president, after whom it is named, could have seen a Rose so tender in colour and noble in form; it was a happy thought to name a Rose in honour of one to whom the society owes so much. The other gold medal was given to Mr. Orpen, one of the most enthusiastic of amateur rosarians, and the variety was named Mrs. O. G. Orpen, a single flower of delicate colouring, a variety we think will be welcomed in English gardens.

The garden Roses from Mr. Alfred Tate, Downside, Leatherhead, for arrangement and individual beauty were worthy of more than passing notice.

The honorary secretary, Mr. E. Mawley, will look back upon the Rose show of 1904 as one of the brightest and greatest in the history of the society. And how much of the result is due to him only those know who are acquainted with his quiet and persistent work. A secretaryship, even if it is distinguished by the prefix honorary, is no sinecure. There must be a personal influence behind, and all we hope is that the society is enriched by the crowds that seemed to fill the tents throughout the day.

The heat was overpowering, but the tents were well ventilated, and although we have yet to discover the secret of instilling life into flowers for more than a few hours when the sun is in summer mood, we dread to think of the consequences of a two-day show, unless on the second day the flowers are renewed.

It is worthy of record that Mr. Mawley was assisted by the officials of the Royal Horticultural Society. It is pleasant to know that a strong bond of friendship exists between the R.H.S. and N.R.S., a friendly meeting together once a year in the Temple Gardens, and in the autumn in the new hall in Vincent Square. We look forward to the autumn show with keen interest. It will be a display of colour. Flowers paling under the hot suns of July will then show their freshest and truest beauty, and we speak especially of the Teas and Hybrid Teas.

The National Rose Society does something more than merely hold a show once a year. Its publications are invaluable, and the newest work will be, perhaps, the most appreciated—a work on pruning Roses for exhibition, garden decoration, pillars and pergolas. It will be issued in November next free to members. The National Rose Society imposes no financial burdens on its members. Membership brings full value for the money, and as we know the honorary secretary is desirous of still further increasing the list of subscribers, we may mention that his address is Rosebank, Great Berkhamstead.

Attached to the schedule for the show are many interesting particulars about the history of the society from the Rev. H. D'Ombrain, V.M.H., who founded the society in 1876, and was for twenty-five years an honorary secretary. In it occur the following words:

"It was on a murky December day in 1876 that the most representative gathering of rosarians ever held in this country met together in the rooms of the Horticultural Club on the Adelphi Terrace to consider what could be done to advance the interests of the Rose, for in truth the queen of flowers had fallen on evil days. Two days' shows were the rule rather than the exception; there was no real classifications of exhibitors, or, indeed, of exhibits. The French plan seemed to have come into vogue, namely, that of classes for a large number of flowers without much reference to their character. Summer Roses were largely in evidence in exhibition stands, and quantity, not quality, appeared to be the object aimed at by societies. It was a bold and daring step then that I took in venturing to invite all lovers of the Rose to meet together to consider the situation. I was not a Rose exhibitor myself, and could not therefore speak from my own experience, but I had always liked during my life being an organiser. I had founded the Dublin Natural History Society, one of whose prominent members was the late Archbishop Whateley, and I was one of the originators of the Horticultural Improvement Society of Ireland; but I knew that if the

plan that I had now in hand succeeded it would involve a greater expenditure of labour than anything that I had previously attempted, and now that I had no longer a populous town parish in which to carry on my ministerial work, but a quiet, retired, rural one in a beautiful part of Kent, I felt I might devote some of my spare time to the society I contemplated founding. But it was with no little anxiety that I watched the door of the place of meeting to see who might come in. As one after another of our most representative Rose growers of that day, both professional and amateur, entered the room things looked brighter, and when Canon Hole came in most of those present felt the day was won. It was truly a representative gathering. Amongst those present on that occasion were Canon Hole (now Dean of Rochester), Rev. C. H. Bulmer, W. Cutbush, John Cranston, W. Robinson, G. Paul, Captain Christy, Herbert J. Adams, Horace K. Mayor, R. N. G. Baker, Rev. J. B. M. Camm, Dr. Robert Hogg, H. K. May, W. E. Ball, James McIntosh, T. Francis Rivers, Charles Noble, R. W. Tootell, Lewis A. Killick, T. J. Mann, John Mayo, B. R. Cant, Edward Mawley, George P. Hawtreys, John Laing, Charles Turner, Hubert Bensted, William Paul, J. L. Curtis, A. W. Paul, the Hon. and Rev. J. T. Boscawen, R. B. Cater, W. Scott, Maurice Young, J. W. Parker, George Prince, and Francis Bell.

"As showing the extent of the society's exhibitions, it may be mentioned that the average number of Rose blooms shown at the last twelve metropolitan exhibitions (exclusive of "garden" Roses) has been 6,000, the highest number being 7,400 in 1897. At the northern exhibition the average number shown has been 3,350, the highest number being 4,300 at Birmingham in 1890; while at the southern shows the average, exclusive of 'garden' Roses, has been 2,400 blooms, and the greatest number 4,000 in 1896 at Reading.

"The number of members at the present time is about 1,100, and the number of affiliated societies 36. People may like to know that the only exhibitors who showed at the exhibition at St. James's Hall in 1877, and who still continue to exhibit, are A. Evans, Marston, near Oxford; Edward Mawley, Berkhamsted; Rev. J. H. Pemberton, Havering; J. T. Strange, Aldermaston; and M. Whittle of Leicester."

NURSEY MEN.

GENERAL SECTION.

Seventy-two blooms, distinct varieties (nurserymen's champion class): First, Messrs. R. Harkness and Co., Hitchin, with an exhibit that, it may be safely said, has rarely, if ever, been surpassed at the National show. All the blooms were magnificent in form and colour, and the varieties shown were seen at their best. Some of the finest were Maman Cochet, Marchioness of Londonderry, Mrs. Edward Mawley, Rev. Alan Cheales, Maréchal Niel, Comtesse de Nadaillac, Gustave Piganeau, Earl of Dufferin, Her Majesty, Mrs. John Laing, Horace Vernet, and Sir Rowland Hill. Messrs. B. Cant and Sons, Old Rose Gardens, Colchester, were second with, on the whole, smaller blooms, though colour and form were splendid. Conspicuously good were Mrs. W. J. Grant, Mrs. John Laing, Maurice Bernardin, Medea, Mrs. Edward Mawley, Marie Baumann, Dupuy Jamin, and Frau Karl Druschki. Messrs. Frank Cant and Co., Colchester, were third. In their exhibit Mrs. John Laing, Bessie Brown, Captain Hayward, Duke of Edinburgh, and Fisher Holmes were the best blooms. There was one more exhibit in this class.

Forty distinct varieties, three blooms of each: First, Messrs. A. Dickson and Sons, Newtownards, with some beautiful Roses, among which Bessie Brown, Ulster, White Maman Cochet, Mrs. W. J. Grant, Mrs. John Laing, and Frau Karl Druschki

were very fine; Messrs. Benjamin Cant and Sons, Colchester, were second. Countess of Caledon, Mildred Grant, Bridesmaid, White Maman Cochet, and Mrs. Edward Mawley were the best blooms; the third prize was taken by Messrs. Frank Cant and Co., Colchester. Their Duke of Edinburgh, Killarney, Mrs. John Laing, and Suzanne Marie Rodocanachi were very good blooms. There were no more exhibits in this class.

Forty-eight blooms, distinct varieties: First, Messrs. J. Burrell and Co., Cambridge, with flowers of good form though somewhat small. Frau Karl Druschki, Sultan of Zanzibar, Mildred Grant, Caroline Testout, Ethel Brownlow, and Bridesmaid were the best; Messrs. G. and W. Burch, Peterborough, were second with rather large, coarser blooms. Her Majesty was very good, and so were Gladys Harkness, Ulrich Brunner, and Xavier Olibo; Messrs. J. Jefferies and Son, Cirencester, were third. In their stand Innocente Pirola, Ulrich Brunner, and Kaiserin Augusta Victoria were exceptionally good. There was one more entry.

Twenty-four blooms, distinct varieties: First, Mr. George Prince, Longworth, Berks, with some lovely blooms, among which were Souvenir de Pierre Notting, Mrs. Edward Mawley, Captain Hayward, White Maman Cochet, Ulrich Brunner, and Mrs. W. J. Grant; second, Mr. Charles Turner, Slough, with Mme. Graveaux, Her Majesty, Beauty of Waltham, Prince Arthur, and A. K. Williams; third, Mr. John Mattock, New Headington, Oxford. There were five more entries.

Twenty distinct varieties, three blooms of each, in vases: First, Mr. Charles Turner, Slough, with some lovely flowers of Maman Cochet, A. K. Williams, Tom Wood, Mrs. J. Laing, Mrs. E. Mawley, and others; second, Messrs. George Cooling and Sons, Bath, with Killarney, Ulrich Brunner, Marchioness of Londonderry, and Mrs. W. J. Grant as their best; third, Mr. George Monnt, Canterbury, his best being Frau Karl Druschki and Mildred Grant. There was one more entry.

TEAS AND NOISETTES.

Twenty-four blooms, distinct: First, Mr. George Prince, Longworth, Berks, with such varieties as White Maman Cochet, Comtesse de Nadaillac, Souvenir de Pierre Notting, Maréchal Niel, Mrs. E. Mawley, Bridesmaid, and others, beautifully shown; second, Messrs. B. R. Cant and Sons, Colchester, with some fine blooms also of such as Mrs. Mawley, Maman Cochet, White Maman Cochet, Mme. Cusin, and others; third, Messrs. Frank Cant and Co., Colchester. There were no more entries.

Twelve blooms, distinct: First, Messrs. J. Burrell and Co., Cambridge, with some good flowers of Comtesse de Nadaillac, Mrs. Edward Mawley, Souv. de Pierre Notting, and others; Mr. John Mattock was a good second. He had excellent Etoile de Lyon, Medea, and Mrs. E. Mawley; Messrs. J. Jefferies and Son, Cirencester, were third. There were two more entries.

Fourteen distinct varieties, three blooms of each: First, Mr. George Prince, Oxford, with a lovely lot, Mrs. Edward Mawley, Innocente Pirola, and Maréchal Niel were among the best; Messrs. Frank Cant and Co., Colchester, were second, Mrs. E. Mawley, Mme. Hoste, and Mme. de Watteville were very good; the third prize was awarded to Mr. John Mattock. There was one more entry.

EXHIBITION ROSES IN VASES.

Twelve distinct varieties, seven blooms of each: First, Messrs. Frank Cant and Co., Colchester, with some splendid blooms. Mrs. W. J. Grant, Killarney, Mrs. E. Mawley, Gladys Harkness, and Mildred Grant were some of the best; Messrs. A. Dickson and Sons, Limited, Newtownards, were second, having fine blooms of Ulster, Florence Pemberton, Mrs. W. J. Grant, and others; third, Mr. George Mount, Canterbury, who also showed well. There were several more entries.

Nine distinct varieties of Teas and Noisettes, seven blooms of each: First, Mr. George Prince, Longworth, Berks, with beautiful Comtesse de Nadaillac, Souv. de Pierre Notting, Maman Cochet, White Maman Cochet, and Mrs. Mawley; Mr. George Mount was second, and Mr. John Mattock third. There were no more entries.

GARDEN ROSES.

Thirty-six distinct varieties, three bunches of each: Mr. John Mattock, New Headington, Oxford, won the first prize with a splendid display of Lady Buttersea, Irene Watts, J. B. Guillot, Marquess of Salisbury, W. Allen Richardson, Souv. de Catherine Guillot, Queen Mab, Mme. Ravary, Liberty, and others; Messrs. Paul and Son, Cheshunt, were second with many good bunches, though somewhat lacking colour. There were no more entries.

Eighteen distinct varieties: First, Mr. George Prince, Longworth, Berks, with lovely bunches of Mme. Abel Chateau, Crimson Rambler, Souv. de J. B. Guillot, and others. Mr. Charles Turner, Slough, was a good second, Crimson Damask and Lady Canon being very beautiful; third, Mr. George Mount, Canterbury.

Eighteen distinct summer-flowering Roses in bunches: First, Messrs. George Cooling and Sons, Bath; Una was the best, and Rosa Mundi, Queen Alexandra, Mme. d'Arblay, and Princess Marie were also good; second, Mr. Charles Turner, Slough, with excellent Crimson Rambler, Lady Sarah Wilson, Crimson Damask, and others; third, Messrs. Paul and Son, Cheshunt. There were two more entries.

Eleven distinct varieties, not less than three bunches of each: First, Mr. George Mount, Canterbury, with good Marquis of Salisbury, Liberty, Rampant, and Killarney; second, Mr. John Mattock, his Leuchtstern and Mme. Abel Chateau being good; third, Messrs. Paul and Son, Cheshunt. There were three more entries.

OPEN CLASSES.

GENERAL SECTION.

Twelve Hybrid Teas, distinct: First, Messrs. Alexander Dickson and Sons, Limited, Newtownards, with beautiful Kaiserin Augusta Victoria, Bessie Brown, Killarney, Mrs. W. J. Grant, Alice Lindell, and others; second, Messrs. B. R. Cant and Sons, Colchester; equal third, Messrs. Paul and Son, Cheshunt, and Messrs. Frank Cant and Co., Colchester. There were seven more entries.

Twelve blooms of any white or yellow Rose in a vase: First, Messrs. Frank Cant and Co., Colchester, with lovely Frau Karl Druschki; second, the King's Acre Nurseries, Limited, Hereford; third, Messrs. B. R. Cant and Sons, Colchester, both showing the same variety. There were several more entries.

Twelve blooms any Rose other than white or yellow: First, Messrs. Frank Cant and Co., Colchester, with Mildred Grant finely shown; second, Messrs. Benjamin Cant and Sons, Colchester, with Mrs. Edward Mawley; third, the King's Acre Nurseries, Limited, Hereford, with Mildred Grant. There were several more exhibits in this class.

Nine blooms any new Rose: First, Messrs. Frank Cant and Co., Colchester, with some lovely blooms of Mildred Grant; second, Messrs. Alexander Dickson and Co., Limited, Newtownards, with the same variety; third, Messrs. B. R. Cant and Sons, Colchester, who showed Frau Karl Druschki. There were five more entries.

Twelve blooms of new Roses: First, Messrs. B. R. Cant and Sons, Colchester, in whose stand were Ben Cant (very rich colour), Mildred Grant, Mamie, Florence Pemberton, Frau Karl Druschki, and others all finely represented. Messrs. Frank Cant and Co., Colchester, were second, with Commandant Felix Faure and Frau Peter Lambert as the best. Messrs. Paul and Son, Cheshunt were third, Ben Cant being their finest bloom. There were two more entries.

NEW SEEDLING ROSES.

In the class for not less than six trusses of any new seedling Rose or distinct sport, a gold medal was awarded to Mr. O. G. Orpen, West Bergholt, Colchester, for a new seedling, a climbing Damask variety named Mrs. O. G. Orpen, with large, rich rose-pink blooms, the bunch of yellow stamens adding to its beauty. A card of commendation was given to Irish Harmony, a large single cream-coloured bloom, yellow in the centre, and with good dark green foliage, from Messrs. Alexander Dickson and Sons, Newtownards. A

gold medal was given to Messrs. Dickson for a new seedling Rose Dean Hole, a lovely flower, perfectly formed, a good deal in the way of Mrs. Mawley, but lighter and more delicately tinted. A card of commendation was also given to Messrs. Dickson's new seedling Rose Lady Betty; the flowers are fawn colour, tinged with rose, which is much deeper in the centre.

Twelve vases of new seedling Roses or distinct sports: A challenge cup offered by Sir George Barham as the prize in this class was awarded to Messrs. Alexander Dickson and Sons, Newtownards. Among other new ones we mention Harry Kirk, creamy yellow with apricot-yellow centre (H.T.), and Mrs. John Bateman, rich rose-pink, the petals much recurved (H.T.) as two lovely varieties which undoubtedly have a future.

DECORATIVE CLASSES.

Arch decorated with long sprays of not more than two varieties of climbing Roses: Messrs. Paul and Son, Cheshunt, were first with a very attractive exhibit. One side of the arch was clothed with Leuchstern and the other with Wallflower, a semi-double rosy red variety, evidently very free. Mr. George Prince, Longworth, Berks, was second, he used Leuchstern and The Garland. The third prize was awarded to Mr. Charles Turner, Slough, who used Crimson Rambler and a white Polyantha.

Twelve varieties of single Roses: First, Messrs. Frank Cant and Co., Colchester. Macrantha was the best bunch in the exhibit, and Leuchstern, Lady Curzon, and Moschata alba were good also. Mr. John Mattock, New Headington, Oxford, was second with rather less striking bunches; the third prize was awarded to Messrs. Paul and Son, Cheshunt. There were two more entries.

Nine distinct varieties, suitable for buttonholes: First, Mr. John Mattock, New Headington, Oxford; second, Mr. George Prince, Longworth, Berks; third, Mr. George Mount, Canterbury. There were two more entries.

AMATEURS.

GENERAL SECTION.

Thirty-six blooms, distinct: First, winning the National Rose Society's Champion Challenge Trophy and replica, E. B. Lindsell, Esq., Hitchin, with beautiful flowers of uniform quality. Perhaps Comtesse de Nadaillac, Ulrich Brunner, Marquise Litta, White Maman Cochet, Louis van Houtte, Bridesmaid, and Frau Karl Druschki were the best; Conway Jones, Esq., Gloucester, was second. Although a good way behind the first prize stand, Frau Karl Druschki, La France, and Mrs. John Laing were very fine blooms: the third prize winner was the Rev. J. H. Pemberton, Havering-atte-Bower, who had very good Comte Rainband, Mrs. John Laing, Fisher Holmes, Duchess of Albany, and others. There were three more entries.

Twenty-four blooms, distinct (extra class): First, F. Dennison, Esq., Birmingham, with very good blooms of General Jacqueminot, Marquise Litta, Mrs. John Laing, White Maman Cochet, and others; second, Mahlin Whittle, Esq., Belgrave, Leicester, with Her Majesty very fine; third, Conway Jones, Esq., Gloucester, who showed several good blooms. There were two more entries.

Twenty-four blooms, distinct: First, E. B. Lindsell, Esq., Hitchin, with finely coloured blooms of Captain Hayward, Fisher Holmes, Alfred Colomb, Mrs. Mawley, and others; second, the Rev. J. H. Pemberton, with excellent Frau Karl Druschki, Mrs. John Laing, and Tennyson; third, O. G. Orpen, Esq., Colchester.

Twelve distinct varieties, three blooms of each: First, E. B. Lindsell, Esq., Hitchin, with splendid Frau Karl Druschki and others; second, J. Dennison, Esq., Birmingham, whose Caroline Testout and Mrs. John Laing were very good; third, Conway Jones, Esq., Gloucester.

Nine blooms of any Rose except Tea or Noisette in vase: First, E. B. Lindsell, Esq., with Alice Lindsell; second, H. V. Machin, Esq., Worksop; third, the Rev. J. H. Pemberton.

GROWERS OF LESS THAN 2,000 PLANTS.

Twenty-four blooms, distinct: First, E. M. Eversfield, Esq., Horsham, with some excellent

blooms, particularly of Kaiserin Augusta Victoria and Mrs. E. Mawley. This stand won the challenge cup offered to growers of less than 2,000 plants. Second, Alfred Slaughter, Esq., Steyning, Sussex, with very good blooms; third, R. F. Hobbs, Esq., Worcester.

Eight distinct varieties, three blooms of each: First, R. F. Hobbs, Esq., Worcester, who showed well, Mildred Grant being excellent; second, E. M. Eversfield, Esq.; third, Alfred Slaughter, Esq. There were several other exhibits, all good.

Seven blooms of any Rose, except Tea or Noisette: First, R. F. Hobbs, Esq.; second, E. M. Eversfield, Esq.; third, R. E. West, Esq., Reigate.

GROWERS OF LESS THAN 1,000 PLANTS.

Twelve blooms, distinct: First prize (Graham Memorial Plate), C. F. H. Leslie, Esq., Hertingfordbury, with very good blooms of Mrs. W. J. Grant, White Maman Cochet, Alice Lindsell, and others; second, C. Page, Esq., Enfield, with lovely blooms of Mrs. Mawley, Lady M. Beaulerc, and others; third, A. E. Farneo, Esq., Sutton, who also showed well. There were sixteen more exhibits in this class, and many of them contained very good blooms.

Five blooms of any Rose except Tea or Noisette in vase: First, G. Moules, Esq., Hitchin, with splendid Mildred Grant; second, Courtenay Page, Esq., Enfield, with Mildred Grant; third, G. A. Hammond, Esq., Burgess Hill, with Frau Karl Druschki.

GROWERS OF LESS THAN 500 PLANTS.

Nine blooms distinct: First (and piece of plate presented by the Ben Cant Memorial Fund), William Upton, Esq., Belgrave, Leicester, with beautiful blooms, especially of Ulster, Mme. Jules Graveaux, Frau Karl Druschki, and others; second, R. W. Bowyer, Esq., Hertford Heath, with fine flowers also; a good third, Mrs. E. A. Moulden, Stevenage. There were nineteen other exhibits in this class.

Six blooms, distinct: First (and piece of plate presented by Messrs. Burrell and Co., Cambridge), H. H. Gifford, Esq., Edensor, Surrey, with very good blooms; a good second, A. C. Turner, Esq., Edware. We could find no third prize winner. There were four more exhibits.

Five blooms any Rose, except Tea or Noisette, in vase: First, A. C. Turner, Esq., Edware, with Frau Karl Druschki; second, R. W. Bowyer, Esq., Hertford Heath, with Frau Karl Druschki; third, Dr. A. H. Williams, Harrow, with Caroline Testout.

GROWERS OF LESS THAN 200 PLANTS.

Six blooms, distinct: First, W. R. Hammond, Esq., Burgess Hill, Maman Cochet and Bessie Brown being excellent; second, F. J. Nightingale, Esq., Sutton; third, Miss A. M. Lucas, Hitchin. There were nine other exhibits in this class.

EXTRA CLASSES.

Twelve blooms, distinct: First (and Challenge Cup presented by the late C. J. Graham, Esq.), George Moules, Esq., Hitchin, with very good blooms, Ulrich Brunner, Frau Karl Druschki, and Mildred Grant being especially fine; second, William Kingston, Esq., Bedford, with beautiful Roses also; third, G. A. Hammond, Esq., Burgess Hill. There were nine other exhibitors.

Four distinct varieties, three blooms of each: First, William Kingston, Esq., Bedford, with excellent Mrs. John Laing and others; second, the Rev. F. Page Roberts, his Frau Karl Druschki being very good; third, John Bateman, Esq., Highgate. There were numerous other competitors.

Twelve blooms, distinct: First (and silver cup given by Messrs. R. Harkness and Co., Hitchin), Mahlon Whittle, Esq., Leicester, with good flowers; second, R. F. Hobbs, Esq., Worcester; third, the Rev. J. H. Pemberton. This class was well contested.

Six blooms, distinct: First, Frank Spencer, Esq., Harrow; second, W. Lenn West, Esq., Sutton; third, Frederick Bostock, Esq., Northampton.

Six blooms, not less than four varieties: First, E. P. Sugden, Esq., Winchmore Hill, his Mrs. Edward Mawley being very fine; second, Mrs.

Harvey Thomas, Windlesham, with splendid Mrs. Mawley also; third, Thomas Halsted, Esq., Reigate. There were many more competitors.

Six blooms, distinct: First, W. Chapman, Esq., Warminster; second, Miss Margerison, Hythe; third, F. J. Nightingale, Esq., Sutton.

Six blooms, distinct, grown within eight miles of Charing Cross: First prize and challenge cup, E. R. Smith, Esq., Muswell Hill, N., with good blooms of Marie Baumann, Caroline Testout, Mildred Grant, Mrs. J. Laing, Frau Karl Druschki, and Ulrich Brunner; second, Miss B. H. Langton, Hendon; third, J. T. Thompson, Esq., Bounds Green, N.

Six blooms of new Roses: First, R. F. Hobbs, Esq., Worcester, with Mildred Grant, Frau Karl Druschki, Alice Lindsell, and others; second, Conway Jones, Esq., Worcester; third, the Rev. J. H. Pemberton.

Messrs. Paul and Son, Cheshunt, were given third prize for a group of Roses in pots. We could find no other exhibits in this class.

TEA AND NOISETTE SECTION.

Five entries were forthcoming in the class for eighteen blooms, distinct. They were a very fine lot altogether, the stand giving Mr. A. Hill Gray, Bath, first prize being a beautifully even lot of blooms. Mrs. E. Mawley (very fine), The Bride, White Maman Cochet, Souv. d'Elise Vardon, Golden Gate, Innocente Pirola, Bridesmaid, Catherine Mermet, Mme. Cusin, and Souv. de S. A. Prince being the best of his flowers. Mr. O. G. Orpen, Colchester, was a very good second, several blooms in his stand being beautifully finished. White Maman Cochet, Jean Ducher, Innocente Pirola, and Lady Mary Corry calling for notice. A good third was found in Mr. Conway Jones, Gloucester, Maman Cochet, Mrs. Edward Mawley, and White Maman Cochet being excellent.

The challenge cup offered by Messrs. J. Cocker and Sons brought out three excellent boxes of Roses. This competition was open to amateurs, irrespective of the number of plants they grow. In this instance Mr. A. Hill Gray again excelled, winning premier honours with a charming series of blooms. Mrs. E. Mawley, Comtesse de Nadaillac, Mme. Cusin, Souv. d'Elise Vardon, Catherine Mermet, White Maman Cochet, Muriel Grahame, The Bride, Medea, and Bridesmaid being conspicuously good. Mr. Alfred Tate, Leatherhead, was placed second with less even blooms, the petals of several blooms being badly bruised. Exceptionally beautiful, however, were the examples of Mrs. Edward Mawley, Maman Cochet, Miss Ethel Brownlow, and Mme. Hoste; third prize was won by the Rev. F. R. Burnside, Great Stambidge, with a pretty lot of Roses, White Maman Cochet and Muriel Grahame calling for notice.

For eight trebles, Tea and Noisette Roses, there were five excellent exhibits. Mr. A. Hill Gray again proved himself invincible, winning the first prize with a grand lot of blooms superbly staged. The varieties were Mrs. Edward Mawley, White Maman Cochet, Comtesse de Nadaillac, The Bride, Medea, Mme. Cusin, Muriel Grahame, and Maman Cochet, all first-rate. The second prize was won by Mr. Conway Jones, also with a fine set, Maman Cochet and White Maman Cochet being charmingly displayed. A good third was found in the Rev. F. R. Burnside, most of his blooms being just past their best. Maman Cochet and White Maman Cochet, however, were very handsome.

For seven blooms of any one variety, to be shown in a single vase, brought out four competitors. A handsome vase of Mrs. Edward Mawley, from Mr. A. Hill Gray, secured leading honours for that excellent grower. The blooms were large, of good form, and beautiful finish. The Rev. F. R. Burnside was placed second with lovely blooms of White Maman Cochet, and with the same variety Mr. E. M. Eversfield, Horsham, was placed third.

Class 54, for the Prince Memorial Prize (a piece of plate value five guineas) was contested by eight exhibits. Mr. R. F. Hobbs, Worcester, was placed first with a neat and even box of blooms. Souv. Pierre Notting was very finely represented, and among others Ernest Metz, Mrs. E. Mawley (small) Maman Cochet, Souv. de S. A. Prince,

Empress A. of Russia, and Bridesmaid were beautiful. Second prize was won by Mr. Joseph Wakerley, Rainham, with a good stand, though of less even character than those in the first prize exhibit. Maman Cochet, Mrs. Edward Mawley, and White Maman Cochet were finely represented; third prize was secured by Mr. Mablon Whittle, Belgrave, Leicester, with a pretty set, Cleopatra and Mme. Jules Graveaux being conspicuous.

Class 55, for five blooms of any one variety shown in a vase. There were six competitors in all, Mr. Joseph Wakerley leading the van with nice blooms of Maman Cochet; second prize was won by Mrs. Alfred Evans, Marston, Oxford, with Mrs. Edward Mawley; and third prize to Mr. C. F. H. Leslie, Hertingfordbury, with smaller examples of White Maman Cochet; the two latter classes were open only to growers of less than 500 plants.

Class 56, for nine blooms, distinct: In the competition for the first prize (piece of plate value two guineas), offered by Mr. A. C. Turner, Dr. T. E. Pallett, Earls Colne, Essex, led the nine competitors with a charming series of blooms. Maman Cochet, Mme. Hoste, Mme. Cusin, Innocente Pirola, Muriel Grahame, Mrs. Edward Mawley, and Bridesmaid were his best blooms; second prize was won by Mr. G. H. Baxter, Brentwood, beautiful finish characterising his flowers. Specially good were Maman Cochet, White Maman Cochet, and Ernest Metz; third prize was placed to the credit of Mr. George Moules, Hitchin, who was close up with a pretty box of blooms. Mrs. Mawley was beautifully represented in this instance.

No less than thirteen competitors were forthcoming in the class for six blooms, distinct varieties. Leading honours fell to the lot of Mr. R. W. Bowyer, Hertford Heath, with a very beautiful lot of flowers. Mrs. Edward Mawley, White Maman Cochet, Maman Cochet, Comtesse de Nadaillac, The Bride, and Mme. de Watteville were in this stand. Second prize was won by Mr. A. C. Turner, Edgware, with a set of nicely finished blooms, The Bride, Muriel Grahame (very good), Ethel Brownlow, and Innocente Pirola being his best. Third prize was secured by Mrs. Times, Hitchin, with pretty, though rather small, blooms of charming form. This was a dainty exhibit.

A spirited competition in the class (No. 58) for five blooms of any one variety, shown in a vase. There were no less than eleven exhibits. The premier position was occupied by Mr. G. H. Baxter, with White Maman Cochet in splendid form. With the same variety Mr. E. J. Holland, Sutton, Surrey, was placed second. In this instance the blooms were rather smaller and less finished than the first prize set. Third prize was won by Mr. W. R. Hammond, Burgess Hill, with lovely blooms of Maman Cochet. The last three classes were open only to growers of less than 200 plants.

EXTRA CLASSES FOR AMATEURS.

Class 59, for four distinct varieties, three blooms of each, for a piece of plate value three guineas, offered as first prize by Mr. George Prince. There were nine handsome exhibits. In this instance Mr. Alfred Slaughter, Steyning, Sussex, was a good first with beautiful trebles of White Maman Cochet, Maman Cochet (lovely), Mrs. E. Mawley, and Souv. de Pierre Notting. Mr. G. H. Baxter, Brentwood, had a nice series of blooms for second prize, Cleopatra, Mme. Cusin, Princess of Wales, and White Maman Cochet were his varieties; third prize was won by Mr. Joseph Wakerley, also with a fine lot of blooms, Medea and White Maman Cochet being seen in excellent condition.

Twelve boxes were staged in class 60, for six blooms in not less than three varieties. This class was open only to amateurs who have never won a prize at an exhibition of the National Rose Society. First prize was won by Mr. W. Lenn West, Sutton, Surrey, with really handsome blooms for a novice at the National Rose Society. Mrs. Edward Mawley, Maman Cochet, and White Maman Cochet were well staged; second prize was won by Mr. C. C. Tunks, Sidcup, with a splendid lot of flowers, Maman Cochet and White Maman Cochet being

excellently shown; third prize was secured by Mr. G. Speight, Market Harborough, with a less even set of blooms, Souv. d'Elise Vardon (very fine) and Mme. de Watteville being his more attractive flowers.

EXHIBITION ROSES IN VASES.

There were but two entries in Class 61 for nine distinct varieties (to include not more than four varieties of Teas or Noisettes), five blooms of each, exhibited in a space not to exceed 5 feet by 3 feet. Mr. A. Hill Gray was a good first, staging grand flowers of Frau Karl Druschki, Mildred Grant, Kaiserin Augusta Victoria, White Maman Cochet, Bessie Brown, Mrs. E. Mawley, La France, Medea, and Souv. de S. A. Prince. Second prize was won by Mr. H. V. Machin, Gateford, Worksop, with a nice series of blooms of more colour—S. M. Rodocanachi, Bessie Brown, Mrs. W. J. Grant, Gustave Piganeau, Marquise Litta, and Caroline Testout were his best blooms.

Class 62, for six distinct varieties, seven blooms of each in vases. There were but two exhibits for the piece of plate, value three guineas, offered by Messrs. A. Dickson and Son, Limited, for first prize. Mr. A. Hill Gray was again to the fore with a charming series of blooms of good quality throughout. White Maman Cochet, Mrs. E. Mawley, Anna Olivier, The Bride, Marie van Houtte, and Mme. Cusin were pleasingly set up. The second prize exhibit was much better displayed, and the blooms were delightfully fresh and beautiful. Innocente Pirola, Souv. d'Elise Vardon, Hon. Edith Gifford, and Mme. Cusin were charming.

Class 63, for five distinct varieties, five blooms of each: A really magnificent lot of flowers gained first prize for Mr. Ernest R. Smith, Muswell Hill, N. In this competition Mr. Will Tayler offered a piece of plate, value two guineas, and the prize was well merited in this instance. Large and handsome blooms of Caroline Testout, Ulrich Brunner, Mrs. John Laing, Mildred Grant, and Mrs. R. G. Sharman Crawford were finely staged. Second prize was won by Miss B. H. Langton with a good lot of blooms. La France, Bessie Brown, Caroline Testout, and Kaiserin Augusta Victoria were the best flowers. The Rev. F. J. Fulford, Flaxley, Gloucester, was third with blooms poorly staged. There were four competitors in this class.

DECORATIVE SECTION.

OPEN TO LADIES ONLY.

The eight exhibits in the class (64) for a decoration of cut Roses for dinner table, arranged with any cut foliage, Ferns, or Grasses, made a very welcome feature in this great display. Delightfully chaste and beautiful was the display made by Miss J. B. Langton, Hendon, N.W. Large blush single Roses (Macrantha) with their yellow stamens made a charming picture, and pleasingly interwoven were sprays of Asparagus Sprengeri, Maidenhair Fern, and Rose foliage and buds. This was not in the least overdone, and well won the piece of plate, value five guineas, given as first prize, by Mr. A. Tate. Mrs. O. G. Orpen was placed second with a pretty arrangement of white and rose-coloured singles, together with buds and sprays of Rose foliage and Ferns. This exhibit lost somewhat by its rather crowded centrepiece. Dainty, indeed, was the third prize exhibit. This came from Miss D. M. Oliver, Tollington Park, and was freely commented on as being "sweet." The variety used in this instance was Waltham Rambler, a pretty rose-tinted single, but the centrepiece was a trifle formal in its outline. Charming, too, was the table of William Allen Richardson Rose from Miss M. M. West, Sutton, Surrey. This was well arranged, Selaginella and Rose foliage and buds adding materially to its attractiveness.

Class 65, for a bowl of Roses arranged with Rose foliage only, was keenly contested, no less than ten exhibits being set up. The first prize was won by Mrs. O. G. Orpen with single Rose Macrantha charmingly arranged. Second prize was won by Miss J. B. Langton with a lovely bowl of La France; and third prize was secured by Mrs. H. E. Molyneux, Balham, with a very handsome vase of Mrs. W. J. Grant deftly arranged.

Class 66 was well filled, ten beautiful vases competing for the piece of plate, value two guineas, offered by Messrs. G. Bunyard and Co. In this instance Mrs. H. E. Molyneux was an easy first with a superb vase of Killarney handsomely displayed, with Asparagus trailing as an adjunct. Second prize was secured by Miss J. B. Langton with Mrs. W. J. Grant pleasingly disposed among Rose foliage, Ferns, and Asparagus Sprengeri. Third prize was won by Mrs. Edward Mawley, Berkhamsted, with Gustave Regis in wonderfully fresh condition, beautifully set up.

In Class 67, for a basket of cut Roses, there were seven exhibits. A rather unusual and quaint-looking basket secured first prize for Mrs. George Lewis, Watford. Second prize was won by Mrs. O. G. Orpen with a lovely basket of Tea Rose arranged with Asparagus fronds; and third prize was secured by Miss J. B. Langton with a pretty basket of Mme. Abel Chatenay, Maidenhair Fern, and Asparagus, lightly and artistically disposed.

GARDEN OR DECORATIVE ROSES.

Class 18, the premier class in the amateur section, was a magnificent effort. The competition was for eighteen distinct varieties, not less than three trusses in each bunch. The first prize was a piece of plate offered by Miss Ellen Willmott, V.M.H., and on this occasion the premier position was occupied by Mr. A. Tate with a superbly fine exhibit. The bunches were very large and handsome, several charming types of "garden" Roses being seen in typical form. The varieties were Reine Olga de Wurtemberg, Alister Stella Gray, Hebe's Lip, Marquis of Salisbury, Lady White, W. A. Richardson, Boule de Neige, Bardou Job, Augustine Guinoisseau, Rêve d'Or, Marquis Balbiano, Perle d'Or, Wallflower, Anna Maria Montravel, Eugénie Lamesch, Gracilis, and Gloire des Rosomanes. Second prize was won by Rev. J. H. Pemberton, Havering-atte-Bower, also with a very beautiful series of bunches, The Garland, Claire Jacquier, Una, Lady Curzon, Macrantha, and Gustave Regis being conspicuously good. Third prize was awarded to Mr. H. V. Machin with a very fresh and beautiful series of bunches, Cecile Brunner, Ma Capucine, Mme. Chedane Guinoisseau, Camoens, Souvenir de Catherine Guillot, and Mme. Pernet Ducher in lovely condition.

Four entries in Class 69 for twelve bunches were an attractive feature: First prize (a piece of plate offered by Mr. Charles Turner) was won by Mrs. A. F. Perkins, Holmwood, Surrey. The bunches were large and in splendid form and condition. Gustave Regis, Marquis of Salisbury, Mme. Jules Grolez, Mme. Pernet Ducher, and Wallflower were finely represented. Miss B. H. Langton was awarded second prize for a beautiful set. Paul's Carmine Pillar, Paul's single white Camoens, Rosa Mundi, Macrantha, and Marquis of Salisbury were in excellent form. Third prize was secured by Mr. J. B. Fortescue, Maidenhead, with large and attractive bunches.

SILVER MEDAL ROSES.

NURSERYMEN.

Best Hybrid Tea.—Mildred Grant, from Messrs. Frank Cant and Co., Braiswick Nursery, Colchester, in the third prize exhibit in the great class for seventy-two blooms.

Best Tea.—White Maman Cochet, from Mr. George Prince, Oxford, in the first prize exhibit in the class for twenty-four distinct Teas.

Best Hybrid Perpetual.—Ulster, from Messrs. Alexander Dickson and Sons, Limited, Newtownards, in the first prize exhibit in the class for forty distinct Roses, three blooms of each.

AMATEURS.

Best Hybrid Perpetual.—Frau Karl Druschki from E. B. Lindsell, Esq., Hitchin, in his first prize exhibit in the class for thirty-six blooms distinct.

Best Hybrid Tea.—Mildred Grant from E. M. Eversfield, Esq., Horsham, in the first prize stand in the class for twenty-four Roses distinct (growers of less than 2,000 plants).

Best Tea.—White Maman Cochet from the Rev. F. R. Burnside, Great Stambidge Rectory, in his exhibit in the class for eighteen blooms of Teas.

THE GARDEN

No. 1704.—VOL. LXVI.

[JULY 16, 1904.]

GARDEN PINKS.

THERE is a great deal more to be done in the way of raising useful garden Pinks. They hybridise so freely and come so well from seed that it is a matter for wonder that it has not already been more largely done. Here and there a good Pink appears, but there is nothing like the number and variety that there might be.

Of florists' Pinks there are but a limited number that are really useful garden plants. Ascot is a good Pink, and we want more of the same type and degree of merit. An Ascot of a rather different tone of pink, clearer and with less of the purple quality, would be a great gain. The double flowers that come from the old white Pink, such as Mrs. Sinkins and Her Majesty, are capital garden flowers. In some soils they are perfect, but they often burst the calyx from being too tightly packed with petals. This is a point that raisers should carefully watch. A Pink may easily be too double. These useful sorts are just a little too full. Probably in some soils, calcareous, slaty, or loamy, they may have vigour enough to build up a non-splitting calyx; but in the lighter soils, that suit them less well, the defect is extremely apparent. A white Pink half-way between these and the common white would be a useful plant.

A type that often shows itself in seedling Pinks is sometimes pretty, but not altogether satisfactory. It has petals of flimsy substance, deeply fringed and much too tightly packed. It generally has a weak purple centre. This deep fringing and thin substance habitually go together.

A good Pink of the old "Black and White" pattern is much wanted. Whether the true old plant is still in existence seems doubtful, for repeated appeals to the horticultural public that have from time to time appeared in THE GARDEN have failed to bring it forth, the weak flowers just described being nearly always sent for it. The old Black and White has petals as firm in substance as a Carnation, with a distinct blotch of a chocolate-black colour, turning a little lighter at two days old. The jags at the edge of the petal are few and blunt, never deeply cut, and the flower is not more than half-double, so that the black blotch shows clearly. The white, from the thickness of the petal, is clear and bright.

The probable reason why the greater number of the florists' Pinks are of so little use in the

garden is because so much attention is given to the lacing at the edge. This tends to muddle the flower in the mass, whereas a clear ground colour and a strong blotch show out well, and the plant, however full of flower, is bright and handsome. It is one of the many cases in which the show and the garden are at variance. As show rules are more or less arbitrary, it seems a matter of regret that their influence should not always be directed to the making of good garden flowers, so that they might work towards the greater and wider usefulness. To obtain prettiness in a single bloom, or even in a single pip of a bloom, as seen in the hand or close to the eye on the show table seems a less worthy object to aim at than the obtaining of a beautiful thing for free garden use.

ROSE SHOWS MORE BEAUTIFUL.

THE recent exhibition of the National Rose Society in the Inner Temple Gardens was the brightest and freshest on record. We are not writing of the beauty of the exhibition flowers, but of the pleasant break away from the traditions of the past. Exhibition blooms were in vast array, and there was the same wholesome competition as in the great Rose years when the show was made up entirely of ranks of green boxes, but with this difference, the garden Roses so-called were everywhere, coming from the trade grower and the amateur in welcome abundance. The society is wise to encourage the exhibition of flowers that fill the home garden with delight, ramble over porch and arch and pergola, and appeal in many ways to those who love their Rose gardens but care little for perfection of form or of colour in the individual bloom. Probably half the members of the society give no thought for the more stereotyped classes of cut flowers, but rejoice in the arches covered with rambling Roses, in the table decorations, vases, and new varieties or hybrids. We have no desire, rather the contrary, to discourage the competition in which colour and finish are the chief attributes. No show could exist without this propelling power, but it must be remembered that the recent acquisition of members is solely due to the desire of the honorary secretary and the committee to recognise the broad principles upon which the National Rose Society is now conducted.

After the great work that has been accomplished in the past, and is being continued in the present, it may seem ungracious to criticise. The exhibition last week almost reached perfection, but its beauty was marred by an absence of a suitable colour association and well-arranged flower groups. The table decorations were spoiled by an irritating

display of boxes underneath the uncovered staging, bare spaces were frequent in conspicuous positions, and there seemed a general absence of cohesion. A Rose show should be a show of beauty, not merely in the individual exhibit, but in arrangement also, and this fault may be remedied with facility by a more liberal display of quiet coloured cloth over the tables and miscellaneous groups. The class for a Rose group failed in its purpose. The truth is pot Roses are things of the past when July approaches, but the English garden is in its fairest dress and can give unstintingly of its choicest flowers, which would have helped at the Rose Show to hide unsightly blanks and give a general freshness and solidity to the whole exhibition. We hope this may be accomplished next year, for much depends upon beauty of arrangement to attract the general public. An enthusiastic exhibitor may care little for arrangement. He sees nothing but the beauty of the individual flower. The wider public, however, who support so strongly the leading exhibitions of to-day think otherwise. It is in no carping spirit we make these remarks, but no one welcomes kindly criticism more cordially than the honorary secretary, whose unselfish and arduous work is so well known to the members of the National Rose Society.

NOTES FROM THE OLD PARSONAGE, GRESFORD.

AS far as this season has gone it is likely to be remembered as one in which hardy plants have shown their capabilities when untouched by frost and biting winds. Of these *Eremurus* have been exceptionally beautiful, and the table below shows their relative time of flowering and approximate heights in the same situation on warm gravel. Here they never attain gigantic proportions, and the lack of rain this summer has further reduced their normal height; they should be moved every third year as they exhaust light gravel soil.

Elwesianus albus is the most beautiful. It appears to be *elwesianus* × *himalaicus*. The plant here appears to be the only one at present in cultivation. The spike is that of a giant *himalaicus*, all the parts being enlarged, and if the flowers were not so closely set it would be as tall, or taller, than *elwesianus*. The stem differs from *himalaicus* in being a rich, deep green, and the foliage is that of *elwesianus*; the flowers are pure white with golden anthers, and very fragrant; it is the first to flower. On many stems dormant buds form; these grow well, and flower two years earlier than seedlings. Plant in boxes of rich mould. I find that *Eremurus* flower strongly the year following removal, if it is done early; they are better lifted and replanted in rich loam every third year; there is no advantage in abnormal

height, and in windy sites it is a manifest disadvantage.

Sort.	First flowered.	Height.
Elwesianus albus	May 25	7 4
Robustus superbus	" 26	7 4
Elwesianus	" 30	8 6
Himalayensis	June 2	6 5
Perry's Hybrid	Injured. Approx.	7 6
Wallace hybrid	Last year flowered July 12	6 6
Olga	Not flowered	
Bungei	July 6 last year	6

In other localities the heights and times of flowering given in this table may not hold good, but the relative proportions will be accurate. Of some of the rarer and newer plants

Pelargonium Endlicherianum stands the winter outside without protection and is a fine plant. The rarer *Onosmas* have also wintered well. *Stellulata* and *Thurberi* are masses of bloom, so also is *alba rosea*. *Anthericum yeddoense* is a charming thing. It is a new *Anthericum* from Japan introduced by Mr. Amos Perry. The leaves are sabre-shaped, and the flower is like a magnified Lily of the Valley, with flat, curved stems. Last year with me was, I think, its first flowering in England. Evidently it is a strong and healthy grower.

Paeonia lutea (Franchet).—The year before last I received a plant from M. Lemoine, potted and framed it for the first winter. Last autumn it was planted out, and unprotected till its shoots appeared in the spring. It may be described as a tree Paeony with herbaceous affinities. The flower, as I write, is fully expanded, single, of a rich yellow colour, about the size of *Paeonia tenuifolia*; the foliage is striking and handsome, the stems bearing the buds appear to have the curious habit of curling down so that the bud-apex points to the ground. Its value will be to hybridisers rather than florists.

Verbasiums.—We are fortunate in our soil for growing *Verbasiums*, they flourish exceedingly. Some hybrids raised here are amongst the finest hardy perennials, notably one, of which the flower, $1\frac{1}{2}$ inches across, is a pyramid of bloom of a soft buff-yellow colour with purple central blotch, the leaves are silvery and tomentose. Hybrids, I think, *olympicum* × *weidemannianum*.

Delphiniums.—In a former communication I pressed upon the attention of your readers the value and beauty of *Delphinium Persimmon*. I use it for bedding with one variety of Hybrid Teas, pure rose, and a bed of eighteen, even height, 6 feet or so, with their elegant spikes of enormous pure blue flowers showing above the Roses cannot be easily surpassed; it is barren, and remains in flower three months. *Belladonna* × *grandiflora*. Messrs. Kelway and Sons raised this fine hybrid. P. H. MILES.

NOTES OF THE WEEK.

FORTHCOMING EVENTS.

- July 19.—Salthaire and Tibshelf Rose Shows.
- July 20.—National Sweet Pea Society's Show at Crystal Palace (two days); Hereford.
- July 21.—Halifax Rose Show; National Carnation and Picotee Society's (Southern Section) Show.
- July 22.—Opening of the New Horticultural Hall, Vincent Square, by His Majesty the King; Southampton Carnation and Picotee Show; Handsworth Horticultural Society's Floral Fête (two days).
- July 26.—Royal Horticultural Society, Committee Meetings in New Hall.
- July 27.—Newcastle-upon-Tyne Summer Flower Show (three days); Cardiff Summer Show (two).
- July 28.—Chesterfield Carnation Show at Birmingham (two days).

Limnanthes Douglasii and Forget-me-not.—I have had a most successful spring bed this past season of *Limnanthes Douglasii* and Forget-me-not freely mixed. It was on a south border, and was not only effective but lasted a long time in bloom.—HEDGERLEY.

Chlidanthus fragrans.—This bulb is rarely met with in gardens, though it appears perfectly hardy in South Devon and Cornwall. It is now in bloom with me, and is a very pretty sight. The clear yellow flowers are nearly 3 inches across and are very sweetly perfumed. They are borne two on a stem. The bulbs do well in a raised bed beneath a sunny south wall in a compost of peat, loam, and very coarse sand in equal portions. The *Chlidanthus* is a native of Buenos Ayres.—S. W. FITZHERBERT.

Anthericum Liliastrium giganteum.—There is probably but little difference in the forms of St. Bruno's Lily known respectively as major, superbum, and giganteum, but the one I have under the last name is undoubtedly a handsome and effective plant. Its height is 2 feet, and it bears from twelve to sixteen pure white flowers 2 inches in length and $1\frac{1}{2}$ inches across the mouth, a group being very decorative in the herbaceous border when in full flower. The larger form of St. Bernard's Lily (*Anthericum Liliago major*) is also in bloom, but, though a pretty and graceful plant, its smaller flowers lack the effect of the larger blossoms of *A. Liliastrium giganteum*. Both species are natives of Southern Europe and are perfectly hardy, increasing rapidly in the border.—S. W. F.

Epigaea repens.—This is unquestionably the most cherished wild plant in New England. It is greatly sought after at the blossoming season, which is in the early spring, and the flowers are found soon after the snow disappears. The great esteem in which this plant is held is certainly not due to its showy character, quite the reverse. It is extremely modest, retiring, even shy. It is a hard plant to find, and the excitement of the quest for it doubtless adds much to the pleasures of its discovery. It is difficult, almost impossible, to cultivate. It grows spontaneously only in wild, unfrequented situations. In many places where it was formerly abundant it has ceased to grow, the entire stock having been destroyed by repeated pickings; in fact, it is hard to find this plant at all in the neighbourhood of cities on account of the large number who seek after it every succeeding spring.—F. A. WARCH.

Croydon Horticultural Society.—The following meetings will be held during the remainder of the year: August 16—"A Discussion on Insects, Injurious and Beneficial to Gardeners," with specimens and illustrations; September 6—"Narcissi," by Mr. C. W. Greenwood, 50, Selsdon Road, West Norwood; September 20—"Some Phases of Fruit Culture," by Mr. Lewis Castle (gold medallist of the Fruiterers' Company), Ridgmont, Aspley Guise; October 4—"Fruit as a Necessary Food," by Mr. H. Cannell, Swanley, Kent; October 18—"A Horticultural History of the Nineteenth Century" (illustrated), by Mr. J. Harrison Dick, sub-editor "Journal of Horticulture"; November 1—"Birds of Our Gardens" (illustrated with lantern views), by Mr. P. F. Bunyard, 57, Kidderminster Road, West Croydon; November 15—"Vegetables for Exhibition or Yearly Supply," by Mr. J. Friend, Rooknest Gardens, Godstone; December 6—"United Horticultural Benefit and Provident Society," by Mr. G. Dray, superintendent Recreation Grounds, Sydenham, S.E.

Scottish Horticultural Association.—The ordinary monthly meeting of the members of the Scottish Horticultural Association was held in Dowell's Rooms, George Street, Edinburgh, on the evening of Tuesday, the 5th inst. The president of the association, Mr. J. W. M'Hattie, superintendent of the City parks, presided over a large attendance. The table was bright with a number of interesting and beautiful exhibits sent by several of the members and friends. These are too numerous to mention in detail, but a note may be made of the splendid Paeonies from the garden of Mr. C. W. Cowan at Dalhousie Castle, Bonnyrigg; the rare and beautiful *Rosa sulphurea* from the fine collection of Roses

at the Earl of Haddington's garden at Tynninghame; an interesting new hybrid *Verbasium* from the Ioverleith Public Park; a number of Pansies from Messrs. Dobbie and Co. of Rothsay; a fine display of Roses and English and Spanish Irises, most tastefully arranged, from Messrs. Todd and Co., florists, Edinburgh; herbaceous plants, Carnations, and other flowers from Messrs. Jas. Grieve and Sons, Pilrig Nurseries; and a considerable number of other exhibits, together making an interesting little exhibition. The lecture was on "Herbaceous Calceolarias," and was by Mr. Charles Comfort, Broomfield, who gave a valuable paper, recommending the increased cultivation of these Calceolarias and containing many useful cultural details. As Mr. Comfort pointed out, few flowers yield such valuable results with so little expense. Among the errors in cultivation to which special attention was drawn was that of coddling—the most fruitful source of failure. The discussion which followed showed a general agreement with Mr. Comfort's views, and he received a hearty vote of thanks for his paper.

Choisya ternata in Scotland.—The illustration of this shrub in Lord Alverstone's garden, and the accompanying note in THE GARDEN of the 2nd inst., lead me to remark that it may be cultivated much further north than is generally believed. I have had it for several years, and I know of several other gardens in this county where it has done well for some years, while in other parts of the south of Scotland it thrives and flowers perfectly. Along the west and on the east coast also it is frequently to be met with. Recently I saw good specimens of *Choisya ternata* as far north as Perthshire and Forfarshire, and from the appearance of it there I imagine it will succeed in the greater part of Scotland. Such a beautiful shrub should be more largely cultivated in rather light soils, where it seems to thrive better than in heavy ones. It is almost invariably grown as a bush in the north—its proper form.—S. ARNOTT.

The Orange-berried Ivy.—Allow me to thank your correspondent, Mr. E. H. Woodall, page 447, for his valuable note on this Ivy, which has hitherto, as far as my knowledge extends, baffled all attempts to induce it to fruit, at least in this country. With the light, however, brought to bear on its behaviour, one may now hope for better results. I have tried it on a wall in different positions, always with the same result, i.e., a profusion of its neat, pretty leaves, but no fruits. Even when the top of the wall was reached there was no sign of the branches thickening out as the common Ivy does before flowering, and rambling over rock-work it behaved in a similar way. It is, fortunately, a pretty and distinct Ivy for its leaves alone. The growth is slender and clothed with small leaves, sometimes ovate, but usually wedge-shaped towards the point, with short side lobes at the base. The colour is light green, but suffused with brownish grey along the veins. This is generally so noticeable that the entire mass of foliage has quite a greyish tint. Probably, as suggested, the best results will be obtained by growing this Ivy under glass, at all events the experiment is well worth trying.—T.

Himalayan Rhododendrons.—I have read the *resumé* of Sir John Llewelyn's paper on "Himalayan Rhododendrons" with great interest. I note that *R. nobleanum* is said to commence blooming in November and December. This, no doubt, is in South Wales. I fancy it is rather earlier in southern Cornwall, as a gentleman who has what I, believe, to be the finest specimen of *R. Aucklandi* (*griffithianum*) in the British Isles, and who lives in the neighbourhood of Truro, told me that *R. nobleanum venustum* usually began to flower with him in October. *R. grande*, better known as *R. argenteum*, appears to flower at different times in different localities. Probably its correct blooming period is the end of March, at which time, in 1902, the fine specimen at Tregethnan was in full flower and bearing over 300 bloom trusses; but in Mr. T. B. Bolitho's garden at Trewidden, Penzance, *R. grande* flowers in January, for when I was there in February of the present year the flowers were past their best.—S. W. FITZHERBERT.

Success in agriculture and horticulture.—Mr. R. C. Gaut (University of Leeds), who gained the National Diploma of Agriculture at the recent May examinations, has now passed the final examination for the B.Sc. degree (first division) in Agriculture, Victoria University, Manchester.

Pimpinella magna rosea.—I note an award of merit was given to this plant at the last meeting of the Royal Horticultural Society. It is quite a distinct growing border plant, lasting in flower over a long season. With me it grows from 1 foot to 2 feet high, is exceptionally free flowering, and the blossoms are a pretty rosy tint. It is thoroughly hardy and in every way a desirable border plant.—E. MOLYNEUX.

The Vilmorin Memorial.—The committee which has this matter in hand has already received numerous subscriptions. A first list of 5,030 francs, from 424 subscribers, has been published. As well as large amounts of 100 francs, 200 francs, and even 500 francs—as that given by the Société Nationale d'Horticulture de France—the committee has been gratified to receive a large number of small sums, of 2 francs, 1 franc, and even 50 centimes, chiefly from the flower sellers in the markets. This is proof that the idea of the Vilmorin memorial was justified, for it has been favourably received by so many. Subscriptions should be sent to M. Léon Bourguignon, 26, rue Jacob, Paris, who is acting as secretary.

Lilium Kelloggii.—This beautiful Lily has again flowered with me this year, so that one may, I think, consider it established, this being the third year since planting. Here it hardly attains a height of 2 feet, but it is very beautiful and distinct, with its recurved pinkish flowers. I grow it in peaty soil, with some sand, and in a cool and comparatively shaded position at the base of a rockery, which I consider a good place for some of these Lilies. We can hardly have too many of such flowers as this, and, although it keeps a little high in price, *L. Kelloggii* should not be forgotten when planting time comes round again.—S. ARNOTT, *Carsethorn, by Dumfries, N.B.*

Old Warden Park, Biggleswade. This magnificent old place is the residence of Colonel Shuttleworth, and possesses many remarkable features, one of which is the stately trees of huge dimensions, not a few of which must be quite two hundred and fifty years old, and yet in perfect vigour as they stand up strong and tall towards the everlasting sky. There is a large and varied collection of trees, Elm especially attaining to immense size. One veteran has massive lower limbs, in some cases resting upon the ground, in others kept in position by means of strong supports. The visitor interested in arboriculture can find at Old Warden Park a vast material, as interesting as it is varied. There are many very large and handsome specimens of coniferous plants; much that is choice is of fine development. There are some wonderful specimens of Portugal Laurel, the largest measuring 150 feet in circumference, the summit especially crowned with myriads of white blossoms. And then the delightful vistas, the charming glades, the undulations; these and other features combine to form a picture of natural beauty, the details of which are heightened in effect when the sunlight pours its unclouded beauty around it all. There is a very happy blending of evergreen with deciduous trees and shrubs. The Fir tree tribe appear to luxuriate in the soil in which they were planted. The pleasure grounds are of very large extent, and the admirable manner in which they are kept reflects the greatest credit on Mr. Modral and his staff. Close by the estate is the village. Colonel Shuttleworth displays his interest in the villagers by providing them with pleasant cottages, giving employment, &c., and to encourage the social life of the

village he has erected a spacious building to supply opportunities for meeting for various recreations, giving encouragement also by occasionally attending and taking part in social gatherings. During the winter planting and other operations are carried out in order to furnish employment to the labourers on farms close by, who would otherwise be unemployed. Wealth is thus employed in the praiseworthy direction of promoting the common good.—R. D.

St. John's Gardens, Liverpool.—Another addition has been made to the gardens of Liverpool by the opening of St. John's Gardens. The area is not large, but being in the centre of the city makes it most valuable. The Lord Mayor, who presided at the opening function, gave some interesting particulars of the site which was now to be handed over to the public. Alderman Joseph Ball, chairman of the Parks and Gardens Committee, was invited to perform the opening ceremony, and was presented with a massive gold key for this purpose, the gift of the members of the Finance and Parks Committee. Mr. W. Rowlands, Childwall Nurseries, Liverpool, has been entrusted with the gardening department, and has carried out the work most successfully in conjunction with Mr. H. Herbert, superintendent of the Liverpool parks and gardens. The bedding is sunk somewhat below the margins of the lawn for protection from the strong winds that often prevail.

A new horticultural club.—Founded so recently as May last, the Bowden Amateur Horticultural Club gives promise of making its influence felt in the neighbourhood of Altrincham, Cheshire. The club was formed for the promotion of horticulture among amateurs by holding spring, summer, and autumn meetings, for giving lectures, reading essays, and exhibiting flowers from the gardens of members. There are many enthusiastic amateur gardeners in and around the district in which this new club is now working. Many ladies were identified with its formation, the honorary treasurer and honorary secretary and several members of the committee being ladies who take a very keen interest in horticultural matters. Mrs. Duggan, The Downs, Altrincham, is the honorary secretary, and she has already arranged for the summer meeting to be held on Tuesday, the 19th inst., at Sandiway House, Altrincham, and by the kind permission of Mr. G. Faulkner Armitage the

adjoining gardens of "Stamford" will then be open to members. On that occasion, at six o'clock in the evening, Mr. E. H. Jenkins, of Hampton Hill, will read a paper on "Hardy Plants: Their Propagation and Cultivation." The autumn meeting will be held on Friday, September 30 next, when a paper will be read on "Early Outdoor Chrysanthemums" by Mr. D. B. Crane, of Highgate, N. On both of the occasions referred to a good show and an interesting meeting are anticipated, and with the enthusiasm that prevails there is little doubt that the results will be in every way satisfactory.

The double purple Rocket.—There are various forms of this Rocket, but much the best I have seen is that growing at Aldenham, where Mr. Beckett has a strong batch of plants. The variety has received the name of *lilacina plena*. The colour is lilac tinged with rose. Among the charms of this variety are the exquisitely formed flowers. Every petal is seen, which is not the case in other forms. Added to this, the spikes are large. I look upon it as a first-class border plant, especially if planted in a mass.—E. M.

WALL GARDENING.

WE have on many occasions referred to the beauty of wall gardening, and this is an opportune moment, when the seeds are ripening, again to urge upon those with bare walls to clothe them with beauty. Many of the most familiar of rock garden plants may be grown in this way, either by sowing seed wherever the opportunity occurs or by dibbling in little plants in the crevices in spring or in autumn.

Wall gardening, among its many charms and merits, has the great one of making a good show sooner than can be obtained in any other kind of permanent planting. When we plant shrubs and trees we have to wait four or five years before they look at all mature; a border of hardy plants must have at least two years to

FLOWERS ON A LOW WALL IN A BERKSHIRE GARDEN.

A CORNER IN A BERKSHIRE GARDEN WITH FLOWER-COVERED WALL.

come to fair strength; but wall plants, with their roots in the cool depths and their heads in the sun, grow away at once, and reward the careful planter well within the year. Now the means whereby these delightful results may be obtained is within the reach of all. It is only needful to secure that the wall shall be thick enough to allow the moisture to condense within it. The retaining walls are the best, because the soil that is supported by one of their sides stores a constant supply of moisture in immediate contact with them. In such a wall you have only to make a little opening, unless you find one ready, and to introduce the roots of your plant, and to fix it in position with a little moss or sphagnum, or a little rather stiff mould; then you make it all firm by means of a few small angular stones that you can even secure with cement if it should seem desirable. Often it does quite well to sow the seeds of such plants as are easily raised in this way, such as *Erinus*, *Linaria alpina*, &c.; these you introduce into the fissures by means of some rather stiff soil with which the seeds have been incorporated. In a very few years you will have a wall so superbly beflowered that it will draw enthusiastic expressions of admiration both from yourself and from your friends.

In Miss Jekyll's charming book, "Home and Garden," page 116, there are notes about wall gardening which are both interesting and instructive: "One of the best and simplest ways

Rue, Hard Fern, common Polypody, and others, also Houseleeks, Saxifrages, Sedums (Stonecrops), Thymes, and the pretty Sandworts (*Arenaria*).

Sowing the seed as the wall is being made is best, and Ferns should be planted in this way also. A host of plants that are not usually regarded as suitable for this purpose will flourish in a wall, *Verbascums* as an example, which will send up spikes several feet high in this position. Never overplant a wall. A few Snapdragons, Wallflowers, or whatever may be planted are better than attempting too much, especially upon very old walls. In the spring, when seedlings are coming up, it is wise gently to syringe the wall in the evening or very early morning, especially if much exposed to the sun.

USES OF BRITISH PLANTS.

ORCHIDACEÆ.

ORCHIS (*Orchis mascula*, *Morio*, &c.).—The tuberous roots of species of *Orchis* have long been used, especially in the East, for making a drink called salep, or saloop, in England, a word made from the Arabic *Sahlep*. It used to be sold at stalls in the streets of London before coffee supplanted it. The nourishment consists of a substance called bassorine, which replaces starch, the usual reserve food material in tubers, &c. It is said that the best English salep came from Oxfordshire, but the roots were chiefly imported from the Levant.

LILIACEÆ.

Asparagus (*Asparagus officinalis*).—This is an inhabitant of salt marshes and sandy shores of Wales, Cornwall, and Dorset, but is rare. The stems are quite inedible wild; the cultivated form is the result of high nourishment.

Field Garlic (*Allium oleraceum*).—This is a rare plant, occurring on the borders of fields in Devonshire, Somerset, and Gloucestershire. It is one of the "Onions" which bear bulbils in the head of flowers. It is the leaves which are used for flavouring stews, &c.

Chive (*Allium Schoenoprasum*).—A very rare plant, occurring in rocky pastures in Northumberland, Lancashire, Brecon, and Cornwall. Though the Chive is the smallest of the Onion tribe, it is said to be the finest flavoured. When cultivated it is the leaf-tops which are cut and used for flavouring or salads. It may be continuously cut, the bed lasting three or four years.

Crow Garlic (*Allium vineale*).—This is found in dry pastures, but is not common. The head produces bulbils. The leaves are the part used, as of Chives.

Ransoms (*Allium ursinum*).—This was formerly eaten as the old couplet says:

"Eat Leeks in Lide", and Ransoms in May,
And all the year after physicians may play."

Rocamboles or Sand Leek (*Allium Scorodoprasum*).—A rare plant in dry pastures, occurring in North England and Scotland. It has long been cultivated and produces bulbils in the head, as well as cloves to the bulb like the Garlic. Both are used for flavouring or pickles, &c.

Meadow Saffron (*Colchicum autumnale*).—This is not a rare plant in many parts of England, growing in meadows and low-lying pastures. The corm has long been used in medicine, though very poisonous. It is considered of great value for gout and rheumatism.

JUNCACEÆ.

Soft Rush (*Juncus effusus*).—This common plant was of great importance to our ancestors, for it took the place of carpets, and, after removing the skin, the large pith was used for rush-lights. The stems were also employed for mats, baskets, &c.

ARACEÆ.

Lords and Ladies or Cuckoo Pint (*Arum maculatum*).—This has a thick tuber, abounding in starch, though the juice is deleterious. They were formerly collected in the Isle of Portland, the starch being extracted by grating, and after being washed it was sold as Portland Sago.

CYPERACEÆ.

Bulrush or Great Club-rush (*Scirpus lacustris*).—Though called a rush, this is really a sedge. It grows in ponds and lakes, throwing up tall round stems 6 feet or 8 feet in height. These are used for rush-bottomed chairs, mats, hassocks, and in some places for thatching. The principal use is to render casks water-tight by placing them between the staves. The roots, being astringent, were once regarded as of medicinal use.

Cotton Grass (*Eriophorum angustifolium*).—The long silky hairs which surround the fruits are useful for stuffing cushions. It has been woven, but the hairs are too brittle, so do not stand being twisted. Wicks are made of it by country folk.

GRAMINEÆ.

Grasses.—Many genera and species form meadow hay, which need not be here enumerated; but the following Grasses have certain specialities:

Sweet-scented Vernal Grass (*Anthoxanthum odoratum*).—This imparts the peculiar scent to fresh hay; it is the same principle as occurs in the Tonquin Bean and Woodruff. It is a short Grass, not affording much fodder in itself.

Mat Grass (*Ammophila arundinacea*).—This is a common, coarse-growing, maritime Grass on our sea-shores. Its underground creeping stems are valuable in binding the sand together, and preventing its being blown away. It has saved thousands of acres of land. The creeping stems, sometimes 30 feet in length, are made into ropes by seaside

* An old name for March (Chaucer).

dwellers, as well as mats, which have given the name to the Grass.

Annual Meadow Grass (*Poa annua*).—Perennial species of this genus are valuable fodder Grasses, but this annual one is too small to find a home among the usual meadow Grasses; but for such places as the London parks it is invaluable. It seeds profusely, and drives out other plants, so that a constantly-cut lawn may be entirely composed of it, provided it be moist, for it does not succeed in very dry soils. It becomes a perennial under the former conditions.

Reed (*Phragmites communis*).—This well-known and tallest of our native Grasses frequents rivers, lakes, and marshes, bearing long feather-like, purplish panicles with silky hairs, imparting a silvery lustre to them. The stems are used for thatching, being superior to straw. Mats are also made of it, as well as numerous other purposes in fen countries. Pens were originally made of reeds, and, as a fine point was impossible, it accounts for the black-letter type made in imitation of the fourteenth century handwriting.

Couch Grass (*Poa repens*).—This most troublesome of Grasses on arable land, in consequence of its creeping rhizome or underground stem, becomes a valuable plant in its varieties which frequent sandy shores, for they help, with Mat Grass and others, to bind the sand-dunes and prevent their shifting. On the Continent the creeping stems are collected and sold for fodder, as they contain a good deal of starch, sugar, and mucilage. G. HENSLOW.

THE FLOWER GARDEN.

THE SEED TIME AND HARVEST OF DAFFODILS.

BOTH these operations are practically simultaneous in the Daffodil and Narcissi world, for when the seed pod is ripe enough to be gathered the other extremity, namely, the bulb, is ready to be lifted and stored.

Triennial lifting is advisable for division of bulbs, but storing for any space of time is not an absolute necessity, for without doubt, if bulbs have to be lifted for the purpose of division and transplanting to new ground, the best method is to lift and transplant almost simultaneously. There are those who believe that the old roots afford nourishment to the new ones forming, and there is probably good reason for the statement. One thing is certain, that the sooner the bulb is planted after lifting, and especially the Poeticus section, the better, for any ordinary observer must often have noticed how root effort begins in the store quite early in the summer, say, August, and especially if the weather is damp. The functions of the Daffodil and Narcissi are so numerous that Nature requires to have the bulb in her keeping as long as possible, and in their wild existence they would, of course, remain undisturbed in the soil. It is not quite in accordance with trade conveniences that the public should require early delivery of bulbs, neither would it suit gardeners who do not wish to plant bulbs till their summer beds have shed their splendour.

But to experienced growers and seedling raisers, who follow the fortunes of their special bulbs from start to finish, anxiety is probably at the highest pressure when the time arrives for lifting and transplanting. In any ordinary season there is very little doubt that, with perhaps one or two exceptions, such as, say, Weardale Perfection and King Alfred, whose foliage retains vigour somewhat persistently, all bulbs may be lifted after the middle of June, and all keen growers, whose ranks are annually swelling, and who, of late years, have

been procuring many of the new and beautiful varieties chiefly raised by the Rev. G. H. Engleheart, as well as many of the older and charming sorts, should "ask for and see they get" their bulbs as soon as possible after being lifted.

The paring, peeling, and polishing adopted by many to give the bulbs a well-ripened appearance is quite unnecessary. With the increase of Daffodil and spring flower shows, a word of advice may be useful to those who contemplate staging varieties in the numerous classes of Narcissi. To obtain the best results bulbs should be procured and planted, if possible, before the end of July, and the beds should be prepared now, with all forethought as to flowering time, when heavy gales do so much harm to blooms. Soil is a most important factor, and where very heavy the beds should be well raised, and sand with wood ashes introduced. The foliage of rare kinds should never be cut, as it is the life of the bulb, and committees of spring flower shows should never insist on "own foliage," with

WORK AMONG THE DAHLIAS.

As the ground between the rows of plants will get hard trodden during planting time it is well worth turning the soil up with a fork to within 18 inches of the plants. If heavy rains have fallen since the plants were planted out this work is almost a necessity, as the surface will become perfectly hard as soon as the hot sun dries it. This digging is not very heavy work, as the under soil will be in good condition, and so it is merely a matter of forking over. Plants are now growing very fast, and if they have been well looked after are throwing strong shoots from near the base. For a time these are best simply looped up to one stake, but as soon as they are from 12 inches to 15 inches long this system will become dangerous and other stakes will be needed. In a few cases, however, the plants have a tendency to run up and make a bud, without producing side shoots, as they should. The only thing to do is to wait till the shoots have started a little and then cut off the top two or three joints, which will quickly cause the lower growths to push forward. Now and then the plants produce very fine leaves when young at the expense of strong side growth. By dispensing with these one or two

TREE PEONY (50 YEARS OLD) IN THE GARDEN OF MR. F. TAYLOR, THE MANOR HOUSE, DISS, NORFOLK.

each variety. In conclusion, July is, or should be, the busy time of the Daffodil and Narcissi enthusiast, and as a sportsman he may afterwards betake himself to any other pastime in which he indulges, with perhaps an occasional eye to the necessities of his "Daffs" as regards weeding, surface hoeing, and top-dressing, until they signify their gratitude by commencing to push up the ground previous to yielding their spring tribute.

Rosemorran.

C. DAWSON.

THE TREE PEONY.

THE plant shown in the photograph is a specimen in the garden of Mr. F. Taylor, the Manor House, Diss, and late M.P. for South Norfolk. The dimensions are 15 feet in width, and it is about eighty years old, the same age as the Cedar shown in the background. This year there were four hundred flowers of average size, from 8 inches to 9 inches across.

at a time the shoots sooner get the lead. Another important point with bushy growing varieties is to limit the number of shoots, even at so early a stage of growth, as some few varieties produce a number of shoots which are necessarily weakly, and if left fail to lay a good foundation for the future plant. Thin out the worst of these, only tying up the strongest. As soon as it is no longer safe to trust to one stake add two others to form a triangle, or four for a square if time is no object or only a few plants are grown. Three are enough for ordinary purposes. These additional stakes should be well driven into the ground pointing outwards, while the base of the stakes should be rather more than a foot away from the stem each way. A piece of stout string is placed round the stakes, to which eventually the shoots will be tied, so it must be low enough for the laterals to reach comfortably. When these stems are long enough, cut the plant adrift from the one stake which has till now supported it, select, say, six of the strongest shoots as near the ground as possible, and carefully tie them to the string, which, by the way, should be a soft rough string, not hard and smooth. This tying

out is a work which requires some care, as naturally when the shoots are bent out to meet the string it throws a strain on the joint at the main stem, and very often the shoots will break off.

To prevent this not only must the shoot be tied to the string, but another piece of raffia must be placed round lower down and tied back to the main stem, so that the shoot bends instead of slipping out of its socket. Even when every care is taken if a gale should arise considerable damage will be done by breaking the shoots. An important item must now be seen to, namely, covering the soil with rough stable manure: no matter what the weather is during summer, this covering is bound to be beneficial. The material should be, if possible, almost fresh, and having shaken out the shortest spread this near the plants and then cover with straw. The one drawback to this covering is that the birds persistently scratch it about: the only thing which seems to check them at all is to use almost fresh straw on the top. If left undisturbed for any time this manure becomes full of fibrous roots, and should the weather be dry it helps to keep the soil moist. Every effort should be made to keep the plants growing well and healthily, and be sure no thrip exists in the heads of the shoots. The buds must be formed on a healthy strong shoot if a fine flower is to be developed later on. It is seldom that much water is needed before now, and certainly no feeding with manure water, but from the time of planting a syringing overhead at night is always very beneficial.

As soon as the shoots have grown long enough to reach another string, say, 6 inches higher up the stakes, the same process should be repeated as before, except that the shoots will need tying to the string without fear of breaking anywhere. Do not let your wish to see a bloom allow you to leave any buds. Delay this pleasure for a while, or until the main side shoots come into flower.

H. S.

MIMULUS FIRE KING.

This is a brilliant blood crimson variety of the large flowering *Mimulus*, most attractive in colour, and effective both in the open ground and in pots. This type of *Mimulus* has been much improved of late years, and has become a market subject. The finest blooms come on plants grown in pots and placed in the open air, where they can be shaded from the sun for four or five hours during the hottest part of the day. Few plants are so floriferous as the *Mimulus*, and especially so if the seed pods are kept picked off and the plants have every attention in the matter of watering. R. D.

ROCKETS (HESPERIS MATRONALIS.)

THE charming lilac-rose double variety of *Hesperis matronalis*, which Mr. E. Beckett exhibited at the last meeting of the Royal Horticultural Society, is a welcome addition to a class of plants of which we possess but few representatives, supplying a tint of colour and size of bloom most acceptable in every way. There is, of course, the single Rocket, which freely seeds itself and becomes a weed in some gardens; the flowers are white with a tint of pink. It has one advantage, it will grow and flower in East End gardens, where the commonest double varieties would fail.

In addition to the fine new variety mentioned above, which appears to be of vigorous habit, there are some fine double forms, the most plentiful being the common white, the flowers of which become tinted with pink; it is a somewhat tall and strong grower, and when well cared for producing fine spikes of bloom. But in Lancashire and adjacent counties there can be met with a highly refined double white, quite pure, and with compact full blossoms, but it does not do well in the drier and hotter south. I have brought it from Manchester on two or three occasions, only to fail with it after giving it every attention both in pots and in the open border; others evidently experience the same difficulty in cultivating it, as it is never seen among collections of hardy plants at its season of flowering. There are also two forms of the

purple Rocket, the common form and one of dwarfier and more compact habit, which was produced many years ago by the late Mr. Henry Hooper of Bath under the name of Compactness, but I have not seen it for several years past: a plant or two of the old double purple was seen at the Drill Hall on the 13th ult., but they were but sorry illustrations.

The double Rocket is a plant which soon succumbs to neglect. It can be kept in condition only by good cultivation, and I have seen the white and purple double varieties shown in superb condition in various places among collections of hardy cut flowers. Successful cultivators recommend that the plants be divided once in two years, and have fresh quarters given them, as change of soil begets renewed vigour. Division is one method of propagation, another is by means of cuttings made of the young shoots when about 3 inches in length. They may be put into a sandy mixture under the shade of Gooseberry and other bushes. The young plants when rooted should be planted out on a nursery bed to grow into size, and it is a good plan to raise young plants annually in order to ensure a supply. Double Rockets greatly appreciate a generous soil, a moist loam deeply dug and well manured, a little mulching during summer, and an occasional dose of liquid manure are desirable during drying weather, applying the latter after a good soaking of water at the roots.

R. DEAN.

THE ROCK GARDEN.

GOOD COLOUR FROM THE ROCK GARDEN.

ALTHOUGH in their native lands there is no colour more beautiful than that of rock and alpine plants, owing to various causes their full value is seldom shown in gardens.

The common way of making what is called a rockery prevents all breadth of grouping. The puerile idea that a rock garden is made by planting stones on end is against all effective planting. You cannot get plants into natural colonies in that way, and the "pockets" prevent them from taking anything like their usually pretty spreading habit. The great majority of alpine plants do not want pockets; they want to be raised above the level in order to escape the surface water. They enjoy having their roots behind stones, but they no more object to a flat surface or gentle slopes than grass does, as may be seen upon the Alps in all directions. If people would put their rocks in simple ways instead of exposing their sides like milestones, it would be much easier to group well and get the full effect of the colour of the mountain flowers. Another mistake long rooted in our habits and which spoils all the mixed borders in the land, is the common way of placing dots instead of easy groups, putting cultivation or good effect out of court. Hence, although we may secure much of the individual beauty of the plant seen close at hand, we do not get the true colour effect, which is the most subtle charm.

BEAUTY OF GROUPING.

In the rock garden at Swaylands in Kent, made by Mr. Drummond in a very spirited way, we saw much that reminded us of good rock plant colour lately, and there were some very impressive effects from the Gentians, Rocky Mountain Phlox, Purple Rock Cress (*Anubrieta*), and rock shrubs that flower at this season. No other plants specially put out for their show of colour could have given such brilliant effects, and we feel sure that owners of rock gardens might get far more enjoyment from them if they adopted these simpler ways of grouping. We do not say that only one kind of plant should be used in a given spot, for two kinds sometimes intermingle with

pretty effect—as they often do in their native haunts—but the great thing is to get

BROAD GROUPS

of each plant, whether it be *A.p.ne* Heath, or the Purple Rock Cress which flowers for three months in the spring, or such plants as the common Woodruff, which group themselves if we let them. Ten kinds well used are more effective than a hundred species as commonly set out. The plants that may be used are numerous, and their colours refined and beautiful in the highest sense. Beside the true rock plants there are many dwarf shrubs like *Helianthemums*, some of the smaller Roses, and mountain shrubs generally, that lend themselves to fine effect in colour.

OTHER ADVANTAGES.

It is not only beauty that we get, but also helpful simplicity in cultivation; for, clearly, if we have to make changes when a plant gets tired of the ground or for any other reason, it is far easier to deal with visible masses than with scattered dots. Another point is that, with the feeble dotting system in use, the weeds take possession of the bare ground, whereas many of these mountain plants, if allowed to spread into groups, unite to keep the enemy out. In every way, therefore, the rock garden is much more easy to manage where the dotting system is set aside. There remains the question of getting enough plants to secure this effect, and happily most things in common use are readily increased by cuttings or division. Rockfoils, for example, which are so useful, are easily increased to any extent by division; the little American *Phloxes* also. The *Aubrietias* come freely from seed or cuttings. It is only the rarities which may be difficult of increase. Most things of free growth, as rock plants, are of quick increase by simple means.

COARSE PLANTS.

Coarse plants are too often seen flowerless, too vigorous, or without beauty of colour. These should be removed to the herbaceous borders and the wild garden, or elsewhere, not only because of their ugliness, but as being apt to exhaust the ground near fragile plants, robbing them of moisture and light, or actually overgrowing and killing them—a common sight on neglected rock gardens. Plants growing upon *moraines* or cliffs are not overfed, but at least they have not to fight with the vigorous herbs one too often sees on rock gardens. These also help to mar the colour of the rock garden, breaking up masses and giving a very un-alpine look to the scene.

REPETITION FATAL TO GOOD EFFECT.

The repetition of the same thing all over the rock garden is the surest way to destroy harmonious and right colour. If we are fond of yellow Alyssum, or any other showy plant, let it be on a bank or wall in a bold way in one place, or, if it is a plant we are very fond of, we may even have two or three groups of it in different aspects. But if scattered all along the same line of view the result is fatal to any harmony of colour. Again, harsh contrasts should be avoided, seeking rather gentle and harmonious effect. The grouping and massing should never be stiff. Masses might run one into the other here and there, and need not always be confined to plants of one sort. Things of like stature and character might at times be allowed to run together, any hard and fast rule being against good work in gardening as in art. The making and keeping up of a good rock garden is a costly thing, and the least return that can be expected by those

willing to incur the cost is to get the full colour value from the plants.

GRASS.

Often, even in well-formed rock gardens, there are grass paths which are troublesome to keep and less good in their effect than those of stone. Also, in some of our best rock gardens, there are often isolated rocks surrounded by grass, whereas they ought always to rise out of a bed of Thyme, creeping Speedwells, dwarf Heaths, Daphnes, or Milkwoods. Some of the most charming scenes in those parts of the Alps richest in plants are where single stones rise, perhaps, only a couple of feet out of ground which is densely covered with dwarf Daphne or Alpine Anemone. If fearful of trampling upon such plants (which we need not always be, seeing how the Thyme upon our heaths will bear trampling), the simplest way is to put a few old flagstones down as a path, placed not more than a foot apart; these permit of passage in all weathers without injuring the plants. Spaces wasted in many rock gardens upon grass or gravel might, if well carpeted, give good colour, and may at least be planted with Thyme, Stonecrop, Rock-foil, tiny Peppermint, and Sandworts. The objection to grass is that it is not nearly so good in effect as the rock flowers, and it has constantly to be cut at the cost of needless labour.

Since writing the above a wall covered with *Erinus* has come into view, and not for the first time. Its modest colour is most effective when held together in this way, and there could hardly be a better example of the fine colour value that lies half hidden in these mountain flowers. As a dot this plant is without effect; on the wall it is beautiful hundreds of yards away, as well as in every nearer point of view.

W. R. in *Flora and Sylva* (July).

NOTES ON LILIES.

LILIUM NEILGHERRENSE.

A RECENT mention of the Neilgherry Lily on page 431 of the previous volume reminds one how scarce it is now to what it was some time since. About twenty years ago it used to form quite an annual display in the nursery of the late Mr. William Bull at Chelsea, but year by year it became more difficult to get good bulbs, and now it is, I believe, almost impossible. At all events, in Messrs. Wallace's catalogue is the significant announcement—supply doubtful. It is in every way a striking Lily, flowering at any time from August to nearly Christmas, and in the days before retarding Lily bulbs by means of refrigerators was thought of a few flowering examples at the autumn Chrysanthemum exhibitions were always viewed with favour. Though the majority of the long tube-shaped blossoms are more or less of a creamy tint, there is a certain amount of individual variation, for I have had flowers nearly white, and occasionally suffused with purple on the exterior. Mr. Bull used to obtain his supplies from the Neilgherry Hills, and fine bulbs many of them were, one in particular I remember carrying five flowers.

Instructions are often given for the culture of *Lilium neilgherrense*, but as far as my experience extends a supply can only be kept up by continual importations. True, given bulbs of sufficient strength, imported direct from their Indian home, the cultivation necessary to develop the blossoms is a simple matter, but the following year the display will be much less, and after that the plants cannot be depended upon. Freshly imported bulbs that arrive here, say, in February, should without delay be potted in a mixture of loam, a little peat,

and a good sprinkling of sand. The upper part of the bulb may be about half an inch below the surface of the soil. After potting enough water must be given to keep the soil slightly moist, and as the plants grow and roots develop an increased amount is, of course, necessary. A peculiar feature of the Neilgherry Lily is that very frequently the stem, instead of growing upright, proceeds horizontally from the top of the bulb and extends in this way till the edge of the pot is reached, when it takes a downward direction below the ball of earth, finally making its appearance at the side of the pot just opposite to that from whence it entered. Planted out these stems will often run some distance in this way, not only under cultivation but also in a wild state. Besides this Lily, the Burmese species such as *L. bakerianum* or *Lowi*, *L. nepalense*, and *L. sulphureum*, are more difficult to obtain in the form of large bulbs than was at one time the case.

H. P.

THE ROSE GARDEN.

NOTES ON SOME NEW ROSES.

I WILL only preface these notes with the statement that I have seen all the Roses mentioned growing and flowering out of doors—with the single exception of *Etoile de France*, which I have only seen under glass—most of them in the large nurseries, some few in my own garden. If there is any one Rose I should like to draw particular attention to it is *Louis Ricard*. I think we have found at last a really good dark Hybrid Perpetual, and I believe that what Frau Karl Druschki has been to the white flowers *Louis Ricard* will be in the dark section, namely, the finest exhibition Rose we have of its colour. This is high praise, but not, I think, undeserved.

Aimée Cochet.—One of Messrs. Soupert and Notting's introductions of 1902, a Hybrid Tea of distinct promise, colour flesh pink, flowers large and full, with the desired pointed centre, a free bloomer of good growth.

Alice Lindsell.—A Rose I have already referred to in these columns. One of Messrs. Dickson's best, and that is saying a good deal.

Boadicea.—A grand Tea, that was well shown at the Royal Horticultural Society's Temple show by the raisers, Messrs. William Paul and Son of Waltham Cross. A robust Comtesse de Nadaillac.

Bob Davidson.—A Hybrid Perpetual of 1902 of Messrs. Dickson's raising. This Rose is turning out well; its colour is excellent, and it is a good grower.

Commandant Felix Faure.—Sent out in 1902 by Bontigny, this Rose has done well with me. A well-known grower writes: "This is a grand Hybrid Perpetual, of a rich crimson, not unlike Duke of Edinburgh when seen at its best; but in shape unlike that good old Rose, being finely cupped, with pointed centre. It is a fine grower, free and continuous flowering, and I think very highly of it." I have seen some lovely coloured flowers this year of this Rose, quite up to show form. Its colour is exceedingly bright, and it is undoubtedly one of the best of the new Roses.

Edmond Deshayes.—A plant of this has done well with me. The flowers are nearly white, large, and imbricated. Good enough for exhibition.

Earl of Warwick.—This I have already referred to in these columns. Messrs. William Paul will be distributing it in the autumn. It will prove one of those all round satisfactory Roses that are so useful. Quite good enough for the exhibitor's purpose, but at the same

time an excellent garden Rose, vigorous in growth and of free flowering habit. The colour is distinct, true salmon-pink, an offspring of Mrs. W. J. Grant, and raised at the Waltham nurseries of the distributors. It was well shown by them at the Royal Horticultural Society's Temple show in May last.

Etoile de France.—As I anticipated in my first note to you on this Rose, it was exhibited in fine form at the Temple in May, Messrs. William Paul and Son having half a dozen plants in their magnificent collection. It promises to be a good bedder, and no doubt will often be found on the show table. There was a suggestion of purple in the colour in the older flowers that one does not like to see, but I think this is one of the Roses that have come to stay. I have to thank Messrs. Frank Cant and Co. of Colchester for sending me flowers of this and other new Roses, and I am similarly indebted to Messrs. Cooling of Bath and Messrs. Paul and Son of Cheshunt.

Franz Deegan.—This may be described as a pale yellow Kaiserin A. Victoria, but it opens more freely. I have had very pretty flowers on a maiden plant.

H. E. MOLYNEUX.

(To be continued.)

NOTES ON HARDY PLANTS.

BULBS REMAINING DORMANT.

ON page 231, Vol. LXIV., I recounted some experiences of bulbs remaining dormant, and now return again to the subject. The bulbs of *Ornithogalum arabicum* that I mentioned as having shown no signs of growth for a whole year, but still plump and apparently sound, have made no visible sign of growth this year. A day or two ago I uncovered a couple and found them hard and plump, but with no more roots than when I examined them last autumn. How long they will remain in this comatose condition I have no idea, but they show no sign of rotting up to the present. The tuber of *Tropaeolum pentaphyllum* that I wrote of as having died down in the winter of 1903 and shown no sign of growth up to the end of September, when I penned my note, commenced to send up shoots in October, kept growing all through the winter and is now in flower.

S. W. FITZHERBERT.

DIMORPHOTHECA ECKLONIS IN THE OPEN.

THIS plant, generally treated as a greenhouse subject, is far more effective in the open than under glass. In the open air it makes far sturdier growth and flowers profusely. Growing rapidly, effective plants for the outdoor bed may be raised from cuttings in one year if occasionally stopped. Good plants 2 feet in height and as much through can be easily lifted in the autumn, placed in large pots, kept where severe frost will not reach them, and planted out in the spring. This practice is quite applicable to any district in the British Isles. In favoured sites in the south-west the *Dimorphothea* may be left undisturbed in the open through the winter, though if this should prove unusually severe the plant will probably die. I have a plant in the garden that has been in the open bed entirely unprotected during the whole winter and has suffered no harm, though it has experienced 6° of frost. It is rather over 3 feet in height and of about the same diameter, and in the early portion of the month was a beautiful sight, being covered with some hundreds of its white, purple-backed flowers set off by their violet-blue central discs. In dull weather and in the evening the flowers close, so that it is only when the sun is shining that the plant presents its fullest attractions. A native of South Africa, the *Dimorphothea* has been styled the Transvaal Daisy, a title often also applied to

the brilliant *Gerbera Jamesoni*, so that amateurs are sometimes puzzled by this similarity of nomenclature.

S. W. FITZGERALD.

ENOOTHERA MARGINATA.

THIS Evening Primrose, known also by the names of *E. eximia* and *E. caespitosa*, is, without doubt, the most lovely of the entire family. Its great, pure white flowers, cup-shaped and often 5 inches across, emit a delightful Magnolia-like fragrance. The blossoms are, however, very fugitive, opening after sundown and fading before the next noon; but, on a large plant, they are produced in such abundance that their short life is not a matter of much moment. Blooms are produced continuously

stock, placed in a bed of pure sand in the open, covered with a bell-glass and kept shaded and watered will soon root.

S. W. F.

GROUPING OF HARDY FLOWERS.

IN the garden shown in the illustration there is at least one lesson given by the borders, and that is the value of one single plant or family in certain positions. We may try every kind of mixture and combination, and fail to get anything so good as allowing a plant that likes the place to

of choice shrubs. Where these are newly planted, the Irises are the finest things to furnish the space between the shrubs, which never ought to be jammed together, as they are by many planters. The simple grouping shown is the more beautiful from the way in which the plants creep over the stones in the pathway.

RECENT PLANT PORTRAITS.

THE July number of the *Botanical Magazine* contains portraits of

Vallozia trichophylla.—Native of Eastern Tropical Africa, also known under the synonym of *V.*

A STONE PATHWAY IN FLOWER GARDEN, SHOWING THE BEAUTY OF SIMPLE GROUPING. (From a photograph by Miss Willmott.)

through the three summer months, and for these to be seen to the best advantage the plant should be grown on an elevated ledge about 3 feet from the ground and near a pathway, so that the blossoms are brought close to the eye. A native of the Californian mountains, introduced more than thirty years ago, this *Enothera* can scarcely be deemed hardy, though it has been known to endure fairly severe frosts without detriment. When it is happy in its surroundings it spreads rapidly and often appropriates a space 4 feet square in a couple of years. In some gardens, however, it proves hard to grow and disappears in the winter. It is easily raised from cuttings of the flowering stem, which, if taken off with an inch of the woody

have its own way. This is particularly true of very hardy plants. There is nothing so reposeful to the eye as a group or colouring of one thing doing well. Among the flowers we enjoy in this way are Lilies of the Valley, Solomon's Seal, Globe Flowers, and Irises. The Iris is more valuable than most flowers from its fine form of leaf and evergreen character. The flower of the Florence and the rich purple Iris in the garden are handsome in bold masses. But when the bloom passes away there remain always the fine sword-like leaves, never in the way, and so useful where a little repose is desired. We find them excellent in bold groups

equisetoides. This is a very beautiful and uncommon-looking plant of the natural order of Amaryllidaceæ, and produces triplets of showy rosy lilac flowers resembling a large Crocus. It is described as a shrub having a thick stock 1 foot or more in diameter, and short, thick, primary branches. The flowering shoots are numerous and very short.

Gronoma gracilis.—Native of Tropical America, also known as *G. weddeliana*. This is a graceful tropical Palm, with bunches of small yellow flowers.

Spathoglottis hardingiana.—Native of North Burma. This is a rather pretty Orchid of the Epidendrum family, with upright panicles of small rose-coloured flowers.

Chrysanthemum ornatum.—Native of Japan, also known as *C. marginatum*. This is a pretty sort, with medium-sized pure white flowers and foliage faintly margined with white.

Pitcairnia spathacea.—Native of Argentina, also known as *Puya spathacea*. This is an interesting but not very beautiful plant, producing tall, branching spikes of pale pink tubular flowers with bluish green front petals.

The first number of the *Revue Horticole* for July figures a group of three pretty varieties of hybrid Clematis named Mme. Raymond Guillot, Mme. Moret, and Mme. Leroyer. These are said to be quite a new race, produced by crossing a herbaceous perennial species coccinea with a shrubby species of the Jackmani race. They are described at some length by their raiser, the well-known French hybridist, M. Francisque Morel of Lyons.

The *Revue de l'Horticulture Belge* for July contains portraits of a handsome variety of

Iris pallida, with golden variegated foliage, named *Iris pallida foliis variegatis*, and

Ficus diversifolia, an upright-growing shrub, bearing ornamental golden-yellow fruits of a pyriform shape. They are produced in profusion from the axil of almost every leaf, and stand upright on the branchlet of the shrub. This is a native of the Malay country, and is also known under the following synonyms—*F. spatulata*, *F. deltoidea*, *F. ovoidea*, *F. sideroxilifolia*, *F. lutescens*, and *Erythroyne frutescens*.

W. E. GUMBLETON.

AN ARTIST'S NOTE-BOOK.

IPOMŒA RUBRO-CŒRULEA.

SEVERAL notes have appeared in THE GARDEN concerning this glorious climber, both as to its value as a greenhouse plant and in favoured counties for a wall outdoors. Writing from South Devon last September, "S. W. F." says: "It has been a beautiful sight with me against a sunny wall in the open for the last six weeks, and it seems strange that so few employ this lovely plant for the adornment of their gardens during the late summer and early autumn. The pale blue flowers, from 3 inches to 4 inches in diameter, are the admiration of all beholders, and supply a tint absolutely unique in the summer garden. The best plan is to raise the seeds in heat, placing them separately in 4½-inch pots in porous soil, and to grow the plants on until they are from 18 inches to 2 feet high, with the flower buds formed. They should be planted in rich soil against a sunny wall, care being taken not to disturb the roots in turning them out. Thus treated they receive no check and continue to make growth and to form additional flower buds, readily ascending wire or string strained tightly 2 inches or so away from the wall. It is well to have them ready to put out about the end of June or early July, when hot weather can generally be reckoned on." *Ipomœa rubro-cœrulea* may be grown in this manner at least as far north as the Midlands. In one garden known to us it is used with good effect in the summer garden.

ROUND ABOUT A GARDEN.

DROUGHT AND BAD TEMPER.

HOW a period of drought brings out the quarrelsomeness of plants! "It is easy," says an old proverb, "for the happy to be kind." And, when the perennial border gets sufficient rain in season, how pleasantly the satisfied plants get along with one another! There is a little jostling, no doubt,

No one can grow fat on good fortune without occupying more cubic feet of space than he did before; and if the border is well filled there is always a tendency of the robust to bulge against their neighbours. This, however, is seldom difficult to correct. Like the conductor of a crowded omnibus, you can always persuade the strong to squeeze up a bit in order to leave room for the weak, and so you may get every inch of space occupied exactly as it ought to be according to the unwritten law of a well-conducted garden.

"FALLING OUT."

When, however, hot days come in succession with very little rain—before these lines are printed all our gardens will have been drenched probably—some of the outlying borders of a large garden must be left to take care of themselves; and, if the soil is light, they soon get thirsty and fall out with one another. And that phrase "fall out"

AN ANNUAL IPOMŒA

(*I. RUBRO CŒRULEA*).

Natural size.

From a drawing by H. G.

Moon.

might have been borrowed directly from the quarrels of plants, for it describes exactly what they do. At the knuckle end of a long border there is a large clump of German Iris, which, with its neighbours, has always rather a hard time. In addition to the lightness of the soil it stands within range of the encroaching roots of trees; and it is here that the first effects of hot weather are always perceptible. The German Iris at once "falls out," and its neighbours suffer,

THE IRIS ON THE WAR-PATH.

For in three wet years the Iris has so prospered that, from a mere slip, it has grown into a large circular clump of matted rhizomes, throwing up a luxuriant ring of broad green blades and a profusion of fine flowers in spring. In any case it would have to be divided this year because it is crowding its neighbours; but the effect of the dry weather has been to

make it maliciously aggressive. Each of its several hundred blades has fallen flat and has fallen outwards, and the consequence is that every plant within a radius of 18 inches has been weighed down and half suffocated. On the sun-smitten plains of Kashmir I have seen large tracts of plainland covered with blooming Iris in spring and with Iris foliage which "flopped" to the ground in hot weather. One could not help wondering how the plant obtained its monopoly of the ground which it occupied, but now the mystery is explained. By "flopping" outwards from its centre—in the same way that Primroses and scores of other wild plants behave in summer—the Iris smothers and kills its immediate neighbours, and so it spreads and spreads until the whole plain seems in spring a flower-bed of pale mauve Irises.

WANTED—A RULE.

This seems simple enough; but what is it which tells each Iris blade in which direction to fall when the supply of moisture to keep its tissues crisp and tense is failing? Take my Iris clump, for instance. The blades to the north have fallen further north, those to the east have fallen to the east, and those to the west and the south have respectively observed their proper direction. The initial slope of the blades probably decides the matter, and in a circular clump you will usually find all the green blades leaning slightly outwards even in the most prosperous times, when they are almost perpendicular. By this means they are always annexing new territory instead of crowding each other. But what is it which warns them against crowding each other? Why, in fact, does an Iris clump always tend to become a circle spreading outwards?

THE EXPLANATION?

The probable explanation is that the blades have a tendency to lean towards that side from which the roots draw up most moisture, though

you would naturally expect them to lean to the other side, since the outer cells should be first distended. Nature, however, seems to have discovered that the plant's chances in the struggle of existence are improved by the rising sap crossing over to the opposite side to that from which it is drawn, so that, as the ring of Iris roots exhausts the soil within its circle, the blades are all curved outwards, ready to occupy a new frontier of ground, at the point of the bayonet, so to speak. And the habit is so common in plant life that it must be subject to some such rule. Every plant which forms a rosette of leaves upon the ground, like the Primrose or the Plantain, exhibits it in the strongest form. Every kind of wild grass which grows in clumps, every Fern, every plant which rises from a bulb—indeed, it would be difficult to name any herbaceous plant of any kind which does not come under the rule.

A LARGE ENQUIRY.

This suggests enquiry as to the operation of the rule in the case of plants of larger growth. Do trees lean in the direction from which their roots draw most moisture? Of course, in most landscapes the slope of the trees indicates merely the direction of the prevailing wind. But may it not be possible, after allowing for the influence of the wind, to discover by the growth of trees in which direction the supply of water lies, and so deprive the water-diviners of their pretended sphere of utility? It would be a grand principle to establish that the water supply of a neighbourhood is always situated at the point towards which vegetation converges. As we have seen in the case of the Iris, there is some principle at work which causes all the blades to "flop" outwards, and, as all plants which grow in tufts do the same, it seems natural to conclude that Nature has given them the power of turning in the direction from which they draw nourishment. Therefore the position of the water supply in a landscape should be indicated at once to the expert by the drift of the vegetation. This may seem a large conclusion to draw from slender premisses; but what I would insist upon is that when the blades of an Iris clump, or a tuft of grass, or the leaves of a Primrose or Plantain, or even, perhaps, the Mushrooms which make "fairy rings" in the grass, persistently diverge *outwards*, they must obey some rule of wide-reaching scope. Of the Mushrooms it is easy to say that their tendency is to occupy unexhausted ground; but why should the leaves and branches of other plants always diverge unless it is the rule that the sap always crosses over, so as to distend the cells of each on the side opposite to that from which it has been drawn? E. K. R.

THE KITCHEN GARDEN.

WHEN TO PLANT ASPARAGUS.

JULY may appear a rather unseasonable date to offer advice or comment upon the various methods of planting Asparagus, but my remarks will have a special reference to the summer treatment of seedling plants. Transplanting Asparagus frequently proves a more delicate undertaking than anticipated, failures to quickly establish a good bed being far more numerous than successes. At any rate, such is the case in this district, and it is likely to be so until a different method of procedure is adopted. In most instances the beds have been prepared considerably in advance of planting time, and if the soil was of a light or quickly drying character, this would be a correct, or at any rate quite safe, proceeding. As it happens in our case, it is neither the one nor the other. The

soil in the beds being deep, loose, and finely divided soon becomes saturated and cold, very rarely being fit for the reception of the roots when planting time arrives. What makes matters worse, if the roots or crowns are bought in, is that they are usually days before they reach their destination. As a consequence, in addition to being unavoidably mutilated when lifted, they also become very dry, cold winds, and it may be some sunshine completely killing what fresh root fibres may have been formed prior to their being lifted. In this badly crippled state it is not to be wondered at if a good percentage of them fail to recover from the severe check.

Late in March or early in April, according to circumstances, is the usual time for transplanting Asparagus, this being the time when active root and top-growth commences, nor if the fresh stock has to be got from a distance can this rule be well departed from. It would not be wise to plant earlier, the lifting and replanting being done perhaps during the prevalence of cold March winds, while if deferred till late in April or early in May, all the more forward shoots and young roots would be lost in transit. As it is, many of the just moving shoots come to grief, these being very brittle, and the packing must be very careful indeed if it saves them. All this is mentioned, in order that employers may appreciate the difficulties their gardeners have sometimes to contend with, and to be better able to account for any failures that occur. How to avoid these unfortunate occurrences is the next question, and this, I think, can be answered satisfactorily. My ideas, however, on the subject are not novel, but having from experience found it answers well to deviate from the usual routine, I can with confidence recommend others to do the same. After repeated trials and from close observation of what has been done elsewhere, I have arrived at the conclusion that the seed should be sown where the plants are to grow, or else that new beds ought to be formed with one year old plants only. Frequently higher prices are paid for much older roots, the impression being that these will be much the quickest to yield strong shoots for cutting. They may do so in some few instances, but more often than not they make but poor progress, many of the roots failing outright; while others ought not really to be cut from till they have two clear seasons' growth. When the seed is sown where the plants are to remain, the seedlings being well thinned out not later than July, those reserved grow strongly and root vigorously in all directions. During the following summer they will throw up numerous strong shoots, and may be cut from lightly in the third season, though it is better, if possible, to encourage early and strong growth for yet another summer.

The next best method of quickly forming profitable Asparagus beds is to transplant one year old home-raised seedlings, deferring this important work in all cases, especially where the soil is cold and heavy or the position late and cold, till the first fortnight in May. We have found the best results attending the latter practice, and for the future no transplanting will be done before May. Not only is it wise to defer this work till the first shoots are about 1 foot in height, but—in our case, at any rate—we prefer to prepare the beds only a few hours or just immediately in advance of planting. The soil can be returned to the trench, well mixed, and the beds formed evenly, all therefore sinking regularly, or it can be trenched, well broken up, and otherwise made fit for planting at once. Once a heavy rain falls on newly moved soil of a clayey nature, it is not fit to plant for many days or even weeks after, the wiser plan, therefore, being to plant the Asparagus before the soil has become saturated. If the plants are prepared on the place there is no difficulty about it, as, should the weather be unfavourable for the work early in May, it may safely be deferred till nearer the end of the month. Last spring we prepared and planted a raised bed with two year old roots during the first week in April, another being formed a fortnight later, and filled with an equal number each of two year old and one year old plants; while yet a third bed was planted during the second week in May, this time with one year

old plants only. Already the young plants have surpassed the older ones, and, what is still more satisfactory and conclusive, the last-formed bed is much superior to the other two.

One year old plants not having become so strongly and widely rooted as those older are much more easily lifted without breaking many roots, and if replanted carefully as fast as they are got up the check is scarcely perceptible. Ours with quite long shoots scarcely flagged in bright sunshine, and not a plant has failed. Those, then, who have raised a few rows of seedlings with a view of forming new beds with them should not neglect the plants in any way. It is not such a great number that is needed for a fresh plantation. Our raised beds are 5 feet wide at the bottom, with sloping edges, and 26 yards long, and in each there are three rows, totalling about 150 plants. There is no necessity to clear the rows of seedlings, but if a portion are left about 18 inches apart, these would either be available for forcing at the end of the second year or else may be left where they are to yield shoots for a few or many years. The seedlings raised this season ought, therefore, to be thinned to 6 inches or 9 inches apart, according to the number required next spring, and all that is further necessary at the present time is to keep the ground about them quite clear of weeds. After a long spell of wet weather clayey soils are apt to crack badly, but a mulching of short manure will tend to prevent this. W.

THE FRUIT GARDEN.

PLUMS AS BUSHES.

WHEN properly managed this is one of the most satisfactory of all methods of growing Plums. Standard trees produce enormous crops sometimes, but as a rule they only bear once in three years, in what are known as good Plum years; for the blossom is destroyed by frost at least one year in three, while another year is used in recuperating after the production of a heavy crop. They do well for market purposes when well established, but for private gardens the bush presents great advantages—the fruit is not blown off by the wind, insect pests can be kept in check, protection can be afforded from the frost, a crop can be reckoned upon almost every year, they are easy to prune, the fruit is much finer both in size and quality, whilst four bushes can be grown in the space occupied by one standard, the four being different varieties, and so providing a succession of fruit, instead of an enormous quantity of the same sort. In addition to these solid advantages, while the standard is of little or no beauty except when in blossom, some of the large-leaved varieties as bushes, if kept free from insect pests, make really handsome shrubs on a lawn. Much space might thus be utilised which is now occupied by shrubs of little beauty. Growing Plums in this way is such an easy and interesting occupation, and such a source of delight in its results, that some ladies have of late years taken to it with enthusiasm, most of the work being quite clean.

Fortunately, the hardier Plums will grow on almost any soil, though a good clay loam, well drained and resting on a calcareous subsoil, is the most suitable and gives the best results, and, in fact, for some of the tender Gages, is almost necessary for success. It is said that a soil which will grow a good Cabbage will do well for Plums; but a soil containing an excess of humus and a deficiency of lime and phosphates is apt to induce too rank a growth for fruitfulness. The soil is not of such supreme importance to bushes as to standards, as the former can be lifted occasionally and good soil put underneath and around them. Trees so managed are extremely fruitful and can be grown in a very small space. Plums are of varying tastes and constitutions, some succeeding specially well in one district and some in another, and a consultation before planting with a local nurseryman, or some one who grows a number of varieties, with a view to ascertaining if any particular sorts are a

failure, may save some disappointment subsequently. The stocks on which the Plums are grafted is a matter of considerable importance, few people when buying trees, even when choosing them personally, taking any trouble about it. Some nurserymen are fond of grafting on the Brussels stock, as it is such a vigorous grower and trees upon it rapidly attain a good size. It is quite unfit for trees to be grown on the restrictive system, as it produces a superabundance of spray and often a constant succession of suckers, and it takes several years to get them into bearing, even with summer pinching and lifting.

The common Plum is a good stock, for, though vigorous, it is much less so than the Brussels stock. Other more or less suitable stocks are the Mirabelle Petite and Pershore Plum, while for dry, sandy, or chalky soils the Sloe makes a very excellent stock, as it will thrive on a soil upon which the common Plum will only just exist. Bushes should be planted as early in November as possible, care being taken never to plant in wet or sticky soil. A layer of mortar rubbish at the bottom of the hole serves the double purpose of drainage and feeding the trees, while some basic slag, bone dust, or bone meal mixed with the soil will maintain the trees in health and vigour for years to come, lessening their liability to become exhausted by the heavy crops bushes so often bear. No animal manure should be mixed with the soil, as young Plums generally grow strong enough, though a mulching of strong manure is beneficial. Bushes should be 8 feet or 10 feet apart, supposing them to be grown on the restrictive principle, as distinct from the natural bushes market growers adopt.

The pruning of bush Plums is most important, especially during the first two or three years. All shoots not wanted for the extension of the tree should be pinched to three or four good leaves, not counting the small leaves at the base, as soon as the lower leaves are well developed, and the resulting shoots or laterals pinched to one leaf, and so on again if necessary, the whole shoot being cut back to two or three leaves, or one good leaf, the end of August or beginning of September. The extension shoots in young and vigorous trees may be cut back to 6 inches to 12 inches, according to their strength, the weakest cut back shortest, about midsummer or soon after. This lets the sun to the fruit as well as to the developing fruit-buds on the inner parts of the tree, for if the tree remains like a thickset all the summer no fruit buds will be formed in the centre. If the terminal bud on any shoot breaks out the shoot can be shortened to another leaf later on. The removal of the long shoots will give a great impetus to the swelling fruit, and will facilitate picking later on. If the aphids gets upon the trees badly, as it rarely does till the end of June, it can be remedied by picking off the affected parts, as it is only the growing extremities which are affected as a rule. If this does not meet the case they should be syringed with soft soap and quassia, or with a solution of paraffin-naphthalene emulsion of soft soap.

Trees should not be allowed to grow more than 6 feet or 7 feet in diameter and 6 feet high, for otherwise picking and pruning become difficult, and the sun does not get to the centre of the tree, which soon becomes barren, not only of fruit but of spurs. One thing to be looked to in pruning is the maintenance of an open centre, so that all the branches, both inside and outside, may be clothed with spurs, and form, in fact, cordons. Trees often grow much too vigorously at first, and if summer pinching is not sufficient to restrain vigour and induce fruitfulness, they should be lifted after the second summer's growth, unless the branches are seen to be well set with fruit-buds. Unless this is done, or the trees bear very heavily, the hard pruning necessary when the trees attain their full size destroys the reciprocal action between roots and branches, and the constant effort of the trees to restore it results in woody growth and barrenness.

The tendency with well-managed bush trees is so to exhaust themselves by producing enormous crops of fruit that they need two or three years' rest. This can be prevented in two ways. Unless the fruit is very thick indeed it is a pity to thin it

when very small, except with one or two very free setters like Early Transparent Gage, Victoria, Orleans, &c., but if thinned as soon as stoning is finished, the fruit picked off will be useful for culinary purposes. This will relieve the trees a good deal, and it can be still further helped by the application of liquid manure in the summer, the easiest way to give this being to sprinkle 1lb. of good guano on the surface of the soil around each tree, lightly hoe it in, and then give a good watering. This may be done once a fortnight if the trees are carrying a very heavy crop, though if a mulch is put round the trees—an excellent plan to conserve the moisture—the hoeing is not possible, though an excellent thing for letting the air into the soil. In addition to this method of feeding the trees should receive a dressing of basic slag in the autumn at the rate of 5lb. to the 20 square yards, and if the growth of the tree is weak or insufficient through excessive cropping, some animal manure should be given as well. Trees fed in this way will rarely be unfruitful, and when growers complain of their unfruitfulness after a few years, failure to help the trees in this way is generally the cause of it. It follows that when a tree has exhausted the plant food within reach of its roots in bearing heavy crops that it can produce no more until the roots have gone further in search of more food. Bush Plums are easily protected from frost in the spring by throwing pieces of canvas or other light material over the tops of the trees. There are not generally many nights when it is necessary, as 5° of frost does no harm if it is dry, and therefore it is all the greater pity to lose a crop for want of such a little attention. The loss of the blossom through frost often affects the next year's crop by inducing too luxuriant growth, especially with some of the Gages. The first great secret of success with these trees is to get a good crop of fruit when the trees are young, and so check the tendency to luxuriance of growth; and the second secret is to secure to every part of the trees a full amount of sun and air to ripen the wood and develop the fruit buds.

ALGER PETTS.

GARDENING OF THE WEEK.

FRUIT GARDEN.

MUSCAT GRAPES.

MUSCATS which are now ripe, and those approaching ripeness, should have a slightly drier atmosphere, also plenty of light, by keeping the laterals pinched and the leaves lightly drawn aside from the bunches. Keep the border fairly moist and mulched with litter, and a slight warmth in the pipes at nights, especially in dull or wet weather. Muscats for autumn and winter use will require plenty of heat and moisture, with liberal supplies of warm weak liquid and occasional sprinklings of some approved Vine manure. Give a temperature of 70° at night, 85° by day, rising to 90° with sun-heat after closing. Remove any seedless berries from the bunches which have been overlooked. Give plenty of air in favourable weather, with a light shade, and more especially is this beneficial during the stoning period.

POT VINES.

Pot Vines which are intended for early forcing next winter need more ventilation and a little less moisture at the roots. Good supplies of liquid manure must, however, still be given, the Vines must be kept well syringed to keep down red spider, and the laterals closely pinched.

STRAWBERRIES.

The earliest runners layered, as advised in a previous calendar, are now ready for potting into 6-inch pots. Mix up a compost of fairly heavy loam with an addition of lime rubble, bone-meal, and fine charcoal. This must be rather dry when used, to allow of its being made quite firm. Use clean pots, with a sprinkling of soot over the crocks. This will help to keep out the worms. The plants should be placed in an open position on a firm ash base. The plants should be first well

watered, and afterwards carefully watered until rooted through, lightly sprinkling the plants over through a fine rose can several times daily. As soon as the fruit has been gathered from the beds, and the required number of layers obtained, remove surplus runners. The planting season will soon be here, and the ground for new beds should be prepared. It is best to dig deeply and manure liberally the previous winter, or, better still, to bastard trench it, afterwards planting an early crop of Potatoes, which can be cleared in good time. Select those varieties which fruit best in the district for the main crop. At the same time give a trial to newer ones. The Laxton has done remarkably well outside here. The alpine varieties which have had all the early flowers picked off should now be encouraged by being mulched and well watered with liquid manure.

THINNING FRUITS.

Thin the fruits of Apples and Pears on pyramids and bushes, also on half standards. Pears will not require so much thinning, with the exception of wall trees, where fruits are set thickly. Apples are thickly set in clusters, and will be much improved in quality by being freely thinned.

Impney Gardens, Droitwich.

F. JORDAN.

INDOOR GARDEN.

EUCARIS AMAZONICA.

THAT portion of these plants that six to eight weeks ago were in flower are just completing their growth. It is advisable that such plants should be given a little consideration, and a rest may be given by removing them to a lower temperature and to a position in which they can be afforded more air, and, consequently, a slightly reduced supply of water to their roots. By September next such plants, with careful treatment, should produce another good crop of flowers. To plants in a growing condition afford copious supplies of soot water and an occasional weak dose of guano water, as well as manure liquid. Probably the best time for repotting—and this should seldom be attempted—is just previous to starting them into growth, but late autumn potting is not advised.

TREE CARNATIONS

that have for some time been in their flowering pots are now quite ready for removal from the frame or other protection to the open air. During a hot and dry season it may be advisable to plunge the pots in sand or ashes and thereby reduce the labour entailed in watering; but during a season like the present—and especially in the north—placing the pots on a bed of coarse gravel is advised, previous to which dust the gravel-beds well with soot to check the ingress of worms. As the shoots of vigorous growing plants elongate they are liable to be broken by wind, so that attention to staking will be necessary. Stimulating liquids are quite unnecessary until the pots are getting filled with roots, and at all times the best of care is necessary in affording them water. It is a good plan when placing the plants in the open air to arrange them so that any spare frame-lights may during stormy weather be temporarily placed over them in order to shield them from heavy rains and thus prevent the soil in the pots from getting soddened with water.

VAILLOTA PURPUREA.

The best time for repotting these plants is directly their flower-spikes are produced. This is seldom necessary, as the plants dislike being disturbed; but whenever it is done afford them for a little time afterwards a light shade during hot, sunny weather. Keep the surroundings of the plants cool and moist, and do not apply water to their roots superabundantly until leaf growth begins to develop, and at this time a little fertiliser may with advantage be given.

MISCELLANEOUS.

Opportunities are now afforded for staking, cleaning, and otherwise preparing plants generally for all kinds of decorative work. Tradescantias and Paeonies are usually in demand, and a stock of these may be easily produced by inserting from eight to ten cuttings in 3-inch pots, and which after propagation may be grown on for use in the

same pots. Train and encourage the shoots of Smilax to grow up thin, stretched-out strings, so that when growth is completed they may be cut away in lengths suitable to any purpose.

J. P. LEADBETTER.

Tranby Croft Gardens, Hull.

KITCHEN GARDEN.

CELERY.

THE remaining trenches may now be filled up. These will provide good Celery through the winter and spring months, and there will be no danger of the plants running to seed, as is often the case from very early sowings. Before lifting the plants, give them a good soaking of water, so that each may be lifted with a good ball of earth. If the weather is very hot, frequent watering will be required till they have become established. It may also be necessary to shade the plants for a few days. This may be done by placing some spruce branches across the trenches, removing them in the afternoons.

SPINACH.

A good sowing of Spinach should now be made for autumn use. This plant will stand better now and should not run to seed so quickly. In order to have fine broad-leaved, vigorous plants the ground for this sowing should be well prepared, and in an open situation. Spinach in many gardens is too often relegated to some out-of-the-way corner or jammed between rows of other crops. Sow 15 inches apart between the rows. A few rows of Spinach Beet may also be got in now. This vegetable is often appreciated in winter and very early spring.

ONIONS.

A plot should now be got in readiness for the sowing of these, prepared the same as for spring sowings. Sow seeds of Giant Rocca, Trebons, or other suitable and hardy sorts. Sow rather thickly, so that a sufficient amount of plants may be had for spring use and for transplanting into beds.

LEEKS.

Those sown in April for the main crop should now be planted out as advised in a former calendar. Ground that has been cleared of early Potatoes or Cabbage will suit them well. Those sown in heat and that are now growing rapidly in trenches may have some soil drawn to the stems. Give frequent waterings with liquid manure with soot added.

CARROTS.

The last sowing of these may be made now. Where Carrots are a troublesome crop, the better plan to adopt is that of frequent sowing. The plants will generally stand until fit for use, though they may be very small. Make the soil firm before putting in the seed. Early Horn is a suitable variety for sowing at this date.

EARLY POTATOES.

Varieties such as Sharpe's Victor, Harbinger, &c., may be lifted and the most shapely tubers selected for sets. Those for seed may be laid out in the sun to green or be placed in a cool airy room. Those for consumption may be put into a pit or dark cellar. Some manure can be got into the land cleared of early Potatoes in readiness for the planting of Cabbage, or other winter crops.

*Hopetoun House Gardens,
South Queensferry, N.B.*

THOMAS HAY.

FLOWER GARDEN.

THE WILD GARDEN.

THE growth of all established plants has been so luxuriant this year that, although, as a rule, the wild garden should be left alone as much as possible, it has become necessary to restrict many of the strongest growers, which, if allowed to grow unchecked, would quickly take the lead and smother many smaller and probably more desirable plants. But all necessary thinning and pruning should be done with the greatest care and judgment, or the work will leave behind a prim stiffness and formality which will utterly destroy the charm of this delightful phase of gardening. This is the time to make a few notes of any future improvements, and to carefully jot down the names of suitable plants to raise or procure for the purpose. The native Foxglove has made a most attractive show this year, and the introduction of a few plants of the improved varieties serves to render this corner even more attractive. These seed very freely, and after a couple of years there will be numbers with varied colours and markings. An indiscriminate mixture of *Eschscholtzia californica* and its varieties thrives remarkably, and makes a most brilliant show if planted on a dry sunny slope where many other things would shrivel and die. And here again one planting will suffice, for they freely reproduce themselves. If space can be afforded the addition of many of the more showy

hedge plants adds greatly to its interest. In the moister spots the Gunneras have made enormous leaves, and have thrown up numbers of their remarkable cone-like inflorescences. With young plants it is as well perhaps to remove most of them to strengthen the plant, but with the old-established clumps I prefer to let them remain. The vigorous *Impatiens Roylei* (*I. glandulifera*) grows freely under similar conditions, and a bold group of it is very striking. In a rich moist soil it will grow to quite 6 feet in height, and under favourable conditions it becomes naturalised. A. C. BARTLETT.

Pencarrow Gardens, Bodmin.

ORCHIDS.

DENDROBIUM CHRYSANTHUM.

THIS being an early growing species the new growths are now fully developed; a slight rest should be given by removing them to an intermediate temperature. It is not necessary to withhold water, the change of temperature being quite enough to bring about the desired rest. As soon as the flower-buds begin to show themselves the plants should again be taken back to the stove Orchid house till they are fully expanded, when they will benefit by being again removed to a house in which the atmosphere is dryer and cooler. They will be best in such a house as this until the new growths are well advanced, when repotting may be done.

DENDROBIUM DENSIFLORUM AND THYSIFLORUM AND D. FARMERI.

The growths on these are now sufficiently advanced to enable repotting to be done in a compost of two parts peat and one part sphagnum, well mixed with some sand and small crocks. Pots are very suitable. Half fill them with chopped rhizomes. Keep the compost low enough to allow of a top-dressing with sphagnum. I strongly advise that old specimens that have decayed centres and have many old pseudo-bulbs per lead should be carefully pulled to pieces, and the old bulbs and rhizomes cut away, so that when the plant is rebuilt no lead has more than three bulbs behind it. The plants would then go on for several years. Such radical treatment would not be needed if some are taken away each season. Plants that do not require potting will benefit by having some of the surface material removed and fresh added. From now till the completion of growth the stove Orchid house affords the best home. After that time the temperature of the intermediate house is suitable till the flowers show signs of appearing in the spring.

DENDROBIUM CHRYSOTOXUM AND D. SUAVISSIMUM.

Though closely akin to the foregoing, and with the exception of position when growing, they may be given the same treatment; yet to obtain the best results the growths must be developed in strong light. Only enough shade to prevent the leaves being scorched should be given, and the cooler buoyant atmosphere of the Cattleya house is more suitable than the stove house. When the growths are well advanced is the best time to repot. Newly potted plants require careful watering; otherwise when growing water them freely and spray on all favourable days. It is important that the growth should be completed as early as possible, so that they may ripen early. When the new growth is fully developed very little water will suffice to maintain a healthy plant.

Gatton Park Gardens, Reigate. W. P. BOUND.

NOVEL POTATO PRODUCTION.

FEW people are aware that an entirely new system of growing young Potatoes during the autumn and winter months has been recently discovered. This novel method of Potato culture is likely to become exceedingly popular, as it is so simple that the merest amateur can scarcely fail to be successful in his first trial. Like a good many other things,

TWO YEAR OLD SETS WITH GROWING TUBERS.

VIEW OF CAVE WITH OLD TUBERS ON ROCK.

it was found out quite accidentally. Mr. G. Stanton, steward of Park Place, Henley, being the fortunate discoverer. He came across it in this way: The establishment of which he has charge being a large one, a considerable quantity of potatoes are stored each year. When the tubers are lifted they are carted to some chalk caverns, of which there are several on the estate, and there placed on the floor in heaps. These caverns are, of course, perfectly dark. Now the crop thus garnered a year or so ago was a particularly large one, far more Potatoes being stored away than could be possibly used. On previous similar occasions any surplus had been given away when the following season's crop was lifted. Accordingly, in July of the succeeding year, preparations were made for the removal of all the old Potatoes remaining. It was then discovered that many of the old tubers were simply covered with tiny new Potatoes, very small certainly, but real Potatoes nevertheless. The most promising of these tubers were selected and placed one deep on the floor of another part of the cavern, a little finely sifted dry soil being lightly sprinkled over them. About a month afterwards it was found that the budding Potatoes had increased very much in size, and were, in fact, big enough to gather for the table. They were found to be very much superior in quality to young Potatoes grown in the ordinary manner, being almost entirely free from waxiness. So satisfactory were the results of these experiments that arrangements were made for a large number of old tubers to be placed on rough wooden shelves and arranged in the manner indicated. Throughout the autumn and succeeding winter the needs of the establishment were fully met by young Potatoes produced in this novel manner.

It is found that the old tubers will go on producing small Potatoes for a long time, often until they have little left but the skin. After all the biggest new Potatoes have been picked off the old tubers, they are placed once more in

the mould, the tiny ones being ready for gathering at a later date, thus giving a succession. It is strange that practically no leaf or root action is made from the old Potatoes.

Satisfactory results have been obtained from Potatoes grown in this manner in Mushroom beds, or in frames with a little heat, although artificial warmth does not appear to be at all necessary.

Anyone who can find a dark dry corner, with a fairly even temperature, can grow Potatoes in this manner, only the place must be perfectly dark. Those thinking of experimenting in this direction should at once procure some old Potatoes of a decent size, as they should be started in August. The kind which has given the satisfactory results detailed above is Windsor Castle, though probably any main crop or late varieties would do as well.

A little care should be exercised in the cooking of these Potatoes. It is very important that they should be *slowly* boiled in a saucepan for seven or eight minutes, and after that steamed until done.

NURSERY GARDENS.

MESSRS. STORRIE AND STORRIE,
DUNDEE.

WELL known to horticulturists in the south as well as the north are Messrs. Storrie and Storrie of Dundee and Glencarse, and the exhibits of this firm in London and elsewhere have made some of their special productions widely known. The seed warehouse and offices of the firm are in Seagate, Dundee, where the management is largely in the hands of Mr. Hutcheson, one of the members of the firm. In the Craig Street Flower Market the firm has also a prominent position, so that the local trade is an extensive and increasing one. The

nurseries are at Glencarse, close to the railway station of that name and about twelve miles from Dundee on the railway between that city and Perth. The position of the nurseries is an open one, ensuring firm growth, while the soil is rather heavy, necessitating a good deal of labour and attention at certain seasons, but favourable to the growth of many plants and trees. Messrs. Storrie and Storrie have certain specialities which form leading features in their business. Many of these are familiar to those who frequent the meetings and shows of the Royal Horticultural Society and the shows of the Royal Caledonian Horticultural Society. In the nurseries it is apparent that exceptional quality is the object aimed at. Thus this year the strain of Iceland Poppies, containing the most exquisite tints, will again undergo a drastic selection. This strain, which originated at Glencarse, has been hardly sufficiently fixed, and Mr. D. Storrie expresses himself as disappointed with the proportion of new tints which have appeared from last year's seed. This means that the process of selection must be continued for a little longer. As is well known, Messrs. Storrie have a splendid stock of border Auriculas. These are grown at Glencarse in great breadths, and their "Invincible" yellows are of great beauty and sweetly scented; while the "Nondescript" or variously coloured Auriculas are also general favourites. Primroses and Polyanthus are also specialities, and about 200 named varieties of the latter are cultivated. Hose-in-hose varieties receive special attention, and these flowers are to be seen in great quantities. There are specialities cultivated under glass also, for which there is ample accommodation. The "Invincible" single Begonias are immense in size, and a steady improvement in substance is apparent within the last few years.

Cyclamens, Cinerarias, Primulas, both *P. sinensis* and *P. obconica*, and other indoor florist's flowers are specially studied and rigorously selected for improvement. So are Gloxinias, of which there is a remarkably good strain. A well-known speciality of Messrs. Storrie is the Streptocarpus, and great numbers of these are grown and carefully selected for seed. They have been exceptionally fine this year. Celosias also receive particular attention, and the plumosa and cristata classes are very good. Pelargoniums of different classes are cultivated largely with such favourite greenhouse and stove plants as Fuchsias, Crotons (*Codiaeums*), Coleuses, particularly fine, and other plants suitable for the large general and local trade of the firm. Clematises are largely propagated, and Messrs. Storrie and Storrie are very successful with these.

It is a surprise to those who have only heard of Messrs. Storrie and Storrie in connexion with flowers to find that probably their leading speciality is fruit trees. Mr. David Storrie takes the keenest interest in fruit culture, and his experimental grounds are evidence of the care and thoroughness of this department. A large stretch of the spacious nursery is devoted to trial grounds for the various Apples, Pears, Plums, Cherries, Gooseberries, Raspberries, and Currants in cultivation. Here all the old and new varieties are grown and passed under review, and Mr. Storrie could tell many interesting experiences of the troubles of nomenclature which have fallen to his lot in comparing the varieties. Still more interesting is it to have his opinion of the comparative merits of these as adapted or unsuitable for Scottish growers. The trees and bushes are models of what fruit trees should be.

In the trial grounds there are upwards of 250 varieties of Apples; thirty varieties of Raspberries (one of the most important crops of the great Blairgowrie fruit industry), about sixty Red Currants, eighteen or so White Currants, eighty Plums, many Pears (including the old ones formerly prized in the Carse of Gowrie), Black Currants, and Cherries, while the newer fruits, such as the Loganberry, are also represented. This year at Glencarse it may be said that Apples are a heavy crop, as are Currants, Cherries, and Gooseberries; but Pears, except some of the older and hardier varieties, and Plums are not so good, this being a general experience in the north.

S. A.

THE FERN GARDEN.

MAIDENHAIR FERNS FOR CUTTING.

WHERE there is any great demand for cut fronds of these Ferns, the earlier started plants will no doubt have been run upon somewhat hard from the time their fronds were fit for use. It will do these plants a considerable amount of good if they are for a few weeks kept quite cool and comparatively dry at the root, only just sufficient water being given them to prevent actual suffering. Whilst this is being done all the shabby fronds may be cut off with advantage. In fact, when the plants are quite dry at the roots it will not do them any harm to cut off all the fronds that have been left, although thinning out would be safer where the plants are at all overpotted. These plants after a few weeks' rest will again start into good growth and perfect a crop of most useful fronds for the winter season. It will not be advisable to repot any plants from such a stock now; this would rather tend towards a too soft growth; in fact, Maidenhair Ferns are frequently far too much overpotted when this object of a cut supply is the chief and all-important point. When sufficient rest has been allowed them, the plants should be given a fair amount of warmth, but not with too much moisture in the atmosphere. A pit, for instance, from which a crop of Melons has been taken would be a good position. Here they would be tolerably near the glass, with probably the chance of a slight amount of fire-heat if needed. The all-important matter, however, is to secure a hard growth; this is best done by free exposure to light with a liberal amount of ventilation, and, as before advised, not too much moisture. When the growth becomes free and plentiful, then it must be seen to that they do not suffer at the roots from want of water. In the case of a stock which has not been run upon hard and which has been grown on in the usual way without early starting into growth, the fronds will now be well hardened and in good condition for cutting. These plants will continue to grow for a long time to come, thus forming a good succession of fronds. As in the case of the others, too much shading is a great mistake; this, combined with a moist atmosphere, produces large pinnae, with fronds also that are frequently much too large for use, whilst they never last nearly so long as the smaller ones when cut. Plants grown in this way might, it is true, be considered to be well developed; but this is what is not required from a practical point of view. Besides, light-coloured fronds are always the most sought after by floral decorators as being the most effective. These can only be had when the plants are not grown in too kind a manner. Another point which is overlooked by some growers or not given enough consideration is that of the soil. If too much reliance is placed upon peat there will always be a tendency towards vigorous growth. On the other hand, by using a light fibrous loam or heavier loam that is corrected by the addition of a little peat, the results will be found far more satisfactory. I have previously alluded to keeping the plants in a fairly light position. This may in some cases (it is so in my own case) be somewhat of a difficulty, particularly where the majority of the houses are specially devoted to fruit culture, the occupants of the roofs thus imparting too much shade. Rather than attempt to grow the plants in such positions it will be a better plan to keep the stock in cold frames with a light shade upon the glass if much exposed. Frames can usually be spared at this season of the year. In some instances they are not nearly all to be found in actual use about now, the lights often being for the time stacked away upon their sides. Here, then, those who have a good stock of plants may safely place them when so situated as not to be able to give them a fair chance in their houses. If this were done more than it is, we should not see so many Maidenhair Ferns drawing out a miserable existence in places totally unfit for them. As an instance of this I would only allude to the one fact, viz., that of still continuing to grow the plants in

the heat and moisture of a stove house at all times of the year, frequently over-potted and as much over-watered. Another fine place for securing a good enduring growth is upon shelves, whence the plants have always a free circulation of air playing around them. In such positions they will, of course, be found to dry up quickly, but this should not be any drawback in the least. The basket culture of these Ferns should be more practised where possible. By this mode of culture a good stock of fronds will frequently be in hand when the pot plants have been hard cut, simply because the basket plants are not so accessible at the moment. The smaller growing Maidenheads which assume a roseate tint will be found to be further intensified in colour when grown fairly well exposed to the light and air, although most of these require rather more warmth than the common kind. *A. tinctum*, *A. rubellum*, and *A. Veitchii* are three of the best of these to supply occasional fronds in a cut state. Where seedlings of any kinds are seen to be springing up they should be well cared for, a young stock of these being always useful to supply the place of the older and somewhat exhausted plants. Wherever it is possible and practicable also, I would advise the extended culture of Maidenhair Ferns planted out. This may be done upon bare walls hitherto unsightly by merely fixing some wirework to the face with a little soil; margins also to stages may be planted with decided advantage. Besides *A. cuneatum* for cutting, note should be taken of *A. elegans*, *A. mundulum*, *A. deflexum*, *A. Williamsii*, and *A. Bausei*. F.

NOTABLE GARDENS.

NOTES FROM A SOMERSETSHIRE GARDEN.

CRICKET ST. THOMAS ranks among the finest gardens in the west. On the rockery there are some fine bits of colour from plants that bloom at this season. Near by is a large bed of herbaceous Peonies in the best of health. Near the house are large beds devoted to all the best kinds of hardy border plants, arranged to keep up a continuous display throughout the year. On the walls some of the best Tea Roses are in bloom. In the kitchen garden are two borders on either side of the central walk, spanned by several Oak arches, over which are growing Crimson Rambler and other Roses and climbing plants. At the time of my visit the borders were gay with Oriental Poppies, Canterbury Bells, Aquilegias, Spanish and other Irises, Peonies, &c. On a high wall I saw the finest crop of Figs I have ever seen at this season out of doors in an inland garden. There will be an enormous crop. The first dish of Peas was gathered from Chelsea Gem, raised in pots and planted out early, those sown in the open following a week or ten days later.

The fruit crops under glass are most promising, Peaches and Grapes especially. There are still some trees of the former planted by the late Mr. Davis forty years ago, and still doing good service. In a large span-roofedinery there are Black Hamburgh vines planted on the south side and trained over the roof to the opposite wall. The portion on the north side is doing equally as well as that on the south as regards the crop and growth, but I was told by Mr. Syon that the flavour was not so good. These vines are from twenty to twenty-five years old. Did space permit I would have given a description of a house full of plants in flower in which there was a grand lot of *Streptoclen Jamesoni*. JOHN CROOK.

WESTWOOD, NEWPORT-ON-TAY.

UPON a recent visit to Westwood, Newport-on-Tay, the residence of Mrs. Walker, I found Mr. James Bethel, the head gardener, who is also secretary of the Dundee Horticultural Association, in the midst of his work. The grounds at Westwood, though not very extensively, are most attractive. They are admirably kept and contain many interesting things, while they give evidence of

Mr. Bethel's skill and enthusiasm for his work. The approach is prettily arranged with rockwork, upon which are some good alpine, while a collection of these plants in pans for exhibition is also grown. Bedding out is carried on to some extent with good taste, while hardy border flowers, Ferns, Dahlias, and other good garden plants are all done well. The collection of Ferns is a good one, and contains specimens which have carried off many prizes at shows. Mr. Bethel likes to keep up with the times, and has a border of *Storrie* and *Storrie's* new Iceland Poppies, as well as a number of the same firm's choice *Polyanthuses*, and a collection of the best new Sweet Peas, grown as pyramids. Under glass there are good *Pelargoniums*, *Cinerarias*, *Gloxinias*, and other favourite flowers, together with an unusually fine lot of *Begonias*, one of Mr. Bethel's specialities. *Chrysanthemums* in pots are also highly promising. The appearance of the grounds is very pleasing, trees, flowering and other shrubs and climbers, as well as the velvety lawns, all showing careful work. Apples and other fruits are doing as well as anywhere in the district. Of Strawberries Mr. Bethel's best varieties are *Garibaldi* and *Royal Sovereign*. There is a splendid strain of prize *Parsley* grown here, and among Peas Mr. Bethel prefers for early work *Croll's Early Defiance*, *Gradus* being another favourite. The newer Potatoes are represented by *Northern Star* (from cutting), *King Edward VII.*, and *Coronation*. S. A.

MISCELLANEOUS.

NOTES FROM A TOWN GARDEN.

TOWN gardens, as well as those in the country, have benefited by the splendid weather of early summer, that is provided the plants have been well supplied with water, which in small gardens is all important; often rain does them very little good, because much of it fails to reach the roots of the plants.

Lilium washingtonianum.—What an attractive Lily this is, and one that is of fairly easy culture. It enjoys a well-drained soil and partial shade; loam with leaf-mould and sand freely intermixed suit it well. The flowers vary considerably in colour; some are wholly white, while others are more or less tinged with pale purple. This is more pronounced as the flowers age. Bulbs planted early this year are now bearing blooms on stems some 2½ feet high. Some find this Lily difficult of cultivation, but I find that if given a sandy soil and not exposed to much sun or wind it thrives very satisfactorily. *Lilium pardalinum*, with its handsome richly-coloured orange purple-spotted blooms, is now also out. While an ideal position for this Lily is in a thin woodland, planted in moist, peaty soil, it is interesting to know that it will grow in a border of loam, leaf-soil, and sand with a northern aspect. How long it will remain in good health is still to be recorded, but at present it promises well. *L. superbum*, another North American Swamp Lily, is doing well in a similar position, and one stem has several flower-buds just about to open. There seems to be no accounting for the behaviour of *Lilium candidum*, as out of a clump of seven bulbs, the growths of which are apparently of equal vigour, only one flowering stem has been produced.

Among Roses *Caroline Testout* has been wonderfully good; the large, rich pink, shell-like petals are of splendid substance and make a grand flower. This variety has bloomed exceptionally well this year, and especially those plants with a western exposure and shaded from the south and east. *Margaret Dickson*, too, is a Rose that is admirably suited to the town garden. Homer does well as a half standard, and so do *Charles Lefebvre*, *Crown Prince*, *Camille Bernardin*, and *Comtesse de Ludre*, while among the dwarfs *General Jacqueminot*, *Victor Hugo*, *Victor Verdier*, *Etienne Levet*, *La France*, and *Spencer* are perhaps the best.

Of annual flowers *Linum grandiflorum rubrum* has been very bright; the fairly large, deep red flowers on graceful stems that sway with every breeze make a bright display on a sunny day; on

dull days and in the evening the flowers partially close up. To get a really good show this annual must be sown fairly thickly. I remember having seen outside borders, some 20 yards or 30 yards long, covered with this annual, and when the flowers were open they made masses of red and transformed the bare soil of the Vine borders into masses of red and green. This is an idea that is worthy of imitation in gardens. The Linum is so shallow rooting as not to be able to do harm to the Vine roots, and it serves to keep the border cool to some extent, at the same time making the border a thing of beauty for many weeks, from the time the green growths of the seedlings peep through the soil until the flowers are over. The seedlings do not require thinning out; each is so slender that it takes up little room. To ensure a prolonged display of the flowers of annuals it is most important to give them plenty of water. The more they grow the more they will flower, but if allowed to suffer from drought they quickly cease to do either. *Sidalcea candida*, with flat, round, white flowers on an erect raceme, is very attractive, and is worth more attention than it usually receives. The English Irises are now coming into bloom, and promise to make a lovely display; they are as excellent for the town garden as the Spanish Irises, and most useful for cutting also.

Slugs are usually a bane to the town garden, and some may be glad to know that a sprinkling of common salt kills them quickly. To prevent them reaching seedlings or any other favourite food place a small ridge of salt round the plants to be protected; this seems to keep them away for a time, *i.e.*, until the salt has quite dissolved. Even for some little time afterwards the soil where it has been appears to be distasteful to them, and so they go elsewhere. Armed with a lantern and some salt, a good deal of useful work among the slugs may be done when it is dark. Some Carnation seedlings protected by having salt sprinkled around them are quite untouched, while some unprotected have been badly eaten.

H. P. A.

SOCIETIES.

ROYAL BOTANIC SOCIETY.

ON the 6th inst. the last of the monthly shows of the season was held. The exhibits were not numerous, so many provincial shows, as well as that of the National Rose Society, being in a great measure accountable for the falling off. This was rather unfortunate, for there was a better attendance than usual during the afternoon.

Messrs. Peed and Son of West Norwood had a fine group of *Caladiums*, lightly arranged with Ferns. Among the best sorts were *Fastuosum*, large bright red; H. J. Chapman, soft pink, with bluish veining; Mrs. J. Peed, red, with a crimson shade in the centre; *Silver Queen*, one of the best light varieties; *Mme. E. Pynett*, La Lorraine, and many others, also a few very pretty unnamed seedlings. Gold medal.

Messrs. Barr and Sons, King Street, Covent Garden, also obtained a gold medal for a large and interesting display of hardy flowers. Nymphs were a feature, and included some new varieties. *N. atropurpurea*, large flowers of a rich crimson-purple, and *N. gladiolifera*, a very large white variety, for which a certificate of merit was given, were specially worthy of note. *Delphiniums* were well shown also. *M. Duvalier*, purplish blue; *Manteau d'Azur*; *Clara Stubbs*, deep blue, and many others were good. Japanese and English Irises were well represented. Several good varieties of *Heuchera*, among them *micrantha* and *sanguinea splendens*, which is much brighter in colour than *S. grandiflora*. *Brodiaea murrayana*, with deep purple-blue flowers in umbels, reminds one of an *Agapanthus*. *Gypsophila Stevenii*, *Lilium giganteum*, *Eryngium*, a great variety of Sweet Peas, and other interesting subjects were included.

Mr. Sicklemore, gardener to Dr. Boxall, Abinger Common, Dorking, made a good display with Sweet Peas, having fifty varieties, including all the newest sorts, viz., *Scarlet Gem*, *Dorothy Eckford*, *Countess Spencer*, *Jeannie Gordon*, and *Gracie Greenwood*. Silver-gilt medal.

Lady Alice Dundas, Middleton Lodge, Richmond, Yorks, sent some fine blooms of *Malmaison* Carnation Princess of Wales and other varieties. Cultural commendation.

Mr. W. Baylour Hartland, Cork, sent *Galega Hartlandi variegata*. This has been said to be the same as *G. dubia*, but the foliage showed seemed distinct, and the long racemes of pale blue-mauve flowers were very pretty.

Messrs. Laxton Brothers, Bedford, sent their new Strawberries *Bedford Champion* and *Laxton's Reward*. A certificate of merit was given to the last-named.

Mr. J. P. Harvey, Kidderminster, made a display of Cucumbers, Tomatoes, Strawberries, and Ferns, grown by Mr. A. Coombes by the aid of their fertilisers, and which were certainly good specimens of culture. Silver medal.

Mr. G. Kelf, gardener to Miss Adamson, South Villa, Regent's Park, showed good examples of Peach Dr. Hogg and several sorts of Melons. Of these Regent's Park,

scarlet flesh, well netted and of good flavour, was awarded a certificate of merit. The exhibit also included some good table plants. Silver medal.

The secretary of the National Bee-keepers' Association gave a practical demonstration of how bees can be transferred from one hive to another without destroying them and other interesting details connected with bee-keeping.

HANLEY HORTICULTURAL SHOW.

THIS was beyond question the finest floral exhibition which has ever been seen in North Staffordshire. The show committee has been exceedingly fortunate in enlisting the continued interest and support of not a few of the best nurserymen and growers of the country. The following is a list of the principal prize-winners:

PLANTS.

Group of plants, arranged for effect, not to exceed 300 square feet: First, Messrs. Cypher and Sons, Cheltenham; second, Messrs. Artindale and Son, Sheffield; third, Mr. William Vause, Leamington.

Group of Orchids in bloom, arranged for effect, not to exceed 100 square feet: First, the Duke of Sutherland, Trentham; second, Messrs. Cypher and Sons; third, Mr. John Robson, Altrincham.

Group of *Malmaison* and other Carnations in pots, arranged for effect: First, Mr. John Robson.

Six plants in flower, distinct varieties, but Orchids excluded: First, Messrs. Cypher and Sons; second, Mr. William Vause; third, Mr. T. Bolton, Oakmoor.

Six plants in flower, distinct, and six fine foliage plants, distinct: First, Messrs. Cypher and Sons; second, Mr. William Vause.

Eight exotic Orchids, distinct: First, Messrs. Cypher and Sons; second, Duke of Sutherland; third, Mr. John Robson.

ROSES.

Seventy-two Roses, distinct varieties: First, Messrs. R. Harkness and Co., Hitchin; second, the King's Acre Nurseries, Hereford; third, Messrs. Townsend and Sons, Worcester; fourth, Mr. H. Drew, Faringdon, Berks.

Forty-eight Roses, distinct varieties: First, Messrs. Townsend and Sons; second, Messrs. Perkins and Sons; third, the King's Acre Nurseries; fourth, Mr. W. H. Frettingham, Beeston.

Thirty-six distinct varieties, three blooms of each variety: First, Mr. W. H. Frettingham; second, Messrs. Harkness and Co.; third, the King's Acre Nurseries; fourth, Messrs. Townsend and Sons.

Twelve new Roses, distinct varieties, introduced in 1902, 1903, and 1904, with names: First, Messrs. Perkins and Sons.

Twenty-four Hybrid Teas, distinct varieties: First, Messrs. Harkness and Co.; second, Messrs. Perkins and Sons; third, Messrs. Townsend and Sons; fourth, Mr. Prince.

Twenty-four Tea or Noisette Roses: First, Mr. Prince; second, the King's Acre Nurseries; third, Messrs. Townsend and Sons, Worcester.

Twelve best white Roses, any one variety: First, Messrs. Townsend and Sons; second, the King's Acre Nurseries; third, Messrs. Perkins and Sons.

Twelve best yellow Roses, any one variety: First, Mr. Prince; second, Messrs. Perkins and Sons; third, the King's Acre Nurseries.

Twelve best pink Roses, any one variety: No first; second, Messrs. Perkins and Sons; third, Mr. Prince.

Twelve best red or crimson Roses, any one variety: First, the King's Acre Nurseries; second, Messrs. R. Harkness and Co.; third, Messrs. Townsend and Sons.

Eighteen bunches garden Roses, in not less than twelve varieties: First, Messrs. Townsend and Sons; second, Mr. Prince; third, Messrs. R. Harkness and Co.

Nine bunches, in not less than six varieties: First, Messrs. Townsend and Sons; second, Mr. J. H. White, Worcester; third, Mr. Prince.

CUT FLOWERS.

Best collection of hardy perennials, arranged on table space: First, Messrs. G. Gibson and Co., Bedale; second, Messrs. Harkness and Sons, Bedale; third, Mr. J. H. White, Worcester; fourth, Messrs. Hewitt and Co., Solihull, Birmingham.

Best arranged basket of flowers: First, Messrs. Perkins and Co., Coventry; second, Messrs. Artindale and Son, Sheffield; third, Mr. D. Ffolkes, Newcastle.

Stand of cut flowers for table decoration: First, Messrs. Jenkinson and Sons, Newcastle; second, Mr. T. Boulton; third, Mr. W. Vause; fourth, Mr. D. Ffolkes, Newcastle.

Collection, twelve varieties Sweet Peas: First, Mr. T. Jones, Ruabon; second, Messrs. Hinton Bros., Warwick; third, Messrs. Jarman and Co., Chard; fourth, Mr. J. Bowler, Market Drayton.

Twelve varieties Eckford's Sweet Peas: First, Duke of Sutherland; second, Mr. T. Jones; third, Mr. John Madeley, Market Drayton.

Twelve distinct varieties of Sweet Peas grown from Sydenham's seed: First, Mr. J. Bowler, Market Drayton; second, the Dowager Lady Hindley; third, Mr. T. Jones, Ruabon; fourth, Mr. A. G. Holford, Eccleshall; fifth, Mr. J. H. Marsh, Newcastle.

FRUIT AND VEGETABLES.

Dessert table decorated with flowers and foliage, plants in pots being allowed, but not Orchids; not more than fourteen dishes of fruit selected from the list given: First, the Earl of Harrington; second, the Duke of Westminster; third, the Earl of Carnarvon.

Dinner table decorated with flowers and foliage only, plants in pots allowed: First, Mr. W. Vause; second, Messrs. Jenkinson and Son, Newcastle; third, Mr. W. Marple, Penkridge.

Collection of twelve dishes of fruit, not less than eight kinds and not more than two varieties of a kind, to include black and white Grapes, each collection to be decorated with flowers and foliage: First, the Earl of Lonsborough; second, the Earl of Harrington; third, Lady Beaumont. The Earl of Harrington was awarded first prize for decoration; second, the Earl of Lonsborough; third, Lady Beaumont.

Collection of six dishes of fruit, distinct kinds, to include two bunches of black or white Grapes, or both: First, the Duke of Westminster; second, Lord Bagot; third, Mr. J. Drakes; extra third, the Earl of Carnarvon.

Four bunches of Grapes, two black and two white: First, the Earl of Harrington; second, Lord Bagot; third, Lady Beaumont.

Two bunches of Black Hamburg Grapes: First, the Earl of Harrington; second, the Dowager Lady Hindley, Droitwich; third, the Duke of Westminster, Eaton Hall; fourth, the Marquis of Cholmondeley, Malpass.

Two bunches of black Grapes, any other variety: First, Lord Bagot; second, the Earl of Harrington, Elvaston Castle, Derby; third, Mr. Joseph Drakes.

Two bunches of White Muscat Grapes: First, the Earl of Lonsborough; second, Lord Bagot; third, Lady Beaumont, Carlton Towers, Yorks.

Two bunches of Grapes, any other variety, white: First, Lord Bagot, Blythfield, Rugeley; second, Mr. Joseph Drakes, Market Rasen; third, the Earl of Lonsborough.

One dish of fifty Cherries: First, the Duke of Sutherland; second, the Earl of Harrington; third, the Earl of Lonsborough.

Dish of twenty-five Strawberries: First, the Earl of Lonsborough; second, Lady Beaumont; third, the Duke of Westminster.

Twelve Tomatoes: First, the Earl of Carnarvon; second, the Earl of Lonsborough; third, Lady Beaumont; fourth, Mr. J. Drakes.

Collection of vegetables, grown from Sutton's seeds: First, the Earl of Carnarvon; second, Mr. J. Drakes; third, Mrs. Swann, Oswestry.

Collection of vegetables, grown from Webb's seeds: First, the Earl of Carnarvon; second, Lady Beaumont; third, Mrs. Swann.

Collection of vegetables, grown from Hewitt's seeds: First, Lady Beaumont; second, the Earl of Carnarvon; third, Mrs. Swann; fourth, Mr. J. Drakes.

Certificates of merit were awarded to Messrs. Hewitt and Co., Solihull, for seedling Carnation J. F. L. Evans; and to Messrs. Hinton Brothers, Warwick, for seedling Pea Eric Hinton.

LIST OF MEDALS.

Mr. A. J. A. Bruce, Chorlton-cum-Hardy, small gold medal for *Sarracenia*; Mr. Peed, London, large gold medal for *Gloxinias*; Mr. Sydenham, Birmingham, large silver medal for Sweet Peas; Messrs. Dobbie and Co., Rothesay, gold medal for Sweet Peas, *Violas*, and *Dahlias*; Messrs. Webb, Worsley, silver medal for Sweet Peas, &c.; Messrs. Artindale and Son, Sheffield, large silver medal for *Violas*, &c.; Mr. Hinton, Warwick, large gold medal for Sweet Peas; Mr. Bentley, Leicester, gold medal for Roses; Messrs. Blackmore and Langdon, Twerton, Bath, gold medal for *Begonias*; Messrs. Dickson, Limited, Chester, large silver medal for herbaceous flowers; and Mr. Child, Acock's Green, silver medal for herbaceous flowers.

WINDSOR AND ETON ROSE SHOW.

BY gracious permission of His Majesty the King this society held its thirteenth annual exhibition in perfect weather in the Royal Grounds at Windsor on Saturday, the 9th inst. Competition in most of the classes was fairly strong, and the general excellence of most of the exhibits was very noticeable. There was a good fight for the Challenge Cup (forty-eight single trusses), the place of honour falling to Messrs. R. Harkness and Co., whose blooms were perfect. Mildred Grant in this stand was adjudged the best bloom in the show. Papa Lambert, Bessie Brown, Lady M. Beauclerc, Mme. Cusin, White Maman Cochet, Her Majesty, Horace Vernet, and Mrs. E. Mawley were a few of the best. Messrs. Benjamin R. Cant and Sons, Colchester, were a good second; Messrs. D. Prior and Son third; and Messrs. A. Dickson and Sons fourth.

For eighteen Teas or Noisettes Mr. George Prince was placed first with a lovely stand, which included splendid blooms of Maman Cochet, Mrs. E. Mawley, Bridesmaid, Ernest Metz, Catherine Mermet, and Mme. de Watteville; second, Messrs. D. Prior and Sons; third, Messrs. B. R. Cant and Sons.

For twelve distinct blooms, three trusses of each, Messrs. Harkness and Co., Hitchin, were a good first with an even lot of blooms, of which *Marchioness of Londonderry*, Bessie Brown, Her Majesty, and Lady M. Beauclerc were the best; second, Messrs. Frank Cant and Co.; third, Messrs. B. R. Cant and Sons.

For twelve single trusses of any H.P. or H.T. Messrs. Frank Cant and Co. were first with a perfect lot of Mildred Grant; second, Mr. George Prince, with Bessie Brown; third, Messrs. B. R. Cant and Sons, with Frau Karl Druschki.

For twelve single blooms of Tea or Noisette Messrs. B. R. Cant and Sons were first with a lovely stand of White Maman Cochet; Mr. George Prince was a good second with the same variety, and Messrs. D. Prior and Son third with Maman Cochet.

For eighteen bunches of garden Roses Messrs. Frank Cant and Co. were first with an attractive stand, which included *Gardenia*, *Killarney*, *Marquis of Salisbury*, *Antoine Rivoire*, *Fabvier*, and *Helene*; second, Mr. George Prince; third, Mr. Charles Turner.

Six distinct varieties, five blooms of each: First, Messrs. A. Dickson and Son, with a lovely lot, among which were Mildred Grant, Bessie Brown, Frau Karl Druschki, and Alice Lindsell; second, Mr. Charles Turner; third, Messrs. Frank Cant and Co.

The amateur classes were well filled. For thirty-six distinct single trusses E. B. Lindsell, Esq., was a splendid first, Bessie Brown, Mrs. S. Crawford, Alice Lindsell, White Maman Cochet, Mildred Grant, Mrs. W. J. Grant, and Her Majesty were some of the best in this stand; second, the Rev. J. H. Pemberton; third, H. V. Machin, Esq.

For six single trusses the Rev. J. H. Pemberton was first with Frau Karl Druschki; second, Mrs. Haywood; third, E. B. Lindsell, Esq.

For twelve Tea or Noisettes E. B. Lindsell, Esq., was first with good Maman Cochet, Mrs. E. Mawley, and Catherine

Mermet; second, R. Foley Hobbs, Esq.; third, G. A. Hammond, Esq.

Six Roses, distinct, three trusses each: R. Foley Hobbs, first; the Rev. J. H. Pemberton second; and E. B. Lindsell, Esq., third.

For twelve bunches of garden Roses the Rev. J. H. Pemberton was first with a lovely lot, which included Crimson Rambler, Rosa moschata nivea, and macrantha; second, J. B. Fortescue, Esq., Dropmore (gardener, Mr. Fazel).

For twenty-four distinct single trusses R. Foley Hobbs, Esq., was first with a well set up stand, in which Mildred Grant was splendid. Miss R. H. Langton was a good second.

For twelve distinct Roses G. A. Hammond, Esq. was first; second, J. Bateman; third, F. Wellesley, Esq.

In the local classes there was keen competition, especially in the class for the Windsor Cup. A. Govett, Esq., was the winner with a grand lot of blooms; second, J. B. Fortescue, Esq.; third, W. C. Romaine, Esq.

Twelve distinct single trusses: First, Raven Hollings, Esq.; second, the Rev. H. Hickman; third, Norman Lacy, Esq.

Six distinct single trusses: First, the Rev. J. B. Shackleton; second, Mrs. Harvey Thomas; third, Mr. H. "reph."

There was a tent full of decorated dinner tables. Miss L. Austin was first with an attractive arrangement of Poppies, Sweet Peas, and wild grasses; second, Mrs. Hill; third, Mrs. E. Gould.

For a group of plants A. Govett, Esq., was a good first with a well-arranged group of Bamboos, Francas, Carnations, Kalosanthos, and Crotons; second, W. A. Stearns, Esq.; third, Mrs. Venables.

Nurserymen contributed largely to the success of the show. Messrs. George Jackman and Son, Woking, had hardy plants, Sweet Peas, and Roses; Messrs. Thomas Ware, Feltham, hardy plants and Sweet Peas; Mr. Eric F. Such, Maidenhead, hardy plants and Roses. Messrs. James Veitch, Chelsea, were awarded a first-class certificate for their new Strawberry Alake, which was shown in splendid condition. It has the appearance of being a robust grower and a heavy cropper, and its flavour is excellent. Messrs. Titt and Sons of Windsor had a floral arrangement of Malmays and Sweet Peas. Messrs. John Peed and Son, West Norwood, showed Gloxinias, Streptocarpus, and Begonias. The arrangements of the show were admirably carried out by Mr. Titt, the hon. secretary, who, together with the committee, is to be congratulated in bringing the show to a successful issue.

SOUTHAMPTON ROYAL HORTICULTURAL SOCIETY.

THE summer show of this society was held on the 6th and 7th inst., and in most classes secured a record entry. The show was arranged in a very large tent, and also in the commodious pavilion of the Royal Pier, which, by the way, is an ideal place for a Rose show. Notwithstanding the great heat of both days visitors on the evening of the second day found the blooms little the worse for their two days' exposure; in fact, many were sold at the close at 3d. and 4d. each. The centre of attraction was, of course,

THE ROSES.

comprising sixty boxes of blooms, and were generally considered the best that had been staged at a Southampton show for the last four years.

In the Nurseryman's division, Messrs. D. Prior and Sons, of Colchester, secured the first in the classes for thirty-six blooms distinct, twelve varieties, three blooms of each, and twelve Teas. Messrs. Jarman and Co., of Chard, and Rogers and Son, Limited (local), being second and third respectively. In the class for six dark of one variety, Mrs. Croft Murray, Ryde, was first, Prior and Son second, and Mr. F. W. Flight, Cornstiles, Winchester, third. There were three other entries. For six light, one variety, Mrs. Murray was again first, followed closely by Mr. Flight second, and Messrs. Jarman third. There were nine entries in this class.

Messrs. R. Harkness and Co. entered in all the open classes, but did not show. The flowers in the amateur classes were exceedingly good. Those shown by the prize winners would have done credit to their class in any show. For eighteen blooms, distinct, Mr. F. W. Flight was well to the front with blooms both fresh and perfect in form and colour. Mrs. Murray second, and Lady Campbell third.

For twelve blooms, distinct, and twelve Teas, Mr. Flight was again first in each; Mrs. Murray being also second in each, Lady Campbell being second in the first, and Dr. Seaton third in the other.

In the class for twelve blooms, not less than eight varieties, there were nine entries, Dr. Gillett, of Andover, being first, Mr. W. H. Myers, M.P., Swanmore Park, Bishops Waltham (gardener, Mr. Ellwood), second, and Mr. H. E. Sugden third.

For six blooms there were also nine entries, Mr. J. W. Fleming, Chilworth Manor, being first. The vases of Roses were very attractive, Mr. Fleming being a good first, and Sir Samuel Montagu second.

Messrs. Prior and Sons secured the society's silver medal as the most successful exhibitor in the open classes, and also a silver medal for the premier bloom in that division with Frau Karl Druschki; the silver medal for the premier bloom in the amateur division going to Lady Campbell, with a larger bloom of the same variety.

SWEET PEAS

made a grand show, no less than 200 vases being staged in the competitive classes, and almost as many more in the trade exhibits. For the society's prizes for nine varieties, distinct, Mr. C. W. Breamore staged a splendid lot. Messrs. Jarman and Co. and A. Maple being second and third respectively.

For Messrs. Toogood and Sons' prizes, six varieties Sweet Peas, Mr. J. M. Sheppard was first, Lord Aberdare second, and Mr. F. Cozens third.

For Mr. Robert Sydenham's prizes Mrs. Maltby was first, Mr. F. Cozens second, the Rev. du Boulay third, and Mr. W. F. Limery fourth.

For Mr. Breamore's prizes ten competed, the first being secured by Mr. A. P. Ralli with a grand lot. There were four other prizes awarded.

Bouquets, epergnes, buttonholes, baskets, and vases, in which the ladies came out strong, were all exceedingly well arranged and showing great taste, the most successful being Miss Wills for bouquets, Miss Minnie Snelgrove epergne and basket, Mrs. Croft Murray buttonholes, and Mr. T. Munday vase.

Hardy garden flowers were shown in quantity and of splendid quality. Messrs. Latham's first prize lot in the open class being grand. Mr. Myers also staged a beautiful lot in the amateur class, securing first prize.

THE PLANT CLASSES.

although placed first in order in the schedule, had, with the exception of the ornamental groups, to take quite a second place in merit. Specimen plants we have seen shown much better at Southampton. The groups, however, were certainly a great improvement on last year, that shown by Mr. E. Wills being all that could be desired, light in arrangement, with plenty of relief, without being in any way formal. Ferns and Caladiums were better than usual, Mr. G. Y. Mercer of Hillfield, Bassett, being first for Ferns, and Mr. A. P. Ralli for Caladiums.

FRUIT

was not up to the usual in point of numbers, but that shown was good. For the only two bunches of Grapes shown Lord Aberdare (gardener, Mr. C. H. Holloway) was awarded first. Strawberries were good and plentiful. For two dishes, Mrs. Maltby (gardener, Mr. J. Mathews) was first, and for a single dish Lord Aberdare first. For Peaches Lord Bolton (gardener, Mr. J. Bowerman) was first; and for one Melon, Mr. C. Ritchings, Guernsey, first.

VEGETABLES

were, as usual at Southampton, simply grand. The liberal prizes offered by Messrs. Toogood and Sons and by Messrs. Sutton and Sons drew a very large entry, and good as the first and second undoubtedly were, there were several other collections which, had they been staged in the same manner, would have been very little behind.

Messrs. Toogood offered ten prizes in their class, for which there were twelve entries, Lord Aldenham (gardener, Mr. E. Beckett) being an easy first; Lord Bolton (gardener, Mr. Bowerman) second, both showing good Cauliflowers, Onions, Carrots, Potatoes, Tomatoes, and Peas; third, Mr. W. H. Myers, M.P.; fourth, Mrs. Tragett; fifth, Mr. J. W. Fleming; sixth, Lord Aberdare.

The first three exhibitors in the above class were also placed in the same order of merit for Messrs. Sutton and Sons' prizes open to all customers.

In the local class offered by the same firm, Mrs. Tragett, Abridge Dances, Ronsey (gardener, Mr. H. Pearce), was first; Mr. J. W. Fleming (gardener, Mr. W. Mitchell), second; and Sir S. Montagu, Bart. (gardener, Mr. T. Hall), third.

The prizes offered by Mr. H. Glasspool for cottagers' vegetables brought together six collections, all of remarkable merit. Amongst the many extra

EXHIBITS NOT FOR COMPETITION.

the first claiming notice was a grand collection of herbaceous flowers, Sweet Peas, Pinks, Roses, alpine and other plants, from Messrs. B. Ladhams and Co., Shirley. It occupied one end of the spacious building, and the society's gold medal was awarded.

Messrs. Toogood and Sons also received the same honour for over one hundred varieties of Sweet Peas, shown in bunches and growing in pots.

A silver-gilt medal, with certificate of cultural merit, was awarded to Mr. C. W. Breamore, of Winchester, for a beautiful collection of Sweet Peas; and to Messrs. B. E. Davis and Sons, Yeovil, for Begonia flowers which were of great beauty.

Silver medals and cultural certificates were awarded to Messrs. Edwin Hillier and Sons, Winchester, who included in their exhibits some fine Roses, both of the show and garden varieties.

Mr. E. Wills, Winchester Road Nurseries, Shirley, for miscellaneous collection of plants and some very beautiful floral designs.

Mr. Ellwood received a silver medal for thirty-six varieties of garden Roses.

Messrs. Jarman and Co., Chard, also secured the same honour for a fine collection of cut blooms of Roses, Sweet Peas, herbaceous and other flowers.

First class certificates were awarded to Mr. Dymott, florist, Bitterne Park, for a very fine seedling Petunia; to Mr. Breamore for the following very distinct new Sweet Peas: Douglas Breamore, Reggie Breamore, and Cyril Breamore.

Cultural certificates of merit to Messrs. John Peed and Sons for cut blooms of Begonias and Gloxinias; and to Messrs. W. H. Rogers and Son for decorative group of plants.

The whole of the staging arrangements were carried out by the veteran secretary, Mr. C. S. Fudge, and the catalogue with the awards was on sale in the show soon after it was opened. There was a record attendance on the first day, and in the later part of the second day the show was very much crowded.

NORFOLK AND NORWICH ROSE SHOW.

THIS was held in the gardens of Mr. A. R. Chamberlin, The Grove, Ipswich Road, Norwich, on the 7th inst. Fortunately the weather was favourable, but owing to many other outside attractions in the district the attendance and receipts were much below the average. The hon. secretary is Mr. W. Smith, Prince of Wales Road, Norwich.

In the large class for forty-eight distinct cut Roses, Messrs. F. Cant and Co. took first place, Messrs. Prior and Son a close second. This latter firm, however, took first in eighteen Teas, and also for twelve blooms.

The amateur and private growers' classes were well contested by all the leading local exhibitors of the "Queen of Flowers." The Rev. J. H. Pemberton was first for thirty-

six distinct and first for twenty-four blooms, eight varieties, three of each. In the thirty-six distinct, the Rev. Foster Melliar had unfortunately put up two blooms of Tom Hood, which disqualified him. The Rev. A. L. Fellowes, like several of the local clergy, is a strong exhibitor of Roses; his blooms were very fine, and his dozen blooms of one variety, Maman Cochet, shown with long stems and foliage, were charming.

Among the other prize winners in this section were Dr. Osburne, Miss Penrice, Colonel Danby, Colonel Rous, B. E. Fletcher, Esq., R. Steward, Esq., and T. C. Biofield, Esq. The Rev. J. A. L. Fellowes secured the medal for the best Tea bloom with a White Maman Cochet, and the Rev. J. H. Pemberton that for the best H.P. with a Frau Karl Druschki.

Miscellaneous cut flowers added much to the interest of the show, especially so considering the interest gradually being taken in herbaceous borders. In this section the chief honour fell to Mr. George Davison, gardener to Major Petre, Westwick House, Norwich, who, with a bold and almost faultless bank of forty-eight distinct bunches, eclipsed any other exhibit set up. The Mayor of Norwich had some fine blooms in this section, and was also first for six bunches of exotic flowers. Mrs. Petre's gardener had a grand display in the thirty-six bunch herbaceous class, and was also first for the twelve bunches of flowering shrubs, just beating Mr. G. Davison in this latter class.

In the twenty-four and twelve bunch classes, the Rev. R. W. Pitt, Dr. Osburne, Messrs. A. Major W. J. Birkbeck, and T. Chaplin were the winners. Major Petre was first for Irises, and also for cut Pelargoniums. Mr. U. P. Wright, gardener to W. J. Birkbeck, Esq., Stratton Strawles, was first in a strongly contested class for Sweet Peas. The old-fashioned Sweet William had one or two supporters, and Mr. W. Allan, Guntun Hall Gardens, had some fine Carnations shown as grown.

In this tent a striking feature was the display of cut herbaceous flowers, drawings of flowers in various parts, and photographs of the garden of the boys' school at Crook's Place, Norwich, where Mr. E. Peake is so untiring in imparting horticultural and botanical knowledge to the boys. Mr. H. Dobbie, Thorpe, had also arranged an educational exhibit by setting up about three dozen of our British wild flowers. The pot plant classes comprised some good specimens of Achimenes, Begonias, Coleus, Caladiums, Ferns, Fuchsias, and Pelargoniums.

Mr. Woodhouse, gardener to Dr. Osburne, was successful with Fuchsias, and Mr. W. Rush, gardener to F. P. Hinde, Esq., Thorpe, deserved praise for his exotic Ferns. Mr. C. Burtenshaw, gardener to Henry Skelton, Esq., St. Helens, Norwich, deserved mention for his pretty case of Ferns and the nicely arranged basket of plants. Mr. W. Allan, Guntun Hall Gardens, so well known for his fruit-growing capabilities, was the winner of many prizes in this section, Cherries, Melons, Grapes, and Strawberries being his specialties.

Mr. W. Chettleburgh, gardener to Colonel Rous, Worstead, was a large exhibitor in all classes of the show, and secured many prizes in this section as well as others. The feature of the vegetable section was the grand Peas, Beans, and Onions, Mr. W. J. Lawn, gardener to F. Martin, Esq., Wroxham, being amongst the foremost winners for these.

Messrs. Hobbies, Limited, Dereham, were well represented by a charming stand of Roses in many sections and varieties, including large bunches of the delicate Dorothy Perkins, Clematis, Sweet Peas, in banks beautifully blended, and the new Cactus-flowered zonal Pelargoniums. The stand was splendidly set up and much admired.

Messrs. Daniels Brothers, Limited, Town Close Nurseries, Norwich, also had a fine display of cut blooms and pot plants, the foliage plants of this latter section being especially fine, as were also some Cannas and Carnations.

Messrs. Cutbush and Sons, Highgate, N., set up one of their famous displays of Carnations.

READING GARDENERS' ASSOCIATION.

THE first evening meeting of the summer session was held, by kind permission of Mrs. Harrison, at Shiplake Court. Between seventy and eighty members, accompanied by the president, Mr. Leouard Sutton, left Caversham Lock by steamer, and on reaching Shiplake were met by Mr. J. Hall (the head gardener), Mr. W. Barnes (chairman of the association), and other members who had journeyed by road from Bear Wood, Wokingham, Maidenhead, Henley, &c. A move was at once made to the kitchen garden, the borders of which were gay with Irises, Canterbury Bells, Delphiniums, and other perennials. The vegetables looked remarkably well, especially Potatoes and Peas. In the houses the Grapes excited admiration, as the crop was a heavy one and the bunches and berries were of large size. The party then wended its way to the pleasure grounds and Rose garden. The latter at this time of the year is a feature here, and many varieties of Roses flourish well. At the close of the ramble the president, on behalf of the members, tendered to Mrs. Harrison a most hearty vote of thanks for allowing them to spend such a pleasant evening in her gardens, and spoke of the great educational facilities these visits gave, especially to the younger members. Mr. Barnes, in seconding the proposed vote, also spoke in a similar strain. The weather was very fine, and the evening outing was much enjoyed.

UNITED HORTICULTURAL BENEFIT AND PROVIDENT SOCIETY.

THE quarterly meeting of this society was held at the Caledonian Hotel, Adelphi Terrace, Strand, on Monday evening last, Mr. Charles H. Curtis in the chair. Three new members were elected, making a total of sixty-five this year up to the present time. The death certificate of Mr. W. J. H. G. Earl was produced, and the amount standing to his credit in the ledger was granted to his father, being his nominee. Five members were reported on the sick list. The amount of sick pay for the past month was £20. The usual quarterly allowances from the benevolent fund were granted to three members.

THE HOLLAND PARK SHOW.

THE JULY EXHIBITION OF THE ROYAL HORTICULTURAL SOCIETY.

IT was a beautiful summer day when the show of the Royal Horticultural Society was opened on Tuesday last in the grounds of Holland House, kindly lent by the Earl of Ilchester. The private gardens could also be visited on payment of one shilling, the receipts this year going to the West London Hospital.

The exhibition was visited on the morning of the first day by Her Majesty the Queen, who was accompanied by H.R.H. Princess Victoria.

The Council of the society invited the members of the committees to luncheon on the first day. The chair was taken by Sir Trevor Lawrence, Bart., the president, who was supported by Sir Daniel Morris, Sir John D. T. Llewelyn, Bart., Mr. F. G. Lloyd, Mr. Harry Veitch, the Rev. W. Wilks, Mr. George Paul, Mr. George Bunyard, Mr. H. B. May, Mr. Arthur Wigan, Mr. William Marshall, and many other well-known horticulturists.

Sir Trevor Lawrence, in a brief speech, thanked the committees warmly for the work they were accomplishing for the society, and spoke of the deep interest taken in the Royal Horticultural Society by the King and Queen. Mr. George Paul and Mr. McIndoe responded. The show was excellent throughout.

ORCHIDS.

There were many beautiful Orchids in the group shown by Messrs. Sander and Sons, St. Albans. This display was informally arranged. Instead of a bank of plants of regular outline, small mounds at the front made an irregular margin. Altogether, the plants in this group were given plenty of room, and the result quite justified this arrangement. *Phalænopsis* were prominent, and specially fine was *P. grandiflora* Java variety, with large white flowers, with the faintest blush tinge at the centre; of *Lælio-Cattleyas*, L.-C. Eclipse (with orange-apricot sepals and petals and purple-brown lip), L.-C. D. S. Brown (rosy fawn sepals and petals and lovely rich purple flat lip), L.-C. Henry Greenwood var. *Imperator* (a large flower with rose-lilac sepals and petals, crimson-purple lip, and white throat, except for a central band of crimson) were the finest. *Cattleya* Mrs. Myra Peeters (*C. gaskelliana* alba × *C. Warneri* alba), *C. triumphans* (aurea × Rex, white sepals and petals, purple-white margined lip, and yellow throat lined with purple-brown), *Sophro-Cattleya* Chamberlainii, *Cattleya* Whitei, *Vanda cœrulea*, *Cypripedium* Lord Derby, *C. Phoebe*, some lovely varieties of *Cattleya* Mossiae, *Miltonia* vexillaria var. *Queen Alexandra*, *M. v. var. Chelsiensis*, and various *Oncidiums* were other notable plants in this most interesting group.

Messrs. Charlesworth and Co., Heaton, Bradford, Yorks, showed a splendid lot of Orchids also. Although arranged in a mass, each plant was so disposed and given enough room as to allow of its being seen clearly. The refreshing greenery of

Adiantum between the plants added much to the effect of an attractively displayed group of good things. In the centre, *Oncidium macranthum*, with its curious large yellow bloom, was conspicuous, while here and there the lovely *Vanda cœrulea* associated well with varieties of *Odontoglossum crispum*. *Lælio-Cattleyas* were represented by such as L.-C. Eudora, L.-C. canhamiana, L.-C. Hippolyta var. *Phoebe*, L.-C. Ingrami, L.-C. callistoglossa, and L.-C. canhamiana albens. *Miltonia* vexillaria albiflorum, *M. v. alba*, *Cattleya gaskelliana* alba, *Anguloa uniflora* Turneri (with fawn-pink flowers), *Mormodes luxata eburnea*, *Barkeria spectabile*, and *Erides f'Ansoni* were other Orchids of unusual attractiveness.

R. Briggs-Bury, Esq., Bank House, Accrington, exhibited *Cypripedium lawreanum* byeanum, Bank House variety, a very fine form, the petals rich dark green, and the white ground dorsal sepal heavily lined with the same shade of colour. *Odontoglossum crispum*, Oakfield Sunrise, with rich red petals and white sepals slightly spotted, a remarkable form, was also shown by the same exhibitor.

J. Colman, Esq., Gatton Park, Reigate, Surrey, exhibited a group of Orchids that contained many good things. Among the *Odontoglossums* whose arching racemes relieved any tendency to monotony of outline were *O. crispum* Eleanor, *O. c. bonnyanum*, *O. c. Mary Colman*, and other forms of *O. crispum* and *O. Pescatorei*. Among the *Oncidiums*, which added still further to the attractiveness of Mr. Colman's display, were *O. macranthum*, *O. pretextum*, and others. *C. Mossiae* varieties, *C. schofieldiana*, *C. gigas*, *Lælia tenebrosa*, L.-C. Martinetti, *Lycaste leucantha*, *Lælia elegans* schilleriana, *Cattleya Mossiae reineckiana*, *C. Leopoldi*, *C. Forbesii*, *Miltonia* vexillaria, and *Lælia purpurata* were among others of the best Orchids.

Messrs. Hugh Low and Co., Bush Hill Park, Enfield, exhibited a small group of Orchids, among which were some good *Cattleya Harrisonii*, *C. H. alba*, *C. intermedia* alba, and *Lælio-Cattleya canhamiana* alba. Several *Oncidiums*, including *O. schleiperianum citrinum*, *Lycaste plana* alba, *Disa langleyensis*, *Dendrobium Dearii*, *Cattleya gigas*, and other good Orchids.

M. Jules Hye de Crom, Ghent, showed *Odontoglossum Rolfeæ* Ideal and *Miltonia vexillaria* Queen Alexandra, the latter a large white bloom tinged with faint red around the yellow central blotch.

M. Ch. Vuylsteke, Loochristi, Ghent, exhibited some finely-marked *Odontoglossums*, among which were *O. ardentissimum* Eclair, heavily blotched with light purple upon a white ground; *O. a. Cybele*, *O. Rolfeæ* Aurora, *O. R. Melpomene*, *O. concinnum*, and *O. harryano-crispum* Ixiar, all beautifully marked hybrids.

M. Otto Beyrodt, Marienfelde, Berlin, exhibited *Odontoglossum Brandtiae* (luteo-purpureum × *Pescatorei*), with narrow yellow sepals and petals, the colour deeper at the edges; the lip is white and marked beneath the column with chocolate-red. Some very good plants of *Cattleya gigas* and *Odontoglossum schleiperianum*, Beyrodt's variety.

Sir F. Wigan, Bart., Clare Lawn, East Sheen (Orchid grower, Mr. W. H. Young), showed a small group of Orchids, in which *Cattleya gaskelliana*, *C. gigas*, *C. Allonis*, *C. Eldorado*, *C. Mendelii*, *C. M. Lowi*, *Zygopetalum roeblingianum*, *Sobralia macrantha*, *Cypripedium Veitchii*, *C. Parishii*,

Phalænopsis speciosa, and other good Orchids were noticeable.

Messrs. Clibran, Altrincham, showed a small group of Orchids in which were *Cypripedium callosum* Sanderae, *Miltonia vexillaria* albens, and some *Odontoglossums*. *Dendrobium atro-purpureum* was also well shown.

A botanical certificate was given to *Saccolabium longicalearatum* and to *Dendrobium bellatulum*, a small flower with whitish sepals and petals and orange-red throat, this colour extending into the lip. Shown by Messrs. Sander and Sons.

NEW ORCHIDS.

Cattleya gigas Frau Melanie Beyrodt.—A very beautiful flower with pure white sepals and petals and rich purple-white margined lip. The throat is greenish white at the base and sides, the purple running into the throat at the top. The large size, rich lip and white sepals and petals make this flower very distinct. From M. Otto Beyrodt, Marienfelde, Berlin. First-class certificate.

Lælio-Cattleya Henry Greenwood var. *Imperator*.—A very large bold flower, with rose-tinted spreading sepals and petals and rich crimson-purple lip. On either side of a central line of the latter colour extending into the throat, the colour is creamy white. A very delicately and attractively coloured form. From Messrs. Sander and Sons, St. Albans. First-class certificate.

Cattleya triumphans.—*Cattleya aurea* and *C. rex* are the parents of this pretty hybrid *Cattleya*. The flower is a very dainty and attractive one; sepals and petals milk white, the frilled white margined lip is purple, while the throat is yellow, lined with brown. From Messrs. Sander and Sons, St. Albans. Award of merit.

Lælia crispa-brosa.—This is a hybrid, as its name denotes, between *Lælia crispa* and *L. tenebrosa*, and a good flower has resulted. The somewhat stiffly arranged sepals and petals are pink, while the lip, which has a pink ground colour, is beautifully lined and shaded with dark crimson. The throat is very closely lined with dark crimson. From Messrs. Sander and Sons, St. Albans. Award of merit.

Cattleya gigas Rosslyn variety.—A very pale form of *C. gigas*. Sepals and petals are bluish white, and the lip is mottled lilac-pink; on either side of the entrance to the throat is a blotch of yellow, the throat has a pink ground which is lined with white. From H. T. Pitt, Esq., Stamford Hill, N. (gardener, Mr. Thurgood).

EXHIBITS OUT OF DOORS.

Mr. David Russell (late John Russell), The Essex Nurseries, Brentwood, exhibited a very bright group of *Acers* and other ornamental foliage shrubs. *Acer Negundo* variegatum with purple Beeches were in the background, while *Acer palmatum* varieties, *Ivies*, *Euonymus*, *Hollies*, *Aralia Mandshuricus* variegata, and other plants were conspicuous throughout the group.

Messrs. Thomas Cripps and Sons, Tunbridge Wells, had a very fine display of Japanese *Acers*, many of them large plants and splendidly coloured. There were purples, yellows, greens, and variegated ones; while, together with specimen conifers, which were interspersed throughout, made an imposing and attractive exhibit. Some of the best were *A. palmatum sanguineum*, *A. japonicum aureum*, *A. j. laciniatum*, *A. j. versicolor*, *A. Negundo californica* aurea, *A. palmatum palmatifidum*, *A. p. linearilobum* purpureum Crippsii

(new), a beautiful variety, *A. p. septemlobum elegans purpureum*, *A. p. dissectum*, and *A. p. d. purpureum*. Other plants in the group were *Ives*, *Oaks*, *Cupressus macrocarpa lutea*, *Retinospora obtusa Crippsi*, and *Vitis heterophylla variegata*.

Mr. John Forbes, Hawick, made a bright display out of doors with *Phloxes*, *Pentstemons*, and *Delphiniums* in many varieties. Among the latter *Magnificum*, *Crompton Roberts*, *Telegram*, *Juno*, *Mrs. Ireland*, and *Mrs. Langtry* were good dark blues, and *Petrarch*, *Rupert*, and *Cantab* the best light blues. There were many distinct colours among the *Phloxes* and *Pentstemons* and fine heads of flower.

Messrs. James Veitch and Sons, Limited, Chelsea, exhibited a group of *Campanula peregrina* and *Sciadopitys verticillata*, both very handsome plants.

Mr. J. R. Russell, Richmond, Surrey, exhibited a collection of fine *Ives* in many varieties. Both standards and bushes were shown, making altogether a most pleasing display.

FRUIT.

Messrs. George Bunyard and Co., Maidstone, exhibited fruit trees in pots and a collection of *Strawberries* and *Cherries*. Among the former were *Cherries*: *Emperor Francis*, *Saint Margarets*, *Kirkland's Mammoth*, *Bigarreau Napoleon* (exceptionally well fruited), *Black Tartarian*, and *Bigarreau Donnisen*; *Apples*: *Emperor Alexander* and *Peasgood's Nonsuch*; and *Plums*, *Swan* and *Jefferson*. Among the dishes of *Cherries* the following varieties were finely represented: *Florence*, *Bigarreau Napoleon*, *Abesse d'Oignies*, *Bohemian Black*, *Bigarreau Donnisen*, *Kentish Bigarreau*, and *Bigarreau de Munster*. *Strawberries*: *Climax*, *Eleanor*, *Louis Gauthier*, *Sir Joseph Paxton*, *Dr. Hogg*, *Givon's Late Prolific*, and *Waterloo* were well shown also.

An excellent collection of fruits was shown by *Henry Partridge, Esq., J.P.*, *Bletchingley, Surrey* (gardener, *Mr. J. W. Barks*). *Strawberries*, *Royal Sovereign* and *Givon's Late Prolific*; *Peach*, *Violet Hative*; *Nectarine*, *Stanwick Elruge*; *Melon*, *Hero of Lockinge*; and *Grapes*, *Buckland Sweet-water* and *Black Hamburgh* were the best dishes.

Messrs. James Veitch and Sons, Limited, Chelsea, exhibited two new *Strawberries*, *The Alake* and *President Loubet*. The former gained an award of merit recently, and was then described. The latter is a dark coloured fruit, the result of a cross between *Waterloo* and *Lord Napier*.

Strawberries Monarch, *President*, and *Latest of All*, and some *Globe Artichokes* were exhibited by the *Hon. A. H. T. Montmorency*, *The Grange, Carrick Mines, Dublin*.

From the *Horticultural College, Swanley*, *Apples Lady Sudeley* and *Beauty of Bath* (cultural commendation) and *Melon Swanley Hero* (cultural commendation) were shown.

Messrs. R. V. Whitmore and Co., *Birchwood Park Nurseries, Swanley*, exhibited some small seedling *Melons*.

J. B. Joel, Esq., Potter's Bar (gardener, *Mr. J. May*), showed *Strawberry Waterloo* in splendid condition.

The *Duke of Northumberland, Albury Park, Guildford* (gardener, *Mr. Leach*), showed *Strawberries Eleanor* and *Waterloo*, and *Black Currant* fruiting sprays free from the gall mite. *Mr. Leach* sent a note saying the bushes had been syringed with a strong insecticide, which he had found to check the insect but does not injure the bushes.

NEW FRUITS.

Strawberry Latest.—This is a new seedling *Strawberry*, the result of a cross between an unnamed seedling and *Latest of All*. It is a large fruit of irregular oblong form and dark red colour, and good, though not brisk, flavour. From Messrs. *Laxton Brothers, Bedford*. Award of merit.

Raspberry Penwill's Champion.—A new red variety of somewhat tart flavour; good size, said to bear fruit from early July to late September, and to be of vigorous growth. From *Mr. George Penwill, nurseryman, Totnes*. Award of merit.

ROSES.

The representative group of *Roses* that won the *Sherwood Cup* for Messrs. *Paul and Sons, The Old Nurseries, Cheshunt*, was a splendid display. The *Roses* felt the heat very much as the day advanced, but in the early hours of the show the display was very interesting, and lovely baskets were shown of *Mrs. W. J. Grant*, *Lady Battersea*, *Gustave Regis*, *Victor Hugo*, and *Killarney*. Of the single flowered sorts, *Leuchstern*, *Rosa Alba*, *The Garland*, and *Macrantha* were chaste and beautiful. Of the climbing *Roses*, *Crimson Rambler*, *Wallflower*, *White Pet*, *Rivers' Musk*, *The Tea Rambler*, and a charming assortment of the *Wichuraiana* *Roses*, each contributed to make a welcome feature in the large tent, filling one corner completely.

The silver cup (for being second in the *Sherwood Cup* class) was won by *Mr. George Mount, Canterbury*. Vases of *Mrs. W. J. Grant*, *Caroline Kuster*, *Caroline Testout*, *Fisher Holmes*, *Rubens*, *Anna Olivier*, *Frau Karl Druschki*, and a charming variety of climbing and other *Roses* made an attractive exhibit. This group also filled a corner in the large tent.

Messrs. *George Jackman and Son, Woking*, exhibited a charming display of garden *Roses* in bunches and also single blooms in boxes. Among the former were *Mrs. W. J. Grant*, *Reve d'Or*, *W. A. Richardson*, *Crimson Rambler*, *Dorothy Perkins*, *The Garland*, *Leonie Lamesch*, *L'Idéal*, *Reine Olga*, and others. Among the single blooms were many beautiful *Tea Roses*, as well as such other well-known ones as *Caroline Testout*, *Her Majesty*, *Alfred Colomb*, *Marie Baumann*, *Fisher Holmes*, and others.

Messrs. *T. S. Ware, Limited, Feltham, Middlesex*, showed some lovely blooms of *Frau Karl Druschki*, *Caroline Testout*, *Edith D'ombrain*, *Souv. de Mue*, *Eugene Verdier*, *Bridesmaid*, and others, as well as bunches in vases of *W. A. Richardson*, *Dorothy Perkins*, *Crimson Rambler*, *Aimée Vibert*, *Eugenie Lamesch*, *Belle Siebrecht*, *Helene Liberty*, and others.

Mr. George Mount, Canterbury, also exhibited many good blooms in boxes of *Marie van Houtte*, *Mrs. Edward Mawley*, *Maman Cochet*, *Bessie Brown*, *Killarney*, *White Maman Cochet*, *Frau Karl Druschki*, as well as vases of *Marquis de Salisbury*, *Laurette Messimy*, *Paul's Royal Scarlet*, *Killarney*, and many more.

Mr. David Russell, the Essex Nurseries, Brentwood, exhibited some splendid blooms of *Marchioness of Londonderry*, *Killarney*, *A. K. Williams*, *Clio*, *Ulster*, *Mildred Grant*, and others.

Mr. G. W. Piper, Uckfield, Sussex, showed *Tea Rose Sunrise*, as well as a new seedling climbing *Polyantha* called *Aceituna*, a deep pink. Another *Tea Rose* well shown was *Peace*, a creamy yellow colour.

Messrs. *Alexander Dickson and Sons, Newtownards, County Down, Ireland*, exhibited bunches of such garden *Roses* as *Irish Harmony*, *Irish Pride*, *Irish Elegance*, *Irish Masterpiece*, &c. Other beautiful sorts shown in vases were *Countess of Derby*, *Mrs. David McKee*, *Dean Hole*, *Lena*, *Viscountess Annesley*, *Dr. J. C. Hall*, *Lady Dunleath*, and other new ones. Awards of merit were won by several.

STOVE AND GREENHOUSE PLANTS.

The large tent, as usual, represented the choicer stove and greenhouse plants in remarkably good form and condition. Seldom have we seen these plants staged in a more interesting manner, and as a whole the display was of a very high order of merit. In the north-west corner of the tent *Mr. L. R. Russell, Richmond Nurseries, Richmond*, made a most attractive group of *Crotons*, *Alocasias*, *Dracenas*, *Palms*, and other choice plants. The better *Crotons* were *Golden Ring*, *C. Reidii*, *C. Aigburth Gem*, *C. Majesticus*, and *C. andreaum*. *Alocasia sanderiana*, *A. Martin Cahuzac*, and *A. mortefontaineensis* were conspicuous, as were also *Dracena russelliana* and *D. sanderiana*, *Phyllanthus nivosus*, and other charming plants. Altogether this was a good group, and prettily arranged. An edging of *Caladium Argyrites* gave a neat finish.

A bold and handsome group came from Messrs. *R. and G. Cuthbert, The Nurseries, Southgate*, embracing a nice selection of flowering and foliage plants. In this group the different subjects were arranged in mounds for effect. In this way we saw masses of *Lilium longiflorum giganteum*, *L. tigrinum*, *L. lancifolium rubrum*, and the shapely *L. auratum*. A pretty lot of *Crassula coccinea* was a centre of attraction, as were also groups of *Crimson Rambler Rose*, *Ivy-leaved Pelargonium Beauty Supreme*, *Baden Powell*, *Mauve Beauty*, and *Mrs. Hawley*. The group was backed with well-grown plants of *Hydrangea paniculata* and *Palms*, and a groundwork of *Ferns* and *Asparagus* gave a pleasing finish.

From Messrs. *Sander and Sons, St. Albans*, came a group of choice stove and greenhouse plants, and quite a large quantity of the new, dainty *Cape Daisy* (*Anemone*-flowered), *Marguerite Queen Alexandra*, and different forms of the new *Nicotiana Sanderæ*. The former was arranged on the ground, and on the centre table of the tent their fine effect was supplemented with a beautiful group of choice *Ferns*, *Begonia Rex*, and other plants. In these two groups the more noteworthy plants were *Phœnix Rubellini alpina Sanderæ* (a very striking variegated foliage plant), a grand specimen plant of *Dracena sanderiana*, also a splendid plant of *Heliconia Edwardus Rex*, and *Dracena godseffiana*. On the table was a superb specimen of *Polypodium Knightiæ* and *Begonia Rex*. There were some delightful plants, including *Mrs. H. G. Moon*, *Our Queen*, and *His Majesty*. Interspersed as an edging were some pretty plants of *Asparagus Sprengeri variegatus*.

Messrs. *J. Hill and Son, Barrowfield Nurseries, Lower Edmonton*, set up one of the most representative group of *Ferns* that we have ever seen arranged. Delightfully pleasing were *Asplenium marginatum*, *Nephrolepis Pieronii*, *N. Fosteri*, *Gleichenia habelata*, *Pteris Childsii*, *P. Regina crustata*, *P. Regina*, *Gleichenia dicarpa longipinnata*, *Asplenium formosum*, *Pteris scaberula*, *Gymnogramma Alstoni*, and *G. peruviana argyrophylla*. *Adiantums* were finely displayed, including *A. Pacotti*, *A. luddemannianum*, *A. Colliarii*, and the pretty *A. Legrandii*.

Very fine were the foliage plants with flowers that came from Messrs. *Jamea Veitch and Sons, Chelsea*. Groups of *Carnations* were well arranged in the foreground, and in the centre was a choice display of the Japanese *Rhododendrons*, interspersed were grand specimens of the choicer stove and greenhouse foliage plants. Noteworthy plants were *Davallia Fijiensis robusta*, *Polypodium schneiderianum*, *Coccoloba pubescens (grandifolia)*, *Caladium Louis A. van Houtte*, *C. The Mikado*, *C. Princess of Teck*, *Dieffenbachia Fournieri*, *Caryota Wallisii*, *Croton Warrenii*, *Nepenthes Burkei Excellens*, *N. amesiana*, and *N. mastersiana*. The *Carnations* were finely shown, the better kinds being *Ivanhoe*, *Lady Rose*, *Mme. Adeline Patti*, *Robert Burns*, and *Mercia*; of the *Malmesbury* type and of the border varieties, *G. H. Crane*, *Royalty*, *Mrs. S. J. Brooks*, *Uriah Pike*, *Melba*, and *Sir Hector Macdonald* were the most noteworthy. An edging of *Ferns*, *Caladium Argyrites*, &c., gave a neat finish.

Mr. H. B. May, Dyson's Lane Nurseries, Upper Edmonton, made a large and attractive group of zonal *Pelargoniums*, and a basket of plants of the new *Polyantha Rose Mme. Levasseur*. The zonals deserving mention were *Captain Flayette*, *Mme. Erekener*, *Lady Ilchester*, *Gabrielle Monod*, *Lord Kitchener*, and *Fire Dragon* of the double; and of the single, *Lord Ilchester*, *Mrs. H. B. May*, *Candace*, *Mary Hamilton*, and *Hall Caine* were conspicuous. The plants were in pots, arranged in baskets, and *Ferns* between the latter gave a charming finish. From the same firm came an immense group of *Ferns*. This occupied almost the whole length of one side of the centre table, and was of a most comprehensive character. The plants were pleasingly set out, and each one was in character. Notable examples were *Davallia Fijiensis Dillayii*, *D. ornata*, *D. rufa*, *Polypodium Mayii*, *P. Crasinerium*, *P. schneiderianum*, *Nephrolepis Pieronii*, *N. exaltata*, *N. pectinata*, *Pteris scaberula*, *P. tricolor*, and numerous others.

A grand bank of Caladiums from Messrs. John Peed and Son, West Norwood, was an attractive feature of this great show. Each specimen gave evidence of good culture, and all were beautifully fresh and prettily coloured. Specially good were C. E. Dahle, John Peed, Candidum, Hermione, Salvador Rosa, Mme. E. Pynart, Mme. Marchand, Rio de Janeiro, Mme. D'Hallay, Lord Rosebery, William Marshall, and Marquis of Camden. A pretty edging of Ferns, *Isolepis gracilis*, and *Caladium Argyrites*, with a backing of stately Palms, finished a really handsome group.

Messrs. William Bull and Sons, Chelsea, made another of their beautiful group of the choicer fine-foliaged plants. This embraced Caladiums, Crotons, Palms, Ferns, Pandanus, Dracenas, &c., arranged in a graceful and artistic manner. A very conspicuous feature of this display was a number of freely-flowered growths of the new *Bougainvillea Maude Chettleburgh*. The flowers are very large, and the colour very rich and striking. Of the foliage plants, we may mention as being specially good were *Aralia elegantissima*, *Dracaena Victoria*, *Croton Flamingo*, C. Mme. de Boudnay, C. Reidii, and *Cyathea dealbata*, a most pleasing group.

From Mr. William Icton, Putney Park Nurseries, came a group of retarded Lilies and Azalea mollis, besides a number of pretty foliage plants. The Lily of the Valley was a specially good strain, and the immediate surroundings were rendered fragrant with the strong odour of the Lilies.

In another tent Messrs. James Veitch and Sons, Limited, set up on the side benches a pretty group of charming flowering plants. Groups of the interesting *Rehmannia angulata*, *Lobelia tenuis*, *Fuchsia Sylvia* (a grand acquisition), and *Kalanchoe flammea* were plants that impressed us. The new *Solanum Wendlandii* was a feature of interest. *Begonia Washington* is a brilliant crimson double flower that should be useful as a bedding plant. Of *Streptocarpus* there were several fine hybrids, for which this firm are noted. *S. achimenesiflorus albus*, *S. a. roseus*, and *S. a. giganteus* formed a line the whole length of the group that was finished with an edging of Maidenhair Ferns.

From Messrs. John Laing and Sons, Forest Hill, S.E., came a group of Caladiums and tuberous-rooted Begonias. In the former were many good sorts, including candidum, Silver Cloud, Mrs. Joicey, Gerard Dow, Alexander III., and Duchess de Mortemart. An edging of C. *Argyrites* was used for the front of the group. The Begonias were well done, singles and doubles being equally well represented. Doubles: Lady Londonderry, cream; J. D. Lambert, salmon; Earl Roberts, scarlet; Mrs. Mulholland, yellow, and Sir Charles Tennant, salmon, were some of the best varieties; and of the singles, Lord Howe, Admiral of the Fleet, Lady White, Lady Edridge, Grand Duchess of Hesse, and Queen Alexandra were conspicuously good examples. There were some pretty crested flowers in this collection.

Mr. W. Wells, Leamington Spa, set up a small but very interesting group of the new Asparagus *Myriocladus*, with prettily interspersed plants of Crotons, Caladiums, *Eulalia japonica variegatus*, and Dracenas. This new Asparagus has much to commend it, and it was represented in typical form by this firm.

Tuberous-rooted Begonias from Messrs. Thomas S. Ware (1902), Limited, Feltham, were seen in magnificent form and condition on this occasion. In the centre of the group a mass of new double white Mary Pope was in evidence, and elsewhere the Primrose Mrs. W. G. Valentine was seen. The group was made up of double sorts exclusively, and those that most impressed us besides those already mentioned were Queen Alexandra (Picotee), Mrs. W. S. Ainslie, King Edward VII. (crimson), Dorothy Hawkins (blush salmon), Imbricata, Countess of Ilchester (primrose), Lord Rosebery (crimson), and Countess of Dartmouth.

Both single and double Begonias, as set up by Mr. A. L. Gwillim, Cambrian Nursery, New Eltham, Kent, made a gorgeous display. A grand rich canary yellow double, named Margaret Gwillim, was a specially good sort, showing distinct advance in this section. Other good doubles

were Eltham Glory (fine form of a Picotee flower), Sunset (scarlet-salmon), Venus (salmon flecked white), Cupid (pink), John Peed (frilled salmon), and Charles Kingsley (apricot).

A large group of Carnations was displayed by Messrs. George Boyes, Aylestone Nurseries, Leicester. These were plants in pots, and in many instances the latter were covered with Pterises, &c. The best of the border sorts were Lord Roberts (yellow), Lady Wright (white), Lady Battersea (flaked), Lady Henry Somerset, W. L. Murdoch, Hon. A. Lyttelton (pink), Lady Hart, A. J. Webbe (scarlet), and numerous bunches set up in vases attractively. In the latter set Lord Kitchener was a good dark sort.

Messrs. Blackmore and Langdon, Twerton Hill Nursery, were, as usual, to the front with tuberous-rooted Begonias. In this instance, too, the group was composed exclusively of the double-flowered sorts, and they were represented in charming variety. Good form characterises most of the newer introductions, and in the present instance this was beautifully exemplified. The better sorts were Mrs. A. Hall (salmon), Right Hon. J. Chamberlain (rich crimson), Marchioness of Bath (white), Mrs. Portman Dalton (apple blossom), Seagull (white), and Mrs. Heathcote (primrose) were examples of the highest order of merit.

A table of miscellaneous plants was displayed by Messrs. W. and J. Brown, Stamford and Peterborough. This embraced Verbenas Scarlet King and Miss Willmott; Heliotrope, Lord Roberts; Cactus Geranium, Fire Dragon, and the new sort The Countess, and a number of other interesting plants and cut Roses.

Cactaceous plants from Mr. Richard Anker, agent for Frantz de Laet, Addison Nursery, Kensington, W., were interesting. Large and small plants of well-known kinds were well represented. Two trays of the pretty little *Nertera depressa*, with its small orange-coloured berries, were objects of much interest.

One of the best plants in the show was staged in a group at one end of the big tent. This was *Spiraea compacta hort.* x *Astilbe chinensis*. This was a beautiful pale rose form, and is a plant of the greatest promise. There was also a cross between *Spiraea* (Astilbe) Lemoinei and *Spiraea compacta hort.* The exhibit was put up by Messrs. Gt. Van Waveren and Kruijff Sassenheim, Haarlem, Holland.

Messrs. John Peed and Son, West Norwood, made a fine group of Gloxinias. The flowers were seen in endless variety of colour. Good selfs, as well as pleasingly marked and spotted forms, called forth the highest praise. Good quality throughout was noticeable, the more delicate tints of colour also appealing to the visitors. Interspersed were Ferns, Asparagus, and *Isolepis gracilis* giving a delightful finish to the group.

Carnations from Messrs. B. S. Williams and Sons, Upper Holloway, N., made an interesting group. Such varieties as Thora, Princess of Wales, Mrs. Trelawny, Mr. H. J. Jones, Prime Minister, Fireball, Sir Evelyn Wood, and Lord Rosebery were some of the best shown.

From Mr. H. J. Jones, Ryecroft Nursery, Lewisham, S.E., there came a very large and interesting group of plants and flowers. A very good strain of both double and single tuberous rooted Begonias for bedding purposes was represented by a large number of plants. These embraced charming forms and delightful tones of colour. An immense array of show and fancy Pelargoniums were superbly fine. Striking sorts, such as Eucharis, Princess, Albert Pratt, Rose Queen, Freda Walker, Snowdon, Dorothy, Prince George, and the new regal, Her Majesty. Seventy-two bunches of zonal Pelargoniums were also displayed. We noticed Mr. T. E. Green, Oliver A. Vasey, Artemus, Esme, Grandee, Syrius Fashion, President McKinley, and Conan Doyle were glorious examples of these richly coloured flowers.

Two small round baskets of white West Brighton Gem zonal Pelargoniums were exhibited by Messrs. William Bull and Sons, Chelsea. This is a useful white flower with a West Brighton Gem habit, and should prove a distinct acquisition to the bedding varieties.

Verbena Warley was shown in a good group by Miss Willmott, Great Warley, Brentwood, Essex. This is a striking fiery crimson Verbena, that gives the promise of establishing itself as a standard sort.

New and choice Carnations from Mr. James Douglas, Edenside, Great Bookham, were represented in superb form. Of the Malmaison sorts Princess of Wales, Thora, Lady Jane Seymour, Cecilia, and Rizzio were conspicuous. Of the border sorts, Glowworm (award of merit), King Solomoo (award of merit), Mrs. Keen, Lady Hermione, The Dawn, Lord Napier, Trojan, Beauty of Exmouth, Miss Shiffner, Kaffir, Molly Maguire, and Comet seemed to appeal to us more particularly, and were at all times objects of admiration.

Tuberous-rooted Begonias from Messrs. H. Cannell and Son, Swanley, were grouped very prettily. Good singles were Distinction (orange), Miss W. Nickalls (pink), Lord Bingham (deep crimson), Seymour Lucas (deep rich crimson), Mrs. Bramwell (margined), Duke of Norfolk (buff), and Lady Mary Currie (salmon-buff). An edging of Maidenhair Fern and Echeveria, with its silvery white leaves, gave a pretty finish to the group.

Cactus Dahlias, from Messrs. Dobbie and Co., Rothesay, seemed altogether out of place, and frequent were the comments to that effect. These Dahlias seemed to bring the autumn too near us, and we would rather see them in their proper season.

Numerous bunches of double and single zonal Pelargoniums were arranged by Mr. Vincent Slade, Staplegrave Nurseries, Somerset. These flowers stood the weather well, the double sorts standing out very prominently. Mme. Laury, Pasteur, Mme. H. Tilmant, Cousin Bele, Fire Dragon, Reine Bazin, His Majesty the King, and Her Majesty the Queen were the best of the semi-double and double sorts. The white paper on which the vases stood enhanced the value of the flowers.

Messrs. B. S. Williams and Sons, Upper Holloway, N., grouped in one corner of the first tent twelve specimen plants of Hydrangea.

Carnations from Messrs. William Cutbush and Son, Highgate, N., were a specially good feature. Remarkably fine flowers were set up, embracing all the best of the newest sorts of the Malmaison type of the flower, and a goodly list of the smaller though equally interesting border varieties. Malmaisons included Mercia Thorn, Blush, Lady Rose, Princess of Wales, King Arthur, and the new Duchess of Westminster. Of the border sorts Voltaire, Benbow, Lady Hermione, Daughter of Heth, Leodogran, Chryseis, and Charles Martel were very fine. A long table of miscellaneous plants from the same firm was much admired, and included such subjects as Verbena Miss Willmott, V. Princess of Wales, V. Maiden's Blush, V. King of Scarlet, Latania Barbet Yellow, Erica bothwelliana, and Kalosanthis coccinea. Rose Dorothy Perkins was pleasingly interspersed.

The new zonal Pelargonium Charles Lawrence was staged in fine condition. This is a very good semi-double, freely flowered, on plants having a good habit. The colour is a pleasing shade of salmon-pink. Exhibited by Messrs. G. and A. Clark, Limited, Dover.

Pigmy trees from Messrs. Barr and Sons, Covent Garden, still appeared to create an interest in the minds of many. The ages of these pigmy trees vary from 15 years to 200, and the specimens were in the pink of condition.

Hobbies, Limited, Dereham, exhibited the new Cactus Geranium Cactus Queen, also Cactus King and Fire Dragon.

Messrs. Clibrans, Altrincham and Manchester, put up a table of miscellaneous foliage plants. Crotons, Dracenas, and Palms, though small, were in charming variety. Tuberous-rooted Begonias, Lobelia Mrs. Clibran, and Orchids made an interesting display.

Hobbies, Limited, showed Carnations in a representative manner. Malmaison and border sorts were set up in endless variety, all the better kinds standing out charmingly from the older sorts.

Some of the Rambler Roses were exhibited as standards in this firm's display, and illustrated very forcibly the value of plants worked in this way for festoons, arbours, and similar uses. The plants were in varying heights, and can be had 12 feet high.

A group of Carnations from The Cedars Hardy Plant Nursery, Wells, Somerset, exhibited Princess of Wales and Cecilia in good form. The plants were well grown, and a groundwork of Maidenhair Fern gave the necessary finish.

For a floral decoration of three vases there was only one entry, and this gained but second prize. The exhibit was from Mr. Charles Russell, The Lodge, Pembroke Square, Kensington, W. The centre vase of Lilies was the best of the series. The second of Roses and the third of Iceland Poppies and blue Cornflowers were but poor efforts. The judges' comment on this exhibit was as follows: "The Poppy arrangement offends against all idea of colour harmony, nor have they lasting quality. The Roses very poor and too mixed. The Lilies good, but some flowers are mutilated by the anthers having been removed, and many flowers are broken; otherwise the arrangement is good and bold, but these points spoil it. Second prize given on account of excellent idea of Lily arrangement, though imperfectly carried out."

A huge bank of double tuberous-rooted Begonias was arranged by Messrs. B. R. Davis and Sons, Yeovil Nurseries, Yeovil. Good quality was noticeable in every instance, and this exhibit seemed to suggest that we have reached the apex of culture as regards these plants. Good sorts worthy of notice were Renown, Mrs. Moger, De Wet, Resolution, Ben Davis, Enchantress, Bardeur, W. Sparshot, Canopus, Miss Dorothy Hardwick, St. George, General French, and Lucania. A pretty edging of foliage plants completed the display.

SWEET PEAS.

A bank of well-grown Sweet Peas was charmingly displayed by Mr. C. Breadmore, Winchester. The flowers were large and well coloured. Specially good sorts were Miss Willmott, King Edward VII., Mrs. Walter Wright, Jessie Cuthbertson, Gracie Greenwood, Scarlet Gem, Janet Scott, Lord Rosebery, Triumph, Jeannie Gordon, Dorothy Eckford, Prince of Wales, Othello, Hon. Mrs. Kenyon, Salopian, and Prince Edward of York.

Messrs. John K. King and Sons, Coggeshall, Essex, set up numerous bunches of Sweet Peas in all the new and old forms of this indispensable summer flower. The bunches were small, but they were interesting to many.

Messrs. J. Cheal and Sons, Lowfield Nurseries, Crawley, Sussex, had a thoroughly representative lot of this fragrant annual set up in large bunches, and with flowers showing good culture. Coronet, Gorgeous, Coccinea, Countess of Radnor, Novelty, Chanceller, America, Duke of York, Fascination, Mrs. J. Chamberlain, Queen Victoria, Miss Willmott, Celestial, Black Knight, Blushing Beauty, Hon. F. Bouverie, and Lady Ormsby-Gore were among the more striking bunches.

One of the best lots of Sweet Peas was set up by Mr. H. J. Jones, Lewisham, S.E. They were a very fine lot, all the best sorts being represented. Countess Spencer, Dorothy Eckford, King Edward, Jessie Cuthbertson, Dorothy Tennant, Navy Blue, Mrs. W. P. Wright, Prima Donna, George Gordon, Miss Willmott, Hon. Mrs. Kenyon, were a few of the more striking sorts.

A new Sweet Pea was shown by Mr. William J. Unwin, Histon, Cambs. The variety is called Gladys Unwin, and is very similar to some of the prettier forms of Countess Spencer. A pleasing shade of pink is a good description of its colour.

A pretty exhibit of Sweet Peas was set up by Mr. David Russell, The Esher Nurseries, Brentwood. These were standard sorts, such as Lovely, Lady Mary Currie, Firefly, Royal Rose, Venus, Princess May, Lord Kenyon, Chanceller, Californica, Apple Blossom, Oriental, and quite a large number of the older sorts.

Sweet Peas and Carnations from Messrs. Thomas Ware (1902), Limited, Feltham, were good. The former were set up in bunches. Ferns, Asparagus, and Nepeta variegata were used in association and

gave a charming finish. Very good examples were Miss Willmott, Lady Grisel Hamilton, Mrs. Knight Smith, Lady M. Ormsby-Gore, Mrs. Fitzgerald, America, Lovely, King Edward VII., Agnes Johnston, Mrs. Dugdale, Creole, Scarlet Gem, Gracie Greenwood, and Triumph were some of the more striking sorts exhibited. Carnations, Dorothy, Frances Prior, Uriah Pike, Mrs. Nicholson, George Atwood, and Mrs. Audrey Campbell were charmingly displayed in vases with Carnation "Grass" as an adjunct.

Messrs. Dobbie and Co., Rothesay, also staged Sweet Peas. There was a goodly array, and included in it were all the newer varieties. We noted Mrs. Knight Smith, Mrs. H. K. Barnes, Agnes Johnston, Jeannie Gordon, Marchioness of Cholmondeley, Countess Spencer, Dorothy Eckford, Florence Molyneux, Lord Rosebery, King Edward VII., Jessie Cuthbertson, Mrs. W. P. Wright, Scarlet Gem, and Prima Donna. The flowers were lightly set out in the vases.

Messrs. Barr and Sons put up a pretty exhibit of Sweet Peas, staging popular sorts in neat and pretty bunches.

A fine exhibit was that arranged by Messrs. Jones and Sons, Shrewsbury. The Sweet Peas were elegantly set up, so that each spray of blossoms was seen to advantage. The flowers were large and handsome and the colours good. Among the newer kinds we noticed Countess Spencer, Scarlet Gem, King Edward VII., Jeannie Gordon, Hon. Mrs. Kenyon, Jessie Cuthbertson, Pink Friar, Chanceller, Mrs. Dugdale, Countess of Shrewsbury, Gorgeous, and quite a host of good things.

Hobbies, Limited, Dereham, made a brave show of Sweet Peas. The flowers were large and fresh and beautifully coloured. Elfrida (pink), Gladys Dean (heliotrope-blue), Countess Spencer, Golden Rose, sport from Agnes Johnston, Scarlet Gem, Dainty, King Edward VII., Dorothy Eckford, and Mrs. Knight Smith were among the better kinds.

HARDY FLOWERS.

The hardy plants, as usual, formed a leading and an attractive feature.

Messrs. Wallace and Co., Colchester, showed a magnificent group of the best and most seasonable flowers, disposed in an effective fashion. Lilies were a strong feature, and through the centre the colonies of *L. testacum* (a couple of dozen of spikes at least), *L. Henryi*, fully 10 feet high, and the Madonna Lilies were much admired. These colonies were supported by Iris Monnieri, nearly 7 feet high, very telling in light gold and with dark sword-shaped leaves. In the intervening spaces *Lilium speciosum* in variety, *L. Martagon dalmaticum*, *L. Brownii*, *L. longiflorum giganteum*, and many more were seen. Of equal importance were *Eremurus Bungei*, yellow, and *E. x Shellford*, a form with tawny yellow flowers and buds, and orange anthers. It is one of Professor Foster's raising, and is a seedling from *E. Bungei*. To name in detail all the good plants in Messrs. Wallace's group would occupy too much space. We are content, therefore, to select a few of them. These were *Brodias* and *Calochorti*, *Potentilla formosa*, *Gazania*, early *Gladioli*, a grand mass of *Campanula macrostyla*, with purplish violet blossoms, *Campanulas* of the *pumila* and *carpathica* sections, *Alstroemerias*, English *Irises*, *Orchis foliosa*, *Gladium flavum tricolor* (a very striking Poppy-like plant), and *Romneya Coulteri*, very effective in satin-white, with gold anthers, were among conspicuously good things. The two extremes were hanks of Fortin's Lily of the Valley and *Iris lavigata* in variety.

Messrs. B. S. Williams and Son, Upper Holloway, London, N., contributed in the cut state early *Gladioli* and *Alstroemerias*, with *Lychnis*, *Campanulas*, *Ixias*, and the like.

[Other notes on this section must be held over until next week.]

FLORAL COMMITTEE AWARDS.

Alpinia Sandere.—A very attractive species, with variegated leafage, having as near allies *A. vitata*, *A. nutans*, &c. The exhibited example was about 3 feet high and as much through; the variegation was very distinct. As a specimen for exhibition with stove plants this should prove one of the best. From Messrs. Sander and Sons, St. Albans. First-class certificate.

An award of merit went to each of the following:

Rose Charles J. Graham (H.T.).—The flowers of this Rose are of medium size and rich crimson in colour.

Rose Countess Annesley (H.T.).—In this variety the flowers are of cupped form, and pale flesh pink in colour.

Rose Duchess of Westminster.—In every respect a fine Rose. It is of pale La France colour, and is very distinct; the large, handsome, hairy flowers being effective in the extreme. This set came from Messrs. A. Dickson and Sons, Newtownards.

Rose Mrs. F. W. Flight.—Another fine addition to the pink rambler class. The colour is a warm pink, and the flowers are produced on enormous trusses; a showy Rose. From Mr. F. W. Flight, Winchester.

Begonia Canopus.—An enormous flower of citron yellow hue; the petals freely undulated, and the whole flower of a massive character. From Messrs. B. R. Davis and Sons, Yeovil.

Begonia Margaret Gwillim.—This is also a yellow-flowered variety, the tone rather that of pale canary yellow, the blossoms being about 5 inches across. From Mr. A. L. Gwillim, Eitham.

Gladium flavum tricolor.—A dark-coloured form of the Hon. Poppy from Asia Minor. The cupped flowers are large, of orange and mahogany red, suffused with scarlet, a large ovate dark blotch occurring at the base of each segment. A highly attractive border plant. From Messrs. Wallace, Colchester.

Carnation King Solomon (fancy).—A finely shaped flower, having a buff ground, heavily flushed with scarlet and crimson.

Carnation Glow-worm (self).—A flower of magnificent size and proportions. The colour is scarlet, calyx perfect, and the petals of nearly uniform size to the centre. This pair came from Mr. James Douglas, Great Bookham, and each received the award of merit.

Carnation Lady Lindthorpe.—From Mr. Martin R. Smith, Hayes, Kent.

OFFICIAL LIST OF AWARDS.

Gold medal.—Messrs. James Veitch and Sons, Chelsea, for stove, greenhouse, hardy, and flowering plants; Messrs. Sander and Sons, St. Albans, for Orchids; Dorrien Smith, Esq., for *Fourcroya longeva*; Messrs. T. Cripps and Sons, Tunbridge Wells, for Acers and hardy plants; Messrs. Dicksons, Newtownards, for Roses; Messrs. Blackmore and Langdon, for Begonias; and Messrs. Waverin, for *Astilbea*.

Silver Cup.—First, Messrs. Paul and Son, Cheshunt, for Roses; second, Mr. G. Mount, Canterbury, for Roses.

Silver cup.—Mr. H. B. May, Edmonton, for Ferns and flowering plants; Mr. L. R. Russell, Richmond, for trees, shrubs, &c.; Messrs. G. Bunyard and Co., for herbaceous flowers and fruits; Messrs. T. S. Ware, Limited, for alpine and herbaceous flowers; Messrs. W. Cuthbush and Sons, for Carnations, Irises, &c.; Messrs. J. Peed and Son, for *Gloxinias* and *Caladiums*; Messrs. K. Wallace and Co., for herbaceous and bulbous plants; Mr. Amos Perry, for herbaceous plants, &c.; Messrs. Charlesworth and Co., for Orchids; Mr. John Bradshaw, for hardy plants and flowers; Mr. H. J. Jones, for Sweet Peas, &c.; Messrs. J. Laing and Sons, for Begonias; Messrs. J. Hill and Son, for Ferns; Mr. J. Colman, for Orchids; Messrs. W. Bull and Son, for stove and greenhouse plants; Mr. M. Prichard, for alpine and herbaceous plants; Mr. Laurence Currie, for Water Lilies; Messrs. Barr and Sons, for hardy flowers and pigny trees; Mr. H. Partidge, for fruit; and Mr. C. W. Breadmore, for Sweet Peas.

Silver-gilt Flora medal.—Mr. D. Russell, for hardy trees; Messrs. B. R. Cant, for Roses; Messrs. Dobbies, for *Pansies*, &c.; M. C. Vuylsteke, for Orchids; Messrs. B. S. Williams, for *Gloxinias*; Messrs. Jackman, for Roses and herbaceous plants; Sir F. Wigan, for Orchids; and Mr. G. Mount, for Roses.

Silver-gilt Banksian medal.—Mr. G. Reuthe, for alpine and herbaceous plants; Mr. R. Farrer, for alpine; Messrs. R. and G. Cuthbert, for flowering plants; and Messrs. B. R. Davis and Sons, for Begonias.

Silver Flora medal.—Mr. A. Gwillim, for Begonias; Messrs. H. Low and Co., for Orchids; Messrs. Cheal and Son, for herbaceous plants and shrubs; and Messrs. G. and A. Clark, Limited, for hardy flowers.

Silver Banksian medal.—Mr. J. Forbce, for hardy flowers; Messrs. Jones and Son, for Sweet Peas, &c.; Messrs. Fromow and Sons, for hardy trees; Mr. Ladhams, for herbaceous plants; Mr. V. Slade, for *Pelargoniums*; Mr. J. B. Joel, for Strawberries; Mr. R. Anker, for Cacti; and Messrs. Hobbies, Limited, for Sweet Peas, &c.

HORTICULTURAL SUNDRIES, IMPLEMENTS, &c.

Silver-gilt Flora medal.—Messrs. J. Bentley, Limited, Chemical Works, Hull; Messrs. Putham and Son, Newman Street, Oxford Street, W.; Messrs. W. Wood and Son, Limited, Wood Green, N.; Messrs. G. W. Riley, Norwood Road, Herne Hill; and Messrs. Osman and Co., 132, Commercial Street, E.

Silver Flora medal.—Messrs. H. Castle and Sons, Limited, Baltic Wharf, Westminster; the Anglo-Continental Giano Works, Leadenhall Street; the Four Oaks Nursery and Garden Sundries Company, Sutton Coldfield; Messrs. Champion and Co., 115, City Road, E.C.; Messrs. Duntton and Co., Limited, Lambeth; Messrs. Fenlon and Son, Tudor Street, Whitefriars; Mr. James George, Redgrave Road, Putney; and Messrs. T. Syer and Co., 45, Wilson Street, Finsbury Street, E.C.

Silver Banksian medal.—Messrs. Valls and Co., 16, Coleman Street, E.C.; Messrs. Cory and Co., Shad, Thames, S.E.; M. de Luzi Freres, 99, Lifford Road, Camberwell, S.E.; Messrs. D. Dowel and Son, Ravenscourt Avenue, Hammer-smith; Messrs. W. Herbert and Co., 2, Hop Exchange, S.E.; Mr. H. Pattison, Farm Avenue, Streatham, S.W.; and Mr. R. Pinches, Crown Buildings, Camberwell.

Bronze Banksian medal.—Messrs. William Poore and Co., 139, Cheshide, E.C.

* * * Report of the hardy flowers and sundries is unavoidably held over until next week.

THE GARDEN

No. 1705.—Vol. LXVI.

[JULY 23, 1904.]

THINNING OF FRUIT.

FRUIT crops generally are not quite up to expectations. There are many cases in which trees, Apples in particular, are heavily laden, and a decision must be formed as to whether they shall be allowed to carry their burden to the end of the season or be relieved of a portion of it. There is no need to enlarge on the wisdom of judicious thinning, because it is only a matter of common-sense that a tree is much better able to bring to perfection a moderate quantity of fruit than a very heavy crop. It is true that trees are, generally speaking, vigorous this year, on account of the small strain on their fruiting energies last season, and consequently they are able to carry fairly heavy burdens without any undue tax on their energies; but, in spite of this fact, the spirit of moderation must be allowed to predominate in arriving at a decision as to the exact quantity of fruit any trees should be allowed to carry.

The object, particularly in private gardens, is to get good specimens, hence the necessity of timely thinning; and there need be no waste about it, as there is a demand in most households for Apples for cooking as soon as they are large enough. In some cases more than others is the necessity for thinning apparent. Varieties which have a tendency to make vigorous growth may be allowed to carry heavy crops, and it will do them good, by the effect it will have in checking exuberance; but all Apples are not of this character. A notable exception is Stirling Castle, a reputedly heavy bearer, but one which does not usually make strong growth. It is no uncommon thing to see stunted specimens which have been made so through over-cropping. Naturally, the varieties which need the most attention in the way of judicious thinning are those of long-keeping capacities, because, by relieving the trees of a part of their burden, the fruits which remain get more sustenance and are enabled to develop to larger and finer proportions.

It may be too much to expect a great deal in the way of fruit thinning on tall standard trees, because there is the question of labour to be considered, and usually there are a good many falls through wind and the ravages of the grub of the codlin moth; but in the case of dwarf, pyramid, and half standards, growing in gardens and plantations, the quality of the

produce eventually gathered may be improved by the timely thinning of fruits where they are thickly disposed on the branches. Everyone knows that if Gooseberry bushes are relieved of a part of their burden when the berries are green, the ripe fruit later on will be all the finer, and the same rule applies to Apples, Pears, and Plums. Speaking of the latter fruit, the well-known Victoria is a reputedly heavy cropper, but how often do growers fail to get fruits up to the true standard of the variety, simply because they allow the trees to carry too many. Indeed, there are men who will go to any amount of trouble in propping up heavily laden branches to prevent breaking, but they could never sum up sufficient courage to take off half the fruits, though this would be much the better course to follow.

Indeed, the rule of thinning is one that is closely associated with all branches of gardening, and the adoption of it is the secret of the finest flowers as well as fruit. A case recently came before our notice of a lady who thought the gardener spent an unreasonable amount of time in thinning Grapes, and she failed to realise the advantage of it. In order to convince her the gardener left a few bunches unthinned, which was about the wisest thing he could do under the circumstances, and the lady now is not only a strong advocate for Grape thinning, but everything else in the way of fruit. So many people have yet to realise the advantages of thinning hardy fruits that the operation is anything but general. The besetting sin of avarice may also have something to do with the neglect of thinning, but no great power of argument is needed to prove that it must be false economy to allow a tree to carry twice as much fruit as it is capable of bringing to perfection, while the quality would be considerably better if half the quantity were removed.

ROUND ABOUT A GARDEN.

DROUGHT AND DISASTER.

TO go round about a garden as a long drought approaches—let us hope—its end is rather a pilgrimage of woe. By unremitted watering of the flower beds proper and the lawns, brilliant colours contrasting with stretches of cool green may have been maintained in the main garden; but elsewhere the seamy side of summer shows too plainly. When it comes to watering the perennials to

keep them alive, gardening seems too artificial for a pleasure; and, since even the best intentions and appliances will hardly help you to water the shrubberies and shaded walks, your most strenuous endeavours to make up for the want of rain still fall far short of your garden's needs, and in flagging shrub and flaccid Fern you can measure the drought sinking deeper into the ground every day.

WEAK SPOTS REVEALED.

And it is curious how, at such a time, some deep-seated and unsuspected defect of your soil will come to the surface, just as latent hereditary disease will become manifest in a man worn down by trouble. Traversing the garden now, I see quite plainly why one of two Laburnums, planted to make an arch, never thrived as the other did; why, 20 yards from these, a couple of Larches have always been so unsatisfactorily thin on the top; and why one end of an adjacent shrubbery has always been its knuckle-end, where evergreens and flowering shrubs and perennials all failed to make anything like the growth of their fellows elsewhere. One may have noticed previously that these three weak spots were in a straight line with one another and have suspected a streak of thin soil; but it needed the drought to write the whole secret plainly on the surface of the ground.

A STREAK OF BARRENNESS.

For now—I write on the 19th, before a drop of the rain which seems at last to be approaching has fallen—these isolated spots stand in a broad line of barrenness, on which the grass is browner and the perennials more feeble than anywhere else. The broad line, moreover, takes in several spots where, one remembers, other crippled trees than the failing Laburnum and Larches once stood, trees that were removed so long ago—probably after the last year of drought—that one has almost forgotten how we mourned their premature decline. And if you go through the shrubbery to the outer railing you can see the same broad line still visible, even in the parched brown field, stretching like a yellow ribbon of desert to the point where it joins the drive several hundred yards away. The inhabitants of the village remember well when the drive was moved in order to accommodate the enlargement of the garden and the addition of new shrubberies; but so long as the house stands its occupants will be reminded of the change, which they never saw, by the infertile track that marks the line of the old road in dry seasons.

WHY INSECTS MULTIPLY.

But one may question whether prolonged hot weather brings to the surface in a garden anything more disastrous than the insects. It has long been a maxim that severe winters do not discourage insect life, the argument being that insects are naturally fitted to withstand such cold as can reach them in their hiding-places, whereas when the winter is mild and

the ground soft the birds can get at them. Our experiences of the last two years, when mild winters were followed by such a scarcity of insects as rejoiced the gardener but made the entomologist very sad, were accepted as evidence of the truth of this maxim. But what shall we say now? Last winter was milder than ever. With outdoor Plums and Pears in December, Strawberries in February, to say nothing of wild Primroses at Christmas, the winter of 1903-4 must have gone near to breaking many records of abnormal mildness; and there were very few days in the South of England when frost or snow prevented the birds from discovering hidden insects. Yet this summer has produced such a pestilent wealth of insects as happily has been rare in our recent records.

THE RESULT OF PROLONGED FINE WEATHER.

The truth, indeed, appears to be that the character of the winter has comparatively little to do with the abundance of insects in summer. The dominant factor for each species is the weather at the time of its emergence. Collectors are well aware of the futility of searching for insects abroad when the weather is inclement; and during a bad summer it frequently happens that you will hardly see a single specimen of butterflies which are usually abundant; whereas, given a week of suitable weather at the right season, you may take your butterfly net with confidence to the haunt of a rarity and will not be disappointed. Exceptions and vagaries occur, of course; but a single week of fine weather in a bad year will always suffice to bring out the insects of the season in such hosts that all the previous inclement months would seem to have had no effect upon them; whereas, if that week of good weather had not been vouchsafed, the collector might have gone to the end of the summer without enjoying a single good day for collecting. And between the insects which the entomologist longs to see and those which the gardener hates there cannot be any such marked line of distinction as to justify beliefs that their abundance or the contrary can be the result of an entirely different set of causes. In the lives of all insects the time of most serious risk is that in which they emerge from the chrysalis, and every female which is killed or otherwise prevented from laying eggs then represents hundreds of lives lost to the species. From this it follows that the week of fine weather which enables the collector to fill his killing bottle must also be the time when garden plants and crops are covered with eggs; and when, as this year, many successive weeks of fine weather occur, it is easy to understand how the cumulative insect-life becomes a burden hard to be borne. E. K. R.

THE USE OF THE HOE.

THE primary use of the hoe is for keeping down weeds, but, in addition, it is, properly used, the best cultivator we have. To keep the soil well moved is to give plants a chance to make good root-action, and this is most easily done by the use of the hoe, while the fine surface soil acts partly as a mulch, and also assists in supplying the roots with moisture during dry weather by capillary attraction. That the value of the hoe amongst growing crops is not sufficiently appreciated is a fact that can be seen any day in almost any part of the country, weeds being the most prominent feature of the crops. This is a great mistake, as nothing impoverishes the soil so much as allowing weeds to grow, while, in addition, they also make the ground much drier. It may be thought that the weeds keep the ground moist by acting as a screen against the sun, but anyone who has tested it

knows that at a depth of 2 inches or so the ground under weeds is much drier than an open piece which has been kept clean by the hoe. It is astonishing the amount and depth of moisture a crop of weeds will take from the ground. Where the hoe is used freely, the surface soil becomes broken up into fine particles, which lie close together, and act practically as a mulch. Though the soil may be dust-dry as far as the hoe penetrates, yet just below it will be found to be warm and moist, and will keep so even through a long spell of drought. It has been said that the best time for hoeing is when there are no weeds, and certainly a turn then makes a great difference in the time the weeds will come again, as a large number of seedlings that have just germinated and which can hardly be seen by the unaided eye are destroyed at this time.

The nature of the soil has much to do with the hoeing. On light sandy soils the hoe can be used at any time, as the ground is in perfect working order, even directly after a heavy rain, but on heavy clayey lands the case is different. One must get on the ground when possible, not when it is most desirable. The best time, however, for the first hoeing after the winter is as soon as possible after a rain, just when the ground is beginning to dry. By hoeing it then, while the ground is softened by the wet, the hoe can be, and should be, freely used to its full depth, and not as is the case if the soil has got dry and hard, be merely scratched over the top. This latter method destroys the weeds, but does not give that fine top-soil which is so useful to growing plants, and also so helpful in later hoeings in giving full play to the hoe. I have seen heavy soils that have not been caught at the proper time with a surface as hard as a road, and on which no impression can be made with any tool less than a steam plough, whereas if they had been hoed at the proper time the surface would have been broken up sufficiently to form that fine tilth so beneficial to the crops. By breaking the ground as deeply as the hoe can go, air is admitted to sweeten the soil, and warm rains get a chance to penetrate to the roots below instead of running off and turning paths into drains.

The proper time to hoe generally is when the weather is fine and dry, but if these conditions do not prevail, and the weather keeps showery, then judgment is required when to use the hoe. Here, on our light sandy peat, we can work the ground directly after a shower, and if the weather is unfavourable and likely to keep so we start hoeing at once. It is not so much that we hope to kill the older weeds, but, with the ordinary draw hoe properly and deeply used, numbers of tiny seedlings are turned over and smothered, and from our experience last year we have found that this is the best and cheapest plan, as there was no part of our ground that gave us any real trouble last year. In fact, we were freer from weeds last winter than we have been after many dry seasons, but continual hoeing, wet or fine, was necessary. On heavy lands, however, this would be impossible, as after a rainy time must be allowed for the ground to dry sufficiently to get on it, as it cannot be worked when it is sticky, but the hoe should be used whenever there is an opportunity. It is not so much the weeds that can be seen that are the greatest bother; but it is those tiny seedlings, barely discernible, that make a fairly clean piece of ground very foul in the course of a few days if let alone. When the sun is shining these seedlings cannot be seen, but on a dewy morning, before they become dry, they can be seen in thousands literally covering the ground, and then is the time to kill them.

The cost of keeping the ground clean is a large item in the majority of gardens and nurseries, and it is false economy to stint labour in hoeing, as the more the ground is hoed the better it is for the crops, and also cheaper in the long run. The actual cost varies with the character of the ground, but in light soils the average cost for a year should not exceed 12s. to 14s. per acre, while in heavy lands it will run about 15s. to 18s. per acre annually. This refers to the draw hoe, which is the best to use on a large scale, the Dutch hoe being of no use where acres of ground have to be dealt with.

Bagshot, Surrey.

J. CLARK.

WHOLESOME VEGETABLES.

IT may appear out of place to write on the above when midsummer has only just passed, but the gardener who takes an interest in the kitchen garden is obliged to prepare for future requirements. As regards actual culture I fear I have nothing new to describe, and my note more concerns the value of what may be called the earliest varieties and their usefulness early in spring. As regards seasons and quality we have made considerable progress, as now we have Cabbages that are reliable, there is greater freedom from bolting, and, being smaller, they are of better quality. A small, early, delicate Cabbage is one of our most valuable of sprig vegetables. Even in a private garden where quantities are required there is no loss in growing a small Cabbage, as the plants occupy less space and they are more compact, so that a greater quantity can be grown. With large Cabbages there are loose, large, outer leaves, and these when removed greatly reduce the yield. Another strong indictment against a large Cabbage is that it requires a longer season's growth, and time is more important at the season named, owing to the lack of really good vegetables at command at the time named.

We make three sowings of seeds—a small early sowing is made, a larger one a little later, and a small one a month later still—but in a small garden or where Cabbages are not required after June the last sowing may be omitted. As regards the actual date of sowing, even here I should hesitate to give the exact time; so much depends upon soil, position, and locality. At Syon we sow as near to July 15 as possible for the earliest supply, and for this purpose sow a small, sturdy, short-legged variety, a cross between the excellent Ellam's Dwarf and Sutton's Little Gem. This season, though this variety was ready at the end of March and in quantity early in April, not 1 per cent. bolted. To get Cabbage at the date named the plants must be strong by the middle of September. This date may be a little late for the north, and therefore for the earliest supply our sowing was made on July 10. We usually planted out some six weeks later. It will be seen that a hard and fast line cannot be observed.

The most important sowing is made at the end of July. There is room for greater variety here, but a leading place may be claimed for the small sorts, and no one can go far wrong who relies upon Ellam's Early Dwarf, Sutton's April, or Flower of Spring, and though last, by no means least, that splendid little Cabbage Wheeler's Imperial. There are others. I only note those that have not failed us. This sowing is an important one. A good seed-bed and an open position are essential. Though Cabbages are valuable in March, a full supply with no interval well into May is essential in most gardens. The later sowing depends in a measure upon the grower's demands. Some of the main-crop varieties can be sown, as I find they are even better at this season than the early ones. This sowing is a small one. In some cases the plants are put out in their permanent quarters in February and wintered thickly in rows or left in the seed-bed. I prefer the first-named, but as this lot of plants cannot be called early spring I only note their value, as they give a succession. The seed is best sown in the autumn as advised. When the plants are grown thus they are earlier than seed sown early in the year under glass.

Earlier in my note I briefly touched upon the seed-bed, and much depends upon this and the condition of the soil, whether hot or dry. The seeds may germinate slowly and come up patchy. This should be avoided, and at the sowing it is well to have the soil sufficiently moist to promote quick germination. Also avoid overcrowding, which results in weakly plants. It is also well to sow on the level and away from trees, so that when moisture is given it is retained. It is much better to plant out the seedlings before they get too large, and, in case the quarters are not ready, prick out the seedlings in rows and lift carefully later on. These are only small matters, but as they have a great influence upon the plant they are worth observing, and by so doing bolting or running early in the spring is less prevalent. G. WYTHES.

SOME EFFECTS OF THE DROUGHT.

CLIMATICALLY the season of 1904 is in striking contrast to that of its predecessor, for whereas this time last year the general outcry was for fine weather, at the moment of writing the garden is thirsting for rain. The condition of things would doubtless be worse but for the fact that the rainfall last winter was heavy, and crops, particularly in retentive soils, are not suffering to the extent they would have done otherwise. On light, shallow soils, however, the want of moisture is being seriously felt, crops are ripening prematurely, and the returns in many instances must necessarily be light. Unfortunately, the tropical heat of the latter half of June and July followed a spell of cold drying winds, which appeared to be instrumental in bringing hordes of insect pests, which affected fruit and other trees to an alarming extent. Rain would have helped to wash them away, but it failed to come, and consequently the blight trouble of this year is amongst the worst on record.

It is in such seasons as the present that the benefits of an adequate water supply in the garden are appreciated to the fullest extent. At its best the artificial watering of outdoor crops is wearying work, and its benefits are slight compared to Nature's own way of supplying moisture, but it has to be done if crops are to be kept alive. How much a dry season adds to the labour of the garden no one but gardeners know, because time has to be spent on the operation which can ill be spared when other work is pressing, and yet it must be done, for no man who has the interests of his crops at heart can see them languishing for the want of water as long as he has any facilities at all for supplying it.

The season of production is necessarily shortened by spells of tropical heat and drought. Take Strawberries for instance. The early fruits were remarkably fine and the crops generally good, but the season of picking was shortened considerably by the rapidity with which the fruit ripened. The wisdom of relying on young vigorous plants, instead of on beds of several years standing, has asserted itself this year, for the latter quickly showed their inability to withstand the drought by the withered condition of both plants and fruit after a few days exposure to the sunshine.

The same remarks apply to bush fruits. The healthy young Gooseberry bush of a few years standing can retain its foliage and ripen its crop even though the weather be hot and dry, but the specimen which has passed the heyday of its vigour is quite unable to do so. Debility may be observed in the rusty brown appearance of the leaves, which fall an easy prey to red spider, the berries are quickly scalded by the sunshine or they ripen prematurely, and big gaps are made in the bushes through branches withering and dying away. The same thing occurs in the case of Currants. Our attention was recently drawn to a plantation of Black Currants, one-half of which was formed of old bushes and the other of young specimens planted about two years ago. The small and insignificant fruits on the former were withering and falling off wholesale, while those on the latter were full and plump and looked as if they would hang for a considerable time, though they were all growing under exactly the same conditions. These lessons plainly teach us that there should be no sentiment in our methods of fruit culture, and when a bush or

tree has served its purpose and is on the downward grade it should give place to a young and vigorous successor. We fight under difficulties in a season like this, what with the effects of drought on the one hand and a plethora of insects to deal with on the other; but it is useless to think of giving up in despair, because if caterpillars are left to defoliate the Gooseberry and Currant bushes the sunshine quickly finishes the work of destruction by scalding and withering up the fruits.

Though no vegetable grower wished for a repetition of last year's rainfall the opposite extreme is almost as bad, and the watering-can is playing no small part in the routine of the kitchen garden. No wonder that gardeners anxiously study the barometer and sigh for rain when there is Celery to be put out, and the greens in the seed-bed are spoiling for the want of planting. It is impossible to wait indefinitely for the needed shower, so the plants have to be transferred to their permanent quarters under sunny skies, and watering becomes part of the necessary routine. There are crops, too, which need thinning, such as Carrots, Beet, and Onions, but everyone knows what an almost impossible task this is when the top crust of soil is baked almost as hard as iron. Insects flourish under the conditions that are detrimental to growth, and that hard-backed little pest known as the "flea" plays havoc with the Turnips, seedling Greens, and other plants that are doing their best to grow under the trying conditions.

Green Peas form another crop which is causing considerable concern, for though the pickings have been plentiful up to now we have successional supplies to think about, and the rows from which we hope to gather Peas in August and September are sadly in need of rain. It is disheartening to see Pea haulm turn brown and sickly before pods are formed, and to prevent this resource must be had to watering and mulching. It is in such seasons as this that one realises the wisdom of preparing deep trenches for Peas and Beans, and placing a layer of cool manure in the bottom before sowing. Good drought-resisting Peas will serve their purpose this year, and amongst the many varieties for a dry season few are better than Autocrat, which keeps green and fresh-looking long after some other varieties have gone off entirely.

With regard to Potatoes we do not anticipate a repetition of the "blight" trouble of last year, unless climatic conditions alter considerably, but it is probable that crops will be small. Already the early varieties are ripening off, and even the tops of others which should grow for some time yet have a yellow tinge about them, which we would prefer not to see for some time to come. There is a particular interest in Potatoes this year, for many people who were bit by the craze for new varieties in the spring paid long prices for novelties, which they are naturally anxious should turn out well. If the season is not quite of the right character to test the disease-resisting capacities of Potato novelties we shall have an opportunity of observing how they acquit themselves in a dry summer.

In spite of many duties, however, caused by the necessity of much watering and other things, there is one operation which must not be neglected. It is surface cultivation, and though weeds are not growing fast, the Dutch hoe must not be allowed to hang rusting in the tool shed. It is doubtful whether the usefulness of this implement is fully appreciated, the object of using it during spells of dry weather is to conserve the moisture in the ground. When the sun bakes the surface

soil, cracks and fissures may be seen running in all directions, and it is through these channels that the moisture is absorbed. A free use of the hoe in keeping the soil in a broken crumbling condition on the surface naturally checks the absorption and the moisture, which instead of being drawn into the air remains in the ground for the benefit of the roots of crops. The necessity of watering in tropical seasons is evident to all, but we want to avoid the need of the operation as long as possible, and if the flat hoe were used more in stirring the surface soil between growing crops, they would not only benefit, but the use of the watering-can would be less essential.

NOTES OF THE WEEK.

FORTHCOMING EVENTS.

July 26.—Royal Horticultural Society, Committee Meetings in New Hall.

July 27.—Newcastle-upon-Tyne Summer Flower Show (three days); Cardiff Summer Show (two days).

July 28.—Chesterfield Show; Carnation Show at Birmingham (two days); St. Ives Flower Show.

August 1.—Lichfield, Grantham, Crediton, Atherston, and Ilkeston Horticultural Shows.

August 2.—Mansfield and Leicester Flower Shows (two days).

August 9.—Royal Horticultural Society's Meeting in New Hall, Vincent Square, Westminster.

August 10.—Royal Botanic Society's Annual Meeting; Ventnor, Sevenoaks, and Bishop's Stortford Flower Shows.

August 11.—Taunton Deane Horticultural Show.

August 13.—Sheffield Horticultural Show.

August 16.—Exmouth (two days) and Clay Cross Horticultural Shows.

August 17.—Shrewsbury Floral Fête (two days).

Marguerite Queen Alexandra.—Those who had heard beforehand of Messrs. Sanders' new Marguerite had ample opportunity of seeing it at the exhibition held at Holland Park, for a quantity of plants in full flower were staged there. Accompanying these was a small circular, from which the following extract is made: "This South African Marguerite is a novelty of great beauty and usefulness. It is a pure white, very distinct form of the typical *Chrysanthemum frutescens*, with the addition of a crownlike or Anemone-flowered centre. This grand plant originated in South Africa, from where we have imported it." The plants shown were certainly very promising, though taller than some of the forms of Marguerite that we are accustomed to see. The flowers are from 2½ inches to 3 inches in diameter, with, in most instances, the centre filled with quilled florets after the manner of the Anemone flowered Chrysanthemum. A few, however, are only partially double, while occasionally a single bloom may be met with. By propagating, however, solely from the shoots bearing flowers strictly duplex in character it is more than probable that this tendency to revert to single blossoms will pass away in time. The long wiry stems of this variety will stand it in good stead for cutting, and the length of time that they remain fresh in water is also another point in its favour.

Raspberries in Blairgowrie district.—Although prices for Raspberries in the Blairgowrie district have been falling recently, it is hardly probable that the fall will continue, as the crop is turning out smaller than was at one time expected. In the Rattray district there will be a considerably smaller crop than was anticipated, much damage having been done from various causes. Among recent prices which have been given or offered was £26, only £23 being given soon after, while since that £27 was offered. The acreage shows a steady increase annually, and the increased crop seems largely absorbed by the growing demand for Raspberry jam for abroad, where the climate is unsuitable for the cultivation of this fruit.

National Potato Society.—The schedule of the National Potato Society's show, which is to be held at the Crystal Palace on October 11 and 12, has been issued. Many of the large seed firms give special prizes, and a particularly interesting class is that for the best exhibit of Potatoes in the show, the prize in which is the cup, value 10 guineas, presented by Sir John T. D. Llewellyn. Copies of the schedule may be had from the secretary, Mr. Walter P. Wright, Postling, Hythe.

In aid of the Gardeners' Royal Benevolent Institution.—It is interesting to know that Messrs. Cooling and Sons of Bath had a stall at the recent Bath Rose show in aid of the Gardeners' Royal Benevolent Institution. The exhibitors gave the committee the space and other blooms, and with the aid of one or two collecting boxes at the end of the day a sum of £15 1s. 3d. was realised. Many societies might do the same—[We think so too.—Ed.]—and in this way a very handsome amount would be available for the parent society at very little trouble or cost. Messrs. Cooling get the committee to give them a space in one of the tents, and a few willing helpers (ladies) do the rest.

Scottish Pansy and Viola Association.—The second monthly meeting was held at Buchanan Street, Glasgow, on the 13th inst., for the purpose of awarding certificates to such Pansies and Violas as might be deemed worthy. The following awards were made—Fancy Pansies:—First class certificate to Mary Phillips (Kay), certificates of merit to Provost Thomson (Kay), Mrs. Campbell (Dobbie and Co.), Jeanie Carswell (Dobbie and Co.), Nellie Curson (Dobbie and Co.), Mrs. W. Sinclair (Dobbie and Co.), and Mary B. Wallace (Dobbie and Co.). Show Pansies: Mrs. R. Smith, white ground (Dobbie and Co.), Katie, yellow self (Dobbie and Co.), and A. Paterson, white self (Dobbie and Co.). Violas: Certificates of merit to Lady Grant (Frater), J. H. Watson (Kay), Effie (Dobbie and Co.), and R. MacKellar (Dobbie and Co.). Also certificate of merit to new Lobelia Blue Jacket (Aitchison Brothers). The next meeting will take place on August 10.

Strawberries in the Aberdeen district.—While the Strawberries here are considerably later than in the south, there is good prospect of the crop being in every way satisfactory, although the abundance of fruit everywhere will cause low prices to prevail. The extent of ground under Strawberries in this district increases yearly, and, upon the whole, the enterprise of the growers proves remunerative. The earliest to be marketed is usually John Ruskin, which is found an excellent cropper, but the main crop is still Sir Joseph Paxton. The bulk of the crop is disposed of locally, there being an extensive demand on the part of firms who preserve fruit for the large export and home business. The season here generally lasts until about the end of September.

The Queen at East End flower shows.—Her Majesty's visit to the heart of the East End last week excited the keenest interest. The Queen first inspected the display of plants and flowers at the People's Palace. The centre of the hall was occupied by the magnificent group sent from Frogmore by the King. Others who sent fine displays were the Duke of Eife, Lord Rothschild, Sir Samuel Montagu, M.P., Mr. Spencer Charrington, M.P., Mr. F. A. Bevan, and representatives of several firms. Escorted by the Duke of Eife, with the honorary secretary at hand to explain the exhibits, the Queen at once began her tour of inspection. Passing up the west side of the hall the Queen entered the winter garden, and here first saw the exhibits grown by the juvenile members of the society. Their honorary secretary, Miss Sator, explained the system pursued—how, for a penny, the youngsters buy a small but sturdy plant early in the season, to which a seal is affixed, the rest depending upon the skill and intelligence that the young gardener can display. In the great hall, again, the Queen was especially interested in the section restricted to the "congested district" which covers the densely-populated area from Victoria Park to Thames-side. From these squalid and unlovely streets no fewer than 200 exhibits

had been sent in. The Queen also visited the flower show at St. George's-in-the-East. It is the annual show, but, unfortunately, enthusiasm has been diminishing every year. St. George's is poor, and a bazaar was organised this year in the hope of stirring enthusiasm. The desired effect was obtained, for the entries exceeded those of last year by 100. The financial anxieties of the committee were dispersed when it became known that Her Majesty would visit the show and view the children's flowers. Practically all the flowers which graced the flower-stall came as a present from the Royal Gardens.

Motor vehicles for the Clydesdale fruit districts.—With a view to provide better means of transport for the conveyance of fruit in districts of the Clyde valley rather remote from a railway, a service of motors has been begun, and the first run for the season was made on the 13th inst. Some of the most productive fruit districts on Clydeside have no direct railway connexion, and for a long time much inconvenience and expense have been caused by the necessity of driving the fruit all the way to Glasgow. The fruit farms about Crossford, Kirkfieldbank, Garrison, Rosebank, and Blackwood are among these, and large quantities of fruit have to be driven by horse-drawn vehicles, or taken by bad roads, in some cases, to the nearest stations. The Crossford route was the first on which the motor was beguon, the run being made into Glasgow.

Aphelandra chamissoniana.—Many of the Aphelandras are remarkable, not only for the beauty of their flowers, but also for their handsome leafage, and in the species under notice there is no exception to this rule, as in or out of flower it is very attractive, though doubly so when the bright yellow blossoms are at their best. It is a native of Brazil, and though first distributed by the late Mr. William Bull of Chelsea, under the name of *A. punctata* as long ago as 1881, it is even now seldom met with. Like most other members of the genus, it is of erect growth, the sturdy stem being clothed with leaves about 6 inches long and with the course of the midrib and principal veins marked with a broad white band, breaking off at the edges into dots or freckles of that hue. The ground colour of the leaf being deep green, these light coloured markings stand out conspicuously. The inflorescence consists of a terminal spike with large bracts arranged in a cone-like manner, from the axils of which the flowers are produced. These bracts, which are deeply serrated at the edges, are of a deep chrome yellow, shaded with green towards the base, and when first developed they are also tipped with the same hue. The individual flowers are curved, tubular in shape, about 1½ inches long, of a rather lighter tint of yellow than the bracts, while before expansion they are tipped with green. Though very bright and pretty, they do not last long, but, as a set-off, the showy bracts retain their colour for a considerable time. Like the other members of the genus, this Aphelandra is not difficult to propagate, for cuttings of the half-ripened shoots strike in two or three weeks if dibbled into pots of light sandy soil and placed in a close propagating case in the stove. They will thrive in ordinary potting compost, but must be stopped to ensure a bushy habit, as it is only the stout sturdy stems that bear a good head of blossoms.—H. P.

Floral decorations by Willis and Segar.—I recently had an opportunity of seeing the floral decorations which were carried out by Messrs. Willis and Segar for a grand ball. It was one of the most important decorations the firm have done this season. Roses were the chief feature. In the entrance hall, the staircase, and landing Crimson Ramblers were twined round tall Cocos flexuosa, and archways were formed of them in the window recesses and other available positions. Large crimson Roses stood up among Adiantum farleyense and Cocos weddelliana. The ceiling was festooned with crimson Roses and Smilax, long trails of Smilax and Roses hung down forming curtains to the vestibule at the entrance to the ball-room. A few Liliun longiflorum and other flowers, with Ferns, were used at the base of each of the large Palms. In the ball room pink was the prevailing colour. Upwards

of 2,000 pink Roses were used, pink Malmaison Carnations, pink Gladioli, and pink Pelargoniums. In the large room, in three divisions, the whole of the ceiling was festooned with Smilax and pink Roses. Under the beams of the divisions hung large baskets of Roses, and in the angles were fixed large spreading bouquets. In front of the orchestra gallery were long Bamboo flower-holders filled with Roses and Gypsophila, and surmounted with a bank of Gladioli and Gypsophila. Round the overmantels were large light bouquets of Pelargoniums and spreading sprays of Asparagus Sprengeri. On the mantels were large bunches of Roses from which stood out long sprays of Odontoglossum crispum and beautiful blooms of Cattleyas hung down. The panels of the walls were divided by plinths (corrugated), white with gold facings, the panels being crimson, and Roses hung down the plinths. In the fireplaces were banks of foliage, Alcasia argentea variegata and fine plants of Croton Reidii standing up among Ferns. The electric lights were covered with pink shades, and when lighted up the room seemed a veritable fairyland, and certainly did much credit to the firm.—A. HEMSLEY.

White Sweet Sultan The Bride.—This is a fine selection made by Messrs. Jarman and Co. of Chard, and exhibited by them at the Wolverhampton Floral Fête and awarded a certificate of merit by a committee of the whole of the judges. The purity of the white of the flowers is one of its chief recommendations. Its fine form is another, and, seeing how much the Sweet Sultans are employed in floral decorations, the white form especially, this new variety is likely to become highly popular.—R. D.

Chironia floribunda (ixifera).—Some fine examples of this soft-wooded greenhouse perennial shrub were exhibited by Mr. James Cypher, of Cheltenham, in his collections of stove and greenhouse plants at the recent Wolverhampton Floral Fête, and they created quite a sensation, especially among the gardeners, many of whom appeared to be seeing the plant for the first time. It is, indeed, many-flowered, the blossoms pink, and reminding one a good deal of a charming Linum. It is related to the Gentians; the few species are from Southern Africa. The form under notice was introduced in 1843. I used to see it exhibited at Trowbridge Flower Show in the early seventies, and I lost sight of it until two years ago, when I saw it at the York Flower Show in the form of small table plants in a collection of fruit and flowers. Mr. Cypher has done well to re-introduce it, and I should not be surprised if it became in brisk demand. The late Mr. John Matthews, who was in 1872 gardener at Highfield House, Trowbridge, and was the exhibitor of the Chironia at the local show, employed a simple treatment. He grew it in a mixture of turfy peat, with plenty of sand, giving it ample drainage and being careful not to overpot it, supplying it abundantly with water when growing, and keeping his plants in as light and airy a position as possible. The first plant which came into Mr. Matthews' possession was in a 6-inch pot, and in the autumn season he cut it back, grew it on all the winter in an intermediate house, and, as illustrating its free growth, by the end of May it had been potted on into a 12-inch pot, and it was then nearly 2 feet in height by as many in diameter. It was then removed to the greenhouse to become hardened off and to set its buds. It was shown at Trowbridge, and a few days after at Bath, where it created a sensation, being quite unknown there. I remember hearing Mr. Matthews say that he gave his plant stove treatment in the first instance to get it into size; but when he had made a good specimen of it he always cultivated it in a cold greenhouse, as stove treatment is apt to engender a weakly growth. In October the specimen was cut back close, then repotted in the spring, a large specimen being produced by the August following. It is to be hoped that other fine old plants successfully cultivated by our forefathers and since practically lost may be restored to cultivation, as they appeal as powerfully to the present generation as newly-introduced ones.—R. DEAN.

A new hybrid Orchid, raised by Messrs. F. Sander and Sons of St. Albans and Bruges, has been named after the Rev. David R. Williamson, minister of Kirkmaiden, Wigtownshire, Scotland. It is a very fascinating hybrid between *Lælia purpurata* and *Cattleya maxima* (from the latter of which it derives the exquisite veining of the lip), and has been called *Lælio-Cattleya Williamsoni*. It was recently exhibited in London at the Temple show.

The double Arabis.—I agree with "A.D." about the growth of this spring flower being much too robust to give flower freely when growing in rich soil. One plant I have here proves this quite clearly. I had occasion to lift it when about 1 foot in diameter to make room for something else. I laid it temporarily on the soil within an edging of stone, on the fringe of a low growing Spruce tree, and there it remains, the roots having never been covered, but have struck into the soil, and the plant has spread for the last two years and given huge crops of large spikes of the purest white blossoms.—E. M., *Swanmore Park*.

National Rose Society.—It may interest your Rose-loving readers to know that the receipts in gate money at the National Rose Society's recent exhibition in the Temple Gardens and from the sale of tickets exceeded those from the same sources last year by nearly £100, while one hundred new members, in a great measure owing to the show being held in such a central position in London, have during the last two months joined the society, bringing up the total number of members to over 1,100.—EDWARD MAWLEY, *Hon. Sec.*

Digitalis obscurus.—Referring to a note on *Digitalis obscurus* in your issue of the 9th inst., I may mention that this plant grows not uncommonly on the northern slopes of the hills above Granada in Spain. It is usually to be found in wet places, at the sources of those rather infrequent springs which in some instances appear to be only caused by leakage from artificial water-courses above them. Although not showy, the species is very distinct. The specimens growing in my garden here are grown from roots which I brought from Granada four years ago.—(Mrs.) M. GUYTHERNE-WILLIAMS, *Belvedere, St. Laurence, I.W.*

The yellow-berried Ivy.—It would be interesting to know if this Ivy is the same as that of which Pliny makes mention as growing in the Roman Campagna in his time, and which is still to be found there at the present day. In my garden a long wall facing south-east is covered with it, and in another part of the grounds it grows pretty well on a wall quite 12 feet in height and facing due north. Its handsome bunches of large orange-coloured berries are fully ripe by the end of January at latest, and, arranged with *Chrysanthemums*, make a beautiful table decoration. Strangers are always struck with this Ivy, and I have often sent rooted cuttings of it to friends in England, but do not know if it has proved so hardy a climber there as it is here in Tuscany.—TUSCAN.

Æschynanthus maculatus.—This tropical Gesneriad, though long known to cultivators, is now seldom met with, having probably been superseded by still more decorative stove species. It possesses, however, a distinct value of its own, inasmuch as it is amenable to quite cool house culture, a characteristic it holds in common with only one other of the genus, *Æ. Hildebrandtii*, a much more recent introduction from the alpine districts of Burma. A fine specimen of *Æ. maculatus* is exceedingly ornamental when each drooping spray is lighted up with its corona of brilliant vermilion flowers. The length of time during which the flowers last in perfection is remarkable, and a great point in favour of the plant. They are borne six to ten in a cluster, and are tubular, with lips which are outlined and pointed with purple-brown, whence the specific name. Propagation is very easy from cuttings in spring, when every pair of the thick fleshy leaves seems to be capable of forming roots. Quick growth should be encouraged, and the moist air under a bell-glass suits the cuttings well in their earlier stages. After rooting they should not be allowed to flower in a very small state, which they are generally too ready to do. Very pretty specimens may be grown on a block, in

the same manner as the Epiphytal Orchids, and they also look well in pans embedded in moss in hanging baskets. Those who prefer plants which may be expected to succeed in an unheated greenhouse would do well to make a note of this desirable *Æschynanthus*.—K. L. D.

Veronica anomala.—This pretty little New Zealand *Veronica* is now in full bloom, and is the very ideal of what a rock garden flowering shrub should be. It is barely 2 feet in height and of the same diameter, and every twig is covered with small, narrow-petalled, white flowers, which give the shrub a very charming appearance. The foliage is distinct, the leaves being small and abundant, and the habit is neat and sturdy. In July, 1891, it was thought worthy of an award of merit by the Royal Horticultural Society.—S. W. F.

Genista sagittalis.—This little plant has been very bright throughout the month of June. Planted immediately behind, over which its growths fall, and in the full sunshine it shows its beauty to the best advantage. The winged branches assume a perpendicular position, and every one bears a terminal flower-spike of bright yellow, and when the plant is furnished with several dozen of these, as in the specimen of which I write, its effect is extremely brilliant. The leaves are few in number, but even in the depth of winter the winged branches prevent the plant having a bare appearance. The other day in the South of Ireland I saw a large colony of this *Genista* planted on the steep and sunny bank of a tennis lawn, a very appropriate position for the display of its flowers. It is a native of Southern Europe, and has been introduced over 150 years.—S. W. F.

Cypella Herberti.—This little bulb from Buenos Ayres is now in flower with me. It has flowered annually for the last three years, since when I have had it in my present garden. In my notes from South Devon, July, 1897, I referred to it being in flower in my Torquay garden. When I left I gave my plants to a friend, and noticed them in his garden three years ago. He informed me that they had never flowered since he had had them, and suggested my taking them again and seeing what I could do. I therefore removed them to my present garden at the month of the Dart, where they have flowered every year. Last year I procured some more bulbs from a nurseryman. These are planted by the side of the others. The new bulbs have thrown up such tall flower-spikes—the tallest being over 3 feet in height—and such vigorous foliage that I made sure they were wrongly named, but on the flowers opening they proved to be true *Cypella Herberti*. The flower-spikes from the old bulbs never exceed 18 inches in height, but the pretty *Tigridia*-like bright orange-buff flowers of both are identical.—S. W. FITZHERBERT.

Swanley Horticultural College.—The prizes gained by the women students at the Horticultural College, Swanley, were presented by the Right Hon. the Earl of Onslow, G.C.M.G., on the 11th inst. The weather was all that could be desired, and the large assembly included the Hon. Sir John Cockburn, his Excellency Sir Henry McCallum (Governor of Natal), Miss Wilkinson (Principal), the Lady Frances Balfour, Mr. Medd, Lord and Lady Brassey, the Earl and Countess of Stamford, Mrs. Hopkinson, the Countess of Westmorland, Miss Sieveking (hon. sec.), and General and Mrs. Wace. Miss K. Barrett was the winner of the silver salver, and the Misses J. Fotheringham and A. Yaszowska were at the head of the list for practical garden work.

Lonicera Hildebrandtii.—Several notes have appeared on this Honeysuckle in THE GARDEN from the late Rev. H. Ewbank and others, but we have never seen it so full of flowers as in a moderately warm house in the nursery of Messrs. Paul and Son of Cheshunt. The flowers hang in profusion from the leafy shoots, and their long deep yellow tubes have a pleasant fragrance. In the Isle of Wight and further south it is quite happy out of doors with the protection of a mat during winter. Mr. Ewbank grew it in this way, and we well remember his joy when the first flowers opened.

Gloxinias at Ellet, Regent's Park. There is a beautiful display of *Gloxinias* in this garden. The strain grown is Sutton's. What a magnificent white is Her Majesty! Perhaps it is the finest white yet raised. The plant is of compact habit, the large flowers are freely produced, and clear of the healthy and elegantly recurved foliage. The shades of crimson-scarlet, white margin, rich purples, and violet-purples on white ground are very beautiful. The first batch of this fine collection—tastefully interspersed with Maiden-hair Ferns—began to flower the first week in May. A little cultural note may be serviceable. The plants were in 4½-inch pots, and had been grown from seeds sown in March, 1903. They were a credit to the gardener, Mr. John Addison; and how greatly they would have been enjoyed by the late owner of this charming retreat, Miss Behrens.—Quo.

Phormium tenax.—In your issue of March 12 a note appeared from Mr. T. B. Field under this heading. From Mr. Field's remarks I am inclined to think that his plant is not *Phormium tenax*, but some other species, probably *P. Colensoi*. My reason for this is that he speaks of the leaves "arching over"—a term I should hardly apply to the growth of *P. tenax*. It is true that in a large plant of the latter the leaves often lean outwards, especially when it is grown in the open, but on the whole the habit is stiff. The Mountain Flax (*P. Colensoi*), on the other hand, is a much more graceful plant. Its leaves distinctly "arch over." It is not such a robust grower, is much harder than *P. tenax*, and is the species which, I think, would be by far the most suitable for cultivation in England. Its flower-stems do not rise above the leaves to the same extent as those of *P. tenax*, but grow much more horizontally. There are several variegated and brown forms of both species in cultivation. The fibre of *P. Colensoi* is comparatively worthless; it is only *P. tenax* which yields the fibre of commerce.—A. BATHGATE, *Dunedin, N.Z.*

Two new Strawberries.—At the last meeting of the Royal Horticultural Society the fruit committee had several new Strawberries before them, and two received awards. One, a most promising fruit, just failed to gain it, and as many of your readers did not see these new fruits a few words as to their quality and size may not be out of place. Mere size is no test as regards quality, and some may have thought these new varieties were too large, but there are several points worth considering. Exhibitors do not stage small or medium fruits when a new fruit is exhibited, and we do not condemn mere size if the quality is good. Strawberries often fail at the first trial if shown large, because there is an idea that coarseness must affect the quality, and this objection is natural, but I have found that it is not general, as when the plant is given ordinary culture there is less tendency to coarseness. The new introduction from Messrs. Veitch, Chelsea, raised at their Langley Nursery, named *The Alake*, is notable for its bright red colour and refreshing flavour. It is the result of crossing *Frogmore Late Pine* with *Veitch's Perfection*, and is said to be a heavy cropper, the fruit is irregular in shape, some being conical, others distinctly wedge-shaped, and the flavour is first-rate. It may be said that some of the *Pine* family are not reliable in all soils, and this is so. *Frogmore Late Pine*, though of excellent flavour, will not succeed in all gardens, so that it will be interesting to note if the crossing has resulted in greater vigour. The other seedling given an award came from the well-known Strawberry raisers who have in the past given us some splendid introductions, the Messrs. Laxton, Bedford, and this they have named *The Reward*. This fruit claims the well-known British Queen and Royal Sovereign as parents, though I am not quite sure if British Queen is the best possible parent, as some of our new Strawberries, which have of late years had a good deal of British Queen blood in them, though excellent in quality, failed to be vigorous and in a few years get weaker. This may be the reverse with *The Reward*. If so it is a great gain to get these fruits with the Queen flavour and the free growing, heavy fruiting qualities

[DIANTHUS CALLIZONUS ON THE ROCK GARDEN AT KEW.]

of Royal Sovereign. The fruits are larger, conical, also wedge-shaped here and there, and of a bright colour, very solid, and should travel well. They are very rich and juicy, and though large are produced in great quantities. Another even larger fruit was shown, the new Bedfordshire Champion, and this is very different to the others; it is a rounder fruit. This just failed to get an award; it is evidently an enormous cropper.—G. WYTHES.

TREES AND SHRUBS.

AESCULUS INDICA.

BETWEEN the flowers of this and the common Horse Chestnut there is very little apparent difference, but in other respects the two trees are not at all alike. Introduced in 1828, it was lost sight of until its reintroduction in 1844, and it is still a rare tree, specimens being rarely found in gardens. A figure of it is given in the *Botanical Magazine*, t. 5117, and in the description it is stated to have been first distributed by Dr. Wallich and named by him *Pavia indica*. It is found on mountains at an elevation of from 8,000 feet to 10,000 feet in the Western Himalaya, and is said to make, when mature, quite as handsome a tree as the common Horse Chestnut. At Kew a couple of trees are now, late June, in flower. The inflorescences are longer and narrower than those of the Horse Chestnut, but quite as handsome, the colour of the blossoms being very similar. The leaves differ greatly from those of the European species. They are composed of seven leaflets which have a very wide spread. The three central leaflets are very large, being a foot long and 4 inches wide. They differ from those of the better known species by being much smoother and by having deep red stalks and midribs. The margins are finely serrated and the whole leaf is quite glabrous. The *Botanical Magazine* figure was prepared from an inflorescence produced on a tree in the garden of Mr. C. J. Fox Bunbury, at Mildenhall, Suffolk, in 1858, the plant being then seven years of age and 16 feet high, with a stem 8 inches

in circumference. The seeds are larger than those of the common Chestnut, and take about the same time to germinate. It should be a useful species to cultivate, as it flowers after the other Chestnuts are over, and at a time when the majority of flowering trees are past their best.

C.ESALPINIA JAPONICA.

ALTHOUGH this shrub has flowered well for a number of years on a sunny bank in the Coombe Wood Nursery of Messrs. Veitch, it has never done really well out of doors at Kew until the present year, for while a few inflorescences are generally produced there has never been a good display. This year a specimen growing near the Ferneries is carrying upwards of thirty racemes. *C. japonica* is a Japanese plant, but is also found in various parts of Asia. Out of flower it has attractions, for the bipinnate leaves are large and handsome, the leaflets being small, light green, and dainty. The branches are long, and together with the leaf-stalks are intensely spiny. If left unpruned the branches twine and intertwine and quickly form an impenetrable mass. The flowers are yellow with red or reddish brown anthers, and are borne on axillary racemes from 6 inches to 12 inches in length. At Kew *C. japonica* proves tender in a young state, and the ends of branches on old plants are often cut back by frost in winter. For the majority of gardens a position on a south wall would be most suitable. In gardens in favoured localities a trellis in the open can be used.

STYRAX JAPONICUM.

THIS is one of the loveliest of summer flowering shrubs and also one of the most rare, being seldom met with except in a small state. When, however, a well grown and well flowered specimen is seen, it is difficult to imagine a more beautiful sight, the flowers are pure white with yellow anthers, and pendulous on long, thin stalks from the under sides of the branches. In the Coombe Wood Nursery of Messrs. James Veitch a large specimen was flowering recently, and at the present time a specimen 5 feet high at Kew is in full flower. The Coombe Wood specimen must be at least 12 feet

high, and is wide in comparison, and as it is growing on a bank the full beauty of its flowers can be seen. *S. japonicum* is found both in China and Japan; it grows naturally into a dense bush, with ovate, acuminate leaves, which vary in length from 1 inch to 4 inches. The flowers, as previously stated, are white, and borne, several together, from the leaf axils. *S. japonicum* seems to be a difficult plant to transplant, consequently it is advisable to give it a permanent position as soon as possible. A light soil composed of sandy loam and peat suits it, and it is advisable to prune away some of the lower branches to encourage growth, for when grown as a dense bush the flowers are hidden.

ESCALLONIA PHILIPPIANA.

MOST of the Escallonias are not suitable for growing in the open ground except in the more favoured parts of the country where severe frosts are not experienced, but where they will grow they are most ornamental. *E. philippiana* cannot, however, be classed with other species, as it is perfectly hardy, having withstood 30° of frost without injury, while for beauty it quite equals any of the others. It is found in Valdivia, and there forms a spreading, well-furnished bush 3 feet to 4½ feet high. The leaves are very small and dark green, and make a charming setting for the pretty star-shaped white blossoms, which are borne in profusion, singly or in short spikes, from terminal and lateral buds. It roots readily from cuttings, and in two years forms good plants for beds in the open or for groups in the shrubbery. Single specimens are also to be commended. Good loamy soil is most suitable for its successful cultivation, and an occasional surfacing of well-rotted manure is helpful. The flowering time is June and July.

W. DALLIMORE.

CORNUS KOUSA.

AMONG the more uncommon shrubs noted at the Drill Hall on the 28th ult. were some well-flowered specimens of this *Cornus*, which is, when at its best, a very striking object. It was long known as *Benthamia japonica*, but the genus *Benthamia* is now merged into that of *Cornus*, including the species on which the genus is founded, viz., *B. fragifera* (the Strawberry Tree), which is a native of the Himalayas, and now known as *Cornus capitata*. Where thoroughly hardy it forms a very handsome tree, but it can only be depended upon in the favoured parts of these islands, such as in the extreme west of England and in many districts of Ireland. The flowers, which are in a small, crowded cluster, are, as in many of its relatives, not at all ornamental, but each cluster is surrounded by four large, petal-like bracts of a creamy white, tinged with rose. The flowers are in turn succeeded by fruits, which when ripe bear a considerable resemblance to a Strawberry, hence its popular name. The Japanese *Cornus Kousa* differs from its Himalayan relative in being quite deciduous (whereas the other is more or less evergreen) in its lesser size, and in its floral bracts being white. In the United States the native-flowering Dogwood (*Cornus florida*) is very handsome and deservedly popular, but our summers and autums are, as a rule, not hot and dry enough to ensure a thorough ripening of the wood and a corresponding display of bloom. For this country, at least, *C. Kousa* is the better plant of the two, but, judging by the following extract from Professor Sargent's "Forest Flora of Japan," gardeners across the Atlantic entertain different views:—

"*Cornus Kousa* represents in Japan the *Cornus florida* of Eastern America and the *Cornus Nuttallii* of the Pacific States. From these trees it differs, however, in one particular, in our American flowering Dogwoods the fruits, which are gathered into close heads, are individually distinct, while

in the Japan tree and in an Indian species they are united into a fleshy Strawberry-shaped mass, technically called a syncarp. Owing to this peculiarity of the fruit botanists at one time considered these Asiatic trees generally distinct from the American flowering Dogwoods, and placed them in the genus *Benthamia*, which has since been united with *Cornus*. In Japan *Cornus Kousa* is apparently not common, certainly it is not such a feature of the vegetation in any part of the empire which we visited as *Cornus florida* is in our Middle and Southern States. Indeed, we only saw it in one place among the Hakone Mountains and on the road between Nikko and Lake Chuzenji, where it was a bushy, flat-topped tree, not more than 18 feet or 20 feet high, with wide spreading branches. The leaves are smaller and narrower than those of our eastern American flowering Dogwood; the involucre scales are acute and creamy white, and the heads of flowers are on longer and much more slender peduncles. *Cornus Kousa* also inhabits Central China. It was introduced into our gardens several years ago, and it now flowers every year in the neighbourhood of New York. As an ornamental plant it is certainly inferior in every way to our native flowering Dogwood, and in this country, at least, it will probably never be much grown except as a botanical curiosity." T.

THE FLOWER GARDEN.

GROWING THE ALPINE PINKS.

COMPARATIVELY easy to grow are the greater number of the wild Pinks, requiring only a little care and attention during the early stages of their existence. A few of the rarer species, like the alpine and glacier Pinks, are more difficult to manage, and require special attention in order to grow them successfully and get them to form tufts of fair size and flower freely. Some of the smaller ones, again, suffer very much from damp in winter, and fine plants which have taken years to reach a respectable size are often lost in this way. Seed is the easiest method by which a stock of plants may be obtained, but, owing to the facility with which the various kinds hybridise, they are not to be relied on to come true, except in a few cases and where the plant to be increased in that way is isolated from all others. Cuttings taken just after the plants have done flowering root readily inserted in small pots in a mixture of loam and plenty of sand. The pots should be plunged in a shady frame and kept close for a time until the cuttings are rooted, when they may be potted off singly. Division of the plants in the spring may also be effected with many of the smaller tufted species. The larger kinds, such as *D. Carthusianorum*, *D. Caryophyllus*, *D. cruentus*, *D. giganteus*, and *D. liburnicus*, which are suitable for growing in the flower border, may be raised from seed sown in a little heat in spring. When large enough to handle the seedlings should be pricked out in boxes in a compost composed of half fibrous loam, one part sand, and one part leaf-mould. When well rooted they may be planted out in their permanent places ready for flowering the next spring. This early treatment is also suitable for *D. plumarius*, *D. cæsius*, *D. arenarius*, and others of a like nature, but lime rubbish

may with advantage be added to the soil in which they are grown. *D. alpinus*, *D. callizonus*, *D. glacialis*, *D. monspessulanus*, *D. sylvestris*, and others which inhabit the higher altitudes may also be raised in the same manner, but require more care afterwards. Instead of being pricked out in boxes they should be potted off singly in small pots. These should be plunged in a cool, shady frame for a time till they are of sufficient size for planting out. The compost should consist of loam and leaf-soil, with plenty of grit and lime rubble. This mixture suits nearly all the alpine species, with the exception of *D. glacialis*, which is a granite-loving plant, and to the soil in which it is potted and planted out granite chippings may with advantage be added instead of lime. When planting out in the rock garden a well-drained position with a sunny aspect should be chosen for nearly all the alpine species, though there are some exceptions, as *D. callizonus* and *D. sylvestris*, which two require a certain amount of shade, and should be planted where they receive the direct rays of the sun for a short period only. Established plants of the smaller alpine species require top-dressing once or twice during the season, with a mixture of sand and leaf-soil. This should be worked well amongst the young growths, care being taken that the growing points are not also covered up. The autumn dressing should contain more sand, so as to absorb the excessive moisture surrounding the plant in winter.

Kew.

W. IRVING.

MESEMBRYANTHEMUMS.

THE present season so far has favoured the well-doing of South African plants—at any rate, on our south-east coast. *Mesembryanthemums*, which made too luxuriant growth for their good during the wet summer of 1903, are doing much better this year. In the outdoor garden this fine genus is represented, as a general rule, by only two or three species. *M. uncinatum*, a curious but not very attractive

plant, with stiff, jointed stems and minute pink flowers, which do not often deign to appear, is to be found, being quite hardy, on many rockeries. Ice Plants (*M. crystallinum* and *M. glaciale*) are sometimes grown in the kitchen garden for the occasional garnishing of fruit. *M. cordifolium*, and especially its variegated form, is used as an edging plant, and now and then one meets with the pretty annual species, *M. tricolor*, in company with the more brilliant-hued *Portulacas*. Two reasons have contributed to the neglect of the *Mesembryanthemums*. Amongst the 300 or more species known to cultivation a vast number possess little decorative value and are mainly interesting to botanists, and a botanical plant, as we know, is a horror to most gardeners! But besides this, in common with so many plants of entirely diverse character, newly-raised stock produces the best results, whereas there is an undefined but fixed idea in the gardening mind that utter neglect is the one thing needful for most succulents; consequently one or two scraggy long-suffering specimens may be found lingering in many greenhouses, though the verdict is that nothing can be made of them. The truth is that whilst they can hardly be killed outright if they are grown at all, they can very easily be starved out of all beauty of shape or foliage or flower. The pity is that—except in the extreme south-west of England—they will seldom survive a winter unprotected out of doors, and this not so much on account of cold as damp. A dry, sunny wall facing south, with very sandy joints into which the roots can penetrate, is an ideal position for them, and I am in great hopes that some of the hardiest species may pass through the next winter unscathed in just such a spot in a warm, sheltered garden, where the air is tintured by the salt sea-breezes. Everyone who lives by or near the sea should try *Mesembryanthemums*, for a sandy soil and a salt-laden atmosphere suits them to a nicety. For eight months of the year they should have as much air and sunshine as may be, requiring only to be housed during the extreme severity of winter.

ALPINE PINKS: *DIANTHUS CÆSIUS* ON THE LEFT HAND (TOP), THE OTHER IS *D. PLUMARIUS*.

Cuttings of each sort should be potted and grown on during the summer, to supply all blanks, with the same care that is given to bedding plants, and then their culture is of the simplest character.

M. spectabile is one of the finest for summer flowering, though several allied species not seldom do duty for it. It may be distinguished by its very glaucous leaves, the basal tufts of which send out strong drooping flowering branches. The deep rose-coloured flowers are produced in succession at the ends of the shoots, and are 3 inches across when fully expanded. The peculiar sheen which belongs to the petals of all *Mesembryanthemums* when open in the sunshine makes even a single flower a noticeable object from a distance. A very similar, though really distinct, species is *M. formosum*—the white-eyed red *Mesembryanthemum* of Haworth, the painstaking chronicler of the whole genus in the last century, whose labours have never been superseded. It is a fine plant, vigorous in leaf and flower, and can be recognised by the white or light pink basal ring of its large rosy flowers. The foliage is bright green, not glaucous, and it also differs from *M. spectabile* in its manner of growth. In another member of this group, *M. amicum*, the main distinction seems to consist in the lighter and brighter shade, as well as in the texture, of the flowers, which are also somewhat smaller and have rose-coloured stamens of the same colour as the petals. All three are worth growing, in spite of a certain similarity, and make admirable pot plants, especially when hung against a wall for background, either in or, better still, out of doors.

One of the hardest species is *N. glaucum*, and it is at the same time one of the best. It blooms most freely when the plant is strong, and, in contrast to other kinds, when not too young. To form a good specimen it requires careful pinching back of the leader and afterwards of the side shoots, and sometimes assumes a drooping habit, when the ends of the branches recurve upwards. The foliage is glaucous, but differs entirely from those already mentioned. Haworth calls this the great gold-flowered *Mesembryanthemum*, but its large handsome flowers are bright sulphur-coloured rather than golden. *M. aureum*, which begins to flower as early as February—under glass in most localities—has glorious orange flowers, and is almost as hardy as *M. glaucum*; in fact, this species was the only one which survived last winter, planted on a south wall here, where even *M. glaucum* succumbed; but this was a weakly plant, and the wall in question retains too much moisture in a wet season for succulents. I hope, however, to establish colonies of both these early-flowering kinds on a dryer wall.

Of the freely flowered section (Haworth), *M. bicolor* is brilliant in the extreme, with its orange-scarlet flowers produced in masses. There are a good many of these slender-leaved, free-flowering species which are well worth cultivation, as the small size of their scarlet, or crimson, or mauve coloured flowers is amply atoned for by the dazzling effect of the crowded heads. White flowering kinds are numerous, of which *M. blandum* is one of the most valuable. It has prostrate stems, and in favourable positions opens its pure glistening flowers all the summer through. A sunny bank or narrow border under a house wall suits it to perfection, and, with its pink flowered variety also, succeeds admirably in window boxes, especially by the sea.

There are many more, some of which may be worthy of further notice. I have myself grown

as many as 150 distinct species for the sake of comparison and trial, and have a goodly number at present under observation. Looking round the garden this sunny July morning, and being charmed anew with the brilliant hues of those which are in flower, I am prompted once more to call attention to the rare beauty of this much neglected tribe of plants.

Guestling.

K. L. D.

(To be continued.)

NOTES FROM SWANSWICK

FLOWERS FOR CUTTING.

AS I have planted a good deal of this garden with the cut flower idea in view, the interesting notes on flowers for cutting which have appeared lately came home to me, and some of the results may be mentioned. Of things grown from seed the Shasta Daisies seem likely to be exceedingly profitable from a cutting point of view. One packet produced about 500 plants, which were set out in rows in long narrow beds last September, and are now mostly in full bud, promising an immense crop of bloom for their size. They will, I suppose, stand at least three years in this holding soil, as a number of named varieties of *Pyrethrum uliginosum* have done with success. Single *Pyrethrum roseum* I find exceedingly useful so long as they last, which is, roughly speaking, for the month of June, and then again, if the dead flowers are all clipped off, for about a month later on, but in lesser number. Both they and the Shastas are splendid flowers for sending by post, and last an immense time in water. I find plants of *P. roseum* go on improving year after year, some four year olds being very fine in size, growth, and quantity of flower. We have great difficulty in getting them past the slug-ridden stage of first planting out, but after one season they are all right and give no trouble beyond being very sensitive to drought, and ready to go off flowering if they once approach any extreme dryness. *Galega officinalis*, both lilac and white, grown in the same way (from seed) as the Shasta Daisies, has done well, and will stand for years, and is one of the most useful cutting plants we have. Its delicate tint of colour, in the case of the lilac variety, tones in with nearly everything, and its stiff, yet light and branching habit of growth, makes it very useful in large vase work as supporting foliage.

I have a planting from one packet of the original Storries' improved Iceland Poppy which produced some twenty-five plants. Of these the majority are the ordinary yellow, one or two being semi-double. The rest are in two charming shades of primrose, one only deep red orange, a grand colour, and only striped on the reverse—buff and reddish pink. These will want a couple of years' working up, and in the meanwhile we find the ordinary Iceland Poppy, cut before it is quite full size, very useful, as also is what in the vases is practically indistinguishable from it, and a better laster, *Meconopsis cambrica*. The foliage of this latter is invaluable for cut flower work, where, as here, it grows, self sown, in numbers. The leafage of *Coronilla varia*—one of the most pestilent spreaders that ever choked a border—is also useful if it goes straight into water from the picking; but it is no good for sending by post. The lovely, delicate Maidenhair Fern-like greenery of the bright yellow-flowered *Corydalis* that grows on its own accord out of the foot of the house wall all round the stableyard, and finding itself appreciated is spreading on to a neighbouring rockery and over a wall into the kitchen garden, is also useful for home work on any small scale.

Gypsophila elegans, the annual, is invaluable during part of May and July and all June. It is quite as good as the perennial *Gypsophila* in appearance, gives any bouquet a lovely finish, and comes when nothing else of the kind is available, the sunset pink and feathery clouds of the exquisite London Pride blossom being over just as this *Gypsophila* begins, while the perennial *G. paniculata*, of course, comes on later. A planting or

"pave" of annual *Chrysanthemum Morning Star* has proved itself desirable. This is a first-rate plant in every way; the first flower comes up on a good long stiff stalk in the middle, and when cut the many side growths each produce good blossoms. It is very succulent, seems indifferent to drought, lasts splendidly both packed and in water, and is a handsome large flower of a very pleasing primrose colour. It groups well with anything like *Gypsophila*. Its one fault is that it is a stiff-stemmed flower, but for some purposes this is an advantage. *Coreopsis grandiflora*, in quantity from seed, and just coming into flower, I expect to find very useful, as also a last autumn planting of that loveliest of autumn pink flowers, *Anemone japonica* Queen Charlotte, which is a really good colour, without magenta, and a good stayer in all respects.

Of Pinks, which we have in considerable diversity, not one is so useful or half so charming, from a cutting point of view, as the refined, lovely, snow-white Carnation-like Albino, unfringed, and a good, though moderate, grower. The pink Clove would be useful for cutting if it were a better colour, and such pink Pinks as Paddington, though pretty in the hand, turn off to a dreadful hue after being a day in water. Delphiniums in the pale shades are very lovely and most useful, especially the Cambridge blue ones, and we have masses grown from Sutton's seed, which are a great success.

I grow the Bride Gladiolus in quantity, and it is lovely, but very fleeting. It stands the winter here and increases. *Ixias*, too, are, I think, well worth growing for cutting, as they last a long time indoors, longer in fact than if they are left on the bulb, where hot sun or any approach to dryness seems to scorch them up instantly, despite their South African origin. Here they die out quickly, diminishing by about half each year if not supplemented. *Heucheras* are useful flowers for the present style of exaggeratedly light table decoration, such as we see winning at provincial shows. Three stalks of Job's Tears grass and one Sweet Pea spray was the allowance to each glass in one exhibit I now call to mind. The only other annuals we grow here for cutting are Love-in-a-mist and yellow Sweet Sultan, with *Lavatera*, pink and white. I do not think the idea is in any way original, but some readers may not know that a bit of Elder as greenery helps to keep other flowers fresh. I have a great opinion of Box and Rosemary as supporting green in big arrangements, and the latter is always sweet and fresh in rooms.

M. S. W.

NOTES ON HARDY PLANTS.

CYPRIPEDIUM SPECTABILE IN THE SOUTH OF SCOTLAND.

HARDY Orchids are well grown in the garden of Colonel Maxwell Witham at Kirkconnell, Newabbey, N.B., and among the best is the charming Moccasin flower (*Cypripedium spectabile*). There are two large clumps in the borders which are well established, and which flower freely annually. The proportion of peat naturally present in the soil at Kirkconnell seems to suit this *Cypripedium* admirably, and no difficulty is experienced in cultivating it in the open border. The garden lies somewhat low, but is in a warm position, not far above the sea-level. One clump had in full bloom recently eight fine spikes, which showed the large white and pink blooms to advantage.

S. A.

PHLOMIS TUBEROSA.

AMONG the many flowers in the garden of Captain Stewart, of Shambellie, Dumfries, is the old-fashioned, but striking, *Phlomis tuberosa*, known in British gardens since 1759, but scarcer now than many years ago. It is a good plant for the border or for naturalising, its stems, from 3 feet to 5 feet high, giving whorls of pretty purplish flowers, these looking even more orna-

mental when examined because of the white fringe on the margin of the upper lip. The flowers are rather hairy, with the exception of the lower lip, which is quite smooth. The leaves are ornamental, and the whole effect of the plant, like that of the greater number of the Jerusalem Sages, is rather striking. *P. tuberosa* likes a good soil, although it will thrive almost anywhere. It is perfectly hardy and flowers in June and July. S. A.

GIANT KALES (CRAMBE).

SEVERAL species of this Crucifer are flowering very freely at Kew. For a display of flowers at the present season they are certainly one of the finest large-leaved hardy herbaceous plants. It is equally at home in the herbaceous border, bold masses in beds on the lawn or by the side of a lake, but perhaps the ideal place for it is in the wild garden. When associated with *Arundos*, *Rheums*, and *Gunneras*, the effect is grand. *Crambe cordifolia*, a Caucasian species, *C. orientalis*, Asia Minor and Persia, and *C. pinnatifida*, also from the Caucasus, are the three most useful, except that *C. cordifolia* is two or three weeks later in flowering. The large leaves produced in spring are followed by tall branched stems, 5 feet or 6 feet in height, densely clothed with small snow-white flowers. Seen in the distance the bed illustrated is like a huge ball of snow. The plants may be propagated by seeds, or division of the roots in autumn, and they grow freely in any good garden soil; a top-dressing of sea-sand in autumn is very beneficial. Should they be growing by the side of a lake where waterfowl abound the plants must be protected in spring, as they are very partial to the young fleshy leaves. A. OSBORN.

DAPHNE CNEORUM.

It is pleasant to know, page 366, of so great a success with this charming plant, which is a gem among gems. If such success can be as easily attained as suggested on page 432, viz., the mere admixture of calcareous matter to the soil, then lovers of beautiful hardy plants ought, indeed, to be grateful to "T." for his information. Pointing out successes and the probable causes are much more satisfactory than giving things a bad name by continually recording failures. When living in England I never, owing to the bad name generally given to it, gave *Daphne Cneorum* even a trial. I am inclined to support "T.'s" theory that lime and thorough drainage are the chief conditions of success, seeing that in this neighbourhood the plant is indigenous on heaths with a thin layer (6 inches to 9 inches) of calcareous loam, overlying unfathomable depths of glacial moraine, through which the heaviest rains percolate. After two days of sunshine the soil is perfectly dry again, and during a hot summer it becomes so parched that it seems marvellous how things like *D. Cneorum* and *Gentiana verna*, which are both in flower side by side simultaneously, can possibly exist. On the other hand, a little further away by the riverside this same *Daphne* luxuriates among the bushy undergrowths along the edges of a strip of woodland through which it pushes long, trailing shoots, on soil wet enough to harbour *Pinguicula*. Among the grass immediately beneath, the sub-soil, however, is the same as on the heaths, and no stagnant moisture is therefore possible. From these two extremes it would appear that dryness need not cause any anxiety, whereas in naturally moist places means should be adopted for providing perfect drainage. The following may be of interest as showing what this plant can endure. Late in the autumn of 1901 we traced the roots for a distance of quite a yard in order to lift a plant in its entirety. These roots ran along immediately below the grass fibre and between it and the "dead

soil" beneath. The same night a sharp frost prevented us from planting, so I packed the plant into a box, pushing some moss between the roots and put a lid on the box. The frost continuing, the plant remained in that state through the winter, when the lowest temperature registered was 24° below zero Fahr. Wet having also got inside the box I never looked at the plant again until my daughter told me it looked quite fresh and urged me to plant it. After having taken all that trouble in getting it up after a year of sulking, it suddenly broke forth into a blaze of colour, after which it commenced spreading marvellously, and now covers little less than a square yard of ground. Not a vestige of green has been visible this spring under the carpet of dense blossom. In another instance my little girl was also the means of proving a fallacy largely disseminated. I had always been given to understand that the charming little alpine *Armeria cespitosa* would not bear fertile seeds, being difficult to strike from cuttings. This was very much to be regretted. I had examined the seeds for several years, and they really through the lens looked barren, simply husks. "I shall try them, nevertheless," said my daughter. And behold in less than a week quite a

probably only of biennial duration, though that is a moot point. A white variety of this fine *Campanula*, which has a very distinct character of its own, would be a valuable addition, if it could be found, to the summer border, for plants which flower in July are none too common. K. L. D.

THREE GOOD IRISES.

AMONG the June-flowering Irises few have such a noble appearance as *I. orientalis gigantea*, formerly known as *I. ochroleuca*, *I. aurea*, and *I. Monnieri*. The foliage of all three is precisely similar, and all have the same habit of growth, so that it is almost impossible to distinguish between them when not in flower. The blossoms, however, are very different. In *I. orientalis* the standards are pure white, and the falls white with a broad blotch of bright yellow down the centre. Four flowers are carried, one above the other, on a scape. In *I. aurea* the blossoms are of a uniform bright yellow, and in *I. Monnieri* the standards are pale yellow, and the falls of the same colour with a deep yellow blotch down the centre. Two flowers are carried on the scape in the two last-named species. In cultural directions it is usually stated

CRAMBE ORIENTALE AT KEW.

number of seedlings came up with seed leaves of a quite surprising size. There is nothing like trying for yourself. E. HEINRICH.

Planegg, near Munich (Bavaria).

CAMPANULA PATULA.

AN elegant *Campanula* is flowering in our garden this summer, the seed of which was collected a year or two ago on the borders of Rhenish Prussia. The tall stems in seed having attracted attention, some pods were brought home on the chance of its turning out to be worth garden room. It proves to be an unusually vigorous form of *C. patula*, and is not only handsome in the border with innumerable spikes 3 feet high of mauve-blue wide-open bells, but in a somewhat less buxom condition it is charming for the greenhouse, where the long wands of delicately poised flowers are very effective when grouped with suitable greenery. Though reckoned a British plant one seldom meets with it, and it is quite worthy of a place in the herbaceous border at middle distance. It is

that these Irises require a rich and moist soil, but with me they are growing vigorously and flowering well, with bloom spikes over 5 feet in height, in light soil on a sunny hillside, so that it is evident that those who only possess light soil need not hesitate to embark on their culture. S. W. F.

CODONOPSIS OVATA.

THIS plant, which is nearly related to the *Campanulas*, was introduced from the Himalayas in 1856, and has at different times been known under the names of *Glossocomia ovata* and *Wahlenbergia Roylei*. Though so long known in this country, and one of the most beautiful of June-flowering plants, it is but rarely met with. The drooping flowers, borne at the end of the stems, are bell-shaped and comparatively large. In colour the exterior is pale lavender, but the interior is very lovely. In the centre is a black, five-pointed star surrounded by five blotches of deep orange, above which are two zones of violet-purple, the ground colour being lavender.

The plant grows from 18 inches to 2 feet in height, and is herbaceous, dying down in the winter. In the south-west it is perfectly hardy. The bruised stem has a most unpleasant smell, this being slightly noticeable in the flowers themselves.

S. W. F.

IRIS GIGANTEA.

This Iris is very fine with me this season, the flower stems running up to a height of nearly 5 feet. It is, I think, the finest member of the Iris family, and well deserves a place wherever hardy flowers are grown. The large ivory white flowers are very imposing, and are valuable when cut flowers are in demand. Evidently this Iris likes plenty of moisture when making its growth, or it would not be in such fine form after the excessive rainfall of last summer. It is one of those things that do best when undisturbed for some years. In fact, it requires a couple of seasons to give sufficient strength to allow of the free production of bloom. This Iris, like all of similar growth, enjoys an abundance of good food. A top-dressing of manure, put on in winter, will materially increase the flower bearing capacity of this fine hardy plant. J. CORNHILL.

Byfleet.

LATHYRUS DRUMMONDI.

It requires some years to obtain a good specimen of this everlasting Pea. My best plant is about ten years old, and when in bloom has a diameter of about 6 feet. Under the most favourable conditions, however, it never seems to attain a height of 4 feet, and seems most at home when rambling over low bushes. I once saw a good specimen that had become well established in a shrubbery where it rambled at will, and where the flowers were in some measure screened from hot sun and heavy rains. In such a position it is much more satisfactory than in an open one, where the flowers quickly feel the influence of very hot sun and heavy rains. It is difficult to describe the colour of this Pea, it seems to be a mixture of terra-cotta, carmine, and red. It is so distinct that it should be grown wherever a place can be found for it. It is quite at home in very light sandy soils that parch in hot dry summers, and I do not think it is likely to flourish in ill-drained soils that border on clay.

With me this species does not seed at all freely. In a wet time the flowers do not set, and in a time of prolonged heat and drought the pods turn yellow and drop instead of swelling. Even when ideal weather prevails at flowering time, not more than 10 per cent. of the flowers will yield seed, and the pods rarely contain more than two good seeds.

This reluctance to produce good seeds and the difficulty experienced in getting them to germinate is probably the reason why this Pea is not more frequently seen in English gardens. If the seeds are kept till spring, not one will germinate that season, but some may do so the following year. They should be sown as soon as ripe, keeping them moist and cool, and they will come up at the close of winter.

Byfleet.

J. CORNHILL.

THE ROSE GARDEN.

NOTES ON SOME NEW ROSES.

FLORENCE PEMBERTON.—This is a grand exhibition Rose, but these notes are being written before the Temple Show. If it upholds its early promise it will be prominent at the Temple Gardens on the 6th inst. I am inclined to think it will prove to be the best of Messrs. Dicksons' 1903 set. It is a better grower than Edith D'Ombrain.

Frau Lilla Rautenstrauch.—This, I think, promising, a sport sent out by Peter Lambert, and one of last year's Roses, deep yellow with a suspicion of rose, fine centre, opening well. It is hardly coppery orange as described, if the flowers I have seen were typical.

Frau Peter Lambert.—This has been excellent with me, another of Kaiserin Augusta Victoria seedlings, but a very pretty shade of pink. A hybrid Tea that has, I think, come to

colour. It is one of Messrs. Dicksons' 1902 set, and likely to be a favourite when better known. I think I am right in saying that it was shown by Messrs. Dickson under the name of Janet Scott. Those who like scent as well as form and colour should try John Ruskin.

Lady Moyra Beauclerc.—One of Messrs. Dicksons' Roses, and a very beautiful flower. The colour at times is indescribable. There is something reminiscent of Killarney, and yet it is quite distinct from that beautiful Rose. It missed the gold medal, but many a worse flower has been awarded that distinction. I think it comes better on cut-backs than when grown as a maiden.

Laure Watinne.—A good grower with fine long buds, the colour is deep rose. It will, I think, displace some of the flowers of similar colour.

Louis Ricard.—This Rose seems to have been overlooked, at least I have seen no comments on it in the Horticultural Press, and yet if it always is going to flower like I have seen

it this season, I have no hesitation in saying that it is the best dark Hybrid Perpetual we have seen for many a long day. It is a fine grower, the colour dark velvety crimson, almost black. Sent out by Boutigny, the raiser of Commandant Felix Faure.

Mme. Edmée Metz.—A pretty flower of the general appearance of Mrs. Edward Mawley. A good grower, from Soupert and Notting.

Mme. Vermorel.—This is a good Tea, colour rose, shaded yellow, large buds. It is, I think, very promising. Good Teas are rare.

Mme. Viger.—A hybrid Tea of Viscountess Folkestone parentage. Very pretty in the bud. La France colouring.

Mme. Pauline Bersez.—A maiden plant of this with me has been very charming, creamy white with yellow

centre, yet distinct and delicate in form as well as in colour. A very free-flowering garden Rose that can be recommended.

Marie Crohier.—A deep coloured Caroline Testout, but longer and more pointed in shape. It resembles perhaps Mrs. W. J. Grant more than its parent. Messrs. Frank Cant and Co. sent me a very fine flower of this Rose.

Mrs. Oliver Ames.—A light coloured Mme. Cusin from America. A very pretty Tea.

Perle von Godesberg.—Another K. A. Victoria sport or seedling sent out as a yellow, but very little of that colour is apparent out of doors. It opens better, I think, than the parent, but I am afraid it will have to be treated as synonymous with K. A. Victoria.

Souvenir de Fran Ketten.—A good flower, but the colour is very fleeting. It must be cut in the bud state, when it is excellent.

Souvenir d'Helene.—Another Tea that I think worth noting, as it is a good grower and the flowers open well. Colour white flushed pink.

POLYANTHA ROSE CLAIRE JACQUIER OVER PORCH. (See page 59.)

stay. I have heard it generally well spoken of by several who tried it last year.

Goldelse.—A little deeper in colour than Franz Deegan, and, like that Rose, a sport from K. A. Victoria, but a better grower than its parent.

Helene Guillot.—Messrs. Cooling sent me some fine flowers of this variety, and I have since seen it growing well at more than one nursery. It is almost pure white, and comes from Messrs. J. B. Guillot. Quite up to exhibition standard when well grown. The buds have a salmon-coloured centre that disappears when they open fully.

Jeanne Buatois.—This has considerable merit from a decorative point of view, but is hardly up to show form. It has a pretty bud, pearly white, tinted flesh, with an occasional tint of yellow on the reflexed petal—a cross between Mme. Eugene Resal and, I believe, Merveille de Lyon.

John Ruskin.—This is a fine grower, the flowers are large and bright rosy carmine in

In writing of these new Roses one ought to remember, perhaps, that we have had an exceptional season, at least that is my experience. Maiden plants, although late, have done wonderfully well.

HERBERT E. MOLYNEUX.

Brantwood, Balham.

ROSE CLAIRE JACQUIER.

I SEND you a small photograph of a Rose tree in my garden which you may perhaps think worthy of reproduction in your excellent paper. It is the Polyantha Claire Jacquier, and this year it has been unusually beautiful. It covers some wire arches and measures 20 feet in width by 10 feet in height. The tree is eight years old, and it is protected on the north side by the stable shown in the picture. On the south side of the arch is Carmine Pillar, but, as you see, Claire Jacquier fairly smothers it.

R. C. MOUNT.

Lakefoot, Reading.

FELLENBERG.

A GROUP of this old Rose is very pretty with me just now, though the crimson colouring is not clear as in many other varieties. I have it with an under-planting of white Pansies, and the effect is very good. It is always bright in autumn, and lingers into the winter when the weather is kind. It requires very little pruning, may be planted in shrubbery borders. C.

AN ARTISTS' NOTE-BOOK.

GLAUCIUM FLAVUM TRICOLOR.

THIS is a dark-coloured form of *Glaucium flavum* from Asia Minor, and will prove very welcome to those who are fond of the Horned Poppy. It will doubtless prove a good border plant, and may be regarded as a particularly suitable plant for warm soils. The cupped flowers are large, of orange and mahogany-red, suffused with scarlet, a large, ovate blotch occurring at the base of each segment. It was shown by Messrs. Wallace and Co., Colchester, at the Royal Horticultural Society's show at Holland House held last week, and was then given an award of merit by the floral committee. H. T.

SOME ECHIUMS.

ABOUT the end of 1901 I received, through a friend, from Orotava, in Tenerife, seeds of six species of *Echium* indigenous to that island. Of these three have flowered in my cool greenhouse, without artificial heat during the winter. I send you herewith photographs of the two best.

Echium formosum.—Height, 4 feet 9 inches; flowers, bright pale indigo blue, with long stamens, rose-pink, each tipped with blue. The flower spike is about 18 inches long, the foliage rich green, tomentose in numerous dense heads on separate branches, the leaves 3 inches wide and about 12 inches long. This plant bore three flower spikes.

E. candicans giganteum.—Height, 6 feet 9 inches; flowers, pale rose madder, turning purplish when fading. The flower spike occupies the upper half of the tall single stem. Leaves rather closely whorled and evenly distributed around the stem, narrow, glaucous green, tomentose—some of the lower ones attaining 1 foot 8 inches in length, although measuring scarcely three-quarters of an inch at their widest part.

E. sp. (?).—Height, 4 feet; much branched,

10° of frost, but I have hopes that some of the above mentioned species may prove to be hardy in the southern parts of England.

WALSINGHAM.

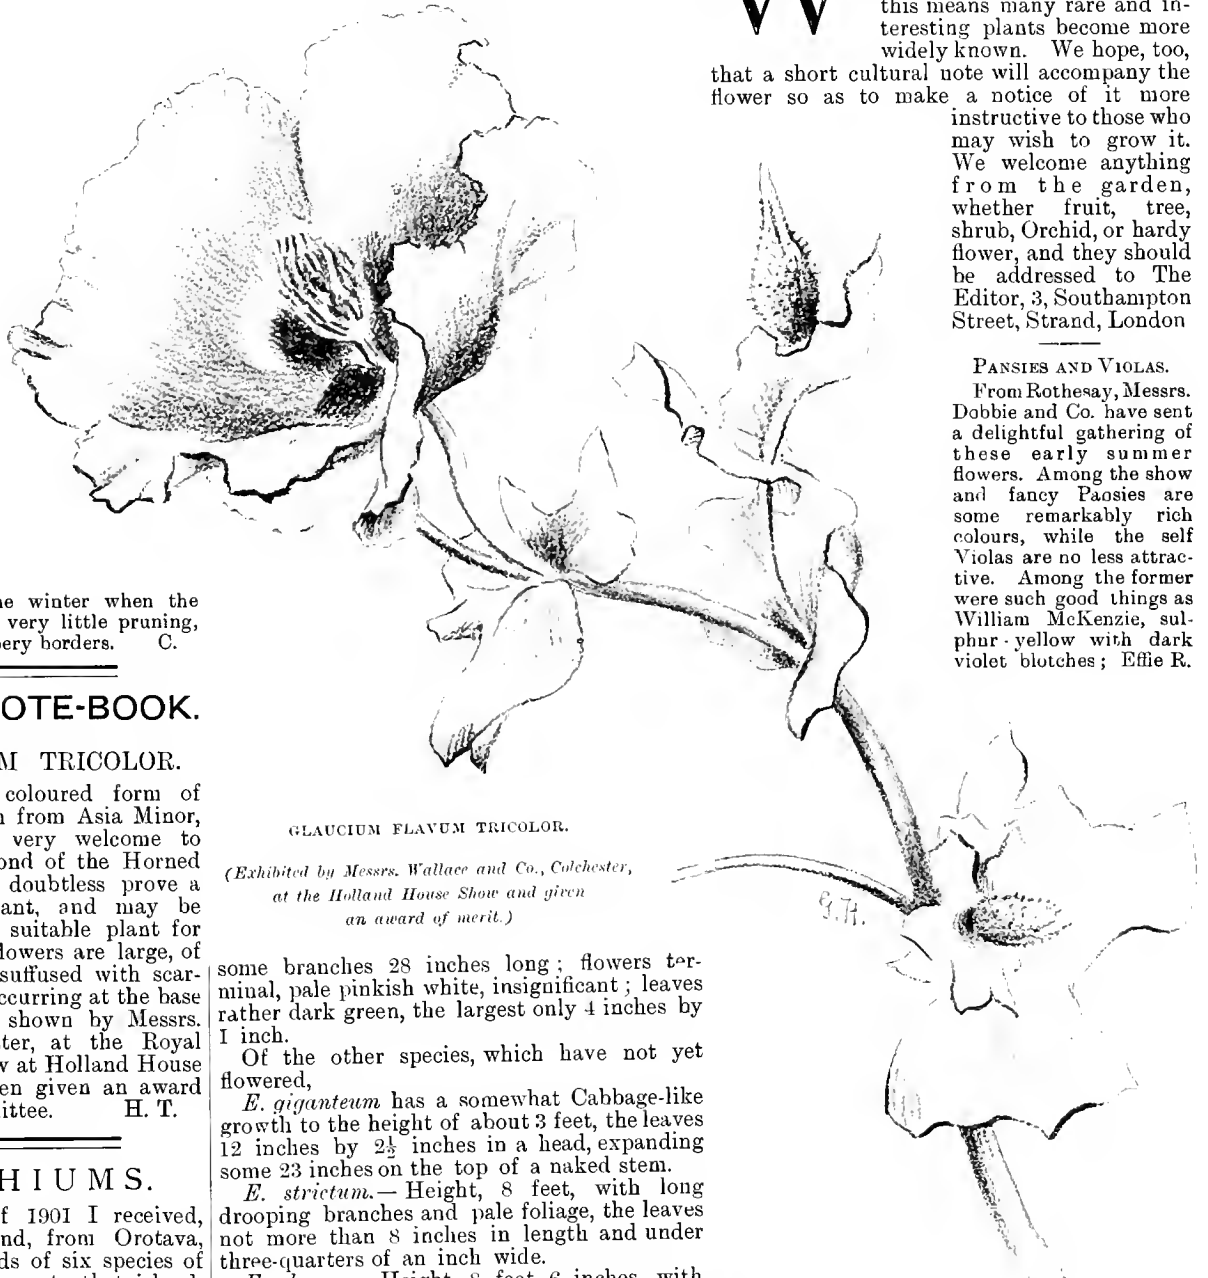

Merton Hall, Thetford, Norfolk.

THE EDITOR'S TABLE.

WE invite our readers to send us anything of special beauty and interest for our table, as by this means many rare and interesting plants become more widely known. We hope, too, that a short cultural note will accompany the flower so as to make a notice of it more instructive to those who may wish to grow it. We welcome anything from the garden, whether fruit, tree, shrub, Orchid, or hardy flower, and they should be addressed to The Editor, 3, Southampton Street, Strand, London

PANSIES AND VIOLAS.

From Rothsay, Messrs. Dobbie and Co. have sent a delightful gathering of these early summer flowers. Among the show and fancy Pansies are some remarkably rich colours, while the self Violas are no less attractive. Among the former were such good things as William McKenzie, sulphur-yellow with dark violet blotches; Effie R.

GLAUCIUM FLAVUM TRICOLOR.

(Exhibited by Messrs. Wallace and Co., Colchester, at the Holland House Show and given an award of merit.)

some branches 28 inches long; flowers terminal, pale pinkish white, insignificant; leaves rather dark green, the largest only 4 inches by 1 inch.

Of the other species, which have not yet flowered,

E. giganteum has a somewhat Cabbage-like growth to the height of about 3 feet, the leaves 12 inches by 2½ inches in a head, expanding some 23 inches on the top of a naked stem.

E. strictum.—Height, 8 feet, with long drooping branches and pale foliage, the leaves not more than 8 inches in length and under three-quarters of an inch wide.

E. elegans.—Height, 8 feet 6 inches, with long naked stem, and branches also naked to half their length, widely spreading, some from 4 feet to 5 feet long. Leaves, pale green, attaining 9 inches in length by 1½ inches wide, and forming many heads at the ends of the branches.

I believe that the names given to these different forms are on the authority of Professor Wildpret, the late botanical curator of the Jardin de Acclimitacion at Tenerife.

The only one that has been tried in the open air (on the undercliff in the Isle of Wight) is *E. giganteum*. This has failed to withstand

Wilson, edged with white and heavily blotched with violet; David Wilson, violet, edged crimson and white; Constance Abercromby, very dark with pale yellow margins; James Dodds, violet and white; and Mrs. Yorke, red-violet with cream edge. There were some beautiful shades of colour among the Violas, some of the best being General Baden Powell, orange; Mrs. B. J. McCrae, pure white with yellow eye; Miss E. Fulton, Ada Anderson, and others. These Pansies have a rare charm in the summer garden, and are useful as an under-planting to Roses; they flower very freely.

GARDEN STOCKS AND DARK-LEAVED SPINACH.

Mr. E. Clemens, The Gardens, Trusley Manor, Etwell, sends superb spikes of Stocks known as "Carter's Branching." The white variety is very pure, and the purple of a good colour, but we prefer the former. There is a danger in getting the individual flower too large. Anything larger than these would be excessively coarse. Mr. Clemens also sends leaves of "a good red-leaved Spinach which has a nice effect for sub-tropical gardening, besides being of value in the kitchen. It is of excellent flavour when cooked, a pleasant green in colour, and stands well in summer." We think Beet is best out of the summer garden, unless it is very carefully placed.

PEA DRUMMOND'S PRINCESS.

Mr. E. Clemens, The Gardens, Trusley Manor, also sends a photograph of Drummond's Princess Pea and some pods. The photograph was taken on the 20th ult., and shows a variety of exceptional good bearing, and picking began on the 1st inst. It succeeds well at Etwell, the plants cropping heavily and the flavour is excellent. Our correspondent writes: "I have grown it in several districts and have never known it to fail. Its only fault is that it grows tall, which well repays for an extra number of Pea sticks."

FLOWERS OF CORDYLINA AUSTRALIS.

Mr. Bartlett sends from Pencarrow Gardens, Cornwall, a spray of Cordylina australis, with the following note: "Several good sized plants were planted out four years ago and two are now flowering. The dense head of flowers is fully 4 feet through, and the delicious perfume attracts swarms of bees; the flowers open freely when cut and placed in water. This Dracæna is much hardier than is generally supposed, for we often get as many as 20° Fahr. of frost during the winter."

ROSE GENERAL GALLIENI.

From Hewell Grange Gardens, Redditch, Mr. A. A. Pettigrew sends flowers of this Rose, whose outer petals are red and yellow, delightfully blended, while towards the centre the colours are rosy fawn and light yellow. Mr. Pettigrew sends the following interesting particulars: "The colouring of this Tea Rose is very beautiful. Note its substance, it never drops its petals, they wither on the flowers. The stem is strong and wiry, and its foliage of deepest green, with no appearance of mildew. Its one defect is the abortive state of the carpels, with absence of stamens, giving the fully opened flower rather a bloated appearance. General Gallieni is described by Messrs. Paul and Son as reddish violet, with white base and petals, fine bold buds, good."

EARLY-FLOWERING GLADIOLI FROM GUERNSEY.

Messrs. Charles Smith and Son, Caledonia Nursery, Guernsey, send many varieties of early flowering Gladioli, and flowers fresher and more beautiful in colouring we have never seen. There is a certain grace in this type that the stronger and larger forms do not possess, and it is for this reason that the varieties named may be recommended so highly for cutting. They have much of the *G. ramosus* blood in them. Ne Plus Ultra is a handsome flower, bright red in colour, with white blotch on each of the lower segments; Blushing Bride is blush colour with red markings, a pretty combination; Crimson Queen, bright crimson, marked with purple on the lower segments; Peach Blossom, delicate pink; Pink Perfection, deep pink and white on the lower segments, a charming flower; The Bride, pure white; and Cardinalis, rich scarlet, with a white blotch on the lower segment. A very bright and useful collection.

FLOWERS FROM ARMAGH.

Mr. John McWalters sends from The Mall, Armagh, a boxful of uncommon plants. The *Alstromerias* are very beautiful, warm and tender colours, and have monopolised a portion of the garden. *Cypripedium spectabile* is quite established

in a cool shady corner, and the stems and flowers show how much they appreciate the place they are growing in. Mr. McWalters sends also *Orchis foliosa*, and remarks that "a pretty little group has been growing in a rock garden for years." It is protected in winter. The flowers of *Ostrowskya magnifica* were very fine. We like to see the big bell-shaped cups of lilac-blue. We are reminded of the beauty of *Carpentaria californica* by a gathering of flowers. The shrub is in fine bloom at Armagh. Among other interesting plants sent were *Abutilon vitifolium*, *Scabiosa caucasica*, and *Polygonum baldschuanicum*.

JAPANESE IRISES AND OTHER FLOWERS.

Messrs. V. N. Gauntlett, Redruth, send flowers of several varieties of the Japanese Iris, *I. Kämpferi*, and other flowers. Of the former especially worthy of note are Monte Rosa, white, with pale lilac-purple edge; Seirin, pure white satin rose, warm purple with deeper veins; Japan, white, very broad segments, yellow at the base; Hiawatha, purple, veined with a richer shade; Ladysmith, purple; and Beauty and Francisca, both of purple colouring. Messrs. Gauntlett also send the beautiful *Zenobia speciosa*, also known as *Andromeda cassinifolia*, and *Buddleia variabilis*.

SEEDLING DELPHINIUMS.

Mr. George M. Taylor, Pinkiehill, Inveresk, N.B., sends flowers of some very beautiful seedling Delphiniums for colour; the spikes are tall, straight, and the flowers are fairly close together, without, however, any of that ugly packing on the stem that disfigure some varieties. We enjoyed the colours, particularly an intense blue.

GALEGA HARTLANDI.

Mr. Hartland sends from his nursery at Cork flowers of this pretty Galega, which is a clear blue and white, and the foliage is variegated. We care little for this yellow in the leaf, as the flowers are quite sufficient colouring.

GARDENING OF THE WEEK.

FLOWER GARDEN.

CARNATION LAYERING.

AS soon as the Carnation flowers have been gathered or have faded layering should be done. After the old flower-stalks and all weeds have been removed it is advisable to prick over the surface soil, and if the bed is at all dry give a copious watering. The soil used should be finely sifted and contain a large proportion of leaf-soil to encourage root production, adding sufficient sand or grit to keep the compost porous. It is important to keep the mounds of good size and flat in shape, or during hot weather they will dry quickly, and the rain or water afforded will run off instead of permeating the soil. The pegs used are usually either made from old Birch brooms, which were cut during wet weather in the spring, or of Bracken, in which case they must be fairly new or they will be too brittle for the purpose. A handy man will quickly cut a large quantity with a pair of secateurs; but of whatever they are made the pegs must be fairly stiff and of good length. The shoots to be layered should be healthy and strong, but not too gross. A little practice will soon enable the operator to become proficient in layering. At the point it is intended to make the incision the leaves should be stripped off, and the cut, which should be made slanting in an upward direction to the middle of the stem, should be nearly 2 inches long, leaving about 4 inches of the growth to form the young plant. This should be carefully bent erect and pegged into the sifted soil, pressing it firm. Give a good watering at once, and damp with a fine rose towards the end of every warm, dry day. The layers should be well rooted in about six or seven weeks' time, when they should be severed from the parent

plant, and carefully planted in prepared beds or potted for wintering in frames.

PREPARING THE BEDS.

Where the Carnation plants will safely winter out of doors the beds should be prepared for their reception a few weeks beforehand. This allows the soil to settle before planting, and a crop of weeds can be easily cleared off while the ground is vacant.

The ground should be deeply dug and liberally dressed with well-rotted manure to encourage the plants to send their roots downwards and become well established before winter. Carnations so treated will be found to stand the winter more successfully than where the preparations are not so thorough.

Pencarrow Gardens, Bodmin.

INDOOR GARDEN.

ACALYPHAS,

of which, perhaps, for decorative work there is none better than tricolor, are, indeed, useful during the autumn and winter. Insert the cuttings singly in 2½-inch pots, and plunge these in a brisk bottom-heat in a close propagating frame, and for some days shade well from the hot sun. When rooted, pot them on according to the purpose for which they are required, but they will grow into useful-sized plants in 4-inch and 5-inch pots.

ALOYSIA CITRIODORA

is never more useful than when grown as a large bush plant for cutting or as small decorative plants in 3-inch pots. For the latter purpose the present is a good time to insert a few cuttings, either singly in 2½-inch pots or three to four round the sides of 3-inch size. When rooted they may be potted singly, or grown on without being disturbed, as they will in any case retain their foliage longer, and will look better than old plants or even those propagated in the spring. A rich sandy loam appears to suit them admirably.

LACHENALIAS,

the best of which, perhaps, is *L. Nelsoni*, should now be given a little attention. The bulbs, which for some time have been at rest, may now have a portion of the surface loose soil removed, and be top-dressed ready for growing on to flower in the same pots as last year, or they can be shaken out of the old soil, and the best or strongest bulbs selected for repotting, eight or nine together, in 5-inch to 6-inch pots. A few bulbs also should be placed in wire baskets, as when in flower they form objects of considerable beauty. Although it is unreasonable to allow the soil in the baskets to get very dry, it would prove just as much a mistake to keep the soil soddened with water before the bulbs begin to make roots. Sufficient water only should be given to keep the soil slightly or reasonably moist to encourage a free root development, as afterwards its application can be increased, and with better effect, according to the plant's requirement.

SCHIZANTHUS

now require to be considered. In some instances the dwarf variety (*Wisetonensis*) only is cultivated; others again prefer the taller growing *pinnatus*, *Grahamii*, or *retusus*. In either case, for early spring flowering, the plants should be raised from seeds to be sown now. These will germinate freely if sown in a light, sandy compost, and afterwards placed in a close humid atmosphere with attention to shading from hot sunshine. A high temperature is not required, 60° to 65° being quite hot enough. Immediately the young plants are through the soil remove the shade and admit light to keep them from becoming drawn, and afterwards air to strengthen their growth.

CYCLAMENS.

Strong plants of these should be given all the air possible. The frame lights during the day must necessarily be over the plants, with shade from strong sunshine, but at night remove the lights and allow the plants to be fully exposed. They will under such treatment grow sturdy, with

short leaf stalks, and their flowers, when properly developed, will be well above the foliage.

J. P. LEADBETTER.

The Gardens, Tranby Croft, Hull.

KITCHEN GARDEN.

TURNIPS.

THE last sowing of the early varieties should now be made. This ought to provide roots until the Swedes are fit for pulling. Ground that has been cleared of Potatoes will be suitable, a cool situation being best, as Turnips soon bolt if the weather is very hot. The ground need not be dug again if it is in good order, merely cleaning and raking it moderately fine for the reception of the seed will do. Golden Ball and Chirk Castle are both suitable for present sowings. Let the seed drills be 15 inches apart, and sow thinly. It is a safe plan to coat the seeds with red lead by slightly wetting the lead and rubbing the seeds through it, or by securely netting the whole plot.

MARROWS.

During the last fortnight the weather has become warmer, and these are now making rapid growth. Marrows should not be allowed to grow thickly. The line should be spread out regularly, allowing sunshine to reach the flowers. Pegs may be used to keep the growths in position, as they are easily blown about by wind. The fruits should not be allowed to remain too long on the plant, but should be used when half-grown, or even smaller. See that Marrows never lack moisture. Little feeding will be needed, but an abundance of water at the roots is necessary.

PARSLEY.

To make sure of this crop another sowing should be made now for covering with frames. If a sowing was made in May some of the young plants should be pricked into frames and some into boxes. These are handy for lifting into a warm house in case of the supply running out. After pricking out the plants should be slightly watered and shaded from strong sunshine for a few days. Rows of Parsley in the open must not suffer from lack of water. This is one of the first things to show signs of distress during a dry period.

GENERAL REMARKS.

Hoing and weeding is the chief work at this period. Continue to plant any vacant plots with Savoys, Greens, and Winter Cabbage. Broccoli may still be planted. Put stakes to Asparagus to prevent breakage by wind. Continue to plant out Lettuce and Endive, and continue weekly sowing of Radish, Mustard and Cress, &c. Remove all Potato tops, loose leaves, and all kinds of rubbish. The removal of such makes the kitchen garden more presentable and attractive. Pinch out the tips from late Beans when the pods are set. Persevere in the eradication of weeds, and if circumstances will not allow the garden to be perfectly clear from them an effort should be made to keep them from seeding at least.

South Queensferry, N.B.

FRUIT GARDEN.

HARDY FRUIT.

ANY young trees which were planted last autumn, and more especially those which were planted late last spring, will require attention in watering and

mulching. During the last few weeks we have had a high temperature and drying winds, and trees growing in light soils are showing the effect of the drought by not making satisfactory growth. When water is supplied a sufficient quantity should be given to thoroughly reach all the roots. No liquid manure should be given to young and newly planted trees which are in satisfactory soil and making good firm wood. Strong growths are not desired to form fibrous roots. The mulching of these trees, and, in fact, all other fruit trees in light and well drained soils in a dry season cannot be over-estimated. The surface soil should in all cases be pointed up before mulching. When this is applied before the soil loses its moisture it is a great saving of labour. The trees should all be gone over and summer pruning finished, when a thorough washing out of all dead leaves with the hose will add considerably to the health of the trees. Continue to tie in and thoroughly

A GROUP OF ORCHIDS IN THE GARDENS OF J. LAWRENCE, ESQ., M.P., THE OAKLANDS, KENLEY, SURREY.

regulate the shoots of Peaches, Nectarines, Pears, and Apricots according to the training followed. Apply the hose-pipe vigorously and keep all insect pests in check. Give water freely to all wall trees that require it. The above varieties require liberal supplies during the time the fruits are swelling. Give liquid manure or light sprinklings of vine manure occasionally to trees carrying heavy crops of fruit.

RASPBERRIES.

These are yielding excellent crops of fruit and should be assisted with liberal supplies of liquid manure. All small canes which were overlooked earlier should be cut away to secure good strong canes for next year's fruiting. Remove old canes as soon as the fruit is gathered, to allow the young ones the benefit of full light and air to thoroughly ripen.

PLUMS AND CHERRIES.

The earliest varieties of these will have had all the fruits cleared off them, and should be removed and plunged out in the open and syringed daily. A light mulch will keep them from becoming too dry. Syringe and clear the trees of any red spider, green and black fly, before plunging. Rich top-dressings should be given to other choice late varieties, with plenty of light and air to obtain rich colour and finish them properly. Damp the stems and all available spaces in the houses, and well syringe with soft water until the fruits show signs of ripening, when direct syringing must be stopped. Early permanent trees of Cherries should have all the ventilation possible when the fruit is cleared, be well watered, and vigorously syringed with the hose-pipe, to keep the foliage healthy and the trees clean.

Impney Gardens, Droitwich.

F. JORDAN.

ORCHIDS.

ORCHIDS AT KENLEY, SURREY.

SHOWN in the accompanying illustration is a group of Orchids in the gardens of J. Lawrence, Esq., M.P., The Oaklands, Kenley, Surrey (gardener, Mr. John Banerman). Prominent among them are *Dendrobium Dalhousiae*, *D. densiflorum*, *D. cretaceum*, *Coeloglyne massangeana*, and various *Cypripediums*, *Cattleyas*, and *Odontoglossums*. The inclusion of such diverse genera shows how comprehensive a collection is grown at The Oaklands, and to judge from the specimens represented they are all finely grown.

WORK FOR THE WEEK.

DENDROBIUM BRYMERIANUM.

It is a great pity that this Orchid does not grow and flower more freely. However, now that plants are generally given a more suitable compost and deeper receptacles a marked improvement is seen. This Orchid should never be disturbed more than is absolutely necessary, but when the compost has become sour it must be done, using fibrous peat and sphagnum in equal parts. On account of the copious supplies of water needed when they are growing, thorough drainage is essential; the pots should be half filled with rhizome. Those not requiring potting this season should have the surface renewed. Back bulbs should be cut away and they may be laid on the stage if an increase in stock is required, when they will soon break.

Give them a position in the coolest part of the stove house. Differing from most *Dendrobiums* this variety does not require to be kept dry at the roots when inactive; it does not need heavy supplies when it is not growing, but dryness at the roots is very detrimental to their well-being at any season of the year.

DENDROBIUM VENTUS.

This most beautiful hybrid, obtained from *D. Falconeri* and *D. nobile*, is growing more or less all through the year, but now is the best time for its renovation. The compost should consist of equal parts of sphagnum and fibrous peat that has had the fine particles taken from it, mixed with sand and crocks. Potting should be performed very

lightly, giving preference to receptacles that have no side perforation. The intermediate house temperature is better than a hotter one at all seasons. Strong light is beneficial. During the autumn give only enough shade to prevent the foliage being disfigured. During bright weather a liberal supply of water is necessary.

DENDROBIUM PARISHII.

Resurfacing or potting may now be done. Use the same compost, affording thorough drainage, and have pans without side holes. It should be grown in a light position, in such a temperature as the *Cattleya* house. When in active growth give water freely, continuing till growth is completed. During the winter months very little water will suffice.

DENDROBIUM PRIMULINUM.

This is another species that prefers the *Cattleya* house temperature, and the growths are now advanced sufficiently to enable potting being done in the same way as advised for *D. Parishii*. Water must be given very sparingly, or the new growths will often decay. When the base of the growth has hardened somewhat, water may be given rather more freely if the weather is bright.

DECIDUOUS DENDROBIUMS.

Any plants that are in small pots and have made good growth and still show signs of growing may be carefully potted, taking the greatest care not to damage any roots. By this means the plants will be materially increased and the autumn roots will have fresh material on which to feed.

W. P. BOUND.

Gatton Park Gardens, Reigate.

NURSERY GARDENS.

GARDEN ROSES AT CHESHUNT.

IT is impossible to chronicle all the beautiful Roses that were in flower when we spent an interesting day recently in this world-famous nursery. The so-called garden Roses were in the full flush of their summer beauty. A few were past their prime for this year, but the majority were exactly right. We wish another name could be discovered for Roses that have no greater claim to the prefix "garden" than the daintily coloured *Mildred Grant* that figured so conspicuously in the prize boxes at the Temple show. All Roses should be for the garden, or of what value are they? And the word is apt to mislead or puzzle those who are not so well acquainted with the many groups of Roses as the learned rosarian. But whatever the name of the groups that cluster over pillar and arch and pergola, they have a beauty that one would never tire of, though it were with us for half the year, and we are glad that Messrs. Paul are working to prolong the season of the single and other flowers that have but a brief life in the midsummer days. We want varieties to be more perpetual, and the hybridists working on the correct lines will soon realise their desires. One of the most striking of the Rambler Roses was

Wallflower.—We have never seen hedges of Roses so brilliant and complete. The flowers are large for a rambling Rose, brighter in colour than those of *Crimson Rambler*, and cluster over the growth in such a way that almost every leaf is hidden, and, as Messrs. Paul say, "with a habit of growth somewhat flat, it easily lends itself to hedge or wall training." This firm won the first prize offered for Roses over an arch with this variety and the pretty pink and white *Leuchstern*. The variety *Wallflower* was raised at Cheshunt by Mr. John Laing Paul, and the way to get the plant in beauty is to cut out the four year old growths and prune it all the way up soon after Christmas. For gardens where a profusion of blossom is desired we can commend the variety *Wallflower* as the most satisfying. It might also be planted against a strong fence with the happiest results.

Una.—This is now fairly well known. There is a large bed of it, 70 feet in circumference, in the Royal Gardens, Kew, and Messrs. Paul have not raised a flower of tenderer colouring and sweetness

than this. It is the outcome of crossing the *Dog Rose* with *Gloire de Dijon*, the flowers white with a suspicion of pink, and relieved with golden stamens, the buds buff. It is growing near *Wallflower*, and the association is interesting, the one a Rose of dashing beauty, the other as modest as the wild Rose of the hedgerow. The place for it is against a fence or to form a low hedge.

The Tea Rambler.—This was everywhere, and it is almost impossible to have too much of it. The name is suggestive and appropriate. It is a Rose of rambling growth, and the flowers beset the slender, graceful shoots, which will sometimes reach a length of 14 feet, drooping with the weight of the salmon and pink flower clusters filled with fragrance of the true *Tea Rose*. In growth it reminds one of *Polyantha grandiflora*, and is a Rose for pillar or pergola, or to make a standard of for the purpose of letting the branches hang gracefully to the level of the ground. We care little for standard Roses, unless the variety is adapted for this training: but *Tea Rambler* is delightful grown in this way. It is also a hedge Rose of the greatest value, as Messrs. Paul have it, in this form too.

R. rugosa repens alba.—The noble plant of this at Cheshunt, covering a space of over 200 square feet, has been described before in *THE GARDEN*. It is a mound of stellate spotless white flowers, and for covering a bank is the queen of Roses.

R. macrantha.—Visitors to the recent exhibition in the Temple Gardens will remember this beautiful single Rose of waxy texture and soft pink and white colouring. Its flowers are large and delightful for the decoration of the table, as might have been seen at the exhibition, when, with this simple flower as the sole ornament, the first prize was gained by Miss Langton. It has the merit of lasting longer than any single Rose owing to the substance of its petals.

The wichuraianas.—This famous group of Roses was in many places, but we were most charmed with a bank of them in one spot, and this reminds us that a width of 12 feet by 9 feet allows about the right space for these rambling Roses. A hint as to culture is to cut out the old wood and lay last year's down. There were the type *Alberic Barbier*, *Gardenia*, the creamy-white *Jersey Beauty*, *Rene André*, one of the loveliest of all, *Rubra*, and a new hybrid that we like very much, *Francois Foucard*, of which the flowers are semi-double, lemon in colour, and produced with the greatest freedom. The *Wichuraianas* were grown as standards also, and in whatever form they are never commonplace. *Adelaide Moule* is very pretty too, with its mantle of pinkish flowers.

Lady Battersea.—This Hybrid Tea has become popular very quickly, and received an award of merit from the Royal Horticultural Society last year when shown by the raisers, Messrs. Paul and Son. It is an excellent variety for forcing into flower early and in the garden also, which is not always the case. The two qualities do not always combine. The growth is very strong, the shoots long, and the flowers are not hidden among the leaves, whilst their colour is a bright cherry red, touched with orange at the base of the petals. It is a Rose full of charm, sweet in scent, and absolutely distinct.

Mrs. Allen Chandler.—This is a new, sweetly fragrant Bourbon Rose, a sport from *Mrs. Paul*, which was raised at Cheshunt, and must be accounted one of the finest of its race. The flower of *Mrs. Allen Chandler* is pure white, and has a pleasant fulness without a suspicion of coarseness, and it is very fine in autumn as well as in summer. This variety was raised by Mr. Allen Chandler, of Haslemere, and is especially recommended as a standard for London gardens. This is interesting, as few Roses are available for the neighbourhood of large towns, the most successful we can recall to mind being *Gloire de Dijon*, *Hon. Edith Gifford*, *Griiss* an *Teplitz*, *Mrs. Rumsey*, *Dr. Rouges*, *Mme. Alfred Carrière*, and *Alister Stella Gray*.

The Lion Rambler.—A very free and striking single Rose of a bright crimson colour. It was raised in this nursery, and may be associated with that other fine single Rose of greater renown—

Paul's Carmine Pillar. The two may well go together for the sake of prolonging the season, all too brief, the *Lion* not flowering until a week later. Messrs. Paul grow it as a pillar Rose and as a bush, and under both conditions with the correct pruning it is a complete success.

Dawn.—A Bourbon Rose raised at Cheshunt, and a seedling from *Mrs. Paul*. The flower is without the fulness of the parent or of *Mrs. Allen Chandler*, but its broad wavy petals are soft rose, a pretty tint which seems to shine in the sunlight. It is a Rose to make a bush of for the shrubby border.

A few hours spent here in the fulness of Rose time is well repaid, the collection is so complete. The *Rosa rugosa* group is represented by all the finest forms. There are *Rosa Korolkowi*, *R. rubrifolia*, *R. blanda*, almost thornless, the beautiful *R. sericea*, with its flowers borne along the stems in the way of a *Philadelphus*, *R. californica plena*, the pretty pink *Rosa Andersoni* mingling with the white of *R. repens alba*, *Cooling's* beautiful form of *R. Brunonis himalaica*, *R. carlica*, *Psyche*, *Euphrosyne*, the *Damson Rose*, the old double *Sweet Briar*, and *Miss Jekyll's* form of *Rosa arvensis*, the true York and Lancaster, *Francois Crousse*, which Mr. Paul considers the finest climbing red Rose, the brilliant *Cheshunt scarlet*, *Turner's* beautiful single Rose of shell-pink colour named *Lady White*, and several novelties among the *Teas* and *Hybrid Teas*, of which we shall make separate notes. The Roses of a bygone age are here too, and one, the most interesting, perhaps, the first Hybrid Perpetual *Rose du Roi*, and one's thoughts go back through the many years that have passed since this flower was first welcomed by the rosarians of those days. The whole Rose world has altered since then, and it is ever changing. During the years that are to come a race of autumn flowering climbers will have been raised, and the year almost encircled with the queen of flowers.

THE HOLLAND PARK SHOW.

HARDY FLOWERS (continued).

A MOST effective group of hardy flowers was that from Messrs. W. Cutbush and Sons, Highgate. Here, again, there was a feast of Lilies and the best of hardy plants. Of the Lilies the forms of *L. speciosum* were excellent, *L. Henryi* of great stature, *L. Krameri*, *L. candidum*, many good forms of *L. umbellatum* and *thunbergianum*, and, not least, a yellow-flowered *L. Henryi*, quite self-coloured save for a few faint stripes of red on the segments. This is most distinct, obviously a variety of the typical plant, with the same stature and habit generally. A further feature of this group was the great array of *Iris laevigata* grown in pots, the finest thing of its kind we have yet seen. Some of the best were *Cassandra*, double deep lilac; *Flora*, deep blue; *Progress*, violet-crimson, very fine; *Venus*, pure white; and *Duchess de Belcourt*, pale rose. A really fine grouping of these valuable plants. Water Lilies in tubs, hardy *Sarracenias*, and similar things were grouped near. Herbaceous *Phloxes* in pots in flower, at each end, gave an added touch of beauty and variety, while the *Bamboos*, here and there disposed, contributed a welcome touch of elegance to the whole.

Messrs. T. S. Ware and Co., Limited, Feltham, grouped hardy cut flowers on a table and on the ground in considerable variety. In this exhibit there was no attempt at design, and the great wealth of material was arranged more from the mixed group standpoint. *Pentstemons*, *Phloxes*, *Gaillardias*, *Day Lilies*, *Lychnises*, the earliest *Sunflowers*, *Iris laevigata*, *Campanulas*, *Lilies* of the *umbellatum* group, *Eremurus Bungei*, and others; *Eryngiums*, *Lathyrus latifolius albus grandiflorus* (very fine), *Delphiniums*, and many more. A set of three *Heleniums* were *H. grandicephalum cupressum* (a very early form), *H. Bolanderi Lemon Queen*, and *H. B. Golden Gem*. The two last are forms of *H. Bolanderi*, with decidedly tubular florets, giving quite a novel effect.

Hardy Water Lilies were splendidly shown by Lawrence Currie, Esq., Minley Manor, Farnborough, Hants (gardener, Mr. Profit). The flowers were cut, and well demonstrated the value of these things in the open. There were nearly thirty pans of these flowers, some of the more conspicuous being *N. alba candidissima*, *N. Marliacea albida*, *N. M. chromatella*, *N. Frœbeli* (a richly coloured form), *N. odorata minor*, *N. M. carnea* (very fine), *N. Laydeckeri liliacea*, and *N. ellisiana*, both finely coloured. This is perhaps one of the finest exhibits of these flowers that has been seen.

A grand lot of hardy flowers came from Mr. M. Prichard, Christchurch, Hants, the material excellent and well disposed. We are in this instance impelled to offer a word of praise by reason of the taste displayed in the grouping. We refrain from a mere enumeration of names, and single out *Helenium pumilum magnificum*, *Spiraea palmata*, most brilliant in colour, *Sidalcea Listeri*, *Campanula lactiflora*, very fine; *Buddleia variabilis*, in excellent bloom, *Coriaria japonica*, *Iris Kämpferi*, *Astrantia major* separating *Gladiolus insignis* from *Spiraea palmata*, white and mauve *Scabiosa caucasica*, and *Eremurus Olge*. A good display of *Eryngiums*, such as *oliverianum* and *giganteum*, *Galega Hartlandi*, *Campanula carpatica*, *C. e. alba* and *C. c. Isabel*, the last a large flower of deep violet, and *Centaurea ruthenica*. These were among the best in a very imposing lot.

A large and showy group of hardy flowers came from J. Bradshaw, Esq., The Grange, Southgate, N. (gardener, Mr. G. Whitelegge). This was an attractive arrangement, and contained *Calochorti*, Iceland Poppies, a brilliant lot of *Delphinium Belladonna*, *Gerbera Jamesoni*, *Lychnis haageana*, *Ostrowskia magnifica* (very fine), with *Pentstemons*, *Lilies*, *Campanulas*, and much more. Geums, tall *Verbascums*, and *Chelone barbata* were other good things.

Messrs. William Bull and Sons, Chelsea, had a small exhibit of early *Gladioli* and *Alstroemerias*.

Anemones from Messrs. Reamsbottom and Co., Geashill, King's County, Ireland, were a most brilliant lot. Singles and doubles in variety, with The Bride, pure white, and King of Scarlets, doubles, were of exceptional merit. King of Salmon is a distinct and good form, very pleasing in colour.

Messrs. George Jackman and Son, Woking, contributed *Phloxes*, *Delphiniums*, in which Beauty of Langport was well shown, also *Salvia ringens*, *Iris Kämpferi*, very good and showy, *Eriogonum speciosum*, a large mass of *Campanula pusilla alba*, *Rudbeckia californica*, with such *Lilies* as *Henryi*, *auratum vittatum*, *Day Lilies*, and the like.

A large number of plants of *Campanula dichotoma* came from Messrs. J. Veitch and Sons, Chelsea. The branching plants are about 4 feet high, flowers violet-blue with dark coloured base.

From Mr. B. Ladhams, Shirley Nurseries, Southampton, came a great variety of hardy things that included *Gaillardias* in much variety; *Pinks*, *Poppies*, *Scabiosa caucasica grandiflora* (very fine), *Platycodon grandiflorum*, *P. g. album* (very pleasing), *Lychnis vespertina plena*, with *Delphiniums*, *Campanula persicifolia* in variety, were among the best in a showy lot.

Furcraea longeva, a noble specimen in flower and some 20 feet high, came from T. A. Dorrien-Smith, Esq., Trescowe Abbey, Isles of Scilly. The flowers are creamy yellow on pendent branches. The plant was grown in the open and is a native of Mexico.

The hardy plants from Mr. Amos Perry, Winchester Hill, were one of the features of the exhibition. Some 80 feet in length, the arrangement was of hardy plants at either end with *Water Lilies* and *aquatics* in the centre. In this way a most charming and naturally disposed group was the result. The idea alone was good—the arrangement was good also. Early *Gladioli*, *Arum Dracunculoides*, *Calochorti*, *Azalea rosæflora*, *Lilium pardalinum*, *Campanulas* such as *garganica* *Moerheimeri* and *nobilis*, *Romneya Coulteri*, very fine, very beautiful *Ixias*, *Lilium Hansonii*, *Iris aurea*, *Eremurus Bungei superbus*, very fine; very light and graceful was *Campanula rotundi-*

folia alba in a large mass; *Lilies* and *Alstroemerias*; *Astrantias* and *Ixias*, always pleasing; *Campanula Wilsoni*, good; and many more bold and good things now in flower were shown. Among *Water Lilies* were *N. gladstoniana*, a glorious white, and *N. gloriosa*, one of the brightest of the reds; other good things were *N. lucida*, *N. Marliacea carnea*, *N. robinsoniana*, *N. ellisiana*, and many more other notable *water plants* were *Pontederia crassipes*, *Sagittaria angustifolia*, *Sibthorpia europæa variegata*, *Sagittaria variabilis*, *Potamogeton crispum*, and *Myriophyllum proserpinoides*. A good edging of a Mossy Saxifrage was a capital idea in the arrangement which has perhaps never been equalled.

Messrs. Cheal and Sons, Crawley, in addition to a large lot of Sweet Peas, contributed many good hardy flowers, such as *Eryngiums*, *Alstroemerias*, *Iris levisata*, *Heleniums*, *Achillea The Pearl*, *Telekia (Bupthalmum) speciosa*, a fine and bold plant, *Spiræas*, *Carnations*, &c.

Of quite an imposing nature was the hardy plant exhibit from Messrs. George Bunyard and Co., Maidstone. Here we noted *Campanulas* in variety, especially of *C. carpatica*, *C. persicifolia*, and others. There were many *Alstroemerias* and such useful plants as *Coreopsis*, *Sidalcea Listeri*, *Thalictrum glaucum*, *Iris levisata* in variety, *Lilium Martagon dalmaticum*, *Heucheras* in variety, *Gaillardias* very beautiful, *Phloxes* in variety, good and showy, *Monarda didyma*, *Centaurea macrocephala*, and *Stenactis speciosa* among the more prominent in a large and attractive lot.

The exhibit of hardy flowers and alpine plants from Messrs. Barr and Sons, Covent Garden and Ditton, was most attractive, some 500 feet of tabling being occupied with good things. The exhibit was in groups, and we saw the early *Gladioli*, *Alstroemerias*, and *Lilium testaceum* in full splendour. Here and there appeared rock plants, such as alpine *Poppies*, *Campanula carpatica pallida*, *C. pumila*, *C. punctata*, *C. pusilla alba*, the *Edelweiss*, *Goodyera pubescens*, and such like plants. Sweet Peas were in charming variety, also *Iris Kämpferi* and the newer *Water Lilies*, of which latter were seen many charming specimens. The towering inflorescence of *Phormium tenax*, the fruiting growths of *Coriaria terminalis*, and pretty flowers of *Lilium Martagon album* were all good. *Lilium Brownii* made a glorious group. Of this alone several dozen flowers were seen on stout, vigorous stems. *Lilium candidum* was very pure and good. *Heucheras*, *Ixias* and *Gypsophilas*, showy *Larkspurs*, with *Coreopsis* and *Acanthus* mingling with *Phloxes* and *Eryngiums* made quite a feast. Towering near was *Lilium giganteum*, with its red-stained flowers. These are but a few in a very large group of hardy flowers, all of which were set up in sensible groups that gave a good idea of their garden value.

Messrs. Jones and Sons, Shrewsbury, had a large lot of *Iris*, chiefly English and Spanish kinds, and in excellent condition. Gold Cup and British Queen were among the best.

Messrs. J. Laing and Sons, Forest Hill, set up hardy flowers, with alpine plants in baskets, and the like. Of the latter we noted *Saxifraga sancta*, *S. valdensis*, *Thymus lanuginosa*, *Sempervivum arachnoideum*, *Sempervivum Lagerei*, some species of *Dianthus*, &c. In the cut state were *Eryngiums*, *Funkias*, *Day Lilies*, *Gaillardias*, *Iris Kämpferi*, &c.

Messrs. G. and A. Clark, Limited, Dover, had a good exhibit of hardy things, in which *Campanula grandiflora*, *C. lactiflora*, *Centaurea macrocephala*, *Coreopsis grandiflora*, *Gaillardias*, *Iris aurea*, *Astrantia carniolica*, *Day Lilies*, early *Gladioli*, *Campanula carpatica Riverslee*, *Senecio clivorum*, *Potentillas*, *Eremurus Bungei*, and many more were in good condition.

From the Misses Hopkins, Mere, Cheshire, came quite an excellent lot of hardy things generally in a pleasing group. There were *Larkspurs* and the smaller *Campanulas*, as *C. pulla*, *C. pusilla alba*, *C. garganica*, *C. persicifolia coronata alba*, *Lilium Martagon album*, *Cobweb Sempervivums*, *Astrantia major*, *Dianthus deltoides*, *Galegas*, and *Geums* in variety, *Dianthus Napoleon III.*, *Erodium Reichardi*, a miniature alpine garden, with *Thrifts*, *Lychnises*, *Liliums*, and other plants.

From the Craven Nursery, Ingleborough, Clapham, Yorks, was shown a rockwork exhibit of a very charming description. *Sedums*, *Saxifragas*, single *Pinks* were all very pleasingly and quite naturally arranged. In trailing masses we noted *Campanula muralis*, *C. cœspitosa*, *C. Stansfieldi*, a very charming plant, probably a hybrid; alpine *Pinks*, *Sempervivums*, *Primula capitata*, *Veronica incana*, and *Saxifraga valdensis* were among interesting things in this exhibit.

The hardy plant group from Mr. G. Reuthe, Keston, contained much of interest and beauty. *Malva moschata alba*, *Campanula turbinata pallida*, *C. pusilla alba*, *C. garganica*, very pleasing in fine tufts, a lovely exhibit alone, the true *C. Raineri*, a lovely lot of *Ixias*, very charming early *Gladioli*, the giant *Thrift*, *Hypericum cuneatum*, with scarlet buds and quite yellow flowers.

Near by was a fine colony of *Saxifraga longifolia* and a giant form of *Magnolia grandiflora*, the brilliant scarlet and gold of *Desfontainia spinosa*, a fine carpet of *Linnea borealis*, &c., of *Liliums* we noted *L. dalmaticum*, *L. Marhan*, *L. Dalhansonii*, *L. testaceum*, *L. Grayi*, *L. Martagon* in variety with others, *Eremuri*, English *Irises*, and *Larkspurs* were all freely shown, together with many other interesting plants.

SUNDRIES.

Messrs. Joseph Bentley, Limited, Hull, exhibited their patent insecticides in variety.

The Four Oaks Nursery Company, Sutton Coldfield showed specimens of the Undentable Syringes. Ohlendorff's Peruvian Guano and Manures were shown by the Anglo-Continental Guano Works, Leadenhall Street, E.C.

Horticultural sundries, mallets, and stakes in Ash were sent by Messrs. John Sills and Co.

Messrs. William Poore and Co., 139, Cheapside, E.C., exhibited oil stoves and other heating apparatus.

Junofloris for preserving cut flowers was shown from 95 and 96, High Holborn.

Mr. J. George, 14, Redgrave Road, Putney, S.W., exhibited horticultural sundries, as also did De Luzy, frères, Camberwell, S.E. Quixol, a preparation for removing grease and stains from clothing, was shown.

Messrs. Champion and Co., 115, City Road, E.C., showed their handsomely finished tubs for shrubs and plants.

From the Royal Doulton Potteries, Lambeth, were exhibited garden vases, sundials, &c.

The Rural table decorations were exhibited by Mr. Robert Sydenham, Tenby Street, Birmingham, and by Mr. Williams, Oxford Road, Ealing.

Messrs. William Wood and Sons, Limited, Wood Green, showed sundries, as, for instance, raffia, stakes, watering-cans, baskets, and tools.

Messrs. W. Herbert and Co., Hop Exchange, S.E., showed specimens of plant foods and various sundries.

Messrs. Fenlon and Son, Tudor Street, Whitefriars, E.C., exhibited their "unique" radiator, for hot water or steam, and other heating apparatus.

Messrs. Osman and Co., 132 and 134, Commercial Street, E.C., exhibited a large display of horticultural sundries as vases and bowls, artificial Palms, labels, knives, flower-boxes, &c.

The Acme Labels were shown by Mr. John Pinches, Crown Street, Camberwell, S.E. These zinc labels are well known for their durability and legibility.

Messrs. Fulham and Son, 71, Newman Street, Oxford Street, W., displayed a rock formation, the crevices of the miniature rock garden being planted with alpine plants, &c. Messrs. Fulham and Son also showed garden vases, sundials, garden seats, &c.

Messrs. Cory and Co., Limited, 13 and 15, Finsbury Street, E.C., exhibited various fumigators, lawn sand, manures, vapour cones, and other specialties.

The Hull Chemical Works, Limited, and Messrs. D. Dowel, Ravenscourt Avenue, W., showed horticultural sundries.

Messrs. J. P. Harvey, Kidderminster, showed specimens of their fertiliser.

The Pattinson Lawn Mower Boots were shown by Mr. H. Pattinson, Streatham, S.W.

Slugdeath, said to be a certain exterminator of slugs, was shown by Messrs. H. Stanley and Co., South Norwood.

Messrs. Valls and Co., 16, Coleman Street, E.C., showed Bætlecute, a cockroach, beetle, and ant exterminator.

Messrs. H. Castle and Sons, Millbank, S.W., exhibited garden seats in teak.

Garden tools were shown by Messrs. Thomas J. Syer and Co., 45, Wilson Street, Finsbury.

The Economic Fencing Co., Ltd, Billiter Street, E.C., exhibited their patent chestnut fencing.

ESCALLONIA PHILIPPIANA.

As shrubs for the open ground near London and farther to the north, the Escallonias as a whole are of but little value. One has to go to Cornwall and such-like places to see them really thriving without any protection. Elsewhere they are killed to the ground in hard winters, and are only really satisfactory when grown on a wall. *Escallonia philippiana*, however, makes an exception to the rule. It is quite hardy, and flowers freely every year. It acquires also an additional value in blossoming so late in the year as July. At the present time its twigs are crowded with the small pure white fragrant flowers. It is quite distinct from the rest of the Escallonias, not only in the flowers, but in the narrow lance-shaped leaves. It has a graceful habit, the branches on older specimens assuming an arching or almost pendulous mode of growth. It is a native of Valdivia, and has been introduced for more than twenty years. The charming *Escallonia langleyensis*, a hybrid raised by Messrs. Veitch, has this species for one parent, and inherits from it a good deal of its hardness.

SOCIETIES.

HARROW FLOWER SHOW.

THE annual exhibition of the Harrow Horticultural Society was held on the 13th inst. in Bowden House School

Grounds, Sudbury Hill, by kind permission of the Rev. W. S. Price. Owing to the long spell of hot weather several growers failed to exhibit in the Rose classes. With this exception, however, an excellent display was made. The large Rose class, for thirty-six blooms distinct, was well contested, and some fine flowers were shown by the competitors. Garden Roses in vases were a feature. With a bloom of Bessie Brown, Mr. Frank Spencer, a local amateur, won two silver medals for the best Rose in the amateurs' and members' classes. White Maman Cochet from Messrs. B. R. Cant and Sons was the best bloom in the show. The exhibition was favoured with delightful weather, which must have been gratifying to Dr. Williams and Mr. Spencer, the honorary secretaries, Mr. Lewis Pawle, the honorary treasurer, and their colleagues.

ROSES (OPEN).

Thirty-six blooms, distinct: The first prize and Jubilee Challenge Cup were taken by Messrs. B. R. Cant and Sons, Old Rose Gardens, Colchester, with a stand of beautiful flowers, fresh, and of uniform quality. Among them Kaiserin Augusta Victoria, Lady Moyra Beauchere, Catherine Mermet, and Mme. Hoste were perhaps the best. Messrs. Frank Cant and Co., Colchester, were second with a more irregular exhibit. However, Victor Hugo, Frau Karl Druschki, Mildred Grant, and Horace Vernet were lovely blooms; third, Messrs. D. Prior and Son, Colchester.

Twelve Roses, distinct, Tea or Noisette: First, Messrs. B. R. Cant and Sons, Colchester, with beautiful blooms of Ethel Brownlow, The Bride, Mrs. Mawley, Mme. Cusin, and others; second, Messrs. D. Prior and Son, Colchester, Mrs. E. Mawley, Bridesmaid, and Muriel Grahame being splendid; third, Messrs. Frank Cant and Co., Colchester. Maman Cochet was very good.

Twelve bunches of garden Roses in vases: First, Messrs. Frank Cant and Co., Colchester, who had a beautiful lot of Killarney, Fellenberg, The Garland, Anna Marie de Montravel, and Fabvier; Messrs. Paul and Son, Cheshunt, were a good second, Mme. Ravary, Gustave Regis, Liberty, and others being finely represented.

AMATEURS.

Twenty-four Roses, distinct: First prize and a cup, Mr. O. G. Orpen, West Bergholt, Colchester, with a pretty stand of blooms, of which Mme. Hoste, Maman Cochet, Mildred Grant, Kaiserin Augusta Victoria, and Catherine Mermet were the best; Miss Beatrice Langton, Hendon, was second with blooms of less regular quality, though A. K. Williams, Mrs. John Laing, Horace Vernet, and others were very good. No more entries.

Twelve Roses, distinct, not open to growers of more than 1,000 Roses: Miss Beatrice Langton, Hendon, was the only exhibitor in this class, and was given first prize for a good stand of blooms.

Twelve Roses, distinct, Tea or Noisette: First, Mr. O. G. Orpen, Colchester, with finely formed blooms of Mrs. Edward Mawley, Lady Roberts, Mme. Hoste, Maman Cochet, Mme. Cusin, and others; second, Miss Beatrice Langton, Hendon, with small flowers.

MEMBERS ONLY.

Twelve Roses, distinct, N.R.S. Silver Medal given to the first prize lot: First, Mr. Frank Spencer, Harrow, White

Maman Cochet, Bessie Brown, and Victor Hugo being excellent blooms; second, Dr. Williams, Harrow, Marchioness of Londonderry, Maman Cochet, and Princess of Wales being well represented.

Six Roses, distinct: First, Mr. J. N. Stuart, with only fair blooms; second, Mr. S. Acton Davis; third, Mr. L. R. W. Forrest. There were several more competitors.

Six Roses, Tea or Noisette: First, Mr. Frank Spencer with good though small blooms, Jean Ducher being perhaps the best; second, Mr. Arnold Mitchell. There were no more entries.

Four Roses of any one variety: First, Mr. Frank Spencer with very good White Maman Cochet; second, Mr. Lewis S. Pawle with Maman Cochet; third, Mr. J. T. Horley with the same variety.

Three vases of Roses: First, Mr. Frank Spencer with very good blooms of Maman Cochet, White Maman Cochet, &c.; second, Mr. J. T. Horley; third, Mr. L. R. W. Forrest.

Four bunches of garden Roses (prizes given by Paul and Son, Cheshunt): First, Mr. C. Graham with a pretty exhibit; second, Mr. S. Hargreaves; third, Mr. J. Osmond, all of whom showed well.

Six Roses (amateur members only): First, Mr. A. Bryans, with very good blooms; second, Mrs. Burton; third, Mr. Donald Hawkins.

One bunch of Roses in vase: First, Mr. Maurice Groom, with good blooms too closely bunched; second, Mrs. Burton, showing Crimson Rambler; third, Miss Edwards.

BEST ROSES.

The National Rose Society's silver-gilt medal for the best Rose in the show was given to a lovely bloom of White Maman Cochet shown by Messrs. B. R. Cant and Sons, Colchester.

A bloom of Bessie Brown shown by Mr. Frank Spencer, Harrow, won the silver medal offered for the best Rose in the amateurs' classes and members' classes respectively.

CUT FLOWERS.

Collection of cut flowers: First, Mr. S. Lithgow, with good Crimson Rambler Roses, Delphiniums, Gentohera, Centaurea, &c.; second, Mr. Arthur S. Hargreaves.

For twelve bunches of cut flowers Mr. E. Graham was first, Liliun candidum being very good; second, Rev. E. C. E. Owen; third, Mr. Lewis S. Pawle.

Six bunches of cut flowers: First, Mr. E. W. Howson, with an attractive exhibit; second, Mr. Arnold Mitchell; third, Mr. J. MacAndrew. This class was well contested, and the flowers made a bright display.

Sweet Peas were largely shown, and appear to be popular with the Harrow exhibitors. The Rev. E. C. E. Shea won first prize for twelve bunches, showing good blooms of the best varieties, although they would have looked much better in tall classes; Mr. H. T. Gordon was a good second, with the flowers too closely bunched; third, Mr. Lewis S. Pawle, who also showed well. There were several other competitors.

Six bunches of Sweet Peas: First, Dr. Williams; second, Mr. E. W. Howson; third, Mr. A. Bussweiler.

There were other classes for Delphiniums, greenhouse flowers, Stocks, and Pansies.

Plants, fruits, and vegetables were well shown, some excellent produce being staged. Strawberries, Gooseberries, and Currants were the principal fruits exhibited, and Messrs. Arthur S. Hargreaves, G. Acton Davis, J. T. Horley, J. A. Stuart, and Mrs. Oakley Fisher were the chief prize-winners. There was keen competition in the cottagers' classes for cut flowers and Grasses.

DECORATIVE CLASSES.

There was keen competition in the classes for table decoration, the first prize being taken by Mrs. A. W. Perkin, who used a salmon-pink Clarkia, Gypsophila, and Grasses, with Smilax on the table, a very pretty effect resulting; Miss Milne, who used mauve Sweet Peas, Scabious, and white Carnations, with Gypsophila, was second; Mrs. Arnold Mitchell, with blue Scabious and Delphiniums, Asparagus and Smilax, was third.

Flowers in vase: First, Miss Hawkins, with Caroline Testout Rose; second, Mrs. Pawle, with a bold arrangement of Delphiniums, Gladioli, &c.; third, Mrs. Oakley Fisher.

Cut flowers in basket: First, Mrs. A. W. Perkin, who used Pink Roses, Carnations, and Pelargoniums; Mrs. A. J. Obermayer, with rose-pink and red Sweet Peas and Gypsophila, was second; third, Mrs. Pawle, with Japanese Irises and mauve Sweet Peas.

Bowl or vase of Roses, open to lady amateurs within 25 miles of Harrow: First, Miss Beatrice Langton, with white Tea Roses in vase; second, Mrs. Burton; third, Mrs. Pawle.

NON-COMPETITIVE EXHIBITS.

Messrs. William Cutbush and Son, Highgate, N., exhibited a group of hardy flowers, such as Phloxes, Lilies, Gaillardias, Delphiniums, &c.

Messrs. Gage and Barker, Harrow, showed horticultural tools and implements.

Messrs. Paul and Son, Cheshunt, exhibited hardy flowers in variety, including Coreopsis, Lilies, Statice, Heuchera, Phlox, Eryngiums, &c.

Messrs. J. Peed and Sons, West Norwood, exhibited a group of Malmaison and Tree Carnations in pots.

Messrs. James Naylor and Sons, Harrow, set up a small group of Lilliums, Palms, and other foliage plants.

THE WALTON ROSE SHOW.

THE third exhibition of the Walton and District Rose and Flower Society held in the grounds of The Grange, by kind permission of Mr. Frank

A FLOWERING SPRAY OF ESCALLONIA PHILIPPIANA.

Roses are always a leading feature at Wolverhampton, several classes for them being provided and very handsome prizes offered. There were fine collections of several varieties of blooms, Messrs. Harkness and Co. Hitchin, adding to their success in this season by taking first prize, with excellent examples of Alfred Colomb, Marie Baumann, Reynolds Hole, Maréchal Niel, Dupuy Jamain, Mrs. John Laing, General Jacqueminot, Maman Cochet, Gustave Piganeau, Frau Karl Druschki, Countess of Rosebery, Fisher Holmes, Bessie Brown, Mildred Grant, Horace Vernet, Ulster, Helen Keller, &c. Mr. Hugh Dickson, Newtownards, Belfast, second, and the King's Acre Nursery Company, third. With forty-eight blooms Messrs. Harkness and Son were again first with Marie Baumann, Prince Arthur, Innocente Pirola, Horace Vernet, Mildred Grant, Florence Pemberton, White Maman Cochet, Mrs. Cocker, Duchess of Bedford, Mme. Delville (a very fine Rose), Ben Cant, Bessie Brown, Her Majesty, Mme. C. Crapetel, Mme. Cosin, Mrs. John Laing, White Maréchal Niel (delicate sulphur), &c.; second, Mr. H. Dickson; third, Messrs. Townsend and Son. With eight varieties in threes, Messrs. Harkness and Co. again came first, their best blooms being Marie Baumann, White Maman Cochet, Bessie Brown

Prince Arthur, Her Majesty, Maman Cochet, Mildred Grant, and Horace Vernet; second, Mr. H. Dickson, who had in good character Her Majesty, Mrs. John Laing, Duke of Wellington, and Marchioness of Londonderry; third, Messrs. Perkins and Sons, Coventry.

With twelve bunches shown with foliage and buds as cut from the plant, Mr. George Prince was first with excellent varieties: Helene, Maman Cochet, Souv. de President Carnot, White Maman Cochet, Crimson Rambler, Himalaica (a charming free flowering single white), Bellefleur, Marie van Houtte, and Climbing White Pet, a nice assortment of garden Roses; Messrs. Townsend and Son were second. With twenty-four Roses Mr. George Prince, Oxford, was first. He had in good character, White Maman Cochet, Marechal Niel, Mildred Grant, Bridesmaid, Xavier Olibo, Bessie Brown, &c.; Messrs. Perkins and Son were second. With twelve Roses, new varieties of the last three years, Messrs. Perkins and Son were first with Mildred Grant, Florence Pemberton, Obergartner Terks, Amy Cochet, Mme. Olivier, Alice Grahame, Robert Scott, and Duchess of Portland as the best; Messrs. Harkness and Co. were second with Frau Karl Druschki, Mildred Grant, Duchess of Portland, Ben Cant, Alice Lindsell, Robert Scott, &c. With twelve blooms of dark Roses, the King's Acre Nursery Company were first with bright A. K. Williams, Mr. H. Dickson was second with Ulrich Brunner, and Messrs. Townsend and Son third with Earl Dufferin. With twelve light Roses Mr. G. Prince was first with Bessie Brown, Mr. H. Dickson second with Mrs. John Laing, and Messrs. Perkins and Son third with Mildred Grant. With twelve Tea-scented varieties Mr. George Prince was first with good blooms of Muriel Grahame, Bridesmaid, Catherine Mermet, Devonensis, Souv. de S. A. Prince, Maman Cochet, White Maman Cochet, &c.; second, the King's Acre Company. With six varieties of Sweet Briars Messrs. Perkins and Son were first, and Mr. C. T. Mander (gardener, Mr. J. F. Simpson) second, both with unnamed varieties. With nine vases of Teas and Noisette Roses, seven blooms in each, Mr. George Prince was first with Maman Cochet, Souv. de S. A. Prince, White Maman Cochet, Mme. C. Kuster, Comtesse de Nadaillac, Golden Gate, &c., being the only exhibitor. Bowls and vases of Roses were shown in their respective classes. Roses were also shown in seven classes by gentlemen's gardeners and amateurs, the Rev. J. H. Pemberton, Havering, and Messrs. Dennison and Whittle being the principal prize-winners, while amateurs alone exhibited in two classes.

Floral decorations were numerous. Bouquets made a fine display, the best for the hand came from Messrs. Perkins and Son, and Mr. M. Jenkinson, Newcastle, was second, both making use of bright Orchids. The best bridal bouquet, which consisted of pale Orchids, came from Mr. M. Jenkinson; Mr. G. Barnett, Kidderminster, was second. Messrs. Perkins and Son came first with a bridal bouquet, using delicate Orchids. Mr. M. Jenkinson was second.

The best collection of decorative plants and bunches of cut flowers came from Mr. A. R. Dutton, Bexley, who had charming vases of Carnations mingled with decorative plants. Mr. W. Finch came second. There was also a class for an arrangement of hardy flowers, but the awards had not been made at the time our report was taken. The best display of plants or floral arrangements was furnished by Mr. J. E. Knight, Wolverhampton, a very bold and finished piece of work having Banboos at the back with bright Crotons, Caladiums, and various cut flowers. Mr. G. H. Kenrick was second with a tasteful table collection admirably arranged, and Messrs. Artindale and Son third, who had a combination of floral decorations, plants, &c.

The best dinner-table decoration was furnished by the Leamington Nursery Company, Orchids being used with excellent effect. Mr. M. Jenkinson was second, his table being arranged in much the same manner. The best table arranged with Sweet Peas was set up by Mrs. E. Pitt, the varieties employed being delicately tinted; Mr. H. A. Canadine, Stourbridge, was second. There were several arrangements of Pansies and Violas; they were generally well done. Here, again, the awards were delayed. There were arrangements in Sweet Peas, but we could find only a second prize awarded to Mr. Knight, Erdmore.

The best eighteen varieties of Sweet Peas came from Mr. E. Amies, Stafford. Fine varieties being staged. Messrs. Hinton Brothers, Warwick, were second. Mr. H. Eckford offered special prizes for twelve varieties. Mr. R. Piazanni, Sheffield, was first with very fine examples of Lady Grisel Hamilton, Countess of Powis, Hon. Mrs. E. Kenyon, Coccinea, Black Knight, Miss Willmott, Jeannie Gordon, &c. The classes for Mr. R. Sydenham's special prizes for twelve bunches, brought a large competition. Mr. W. Marple, Puckridge, was placed first with Miss Willmott, Dorothy Eckford, King Edward VII. (very fine and bright), Lottie Eckford, Jeannie Gordon, Agnes Johnston, &c. Mr. J. Read, The Gardens, Brettey, was second.

Fruit

was represented by excellent produce, Strawberries being the weakest feature. The best four bunches of Grapes came from Lord Saville, Kniford Abbey (gardener, Mr. Doe), who had two excellent bunches each of Muscat of Alexandria and Madresfield Court. The Grapes shown in this and other classes by Mr. Doe were one of the features of the show. The Duke of Newcastle, Clumber (gardener, Mr. C. Barker), was second with a bunch each of nicely finished examples of Buckland Sweetwater, Foster's Seedling, Black Hamburgh, and Madresfield Court. The Earl of Carnarvon, Brettey (gardener, Mr. J. Read), was third. The best two bunches of white Grapes were finely finished Buckland Sweetwater from Mr. Doe. The Earl of Eatham, Ormskirk (gardener, Mr. B. Ashton) was second with the same. For two bunches of black Grapes Mr. Barker came first with well finished Madresfield Court; Mr. Doe second with good bunches also. The veteran, Mr. T. Bannerman, Blithfield, was first with the best dish of Peaches, having very good Royal George. Mr. Ashton and Mr. Read came first with a dish of Nectarines, and Mr. J. H. Goodacre, Elvaston, was second, both with good Lord Napier. Mr. C. T. Mander, Wolverhampton (gardener, Mr. J. F. Simpson), gained the first

prize with three dishes of Strawberries, having Royal Sovereign, Beader, and Sir Joseph Paxton; Mr. Goodacre came second with the Laxton, Royal Sovereign, and La Grosse Sucree. Mr. J. Evans, Wolverhampton, had the best three dishes of Tomatoes; Mr. Read was second. Mr. Doe was placed first with six dishes of fruit having well balanced and finished two bunches of Muscat of Alexandria and Madresfield Court Grapes, Stirling Castle and Dymond Peaches, Improved Downton Nectarines, Melon, and Transparent Gage Plums. Mr. Goodacre was second with excellent black Hamburgh and Muscat of Alexandria Grapes, Chancellor Peaches, Elruze and Lord Napier Nectarines, Melon Lady Sudeley, and Apples and Figs. Mr. T. Bannerman was third. In the Gentlemen's Gardeners' Division for six dishes of fruit, Mr. Doe was again first with Madresfield Court and Muscat of Alexandria Grapes, Goshawk Peach, Improved Downton Nectarine, Figs and Melon. Mr. Goodacre with black Hamburgh and Muscat of Alexandria Grapes, Stirling Castle Peaches, Elruze Nectarines, Melon, and Jules Guyot Pears. Mr. Barker was third.

Vegetables were a fine feature, and some excellent produce was staged. The first of Messrs. Sutton and Sons' special prizes for a collection of six kinds was won by Mr. Beckett, gardener to Lord Aldenham, Elstree, who had model samples. Mr. W. L. Bastin, gardener to Sir A. Henderson, Bart., Faringdon, was a good second. With six kinds, special prizes being offered by Messrs. E. Webb and Sons, Mr. Beckett was again first, and Mr. Bastin second. They also offered prizes for the same number of kinds, open to gentlemen's gardeners. Messrs. Hewitt and Co., Birmingham, and Messrs. Baker, Wolverhampton, offered prizes which brought good competition.

Groups of plants and also collections were shown by gardeners, but time did not admit of gathering up particulars, while a division was set apart for amateurs who do not employ a gardener, in which cut flowers, table decorations, and fruit were shown.

A large tent was set apart for cottagers and children, and here could be seen a varied and most interesting exhibition, the competition in the children's classes being very keen. It was a show in itself, and needed to be seen to be appreciated.

There was, as usual, a large number of exhibits of a miscellaneous character, and several medals were awarded, but as the list was not made public until late, a correct record could not be gathered up. One striking exhibit was from Baker, Wolverhampton, who filled nearly the whole of one side of a tent with Violas, Sweet Peas, Roses, a fine ground bank of zonal Pelargoniums, &c., with some elaborate table decorations. Messrs. Webb and Sons, Stourbridge, had a very tasteful arrangement of floral arches of Sweet Peas, and in addition lilies, hardy flowers, &c. Messrs. Hinton Brothers, Warwick, had a fine collection of Sweet Peas shown in vases, remarkable for their brilliancy of colour; Messrs. R. Smith and Co., Worcester, had hardy cut flowers; Mr. J. H. White, Worcester, the same; Mr. H. Lovatt, Low Hill, had a group of Malmaison Carnations, and Messrs. Gibran and Son, Altrincham, the same and plants of Kalanchoe flammea; Messrs. Jarman and Co., Chard, had Sweet Peas and hardy flowers; Messrs. Dicksons, Limited, Chester, hardy flowers, including Roses, &c.; Mr. E. Murrell, Shrewsbury, had Roses in variety; Mr. W. Knight, Bradmore, Ferns, &c.; Mr. W. Walters, Acoek's Green, Violas; Messrs. W. Artindale and Son, Sheffield, Violas, Carnations, &c.; Mr. H. Brownhill, Sale, a very interesting collection of improved annual Chrysanthemums, single and double; Mr. R. Sydenham, Birmingham, floral decorations of Gladioli, Carnations, &c.; Mr. Vincent Slade, Taunton, a large collection of fine zonal Pelargoniums; Messrs. Hewitt and Co., Solihull, vases of Carnations; Messrs. R. Smith and Co., Worcester, a large group of Carnations, &c.; The Vineries, Limited, Acoek's Green, Roses, &c.; and a group of Malmaison Carnations from Mr. Halliday, gardener to the Earl of Dartmouth.

At the luncheon following the judging, at which the Mayor presided over a large company, testimony was borne by the judges and others to the excellent arrangements made by Mr. W. E. Barnett and his staff.

The show took place, as usual, in West Park, the spacious conservatory in which is well furnished, and the flower garden arrangements most attractive.

EALING HORTICULTURAL SOCIETY.

DELIGHTFUL weather favoured the fourteenth annual summer exhibition of this society on the 6th inst. By the kindness of Leopold de Rothschild, Esq., it was held in Gunnersbury Park, a beautiful place for the purpose. This, apart from the excellent display, had doubtless much to do with the good attendance of visitors. We refer briefly to some of the salient features of the show.

For a group of plants arranged in a space 12 feet by 6 feet, first honours were secured for an effective display by Mr. A. G. Dixon; second, Mr. J. Harris. In a group 9 feet by 6 feet, neat arrangements secured the prizes to Messrs. J. Bishop and M. Hulbert. Fine foliage plants were successfully shown by Messrs. Harris and Spence, the latter exhibitor coming well to the front with Fuchsias, followed by Mr. M. Hulbert. Ferns were an interesting class. In the principal class for these the prizes were gained by Messrs. J. Harris and H. W. Underhill. An attractive class was that provided for twelve Streptocarpus, not less than six distinct, the leading prize-takers being Messrs. H. Peal and A. G. Dixon, the same exhibitors securing the honours for well-flowered Gloxinias.

The Rose tent was a centre of great attraction. For forty-eight blooms, premier honours were secured by Messrs. Harkness and Co. with some fine flowers. Specially noticeable were Frau Karl Druschki, Caroline Testout, Alice Eindsell, Her Majesty, Mrs. Cocker, Mildred Grant, and Maman Cochet. Messrs. G. and W. Burch were a creditable second. With twenty-four blooms honours were reversed with these well-known exhibitors, both showing admirable flowers. The society's silver cup for twenty-four Roses, not less than twelve varieties, was well won by Mr. W. Owen

with some grand blooms, the second prize (silver-gilt medal of the National Rose Society) going to Mr. F. Goodenough for some very creditable flowers.

There was a keen competition in the principal class for table decorations, for three stands or vases of flowers, first honours being ultimately accorded to Mrs. J. C. Peal, in which Carnations, Sweet Peas, Irises, Gypsophila, &c., were tastefully disposed features. Mrs. Noy was second; Sweet Peas were charmingly used. In the class for two bunches of black Grapes, well-finished examples secured the leading prizes to Messrs. F. G. Gledstanes and Mr. H. Peal, the same exhibitors being awarded the prizes for white Grapes. For four dishes of fruit, distinct, the prizes were gained by Messrs. Peal and Noy with creditable productions.

As is always the case here, the cottagers made a fine display of vegetables. Anyone familiar with the allotments at Ealing Dean and St. Mary's would not be surprised to see such highly creditable produce, in many instances superior to contributions from professional growers.

The non-competitive section was a very beautiful and attractive one. A grand group was staged by Mr. George Reynolds, the well-known gardener at Gunnersbury Park. Here were splendidly flowered examples of *Ixora coccinea*, *I. Fraseri*, and *I. Duthi*, towering Palms, grandly coloured Crotons, and a very fine specimen of *Acalypha hispida* were noteworthy. Similar praise must be given to the fine trees (bearing ripe fruits) of Nectarines and Plums contributed by Mr. James Hudson from Gunnersbury House.

Very creditable was an extensive group of Japanese Acers, with an effective foreground of *Kalmia latifolia*, from Messrs. W. Fromow and Sons, Chiswick.

Mr. Russell, Richmond, sent an excellent display of stove and greenhouse plants. Here were the bronze-tinted *Dracena russelliana*, fine Palms, *Caladiums*, and Crotons.

Mrs. H. B. Smith, Broadway, Ealing, always noted for her excellent exhibits, contributed some very tastefully arranged bouquets, &c.

Mr. George Cannon sent a nice collection of cut Roses in good variety, whilst Sweet Peas were admirably shown by Mr. Hawkins.

CROYDON SUMMER SHOW.

THE thirty-seventh summer show of the Croydon Horticultural Society was again held in the grounds of Brickwood House, Addiscombe, by kind permission of Mr. Percy T. Reid, on Wednesday, the 6th inst. The show was favoured with beautiful weather, and the attendance throughout the afternoon and evening, combined with the excellent quality of the Roses and other flowers, and the plants, and fruit, and vegetables combined to make it in every way a success. Although clashing with the National Rose Society's Exhibition, the Beckenham Horticultural Society's Show, and several other local shows, for the most part the classes were all well filled, and a feature of the show was the Roses, which were indeed worthy of an exhibition, and the Sweet Peas, the specimens of the latter shown being of quite exceptional quality. The Gloxinias, too, of almost every hue and shade, reflected the utmost credit on the exhibitors. Silver medals for Roses were awarded to Mr. E. M. Eversfield, of Horsham, for a beautiful specimen of Mrs. John Laing, and to Mr. A. Tait, of Leatherhead, for a fine bloom of Horace Vernet. Amongst the plants was a group exhibited by Mr. C. J. Salter, of Reigate, including some rare Orchids, Pelargoniums, and other plants. Mr. J. R. Box obtained a silver medal for his group of rock plants, as also did Mr. T. Butcher for a very effective table decoration.

The arrangements for the show were again in the hands of Mr. A. C. Rofley, his long experience in these matters being of the utmost value.

ROSES.

Forty-eight Roses, distinct: First, Messrs. D. Prior and Sons, Colchester; second, Messrs. B. R. Cant and Sons, Colchester.

Twenty-four Roses, distinct: First, Messrs. D. Prior and Sons; second, Messrs. B. R. Cant and Sons.

Twenty-four Roses, distinct: First, Mr. F. J. Jeffries, Willis Road, Croydon; second, Mr. T. Butcher, Shirley; third, Mr. J. R. Box, West Wickham.

Eighteen Tea or Noisette Roses, distinct: First, Messrs. D. Prior and Sons; second, Messrs. B. R. Cant and Sons.

Twelve Roses, one variety: First, Messrs. D. Prior and Sons; second, Messrs. B. R. Cant and Sons; third, Mr. F. J. Jeffries.

Twelve Tea or Noisette Roses, one variety: First, Messrs. B. R. Cant and Sons; second, Messrs. D. Prior and Sons.

AMATEURS.

Thirty-six Roses, distinct, challenge cup or bowl: First, A. Tait, Esq., Downside, Leatherhead; second, Mrs. Haywood, Woodhatch Lodge, Reigate; third, E. M. Eversfield, Esq., Denne Park, Horsham.

Twenty-four Roses, distinct: First, Mrs. Haywood.

Eighteen Tea or Noisette Roses, not less than twelve varieties: First, E. M. Eversfield, Esq.; second, Mrs. Haywood.

Six Roses, distinct: First, A. Tait, Esq.; second, Mrs. Haywood.

Twelve Roses, one variety: First, Mrs. Haywood; second, E. M. Eversfield, Esq.

Twelve Roses, distinct: First, E. M. Eversfield, Esq.

Twelve Tea or Noisette Roses, distinct: First, E. M. Eversfield, Esq.

Twelve Roses, distinct, challenge bowl for the year and National Rose Society's silver-gilt medal: First, E. M. Preston, Esq.; second (also silver-gilt medal), W. Holme Davis, Esq.; third, F. S. Rich, Esq., Is. Chichester Road, Croydon.

Six H.P. Roses, distinct: First, C. T. Moore, Esq., Glen-gary, Campden Road, Croydon; second, F. Annison, Esq., St. Augustine's Avenue, Croydon.

Six Tea or Noisette Roses, distinct: First, C. T. Moore, Esq.; second, F. S. Rich, Esq.; third, E. M. Preston, Esq.

Six Roses, one variety: First, E. M. Preston, Esq.; second, F. S. Rich, Esq.; third, F. E. Annison, Esq.

Cut flowers, twenty-four varieties: First, Mr. C. J. Salter, gardener to Mrs. Haywood.

Twenty-four bunches of hardy cut flowers, outdoor: First, Mr. M. E. Mills, gardener to F. Lloyd, Esq., Coombe House, Croydon; second, T. R. Willis, Esq., 61, Avondale Road, third, Mr. J. Clements, gardener to R. Ryley, Esq., Hazlemere, Chichester Road, Croydon.

Twenty-four bunches of Sweet Peas, twelve varieties: First, G. Davidson, Esq., Elm Lodge, Quadrant Road, Thornton Heath; second, Mr. W. Lintott, gardener to Mr. W. Greenwell; third, Mr. M. E. Mills, gardener to F. Lloyd, Esq.

Twenty-four bunches, eight varieties: First, E. T. Baker, Esq., 63, Brigstock Road, Thornton Heath; second, W. Collins, Esq.; third, Mr. A. G. Mason, gardener to F. S. Rich, Esq.

ELTHAM ROSE AND HORTICULTURAL ASSOCIATION.

In the open classes for Roses the exhibits were not numerous, but some very fine blooms were shown.

In the class for forty-eight varieties (for which a cup value fifteen guineas and £1 in cash were offered), Messrs. R. Harkness and Co. of Hitchin secured first honours, with very fine blooms of sorts referred to in previous show reports; Messrs. G. Paul and Son of Cheshunt came second with good blooms, and Messrs. Burch Brothers of Peterborough third. In the class for twenty-four varieties, Messrs. Burch Brothers were first, and in this exhibit Marie Baumann was very fine, and was selected as the best bloom in the show; Messrs. G. Paul were second, and Messrs. Harkness third. Roses were also well shown in the amateur classes.

Sweet Peas were well shown by a good many exhibitors. Mr. C. Usher, gardener to C. K. Wild, Esq., was first in the class for six varieties for which a cup was offered; Mr. Usher also had by far the finest flowers in another class, but was disqualified through using *Gypsophila* with them. This same mistake has frequently been made by exhibitors. At the National Rose Society's show the best table was disqualified for the same reason. As the *Gypsophila* is used solely for garnishing, this ought to be admissible when grasses and other foliage are allowed.

In hardy flowers, Mr. H. Walker, gardener to H. P. Atkins, Esq., was first; Mr. Walker was also a successful exhibitor in several other classes. Table plants were well shown, Mr. Jeffrey, gardener to Mrs. Crundwell, taking first prize. He was also successful in several other plant classes. Mr. J. Boxall, gardener to A. J. Scrutton, Esq., was successful in the class for zonal Pelargoniums and others; *Gloxinias* were beautifully shown, Mr. Walker taking first prize, and Mr. W. H. Day, gardener to Rev. F. C. Bambridge Bell, second, with almost equally good plants. In Begonias, some large, well flowered plants were shown, Mr. H. Male, gardener to J. Rosselli, Esq., being first for both doubles and singles; Mr. J. Cooper, gardener to Mrs. Yeatman, also showed well in this class. Fuchsias were well shown by Mr. H. Male and Mr. Jeffrey. In the groups arranged for effect, Mr. W. Small, gardener to Major H. North, was first with a very pretty arrangement; Mr. T. E. Brown second. This exhibitor also showed other flowering and foliage plants well. In the class for three flowering and three foliage plants, Mr. W. Carr, gardener to E. Roberts, Esq., was first, three good *Orchids* being the flowering plants. *Coleus* were very good, Mr. G. Bamford, gardener to A. C. Latter, Esq., showed very brightly-coloured varieties.

Among specimen flowering plants, *Rhynchospermum jasmynoides*, *Allamanda Hendersonii*, *Clorodendron Balfouri*, and *Plumbago capensis* were good. Ferns were well shown, chiefly large specimens of *Adiantums*. Table arrangements, bouquets, &c., were good.

Fruit and vegetable classes were all well contested.

TRADE EXHIBITS.

Mr. G. Reuthe of Keaton had an excellent collection of hardy flowers and rock plants; Mr. Gwillim, double and single Begonias; Messrs. Peed and Sons of Norwood, *Gloxinia* blooms; Messrs. J. Laing and Sons, Forest Hill, a group of miscellaneous plants.

There was a large and interesting display of cottagers' productions, and a very good attendance of visitors.

Mrs. Crundwell of the Moat kindly lent her beautiful grounds for the occasion, and the whole of the well kept garden was open to visitors.

EAST ANGLIAN HORTICULTURAL CLUB.

THERE was a good muster of members at the July meeting of this club, held on the 14th inst. at the Shire Hall Hotel, Norwich. An essay competition had been arranged for the evening, Messrs. Daniels Brothers, Limited, Norwich, offering good prizes. The subject was "The six best vegetables to grow, and how to grow them." Four members sent in papers, and the judges—Messrs. T. B. Field, Ashwellthorpe Hall Gardens, and W. Denington of Catton, Norwich, a large market grower—who had, previous to the meeting, gone through the papers, gave their awards: The first to Mr. C. H. Fox, gardener to Sir E. Mansell, Bart., Old Catton; second to Mr. Henry Dobbie, gardener to E. Caley, Esq., Pine Banks, Thorpe; and third to Mr. C. Matthews, gardener to L. E. Willett, Esq., Thorpe St. Andrew. Mr. Fox selected Potatoes, Broccoli, Asparagus, Peas, Beans, and Brussels Sprouts, and ably dealt with their cultivation and a useful selection for maintaining a succession. Mr. Dobbie went for Brussels Sprouts, Broccoli, Asparagus, Peas, Beans, and Cauliflower, and dealt with the more scientific nature of the subject, especially the part relating to manures and soils. Mr. Matthews' selection was Potatoes, Peas, Beans, Cauliflowers, Onions, and Celery, adding some useful practical advice upon the cultivation of each subject. During the capital discussion which followed some useful hints upon vegetable culture were gained. Mr. F. Carrington, an amateur of Norwich, a most successful exhibitor of vegetables, gave useful advice. Mr. E. Peake and Mr. C. Hubbard, both head masters in elementary schools in Norwich, where they are doing splendid work in the school gardens, also joined in the debate. Mr. T. B. Field, speaking as one of the judges, remarked that the papers for originality

struck him as being some of the best brought before the club. He also said he was glad to have heard the remark upon the fallacy of deep planting of celery. The President (Mr. J. Powley), Messrs. J. C. Abel, C. Hines, W. Denington, and others also took part in the discussion. Mr. Henry Dobbie brought up for inspection a varied assortment of herbaceous flowers and flowering shrubs, comprising Spiraeas, Tulip Tree, English and Japanese Irises, and Lilies. Mr. Fox staged a massive bunch of seedling Delphiniums, some of which were very fine. These were from seed crossed and saved by himself. The challenge bowl presented by Mrs. Louis Tillett, Old Catton, proceeded a stage further, the section this month being for vegetables, points being awarded as follows: Mr. C. H. Hines, 22; Mr. C. Birtenshaw, 1; and Mr. D. Howlett, 14. The first of the series of competitions for the silver cup presented by Mrs. E. T. Boardman, Norwich, was also held, this being for six bunches of annuals. Here Mr. F. Carrington, the only exhibitor, secured 22 points. Some very fine Roses, both Hybrid Perpetuals and Teas, were shown by Mr. F. Williams, gardener to Mrs. Louis Tillett, Old Catton. Mr. W. Rush, gardener to F. P. Hinde, Esq., Thorpe, deserves mention for his effectively arranged bunch of Sweet Peas. Other good things were also staged.

PORTSMOUTH.

"ROSES and Specimen Plants," such was the announcement in large letters on the posters issued by the Clarence Parade Pier Company for their show on the 14th and 15th inst. Unfortunately there was not a single specimen plant in the show, the first prize of £12 failing to secure an entry. Roses were also a failure. Although good prizes were offered, only one exhibitor appeared in each class. We understand several nurserymen entered but did not put in an appearance. No doubt the warm weather of the previous week and the Windsor and other shows partly accounted for the non-success of this exhibition.

ROSES.

Mrs. Croft Murray of Ryde, Isle of Wight (gardener, Mr. G. Kent), was the only competitor in the classes for forty eight distinct blooms, twelve Hybrid Perpetuals, dark, twelve Hybrid Perpetuals, light, and twelve Teas, and was awarded first prize for each, with blooms of medium size but fresh and in good colour.

For eighteen bunches of garden Roses, W. H. Myers, Esq., M.P., Swanmore Park, Bishop Waltham (gardener, Mr. G. Ellwood), was the only competitor, and a very fine show they made, deservedly securing first prize; they were all good. In the local class for Roses there were three entries: First, Mr. Tullis, Southsea; second, Mr. W. Treas, North End.

For ball bouquet, the first prize of 30s. was secured by Mr. E. Wills of Southampton, with a beautiful arrangement of *Orchids* and Lilies of the Valley; the same exhibitor securing first for a bridal bouquet of great elegance.

Hardy cut flowers were good, Mrs. Murray securing first and Mr. Myers second.

Table plants were also good, and very even in quality, Mr. Myers being first, Mr. Wills second, and Mrs. Hulise third.

The extra exhibits not for competition included a well-arranged stand of Roses, exhibited by Mr. Ellwood, and Sweet Peas from Messrs. J. Agate and Co., Havant, and Peas, herbaceous blooms, &c., from Messrs. Fay and Son, Commercial Road, Landport, and Messrs. Burridge and Sons, London Road, Portsmouth.

MANCHESTER ROYAL BOTANICAL AND HORTICULTURAL SOCIETY.

A good show, glorious weather, and a magnificent attendance may be a short description of this function, which was held in the large show annexe of the society's gardens on the 16th inst. One will have to go back to the early eighties to remember such crowds of visitors. This must be especially cheering to the committee, who have for some time had to face bad times as regards the support they have received from their patrons. Exhibitors have continued to give their loyal support, but this is only one detail, and that not the most important towards success. The Roses have been seen better, although the darks were staged in splendid colour. The Sweet Peas increase yearly.

CUT ROSES.

For sixty distinct single trusses three lots were staged, the premier collection being from Messrs. A. Dickson and Sons, Newtownards, the cream being Helen Keller, Chas. Lefebvre, Mrs. R. G. Sharnan Crawford, Marie Rady, Alice Lindsell, Florence Pemberton, Duchess de Morny, Her Majesty, Alfred Colomb, Frau Karl Druschki, Horace Vernet, Duchess of Bedford, Abel Carrière, Caroline Testout, Suzanne M. Rodocanachi, Beauty of Waltham, Lady Smiley, Harry Kirke, Etienne Levet, William Shean, Annie Wood, A. K. Williams, Alice Grahame, Comte Raimond, Dr. Andry, M. Baumann, Comtesse de Nadailac, Lady Dunleath, Countess of Rosebery, Marie van Houtte, Chas. J. Grahame, Captain Hayward, Helen Guillot, &c.; second, Messrs. R. Harkness and Co., Hitchin; third, King's Acre Nursery Company.

For thirty-six distinct, Messrs. Dickson again led with a fine all-round stand of fresh bright blooms; second, Mr. G. Prince, Oxford, with smaller but bright flowers; third, Mr. H. Drew, Longworth.

For twenty-four Teas or Noisettes, distinct, Mr. G. Prince led with a telling stand; second, Mr. H. Drew; third, Mr. J. Matlock, Oxford.

For twelve Teas or Noisettes, distinct, Mr. G. Prince first; Mr. J. Matlock and Messrs. A. Dickson second and third respectively.

For twelve single trusses, any white or yellow, Mr. G. Prince with White Maman Cochet, first; second, Mr. J. Matlock; third, Messrs. Dickson.

For twelve single trusses of any light colour, Messrs. A. Dickson and Sons were first with Helen Keller; Mr. G. Prince second with Maman Cochet, and Mr. R. Harkness third with Mildred Grant.

For twelve single trusses, any crimson, Messrs. A. Dickson and Sons with brilliant Horace Vernet, King's Acre Nursery Company with A. K. Williams, and Mr. H. Drew with the same variety were the prize winners.

For twenty-four distinct varieties, amateurs, the Rev. J. H. Pemberton, Havering-atte-Bower, had the premier collection; second, Mr. R. Park, Bedale; third, Mr. E. B. Lindsell.

For twelve varieties, distinct: First, Mr. W. Boyes, with medium fresh blooms; second, Mr. E. B. Lindsell; the remaining prize Mr. R. Park.

For eighteen Teas or Noisettes, Mr. R. Foley Hobbs was first, Mr. R. Park second.

For twelve varieties, distinct, the prize takers were Messrs. R. Foley Hobbs, R. Park, and W. Boyes in the order named.

For twelve single trusses, any crimson variety, the awards went to Mr. E. B. Lindsell with A. K. Williams, the Rev. J. H. Pemberton the same variety, and Mr. H. V. Machin with Ulrich Brunner.

Twelve single trusses, any white or yellow, the prize winners were Mr. E. B. Lindsell with White Maman Cochet, the Rev. J. H. Pemberton with the same variety.

For twelve single trusses of any light, the winners proved to be Messrs. R. Foley Hobbs, R. Park, and E. B. Lindsell in the order named.

Local prize winners for twelve varieties were Messrs. C. Burgess, R. Hall, and J. A. Twedale; for six varieties, Messrs. C. Burgess, R. Hall, and S. Hordero.

For buttonhole Roses, open, not less than six varieties, Mr. J. Matlock led with beautiful types of Lady Battersea, Anna Olivier, Meta, Souv. de Mme. Robison, Papa Goutier, Souv. de Catherine Guillot; Mr. G. Prince second with pretty Francois Dabreuil, Marquess of Salisbury, and Papillon.

For a display of Roses, open, Mr. J. Matlock had a brilliant show; second, Mr. G. Prince with a good lot.

For a basket of pink blooms; Mr. O. Robinson second.

For a bouquet of Roses, amateurs, the winners were Messrs. O. Robinson and J. Matlock.

In the open class Mr. H. D. Gooden was the winner.

Silver medals were awarded to the Rev. J. H. Pemberton for the best Tea or Noisette in the show for a very fine Maman Cochet, and to Messrs. A. Dickson and Sons for the best Hybrid Perpetual or Hybrid Tea for a well-formed bloom of Bessie Brown.

SWEET PEAS.

The society's silver medal was awarded to Mr. J. Derbyshire for the best collection, which consisted of over 100 bunches. Especially good were Mrs. H. P. Addleshaw, Dorothy Derbyshire, Mrs. Duggan, Marchioness of Cholmondeley, Mrs. Knight Smith, and a seedling of pale salmon.

For the best collection, not less than twenty-five varieties, Mr. E. Royle, gardener to F. Smith, Esq., won with a good lot; Mr. W. Hampson second, and Mr. W. Shuttlewood, gardener to J. A. Twedale, Esq., third.

NORTH LONSDALE ROSE SHOW.

THIS popular show was held on the 15th inst. in Todbusk Park, Ulverston, by the kindness of F. J. Crossfield, J.P. The competition in the leading classes was not as keen as the committee would wish. Unfortunately, rain fell continuously throughout the day. To counteract the usual heated atmosphere the committee placed huge blocks of ice, weighing two tons, down the centre of the tent.

ROSES.

For seventy-two single trusses Messrs. A. Dickson and Sons, Newtownards, secured the premier award with large bright blooms, the best being Mrs. R. G. Crawford, Marie Rady, Her Majesty, Florence Pemberton, Suzanne Marie Rodocanachi, Mona, Star of Waltham, Marchioness of Londonderry, Mrs. D. J. Jardin, Annie Wood, Frau Karl Druschki, Earl of Dufferin, Mildred Grant, Duchesse de Morny, Leinster, Gustave Piganeau, Duchess of Westminster, La France, Lady Clanmorris, Erin, Mrs. R. G. Sharnan Crawford, Eric, Helen Keller, Mrs. W. J. Grant, Dean Hole, Marie Baumann, Louis van Houtte, Lady Dunleath, Marquise Litta, George Dickson, Miss Nina Dickson, Kaiserin Augusta Victoria, A. K. Williams, Mrs. David McKee, Dr. Andry, Mrs. Coway Jones, Dupuy Jamin, Duchess of Portland, Charles J. Grahame, Duke of Wellington, and a Horace Vernet of fine form and colour. This secured the bronze medal for the finest Rose in the show.

Sixteen trebles, distinct: The same exhibitor was again to the fore with some capital blooms; second, Mr. H. V. Machin, with smaller but smart blooms.

For thirty-six distinct trusses, Messrs. Dickson were again first with telling blooms.

For eighteen distinct, six dark, six light, and six Teas, Messrs. Dickson still held the leading position; Mr. H. V. Machin secured second.

For twelve Teas or Noisettes, distinct, single trusses, Messrs. Dickson again took first honours.

For twelve blooms of any white Rose the Irish firm scored with a good box of Bessie Brown, and for the darks with solid blooms of Alfred Colomb; Mr. H. V. Machin second with Ulrich Brunner.

For twelve new Roses, distinct, Messrs. Dickson were also first, having for the best Tea in the show, Mrs. Myles Kennedy, and for the best new seedling, winning with the same bloom.

Twelve blooms of any Tea or Noisette, Messrs. Dickson were again the premier.

AMATEURS.

For the Gold Challenge Cup, twelve distinct varieties, R. L. Garnett, Esq., secured the award with good blooms, including Bob Davison, which gained the bronze medal for the best dark bloom in amateur classes, and similar award for best light with Mrs. E. Mawley; second, Dr. Tidswell; third, Rev. R. T. Langtree. Silver Challenge Cup for twelve Hybrid Teas, distinct, the same exhibitor again scored, securing bronze medals for the best light and dark in this section.

Eighteen Roses, distinct, the same exhibitor won with nice even blooms; second, Dr. Cambell Hall; third, Mr. H. V. Machin.

Twelve Roses, four distinct varieties, three blooms of each: Mr. Garnet again held his own, Mr. H. V. Machin following.

Six blooms of any one dark H.P. or H.T.: The Rev. R. T. Langtree scored, and for the best six lights Mr. Garnet won with Frau Karl Druschki.

Nine Teas or Noisettes: The Rev. R. T. Langtree held his own.

The local classes were all filled.

For the Ulverston Urban District Council Challenge Cup for nine trusses, Mr. F. J. Harrison held the position of merit, gaining cup and medal.

For the Mrs. Myles Kennedy Challenge Cup for six Teas or Noisettes the previous winner sustained his reputation. Other winners were Messrs. F. M. Hodson, T. H. Heyes, J. H. Boulds, &c.

SWEET PEAS.

These were staged in quantity, and added greatly to the success of the exhibition. For the J. Towers Settle Challenge Trophy for twenty-four distinct varieties, Messrs. Mackereth staged the premier collection, having flowers of good substance and fine colouring; second and third, Messrs. R. Bolton and F. S. Wrightson.

For eighteen bunches, distinct, Miss P. Nash took the leading award.

For the six and nine varieties Mrs. Atkinson won in each class.

For the J. Towers Settle Challenge Cup and silver medal Mr. T. Proctor secured the coveted award; second, Mr. G. Barrow.

HERBACEOUS CUT FLOWERS.

For twenty-four bunches, distinct, Mr. R. L. Garnet won with a very handsome collection tastefully arranged.

For Stocks, which were very fine, many of the spikes being superb, the first awards went to Messrs. Joshua Sharp and J. G. Martin and Mrs. Atkinson.

Amongst the numerous exhibits not staged for competition were eighty bunches of Sweet Peas and a good collection of herbaceous cut flowers from Mr. R. Bolton, Carforth. A good collection of cut flowers, including Delphiniums, Gaillardias, Alstromerias, Irises, Lilliums, bouquets, wreaths, &c., came from Mr. W. Shand, Lancaster.

Messrs. Mawson Brothers showed cut flowers.

LATH ROSE SHOW.

CHIEF interest centred in the competition for the Jubilee trophies. There were only four lots of thirty-six blooms staged by the professional growers—Messrs. Harkness of Hitchin, Messrs. Alexander Dickson of Newtownards, Messrs. Cooling and Sons of Bath, and the King's Acre Nurseries, Hereford. The prizes went in the order in which the names are given, the King's Acre Nurseries being unplaced. Messrs. Harkness staged an even box of splendid blooms. A remarkable feature of their collection was that side by side were found in it the two best Roses in the show, as adjudged to be worthy of the National Society's medals for the best Hybrid Perpetual and for the best Tea or Noisette. The Hybrid Perpetual was a perfect example of the crimson Fisher Holmes, and the Tea was a superb White Maman Cochet. The amateurs' class for their corresponding trophy numbered six entries, and Mr. E. B. Linsdell of Hitchin is rightly to be regarded as the champion of the season, Mr. R. Foley Hobbs of Thornloe, Worcester, coming second, and Mr. W. Boyes of Derby, third. Mr. Hill Gray of Beaulieu carried off some good prizes, and gained the medal for the best Tea or Noisette among the amateurs for a bloom of Maman Cochet. The best Hybrid Perpetual among the amateurs' collection was Her Majesty, staged in Mr. Foley Hobbs' collection. The big nurserymen's class for seventy-two distinct varieties was won by Messrs. Alexander Dickson, Newtownards, but the King's Acre Nurseries, Hereford, were the only other competing firm. Mr. Hill Gray won the open class for twelve single trusses of any Rose with an even exhibit of White Maman Cochet, and the King's Acre Nurseries were second with a very choice box of Her Majesty. The best crimson Rose was A. K. Williams, from the King's Acre Nurseries, Ulrich Brunner being second, while Kaiserin Augusta Victoria (Mr. G. Prince of Oxford) was the best of the yellows. The decorative and garden Roses were better than might have been expected, but here and there was detected evidence of the waning of the season.

WOODBIDGE HORTICULTURAL SOCIETY.

THE annual show of the above well-known old society—the leading horticultural institution in East Anglia—was held on the 14th inst. in the delightful grounds of The Grange, a splendid spot, though a little distance from the railway station, and the show was excellent in almost every department, the only sign of weakness being in the forced fruits. The energetic secretary, Mr. John Andrews, and his committee deserve all praise for their excellent management and for such a charming exhibition, which for many miles round is looked upon as a red-letter day in Suffolk. A stranger at first sight would think Royalty were present, the town being beautifully decorated. It is, indeed, a pleasure to note such success from a horticultural point of view, as the society has passed its jubilee and is as vigorous now as at any time in its history.

ROSES

were a special feature. The Rose tent at Woodbridge alone is well worth a visit, and though doubtless, owing to the heat and the season being well advanced, the exhibits were a little less numerous, the quality was excellent. Messrs. B. R. Cant took the 25-guinea cup for the fourth time, thus becoming the owners, staging thirty-six grand blooms, the other exhibitors being Messrs. Frank Cant second, and Messrs. Prior and Son, Colchester, third. For twenty-four distinct varieties Messrs. Prior were a good first, Messrs. B. R. Cant second, and Messrs. F. Cant third. The same

exhibitors in the order named were successful for the single truss of Teas, and in garden Roses or decorative sorts Messrs. F. Cant led, and for Briars also, Mr. W. E. Long, Saxmundham, being a good second.

In the amateurs' classes some splendid blooms were staged, in the Teas the Rev. A. Foster Melliar, Ipswich, being first, and Mr. Steward second. For twelve, Mr. Foster Melliar was again first, but closely pressed by Mr. O. G. Orpen, Colchester. In the smaller classes the same exhibitors were most successful, Captain C. S. Schriber being also a leading exhibitor.

Carnations were good and largely shown, and the hardy flower class of perennials and herbaceous plants was very fine, Mr. R. C. Notcutt, having a splendid collection, being a good first, with Mr. C. Jacobi second. For perennials, the Hon. W. Lowther was first. For the medal competition Colonel Rous was first; Mr. H. Egerton Green second.

There was a great competition in the Sweet Pea class, Messrs. Johnson, Dr. Cooke, and Messrs. King and Co. being the winners in the large class, Messrs. Long, Johnson, and Burness in the smaller ones; and for Messrs. Eckford's prizes Sir R. Farren, Mr. J. Wood, and Mr. Gall scored in the order named. For stove or greenhouse blooms, the Hon. W. Lowther was a good first, and Mr. Egerton Green second.

The tent for dinner-tables and decorations was a great feature, and there was no lack of competition, though owing to the great heat the lady exhibitors had a trying time. Mrs. Gaffney, Melton, was first for subscribers in the Suffolk district, Miss F. M. Carthew being second, and Miss M. Snell third. For the most tastefully arranged dinner-table (open class) Mrs. Orpen, Colchester, was a good first, with a beautifully arranged table, and in a very strong competition; Miss Brooks, Ipswich, second.

For the best arranged luncheon table Miss Barber, Woodbridge, was first, followed by Miss H. K. Ackers, Colchester, and Miss Fiske, Woodbridge. In the smaller dinner-table competition, Mrs. Hayward, Miss E. M. Kemp, and Miss Minter were the leading exhibitors.

Plants, though not a leading feature as far as large specimens go, were interesting. The best collection came from Mr. J. A. Burgess. The best miscellaneous group was from Mrs. T. Carthew.

For a group of Crotons and Cannas Mr. J. A. Burgess was first.

FRUIT.

There was no lack of hardy fruit and of the best quality. For the best collection of dessert, eight dishes, the competition was weak, but the first prize lot was excellent, Lord Rendlesham having excellent Peaches, Nectarines, Grapes, and Melons; Colonel Rous, Worstead, second. The Hon. W. Lowther had the best Grapes, white and black; Earl Stradbroke second. Lady North had the best white Grapes, Colonel Rous second and Major Howey third. For the best single black, the Hon. W. Lowther was first, and Mr. Burness second. The heaviest Grapes came from Mr. Lindsay Scott, who was first; Mr. Burness second.

For Peaches, Mr. Burness first and the Hon. W. Lowther second. For Nectarines Lady North was first. Small fruits were a special feature; there was a great quantity of Gooseberries, Strawberries, and Currants. The best lots of Strawberries came from Major Howey, Mr. Scott, and Mr. Long; for flavour from Mr. Stevenson, Lord Rendlesham, and Mr. Long. White Currants were splendid, and in the trade class there were some fine exhibits from Mr. Notcutt, who secured the gold medal.

Vegetables were extensive and good in quality. Potatoes were good. For the Notcutt prize the Hon. W. Lowther was first and Mr. Burness second. For Messrs. Sutton's prizes the Hon. W. Lowther was first and Mr. Burness second. For Messrs. Daniel's prizes the same exhibitors, and for Messrs. King's Mr. Wood was first. There was a large number of small classes all well contested.

NOTES FROM THE MARKETS.

SHIRLEY POPPIES.—Growers of experience who take up any class of plants either for pots or for cutting are careful to start with the best procurable, and there is good evidence of this in the Shirley Poppies now seen in the markets. Iceland Poppies have been plentiful for a long time and have sold well.

Malmesbury Carnations.—These are now more plentiful, but the best blooms of the deep pink variety still maintain a good price. Those who take up the culture of these popular Carnations will do well to remember that, while other shades of colour may sell fairly well, it is the deep pink of the Princess of Wales type for which there is the greatest demand. There may be others under different names which are equally good; yet, from what I have seen in nurseries where they are grown extensively, it will be quite safe to depend on the true stock of the Princess of Wales, either for trade or private use.

Border Carnations are now coming plentifully, but it is as well to note that the flowers of these, or, rather, most of them, do not stand up well. And when flowers can be used with stems to

tand up well without the aid of wires there is a great saving of time, besides which, those standing up naturally are far more elegant. We are now getting some English varieties with better stems, but they do not yet quite come up to the Americans. But what I would point out is that, instead of depending on the ordinary border varieties, growers would do well to propagate later batches, or keep older plants stopped for later spring flowering.

A. H.

OBITUARY.

MR. JOHN JEFFERIES.

WE record with much regret the death, which took place early on Friday of last week, after a few weeks' illness, at Minerva Villas, The Avenue, Cirencester, of Mr. John Jefferies, the senior partner of the firm of Messrs. Jefferies and Son. Mr. Jefferies, who had reached the ripe age of eighty-six years, was one of the leading horticulturists and nurserymen of his day. Born at Somerford Keynes, in the neighbouring county of Wilts, he became, when quite a young man, manager to the late Mr. Gregory, seedsman and nurseryman, of Cirencester, whose father established the business more than a century ago. In 1850 Mr. Jefferies acquired the business from Mr. Gregory. At that time the nurseries were far different to what they are now, and included a large area between Victoria Road and Watermoor Road, held of the Abbey Estate, and now built over, and also a considerable extent of ground including what is now the garden of Cirencester House and surrounding land. When occupation of this land was resumed by a former Earl Bathurst, and when the nursery property belonging to the Abbey Estate was sold for building purposes, Mr. Jefferies purchased what afterwards became the Tower Street Nursery, and established extensive nurseries at Somerford Keynes, Siddington, Watermoor, and London Road. Joined and aided by his sons, the business rapidly extended, till it became one of the foremost firms in the kingdom, its reputation for the growth of forest and ornamental trees, the celebrated Cotswold Rose, and other specialities, being high and widespread. Twelve years ago, Mr. Jefferies retired from active business, and his eldest son, Mr. William John Jefferies, to whose energy and ability the success of the establishment was largely due, continued the firm under its old style of "John Jefferies and Son." The opening up and planting of The Avenue as a pleasant thoroughfare to Watermoor Road was primarily due to Mr. Jefferies's liberality and public spirit.

A correspondent who knew Mr. Jefferies well writes: "Few men knew hardy plants and trees better than Mr. Jefferies, especially so was this the case with hardy flowers. Mr. Jefferies had a very refined taste, and no one knew better than he did when a new plant came into his nursery whether it was going to please the general public or not. He had no patience with big lumpy flowers. I well remember how disgusted he was with the mop-headed Chrysanthemums when they first became popular, especially with the Etoile de Lyon type. Of florists' flowers he was a good judge."

The National Sweet Pea Society held their fourth annual exhibition at the Crystal Palace on Wednesday and Thursday last, and a splendid display resulted. Most of the classes were well contested, and there were numerous non-competitive groups also. Mr. A. G. Hayman, Hopsford House, Frome, won the first prize for nineteen varieties in the special audit class; Messrs. Isaac House and Son, Bristol, were first in the classification class for nineteen sorts, and this firm also was first for thirty-six bunches, distinct varieties. Mr. Henry Eckford exhibited a beautiful new and distinct Sweet Pea called Henry Eckford, whose colour may be described as salmon-orange. We shall give a fuller account of the exhibition next week.

THE GARDEN

No. 1706.—VOL. LXVI.

[JULY 30, 1904.]

HYBRID AQUILEGIAS.

MANY groups of hardy garden flowers have undergone much improvement in the hands of the hybridist and selector, and this is conspicuously shown amongst the hybrid Aquilegias or Columbines, which have won the love of all good gardeners for the beauty of their colouring and their graceful form. These thoughts are brought to mind by a few notes from an earnest amateur who has grown the finest varieties for many years. It is the spurred race we most admire, in which the flowers are light and graceful, and have a spur which seems to make everything in proportion, the spurless varieties having a roundness and solidity not free from a certain unwelcome coarseness. Unfortunately, our experience—and we are not alone in this—is that the hybrids are short-lived, the flowers haste away, and the plants too, unless in a soil that is exactly suitable. So many grow the hybrid Columbines that the experience of others will be of advantage to those who wish for the best strains, as the nurseryman usually describes a careful selection of the best colours. The notes to which we refer are as follows :

“*Aquilegia vulgaris* will generally take care of itself in the garden, but, unfortunately, it is not so with most of the hybrids. All will grow in shady places like true alpinists, but as a rule they must have a light soil if they are to last more than two seasons. They rarely make fine plants on wet, heavy soils, and a damp season seems more fatal to them than a severe one. Given a light soil, especially if it is a sandy one and not too dry, many of them will last for years. If the soil is heavy the best thing to do is to give a liberal supply of leaf-mould with it to a depth of at least 1 foot, so that the soil does not become too close.

“The old-fashioned Aquilegias are essentially spring flowers, but the hybrids are in bloom most of June and July, unless the season is a very hot and dry one. Whatever the soil, it is a good plan to raise a fresh stock of plants every two or three years, so that there may be always a supply in their prime, which is in their second and third years.

“Seed should be sown early in the spring, preferably in heat in February or early March, and the best seed to get is a packet of mixed hybrids. It should be sown very thinly, so that the plants may develop well before being

pricked out, as they are very fragile when young. By the end of April or beginning of May they should be pricked out in a somewhat shady position, where the soil has been well prepared by the addition of leaf-mould and road sand unless it is a very light one. This pricking out should be done in damp weather if possible, and the plants need shading and watering if the weather is hot before they are established. If it is a nursery bed only, they may be put in 4 inches apart, but if it is intended that they should flower there, they should be 6 inches apart, and every alternate plant should be taken out after the first season's flowering for planting in other parts of the garden. It will be observed that the young plants are of very different constitutions, some rapidly becoming strong, while others remain weak. It is the latter which will probably turn out to be some of the most delicate and beautiful varieties, and they need to have the best culture possible, and are well worth it. The hybrids will exhibit certain characteristics of some members of their mixed ancestry, and one of these is extreme capriciousness. I have heard that *A. glandulosa* will grow like a weed in certain parts of Scotland, while in most gardens in England it is delicate and short-lived. Some of the species are not true perennials, and hence some of the hybrids are of very doubtful perennial character. Consequently, if a bed is made of them a good reserve of plants should be kept for filling the places of those which die off, as well as those which, though continuing to live, do no good. The planting of Aquilegias in their permanent positions should always be done in October, as they start growing early in the spring, and some should be put in sunny positions and some in shady ones to get a prolongation of the flowering season. Care should be taken in the summer that after they have done flowering they do not get smothered by the summer flowers, as this is almost certain destruction to them. They should make nice tufts of healthy foliage in the late summer to strengthen the plants for the following season's growth, and they will not do this properly unless they have plenty of air.

“Hybrid Aquilegias make very fine button-holes, and nothing goes better with the flower than its own delicately-cut foliage—so much finer than that of *A. vulgaris*. Both, however, quickly flag, and a water-holder is an advantage, almost a necessity. For table decoration they are unsurpassed, and I have more than

once seen prizes at flower shows taken by floral arrangements of which these hybrids formed a considerable part.”

THE GENTIANAS.

GENTIUS, King of Illyricum, the eastern boundary of the Adriatic, was taken prisoner by the Romans about a century and a half before the Christian era for encouraging pirates, and died in custody. He discovered that a certain plant was a very good tonic, and that plant has ever since been called *Gentiana*, after him. This plant is generally supposed to have been the tall, coarse alpine, common in mountainous districts in Central Europe, and known to botanists as *G. lutea*, a preparation of which is still in high repute as a medicine. The Roman naturalist, Pliny, however, tells us that the Gentian has leaves like an Ash tree, and Dioscorides, who wrote a Greek work on medicinal plants about the same time, says it has leaves like a Walnut tree. These statements are not true of the yellow Gentian, but both Pliny and Dioscorides described many plants about which they knew little or nothing, and, in spite of their statements, it is probable that this type of the genus is the plant originally named after King Gentius.

The genus *Gentiana* is a very large one. The names and synonyms of the species occupy nearly twelve columns of fifty names each in “*Index Kewensis*,” and perhaps there are over 200 good species known to botany. But the number of these in common cultivation is comparatively very small, and when we consider the vast interval in stature and habit between *G. lutea*, the type, and such dwarfs as *G. verna* or *G. nivalis*, it is at once obvious that the genus cannot be discussed collectively, but that each species must be dealt with separately. It can hardly be claimed that more than five species are in common cultivation in English gardens.

G. lutea is not very often seen, probably because it is not very attractive as an ornament, and not because there is anything difficult in its treatment, as it will grow in any strong and well-drained soil, and continue healthy without attention for many years. It grows more than 3 feet high, with stont Plantain-shaped leaves and four or five close whorls of flowers of a dull yellow colour. It cannot be divided or transplanted when old, and must be raised from seed, which it ripens abundantly.

G. acaulis, the common *Gentianella*, is known to everybody, but cannot be grown successfully in every garden ; yet those fortunate people in whose gardens it grows well without difficulty are apt to look with pity, not without some contempt, on others who cannot grow what seems to themselves so easy a plant. And yet they cannot tell the reason why their friends fail, and cannot teach them how to succeed. *Gentianella* is an excellent test of a good and

well-drained garden soil, and where the sub-soil is cold and wet, and the atmosphere tainted with stagnant damp evaporating from the ground, this mountain plant is one of the first to show the unfavourable conditions, which little can be done to remedy.

G. verna requires made soil to a depth of a foot or more, and even with that there are few gardens in which it will last more than four or five years without being renewed from seed or from the nursery. It wants well watering in dry weather through summer, and warm, wet winters are unfavourable to it. In many of its native places it is probably frozen every night whilst in flower. The seedlings should be planted in trays, and the contents of the tray, when two or three years old, turned out entire in spring into the place they are to occupy permanently. If planted out in autumn the frosts of winter push the plants out of the ground.

G. asclepiadea is very robust. It is better to raise it from seed than to divide old plants, which take long to recover, and do better when left alone, growing in sheltered and well-drained borders 2 feet high and as much across. There is a variety with dingy white flowers, growing stronger than the type but less ornamental.

G. septemfida is the most easily cultivated species except in dry, sandy soils. The name, which means seven clefts, has been explained as referring to the scales between the divisions of the corolla, which are fimbriated, and may sometimes be found to have seven points; others allege that it is because the flowers in a cluster are often even in number, but these are poor apologies for an inept name.

It is evident to anyone who reads the description of the plant given by the German botanist Pallas, who discovered it more than a century ago, that the specimen from which he took his characters was abnormal, having seven divisions in the corolla instead of the usual five. The words of Pallas are: "*Corollis septemfidis quinquefidis que laciniis intercalaribus ciliatis*" (having the inserted scales fringed). The plant is figured in the *Botanical Magazine*, t. 1229 (A.D. 1810), and Sims, who wrote the letterpress for that volume, rightly says that the corolla is divided "for the most part into five, sometimes six, rarely seven, laciniæ." This desirable species ripens seed plentifully, but grows slowly and lives for many years. The height varies from 3 inches or 4 inches to 18 inches. A dwarf strain may easily be obtained, as the seedlings follow the stature of the parents, and the low growth is neater than the taller. By the late C. WOLLEY-DON.

NOTES OF THE WEEK.

FORTHCOMING EVENTS

August 1. — Lichfield, Grantham, Crediton, Atherstone, and Ilkeston Horticultural Shows.

August 2. — Mansfield and Leicester (two days) Flower Shows.

August 9. — Royal Horticultural Society's Meeting in New Hall, Vincent Square, Westminster.

August 10. — Royal Botanic Society's Annual Meeting; Ventnor, Sevenoaks, and Bishop's Stortford Flower Shows.

August 11. — Taunton Deane Horticultural Show.

August 13. — Sheffield Horticultural Show.

August 16. — Exmouth (two days) and Clay Cross Horticultural Shows.

August 17. — Shrewsbury Floral Fête (two days); Tynemouth (two days) and Calne Horticultural Shows.

August 19. — Devon and Exeter Horticultural Show.

Royal Horticultural Society of Ireland.—The monthly meeting of the Council of the Royal Horticultural Society of Ireland took place at the offices, Moleworth Street. There were present Mr. F. W. Moore, presiding; also Messrs. James Robertson, J. P., George Ross, J. M'Kellar, William Dick, H. P. Goodbody, Captain Riall, D. L., Rev. F. C. Hayes, and Mr. H. A. Smallman. Various arrangements were made in connexion with the August show, which is to take the form of a garden fête, and by kind permission of the president, Lord Ardilaun, is to be held in St. Anne's, Clontarf, on Wednesday, August 10. The house and gardens will be thrown open to visitors to the fête without extra charge, and a military band will be in attendance. Prizes to the value of £130 will be offered for competition. The fête will be open from 1.30 p.m. to 7 p.m., the prices of admission being, 1.30 p.m. to 5 p.m., 2s. (1s. 6d. if the tickets are purchased before August 10), and 5 p.m. to 7 p.m., 1s. The Clontarf and Howth trams go near to the entrance to St. Anne's on the sea road. It is, therefore, hoped that the public will take advantage of the great attractions offered.

Roses at Canonbie, N.B.—The annual Rose show at Canonbie, N.B., was held on the 16th inst., and was one of the best yet held by the society. The blooms were generally of superior quality, and the large proportion of the prizes were creditably won by Mr. T. Pride, Canonbie School House. The twelve blooms of Hybrid Perpetuals with which he won the prize in that class were very fine. Mr. Pride had six first prizes, besides several others. His strongest competitor was Mr. R. M. Elliot, Knittyholm. A capital non-competitive exhibit sent by Messrs. Palmer and Son, Limited, Rose growers, Annao, was much admired. The show was well managed by a competent committee.

Bowdon Amateur Horticultural Club.—The first summer meeting and exhibition of the above club was held at Sandiway House, Altrincham, on Tuesday, the 19th inst., and from every point of view may be regarded as a complete success. A large number of members exhibited at the meeting, the exhibits filling two rooms as well as a large portion of an adjoining hall. Considerable enthusiasm prevailed among the competitors, and many exhibits were excellent. We were especially interested in the Roses and Lilies from Mr. Alfred Jordan, Arncliffe, Bowdon, who, gaining the maximum of points, secured the certificate of merit awarded by the club. Rose Caroline Testout in this exhibit would have done credit to any exhibition. Some splendid blooms of the same variety formed part of the exhibit from Mr. J. R. Ward, Chaseley, Altrincham, who had some very fine *Lilium candidum*. The Delphiniums, Roses, and other hardy flowers from Dr. Moir, Hale Bank, Hale, were quite a notable lot, evidencing good cultivation. Mrs. Duggan, The Downs, Altrincham, who, by the way, is honorary secretary, contributed quite a charming variety of things, from large vases filled with *Lilium pardalium*, *L. excelsum*, and *Bocconia cordata* to smaller vases of *Dianthus hybridus* Napoleon III., the pretty pink-flowered hybrid *Dianthus Eugenie*, and other things. The Tufted Pansies were beautifully fresh; indeed, freshness in the majority of the exhibits was noticeable, with good arrangement generally. It is worthy of note that no prizes were offered. The prevailing enthusiasm afforded good proof of the pleasure derived by this meeting in friendly rivalry. At 6 p.m. Mr. E. H. Jenkins, Hampton Hill, read a paper in the lecture-room entitled "Hardy Plants: Their Propagation and Cultivation." The subject was treated in an authoritative manner, and was well received by the large and enthusiastic gathering of members present.

Nursery changes.—For many years the nursery founded by the late Mr. J. W. Wimsett, and since his death carried on by his son, has, with its neat glass structures, ornamental shrubs, and delightful summer bedding, formed a most attractive feature in the King's Road, Chelsea, and has been a source of great attraction to passers-by, for such a display is rare within London. Unfortunately, we are to lose this little oasis, for a large notice has been erected thereon, conveying the information that the land is to be sold by auction

in the autumn, when we shall probably see the last of it as a nursery, for it is no doubt destined to be covered with bricks and mortar at no very remote date. Chelsea, so long celebrated for its nurseries, is thus losing them one by one, for it was not many years ago that Mr. William Bull disposed of his supplementary nursery in the Ashburnham Road, and since then Messrs. Veitch have considerably reduced the extent of their Chelsea establishment, and a portion has been acquired by the County Council. The offices and headquarters, however, remain at Chelsea, and the lessened glass area is compensated for over and over again by the new nursery at Feltham. Furthermore, the associations of the old nursery are not to be entirely lost, for the name of the new street that runs through it is Hortensia Road.—H. P.

School gardening.—It is several years now since this subject was first introduced into the elementary schools of Norwich, Mr. C. Hubbard promoting practical gardening in the large piece of land attached to the Nelson Street Schools. Mr. Edward Peake, head master of the Crook's Place Boys' School, situated in a congested district but somewhat near the Public Park, Chapel Field, being devoted to flowers, decided to strike out on the same line. Through great perseverance he managed to secure as his school garden a strip of land in the Chapel Field, and by dint of much care and teaching of the boys this is now a credit to the neighbourhood. The plants are all clearly labelled and tended by the boys, so as to infuse into them a love for flowers and gardening. This year, after the planting season, what few plants and seeds were over were distributed amongst the boys to take home to cultivate, with the idea of exhibiting the full-grown plants later on. This exhibition took place on the 20th inst., and was most interesting. Several prominent citizens and members of the Education Committee visited the gardens during the exhibition and expressed their pleasure at the results of Mr. Peake's labours.

Galega Hartlandi.—This plant, with its abundance of racemes of pretty mauve and white flowers, has been a picture for several weeks, and still is making a brave show. It is an ideal plant for the herbaceous border, but it wants plenty of room, as it increases very quickly. One or two plants planted two seasons ago are now quite large bushes, and soon will need dividing. A correspondent recently mentioned the Galega as useful for cutting, but I find that the flowers quickly drop when the shoots are cut and placed in water. This Galega (whose origin seems somewhat uncertain) certainly deserves extended culture, for it is so easy to grow and yields such a wealth of flowers. Perhaps Mr. Hartland, who sent it out, could tell something of its origin. It is not at all fastidious as to soil, for it seems to do well in the poorest border; in fact, in a good soil it is almost too rampant, and is liable to smother other good but less vigorous plants. It flowers more freely, too, when the soil is not very rich.—H. A. P.

Campanula isophylla alba and C. Mayi.—These pretty bell-flowers are now coming into the market. For hanging in a window in a pot no plant succeeds so well. It was through being seen in cottage windows that the white variety was first taken up by growers for market. It is not only as a window plant that it is useful—it will continue flowering in the conservatory for a long period. For wall gardens both the white and blue may be specially recommended. They may not be quite hardy, but they will live through the winter with a slight protection, or young plants kept in a cold pit through the winter and planted out early will make a good show the same season.—A. H.

Rose Mme. d'Arblay.—From Westons-birt Rectory, Tetbury, Gloucestershire, the Rev. David Kitcat, sends a photograph of the gable end of the rectory, which is covered with a splendid plant of Rose Mme. d'Arblay, planted some thirty years ago. He says: "It has this season thrown out the mass of bloom shown in the photograph. The Rose intermingles with Honeysuckle and Virginian Creeper. Possibly its profusion of flowers this season is partly owing to the wet season last year."

The New Zealand Flax (*Phormium tenax*) in Kirkcudbrightshire.—Those who doubt the hardiness of *Phormium tenax* in many parts of the country will be interested to know of the fine plants in the gardens of Captain Hope, at St. Mary's Isle, Kirkcudbrightshire, N.B. They are grown in the open without protection and flower annually. One specially good clump is about 12 feet high and at least 7 feet in diameter. It has seven spikes. I know the *Phormium* in several other Kirkcudbrightshire gardens, but I do not think that there is at present a finer one in the county than that at St. Mary's Isle.—S. ARNOTT.

Rose Ulrich Brunner as a standard.—What a splendid Rose this is for a standard! It grows freely and flowers profusely, producing large bold blooms. Recently, in the garden of Comte de Mauny Talvande at Terrick, I saw a very fine standard plant of this Rose bearing numerous blooms, and all large and of good colouring. Clio, Baroness Rothschild, and Mrs. John Laing, too, had made splendid standards, although all of them were only planted last year. Reine Marie Henriette as a pillar Rose, I think, is not often seen, but at Terrick it does splendidly when thus grown. The vigorous shoots flower freely, and when the blooms are at their best they make a lovely picture. Mrs. John Laing is a favourite Rose at Terrick, and hundreds of them are grown. There are large beds planted with this variety alone, and they make a wonderful show when the blooms are at their best. The climbing Polyantha Queen Alexandra, Blush Rambler, Waltham Rambler, Dorothy Perkins, and William Allen Richardson are all doing well here as pillar Roses.—H. P. A.

Sedum spurium.—What a bright and useful plant this is! It grows in the poorest of soil, and almost where there is no soil at all, and flowers abundantly. For a hot, dry place it would be difficult to find a July flowering hardy plant to beat it. The flowers are reddish pink, very numerous, and borne in short, umbellate cymes. There is a form with white flowers also, but these are rather a dirty white, and consequently in a mass are not so attractive. In Mr. Perry's nursery at Winchmore Hill there are large groups

of this *Sedum*. In some cases the plants have spread and covered the path edges, making a delightful feature. I recently saw it quite at home also on a hot, dry bank by the side of some stone steps with little soil to grow in. It quickly spreads and forms a pretty carpet of colour at this time of year. In the "Kew Hand List of Hardy Plants" the specific name *spurium* is kept up, while Nicholson gives *spurium* as a synonym of *S. stoloniferum*. *S. dentatum* and *S. denticulatum* are also there given as synonymous, but the Kew list gives none of these.—H. P. A.

Notes from Baden-Baden.—During the past six weeks we have on two occasions only had showers of rain; the rest of that time has been sunny and warm, from 80° to 96° Fahr. In consequence the pleasures of the gardens are reduced to a minimum. Trees begin to lose their leaves, and certain plants used to a cool atmosphere are entirely burnt up. The flowers of *Gladioli* wither before expansion, and many small plants are killed by the heat, notwithstanding the fact that they have been shaded. Under some artificial shade *Littonia modesta* and *Sandersonia aurantiaca* look happy, showing dozens of their striking orange-yellow flowers. Asiatic and American *Gentianas* watered daily are a mass of bloom, and stand the sun well. *G. Olivieri*, with its big clusters of large, glistening blue flowers, is most showy. Deeper in colour, and with fewer but larger flowers, is *G. dahurica*, that also does well. A new one has made its appearance, and comes out with turquoise blue flowers, changing afterwards to white. *Adenophora Potanini alba* is quite a gem; the multitude of snow-white bells attracts from afar. *Campanula mirabilis* has been very handsome; it is a much-branched plant about 70 centimetres high, with numerous delicate blue-coloured large flowers, in form like those of *turbinata*. *Pelargonium endlicherianum* seems to like the dry warm air; it is full of bright purple flowers. Its value lies in its hardiness.—MAX LEICHTLIN, *Baden-Baden*.

Forestry at the Highland Society's show.—The forestry section of the Highland Agricultural Society's show, which opened at Perth on the 19th inst., is one of the best of its

kind ever held in connexion with the society, although it is rather smaller than might have been expected in such a district as Perthshire, where forestry is extensively practised. It represents, however, a great improvement upon the same section at Dumfries last year, where the competition was very limited. The organisation was under the charge of the Royal Scottish Arboricultural Society, to whom much of the improvement is due. A leading feature of this section is the comprehensive character of the exhibits sent from Scone, the estate of the Earl of Mansfield, and shown by Mr. Pitcaithley, the forester. The group of conifers in pots from Scone Palace Gardens was most extensive, and seldom, if ever, has one so large been sent from any private estate to a Scottish show. Other exhibits from Scone showed the timber produced on the estate and the uses to which it was applied. The Royal Scottish Arboricultural Society's collection of sections of British trees and of micro-photograph slides of plant tissues was highly interesting. Sir Neil Menzies showed a number of branches of conifers, cones, and timber from his estate. From Murthly, Ochertyre, Zanrick Castle, and other Scottish estates some valuable exhibits were also sent, and the Swedish State Forest Department also contributed specimens. In the competitive classes there was much better competition than last year. In several classes the number of exhibitors was unexpectedly large, with a corresponding degree of excellence.

Carnation Raby Castle.—As a free-flowering border Carnation of easy culture this old variety is still one of the best. Among several varieties I have grown the plants of this sort are conspicuously good, both in growth and blooming. The quantity of flowers that can be obtained from one plant is surprising, and they are very beautiful, too, with their rich pink fringed petals. This variety has given much better results than *Uriah Pike*, *Miss Audrey Campbell*, *Mrs. Reynolds-Hole*, *Mephisto*, *Mrs. Nicholson*, *Richmond*, and others, and for cutting no variety that I have grown has proved more satisfactory. Can any readers of THE GARDEN tell me if Carnations do not like fresh soil? In the spring I made a border for Carnation culture from part of the lawn; that is to say, I removed the layer of turf, well dug the soil beneath, chopped the turves into small pieces, and mixed with the other soil. The result has been disappointing, and I have wondered whether it is because of the presence of the turfy soil. I always understood that the admixture of chopped turves to the border was excellent for plants. This is the only way in which I can account for the somewhat indifferent results these Carnations have given.—A. H. P.

THE ROSE GARDEN.

A ROSE GARDEN IN ESSEX.

HOW generously flowers repay us for loving care is shown in the accompanying photographs. The bed of *Mme. Gabriel Luizet* Roses is one of five of various sorts divided by grass, all of which have been almost equally good this year; they are about four years old. *Caroline Testout* also does well in my garden, as the flowers in the bowls testify. The herbaceous borders are furnished chiefly with *Delphiniums*, *Mulleins*, *Foxgloves*, *Alstroemerias*, *Pentstemons*, and white *Lilies*. You may be interested to hear that I have an old tree of *Mrs. Bosanquet* (I believe), which was by no means young when I came here thirty

A BOWLFUL OF ROSE CAROLINE TESTOUT.

years ago. It has bloomed profusely every year, including the present season, although it is now in a very decrepit condition. A *Souv. de la Malmaison* of apparently about the same age is still quite flourishing.

(Mrs.) L. A. BROOKS.

Durals, Grays, Essex.

THE PLEASURE OF ROSE GROWING.

It is not a difficult matter to decide by what means we may obtain the greatest amount of pleasure from our Roses. Some seek it through the medium of the exhibition, but there it is dearly bought, at least by amateurs. Our methods of Rose showing are so stereotyped. We think so much of single blooms, that if one would enter the show arena he must begin by making great sacrifices. The pleasure of Rose showing does not permanently satisfy. Anyone visiting a Rose show cannot fail to admire the magnificent flowers seen there. I do not wish to say one word against the practice of growing and showing them. It is something to know to what perfection of form and colouring particular kinds can be brought, but that is not, or should not be, the sole end and aim of Rose shows. A celebrated amateur exhibitor recently visited a garden where Roses are largely grown solely for effect, and he confessed that that was more after his own desire, and he thought he should give up exhibiting. In the course of that ramble he experienced pleasure altogether beyond what he had realised as an exhibitor. To exhibit successfully one must practise numerous details that need never worry the ordinary grower. From the pruning to the flowering there is a marked difference in the methods.

The exhibitor's plants must be hard pruned, and then comes the inevitable disbudding. It is no exaggeration to state in regard to many Roses that the ordinary grower has a score of flowers where the exhibitor can take but one. When the buds are selected then comes the feeding. Then there is the question of protecting and shading from storm or bright sunshine. Yet this is essential to meet the requirements of the exhibition, which at present only fosters the production of fine flowers, and therefore excludes many worthy kinds simply because their flowers are not up to a particular standard of form. If we would seek and realise the fullest pleasure, we must wait until at Rose shows classes are provided for Roses as grown in gardens, the same to be judged on their own merits, and not from any pre-existing standard. At present one type of flower only is encouraged or accepted, regardless of those lovely kinds so handsome in the bud and so profuse in regard to the great trusses of flowers they produce. In the garden these last often give us the most pleasure. The exhibitor above referred to was charmed with Mme. Joseph Schwartz as it appeared in a group, the strong shoots terminated by immense clusters of bloom standing erect, some of the flowers fully out, showing their great flesh-tinted, rose-margined,

shell-like petals, others mere buds of delicate hue opening in succession. *Marquise de Vivens* and *Dr. Grill* were unknown to him, and yet there were not two lovelier groups, especially that of the latter. Such kinds as these never appear at the shows, but why should they not do so? If such kinds treated as the show kinds are will not then produce full flowers simply because naturally there is not sufficient substance, surely they should not be ignored. Whether exhibited or not they will give us much pleasure in gardens, as they are most reliable in regard to their blooming. If the bud of to-day is a full-blown flower to-morrow, that matters not, for quantity atones for want of quality, and even these many-tinted, open, loose flowers have a fine effect on a bright summer day. Again, when we grow

present time we should have great glowing groups of Tea and Monthly Roses filling the air with rich fragrance. Many Roses make such excellent bushes that when grouped and in full growth they effectually hide the earth beneath them. Those that do not do so, and newly-planted groups also, should be carpeted with some of the many dwarf plants so suitable for the purpose. This adds to their appearance and increases our pleasure. Surface-rooting plants, like *Sedums* and *Saxifrages*, and lovely alpines, such as *Linaria alpina*, do not rob the Roses in the slightest degree, but without a doubt they benefit them, for on a scorching hot day I was admiring a group of *The Bride Tea Rose* carpeted with *Sedum glaucum*, and placing my hand under and among the carpet I found the earth cool and moist, whilst bare ground was hot and dry. That night there came the most severe thunderstorm, accompanied by a deluge of rain, that has been in this district for years. Next morning I looked round the Roses, and the full, heavy flowers of this and other kinds were borne down by the weight of water that had descended upon them, but they were pure and unsoiled, for the advantages of the carpet were shown in that no splashing of the earth could take place. A great many are thinking what they can plant to reduce the quantity of tender bedding plants. If they have sunny flower gardens, let them try Tea Roses, for they are ever growing, ever blooming, are a source of great pleasure through summer and autumn, can be planted thickly alone or thinly to admit of combinations, and, all things considered, are the most thoroughly satisfactory of all. A.

CLIMBING ROSE FLORA.

This fine old climbing Rose is prominent in the large collection of old and new Roses in the gardens of St. Mary's Isle, Kirkcudbright, the property of Captain Hope, R.N. It is used in many ways, such as a pillar Rose, as a weeping Rose, and on walls. In all these positions it is very beautiful, with its masses of delicate pink flowers. A remarkably fine sight in the middle of July was a wall 100 yards long and 10 feet or 12 feet high, clothed with this Rose entirely, and bearing many thousands of flowers. It is a great favourite with the family and their friends, by whom it is known as Mrs. Hope's Rose. Mr. Jeffrey, the gardener at St. Mary's Isle, believes that

this Rose is the same as that sometimes known as *Alva Pink*, a name not to be met with in modern catalogues. In the increased taste for garden Roses, particularly of a rambling or climbing character, it is to be hoped that this fine Rose will not be forgotten, old though it is. S. A.

USES OF BRITISH PLANTS.

CONIFERÆ.

THERE are only three trees or shrubs belonging to this group of "cone-bearers," as the name implies, in Great Britain—the Scotch Fir, the Juniper, and the Yew.

The Scotch Fir (*Pinus sylvestris*) is found truly wild in a comparatively few places from York to

DELPHINIUMS AND FOXGLOVES IN AN ESSEX GARDEN.

for pleasure only we shall not have many leggy standards, but dwarf bush plants, and these not set out a yard apart, but grouped or massed, since this is the very best way of showing off the merits of fine Roses.

It is too generally supposed that Roses are gross feeders, and the heavy manurial mulches and the drenchings with strong liquid so commonly given detract from our pleasure. We can modify this to a considerable extent, and have Roses in abundance without the slightest aid from rank manures. If our Rose beds are redolent with the odours of the farmyard, we cannot have them beside our open doors or beneath our windows, and, other things being favourable, that is just the spot where at the

Sutherland, but where planted it multiplies itself by seed. It can attain a height of 100 feet, with a trunk 4 feet to 5 feet in diameter. It is valuable for its timber. Some hundred years ago a Scotch forest supplied sufficient for forty-one ships. It is said that the best masts and spars are constructed from this Pine. The timber is imported from Norway under the name of Red Deal. The use of the smaller branches, &c., is for making tar and pitch. For this purpose they are burnt in an enclosure of earth, covered with turf. Slow combustion thus occurs, and tar is drawn off by a pipe thrust into the base of the mound. The more solid residue is pitch. Turpentine is obtained by removing the bark when the juice exudes and coagulates. This is distilled, the essential oil being called spirits of turpentine, resin being the solid substance left. The Scotch formerly used the roots as candles, as they are rich in resinous matters.

Juniper (*Juniperus communis*).—This grows in the form of small bushes on the Downs of Sussex, but is much larger or even small trees 10 feet to 12 feet high from Yorkshire to Shetland, assuming a dwarf form (*nana*) on the mountains of North Wales, Westmoreland to Shetland, ascending to 2,700 feet. The wood of this species is not of much use, only being employed for small articles. The principal commodity are the berries, collected for their essential oil. They are included in the British Pharmacopœia, as the "oil of Juniper" is regarded as a local stimulant. It is also used for flavouring gin. The origin of the word "gin" is peculiar. It is short for *geneva*, a corruption of the French *genevra* from the Latin *Juniperus*, which means "youth-producing," from its evergreen character.

Yew (*Taxus baccata*).—This is a familiar tree nearly all over England and Scotland. A fastigate or erect variety, with the leaves spreading instead of lying horizontally, was discovered in Ireland. From this source all the Irish Yews of this form have been propagated. The Yew seems able to live longer than most, if not all, trees. They grow very slowly after the first half century—about one-twelfth of an inch annually, but trunks of ancient trees are recorded as being upwards of 80 feet in girth. Those at Fountains Abbey are said to have been there in the early part of the twelfth century. The wood is of a yellow-orange tint, and very durable. Some wood brought from the palaces of Nineveh, and recorded on a tablet discovered as having been brought as "Cedar" from Lebanon, proved on a microscopical examination to be Yew, and possibly what was called "Algum" or "Almug." The wood appears to have been one used for the statues of the gods by the Ancients, on account of its durability and hardness. The most famous use of the wood was for bows in the Middle Ages. The leaves and seed (but not the scarlet cup, in which the seed lies) are poisonous to cattle, and the latter to children, who are especially liable to eat it with the sweet cup.

G. HENSLOW.

MESEMBRYANTHEMUMS.—II.

A DRAWBACK to the full enjoyment of Mesembryanthemums—common to many other South African composites, *e.g.*, *Arctotis*, *Gazania*, and others—is their habit of opening mainly in the sunshine of the early hours of the day. Mainly is said advisedly, because a remarkable divergence occurs in some of the genus. A good many, especially of the stemless species, like *M. tigrinum*, remain fast closed in brightest weather until after midday. Others, like *M. scapigera*, cannot be coaxed to unfold until four o'clock,

BED OF ROSE MME. GABRIEL LUIZET. (See page 71.)

and that only on sunny days, while a few are even night-flowering, and do not expand until after sundown. There are several species, nevertheless, that drop out of this peculiar characteristic altogether, and, when once fully blown, do not again close. Of these, *M. lacerum*, a tender species by no means frost-proof, is a noteworthy example. It is now in bloom in the greenhouse, and is remarkable both in foliage and in its full-petalled flowers with incurving stamens, of the shade sometimes described as chamois pink. The triangular, scimitar-shaped leaves with strongly serrated keels are pale sea-green, and a well-grown specimen, even when not in flower, may be used with good effect as a foliage plant. The flowers are produced at the ends of the branches, and last in good condition for several weeks, though the colour changes with age to a more ordinary tone of pink. A more familiar species, which also does not close, is *M. inculdens*, a low-growing, spreading plant 4 inches to 6 inches high, with wheel-shaped satiny flowers of pale mauve or heliotrope colour. This may be markedly handsome, or very shabby and uninteresting, according to the care it receives. The dark green cuneiform leaves, when exposed to air and sunlight, are beautifully tipped with scarlet-bronze. It is somewhat more slow-growing and not so hardy as some other kinds, and two year old plants and even older give the best results.

Most of the kinds already noted are tall growing, though some, like *M. spectabile*, may be grown either in upright or drooping form, according to convenience. The different varieties, which are innumerable of *M. falciforme*, however, are all more or less prostrate, being spreading, twiggy shrubs with glaucous leaves and flowers of every shade from deep pink to glistening white. It is astonishing that these showy species should not be more grown than they are, especially in sunny gardens, for they might be used in many ways with excellent effect. I have seen spreading cushions of some of the best varieties in their second season so covered

with flowers that it would have been difficult for a pin to be passed between them. It may almost be said that they flower too freely, for the pretty glaucous foliage is often completely smothered. To ensure such abundance of flower, however, the plants must not be mewed up in the moist air of a greenhouse during the spring and summer, but must have healthy outdoor treatment, taking care only to protect them during winter from frost and damp. In common with some few other species, notably *M. deltoideum* and its allies and *M. lunulatum*, the varieties of *M. falciforme* are very sweet-scented, and when grown in masses will perfume the air with their Almond-like fragrance.

M. edule—the species which probably gave the old name of Fig-Marigold to the genus—is very common in the south-western counties by the sea, where it is naturalised and made of little account, but to come upon a luxuriant mat of its fine triangular leaves, dark green except where the sun has bronzed them and touched their edges with scarlet, stretching out over the sparkling sand, and studded with their wide-open sulphur bosses, is a sight worth a long journey to see. A very similar species as to foliage, *M. rubrocinctum*, has crimson-red flowers and is fairly hardy if grown on a dry wall.

The stemless species, of which there are a great number, are generally included by lovers of Cacti in their collections of succulent plants. They do not give masses of colour like those mentioned above, but are pretty and interesting in the various foliage forms they assume. Of these *M. tigrinum* is perhaps the best known and has sharply-toothed, boat-shaped leaves, each rosette of which produces one handsome yellow flower. Only an enthusiast would trouble to grow many of these vegetable curiosities, but few who have seen the finer Mesembryanthemums grown as they can and should be grown could resist the temptation of trying some of the most decorative species.

Several kinds, referred to by Haworth with great praise, are unfortunately now lost to

cultivation in England, or practically so. A few may be named in case any of them may be still lingering in some harbour of safety whence they may be launched once more. Amongst them are *M. speciosum*, with fine orange flowers; *M. striatum*, which used to be grown by the thousand by nurserymen in the days when these plants were in the zenith of their popularity; *M. hirtellum*, *M. variabile*, and *M. versicolor*, all of which are likely to be showy, as they belong to the many-flowered section. The two last are described as changing the colour of their flowers, *M. versicolor* in particular being of interest from its rubicund tints becoming pale at noon, and reviving again when the sunlight wanes. Haworth, in general, is so accurate in his observations that there is no reason for taking this as a mythical statement. There are many interesting plates of *Mesembryanthemums* to be found in illustrated works of a former generation—e.g., in Redouté's "Plantes Grasses"—in the "Hortus Elthamensis" of Dillenius, and, above all, in the splendid Monograph of the genus (Sahn-Dyck). These works are all to be found on the shelves of the Linnean Society's library, to which access is always most courteously granted to anyone interested in the subject.

A short list of some of the most desirable species for ordinary gardens is subjoined:

<i>M. amœnum</i> , rose.	<i>M. glaucum</i> , canary yellow.
" <i>aureum</i> , glowing orange.	" <i>inclaudens</i> , heliotrope.
" <i>blandum</i> , white.	" <i>lacerum</i> , chamois pink.
" <i>blandum roseum</i> , pink.	" <i>lepidum</i> , white.
" <i>bicolorum</i> , scarlet and orange.	" <i>micans</i> , crimson.
" <i>cadens</i> , pink and white vars., trailers.	" <i>polyanthum</i> , violet.
" <i>Cooperi</i> , purple-red.	" <i>pomeridianum</i> , yellow.
" <i>edule</i> , sulphur.	" <i>productum</i> , purple.
" <i>falciforme</i> , rose to pure white.	" <i>spectabile</i> , rose.
" <i>formosum</i> , rose, with white eye.	" <i>tigrinum</i> , golden.
	" <i>tricolor</i> , pink and white vars.
	" <i>violaceum</i> , mauve.

* Annuals.

K. L. D.

THE FLOWER GARDEN.

SOME NEW HYBRID CLEMATISES.

FIFTY years ago half the new plants were obtained by direct importation from the country of their origin, and the remainder were selected from seedlings or "sports." To these two sources of supply we must now add hybridisation, which is very different to selection, both in its manner of action and in its results. Of these three sources from which novelties are derived the first is beginning to be exhausted. There will soon be left few or none of those fertile unexplored countries which from time to time enrich our gardens with hitherto unknown plants. But, in compensation, selection will extend itself over an ever increasing field. As for hybridisation, although yet in its infancy, the first results enable us to see what a vast field it offers to our investigations. Here there is no limit to our discoveries. It is a horizon without bounds, where one step forward calls for another; an inexhaustible mine, whose exploitation, far from exhausting the material, adds to it by each discovery some new element. Doubtless we shall have exhausted the flora of every clime before the riches held in reserve in the arena of hybridisation will have been more than glanced at by us. Though there should be nothing new under the sun, there will still be novelties. I would like now to call attention to three hybrid Clematises obtained from species very remote from each other, since one is a perennial. The perennial is that beautiful Clematis with urceolate vermilion-red flowers, whose more remarkable forms have been published. The shrub belongs to the series of large blossomed Clematises like Jackmani, rubella, Gipsy Queen, Perle d'Azur, Ville de Lyon, Comtesse de Bouchaud, Nellie Moser, Viticella venosa, modesta,

&c., whose numerous varieties furnish our gardens with some of their most attractive flowers. Now that the introduction of the parents has been made, a glance at the offsprings will be sufficient to show that they are entirely different. So true is this, that, if these plants had been introduced as having been found in a wild state, there is no doubt that they would have been accepted without hesitation as authentic new species. Does this faculty of continuing, as it were, with his own hands the Divine work of creation do nothing towards raising the gardener in his own estimation, towards giving him a high opinion of his power and of the part he plays in the world? The presence of Clematis coccinea is revealed by the brilliant tinges of vermilion-red. The three plants mentioned have been dedicated—the first, Mme. Raymond Guillot, to the artist; the others to two distinguished ladies of Lyons with a love for flowers. Here follows a description of these varieties:

Mme. Raymond Guillot, herbaceous, annual; leaves deeply divided, reddish petioles; peduncles one flowered; buds purple on their first appearance; flowers of a velvety purple. The product of Gipsy Queen × coccinea.

Mme. Moret, herbaceous, annual; leaves with rounded divisions, obtuse, very irregularly lobed; peduncles many flowered; buds green at first, reddening towards the top; flowers brilliant crimson, with bright red veining; sepals vinous red on the exterior. It has not yet produced seeds. The result of Comtesse de Bouchaud × coccinea.

Mme. Leroyer, herbaceous; leaves large, with large, rounded divisions; peduncles generally bearing three flowers; buds short, very thick, deeply furrowed, green at first, passing to pink at the time of opening; flowers white, margined with pink. Ville de Lyon × coccinea. This race of Clematis is distinguished by the ease with which it accommodates itself to high temperatures. The plants flower magnificently in July and August under the hottest sun, and develop their blossoms splendidly upon sun-scorched walls.

F. MOREL, in *La Revue Horticole*.

NATURAL GROUPING.

SOME of the best garden effects are the result of accident. If in cutting a bunch of flowers one simply puts them together as they are taken from the plants, the effect is frequently much more pleasing than when the arrangement has been studied. In the same way hardly plants of various kinds which may happen to come together not infrequently create a very pleasing effect. Everyone knows how wild flowers grow. There is absolutely no regularity in the way in which they appear, and yet how gratifying to the eye is that natural grouping. Some years ago a Clover field here was cut at the usual time. The weather happened to be hot and dry, and for months afterwards there was one of the fairest floral displays in that field I have ever seen. The second crop of Clover, not running up high, the various wild flowers showed to the best advantage. There were Poppies, Ox-eye Daisies, Corn Marigolds, Matricaria, Cornflowers, with large patches of Viper's Bugloss, the field being a mass of colour throughout the summer. It was a good specimen of Nature's way of arranging things, and was infinitely more pleasing than any studied arrangement could have been. One of the prettiest garden pictures I have ever seen was formed in quite an accidental manner. It consisted of hardy Cyclamens, Narcissi, Primroses, Dog's-tooth Violets, Wallflowers, Anemone apennina, and robinsoniana, Epimediums, Fritillarias, blue Omphalodes, and Megaseas. Only a few square yards were occupied with this variety of spring-flowering things, but the effect was pleasing because there was never any attempt made at arrangement. The border was backed by a Holly hedge, and a Plum tree formed the central feature. The hardy Cyclamens had been planted about twenty years, and covered some square yards of ground. In autumn they threw up hundreds of pure white and rosy pink blooms, and all through the winter and spring they preserved the beauty of their leaves, which differ considerably in form and

marking. Among them grew a lot of the white and chequered Fritillarias, the produce of two or three bulbs that accidentally got among them some ten years ago. There was good protection from cold winds, and the branches of the Plum tree in a measure protected the blooms from spring frosts, which are apt to spoil such things as Omphalodes, Megaseas, and spring-flowering Anemones.

Byfleet.

J. CORNHILL.

DAHLIAS.

WATERING AND GIVING LIQUID MANURE.

IF the weather be dry, as soon as the plants have reached about two strings, as explained in my last article, somewhat copious waterings will be needed; to say how often is impossible, but in really dry seasons twice a week is none too much. It is almost useless to water in small quantities, give at least two gallons at one time to a plant, this will soak the ground to a fair depth and last for some days, whereas if the water is given a little at a time, even if every other day, no good results, as the roots receive little of it. Manure water is also necessary. A large tub should be filled and allowed to stand in the sun if possible, unless the water comes from ponds or has otherwise been exposed to the air, and then a bag full of manure put in and well stirred. This manure may be either from sheep, cows, or chickens, or failing this, use rotten stable manure, at any rate do not be afraid of getting it too strong. Dahlias will stand a lot of manure water in dry weather. Also vary the manure, and put a bag of soot in the tub. In many places sewage is obtainable, and if so by all means give the Dahlias a dose or two of it, but I would dilute it a little, as when strong fiery stuff it may burn the stems. In the case of Cactus varieties for exhibition it is not advisable to overdo the sewage business, or very heavy, though large fine flowers will be the result, and in the case of doubles, if not used with care, the flowers will be very ugly. Well moisten a circle of soil, say, 3 feet across, i.e. 18 inches from the stem each way. The benefit of having a good heavy mulch of rough stable litter on the ground will now be apparent by the amount of water it saves by the litter preventing the sun from drying it up as fast as it is given.

With watering and feeding the plants will push on very fast and the first flowers will begin to open. This may be any time from mid-July to mid-August, but probably about the first week of August. I do not altogether advocate cutting these flowers off before they are out, but at the same time, if the finest results are looked for later, do not allow these first flowers to draw more strength than is absolutely necessary out of the plants; remove them, and look after the young growing wood. I have often seen plants treated very badly in this respect, the grower being so anxious to push on these first fine buds that far too much of the side growth has been lost. Only last year I saw as fine a lot of plants as one could wish completely sacrificed for the sake of half a dozen of the first main stem blooms. By growing the plants in this way there are in July fine strong plants, buds set, young lower growth coming on, which, instead of being left to flower later on, is cut off indiscriminately with the most disastrous result. These first flowers were no real use to the grower who wanted his best blooms from the middle of August till September, but he left his first buds, and when they developed so well congratulated himself on his success, not thinking where he would be in a few weeks' time.

As to the correct way to thin, whilst always attending to the buds already set and swelling and disbudded down about two joints, never cut off the strong young growth. Remove as much of the spindling shoots inside the plants as you like, also any large leaves where the plants are thick, and when flowers hang till past their best cut off the bloom and the wood down as far as disbudded. Of course the strings for tying out the shoots to are added as often as the height of the plants requires it. Some, such as Ajax, Mrs. Mawley, and H. J. Jones, may need four or five, whilst others,

such as Mrs. Winstanley and Aunt Chloe are amply provided with two. Altogether during early August, if the summer is very dry, Dahlia growing is not easy. One prevalent error in dry times is to neglect the safe tying of the plants, as with the hot weather there is little wind, and more thought is given to watering, when perhaps a sudden thunderstorm, though of short duration, may break down the plants. S.

SUCCULENTS.

THE tribe—or, rather, tribes—of so-called succulent plants undoubtedly embrace the most remarkable cases of natural adaptation to circumstances of heat and drought which *prima facie* would render vegetation of any kind an impossibility.

In their case a superabundance of two great essentials to vegetative growth—viz., heat and light—is accompanied by an apparent entire absence of a third and equally indispensable factor—moisture. Those who have visited the natural habitats of these plants, such as the Cacti and the imitative Euphorbias, find them growing as a rule in the poorest of soil, composed mainly of rocky debris, which is for the greater part of the year exposed to a hot and literally baking sun, unrelieved for months together by even a shower. To look at the soil and feel it, one might as well expect to find plants growing on a burning brick-kiln, and yet out of the chinks and crevices there will be growing a number of species varying in size from huge tree-like ones to small heaped masses of ball or Pear-shaped forms, one and all of which if wounded will be found so full of sap that the term “succulents” is seen to be appropriate enough despite the environments. Associated with these we shall find other and very different looking plants of the Yucca, Aloe, and Agave persuasion, equally defiant of drought and baking, and equally juicy, their spiky foliage being thick and hard, and protected in every case with the toughest of skins as a species of vegetable armour. Succulents, however, are by no means confined to the tropics or even sub-tropical districts, though more abundant in the dry regions which prevail there over enormous areas where drought is the rule and rain the exception. In nearly all parts of the world we find localities more or less exposed to drought and plants of many genera fitted to occupy them. Our common House-leeks and Stonecrop are home examples, and will, as we know, thrive on dry walls in the full sun where but little moisture can be retained after rainfall. Their very position necessitates an approach to the constitution of desert plants, since otherwise a spell of drought would certainly starve them to death for lack of the moisture which, as it is, is retained within their condensed fleshy leaves. The secret of resistance to drought lies in this density and compression of the foliage or in its entire suppression and delegation of its vital functions to the stalks and stems, from which the leaves in a long evolutionary process have finally been eliminated. In the Cacti—most of them, at any rate—we see this process of abortion completed. Nothing is left but fleshy stalks, thickened, grooved, and bristling with thorns, which mark the spots where leaves should be. To this category belong the Cereus tribe and those which form ball or Pear-shaped masses. In the Opuntias or Prickly Pears we have a considerable range of forms, some on Cereus or snake-like lines, and others, the more familiar ones, with thick, flattened, Pear-shaped leaves, or rather pseudo leaves; in the Phyllocacti we have the stems still more leaf-like, though still without leaves proper; and, finally, in the Pereskias we arrive at really leafy forms. As a natural result we find these different species fitted for various environments, and the nearer they approach the true leaf form the less we are likely to find them in the open burning llanos where their spikier relatives are quite at home. The Cactus-like Euphorbias differ from the Cacti generally in not having apparently as yet reached the entirely leafless stage, since if we examine a growing specimen we shall find at the summit of the spiny, corrugated stalks a number of more or less tiny leaves around

the growing point, which are shed shortly after their formation, and in this way prove that the thorny warts left at their bases really mark the sites of the quite aborted leaves of long-past Cacti. In the Mesembryanthemums and Portulacas we see as it were the link between leafless succulents and plants with ordinary foliage, their fleshy, juicy leaves varying from true leafy-looking types to long, narrow ones, presenting as small a superficial area to the sun as possible. In all plants with green leaves or their substitutes the vital operations of growth are accompanied by a greater or less circulation of sap and a transpiration or perspiring of a portion of this through the pores or stomata of the leaves, and it may be taken as a rule that the larger the superficial area of the foliage the greater is the need of a liberal supply of moisture from below to replace this loss. Hence it is a first essential for a plant exposed to dry conditions for any lengthened period that the transpiring surfaces should be reduced to a minimum, and this explains the weird and bizarre forms assumed by Cacti, Euphorbia, and their kin, and the dense, contracted foliage of succulent plants generally. CHAS. T. DRURY, F.L.S., V.M.H.

TREES AND SHRUBS.

PLANT WOUNDS AND NATURAL PRUNING.

PERHAPS we do not always remember, when we go into the woods, that the trees with tall, clean trunks were not always so smooth and lofty, but started as small plants with branches near the ground. How is it, then, that there is so little evidence of those old branches when they grow larger? The tree must be able in some way or other to get rid of them without injury to itself. This requires breaking the branches in some way, in spite of the fact that perhaps the greatest danger to which a plant or animal can be exposed is a wound, by means of which bacteria may enter and cause blood poisoning or decay, as the case may be. Every healthy organism, whether plant or animal, is able to resist such attacks for some time, which is not a bad thing for the bacteria, as otherwise it would be like the bear living by sucking its own paws—there would soon be nothing but bacteria left to feed upon one another. In our own bodies we have the white blood corpuscles, whose function it is to destroy any bacteria that may find an entrance into the blood. In some diseases infected spots are shut off from the rest of the body by layers of resistant tissue that keep the “germs” from getting into the general circulation, and in time cause their destruction from lack of food. Plants do not have white corpuscles, but it is certain that they have some means of resisting such attacks.

Perhaps the simplest way of keeping out bacteria would be the drying of the tissues around the wound, and we find that this takes place frequently. The hard, dry cell walls do not easily yield nourishment to the “germs,” as we know from the length of time seasoned timber lasts. Cellulose, which is the principal constituent of the cell walls, is closely related to sugar, starch, glucose, and a number of gums, but it is much more resistant to the action of chemicals, and digestive fluids do not readily dissolve it. When the wood is fresh there is a greater chance that the cellulose may be eaten away. After drying it resists the attacks long enough to give the plant an opportunity to strengthen its defences. Among many cryptogamous plants this is the sole method of protection, while only a few phanerogams depend on it alone. As a rule, they produce a layer of “wound-cork” that cuts off the injured spot from the underlying parts of the stem. This is nearly a complete cure in the case of the more tender parts. Woody stems form a callus by the growth of the surrounding cells that afterwards form a corky layer. The new wood gradually spreads over the wound until the edges meet and coalesce. Outwardly it seems as if there had been no harm done, but the

injured cells inside remain brown and dead, and can be seen until the decay of the tree by cutting into the wood. When a thin section of the “wound-wood” is examined under the microscope it is seen to be made up of nearly cubical cells that are quite unlike the usual elongated cells of normal wood. As the tree increases in diameter these wound cells become more and more like those of injured wood.

Many plants possess strongly-smelling ethereal oils that play a part in warding off enemies that might otherwise use them for food. These substances are often contained in special glands or receptacles. The different gums and resins occur in similar canals and receptacles throughout the plant. One of their principal uses seems to be to flow out and cover up wounds, and in this way to prevent the entrance of injurious fungi or bacteria. Cherry Tree gum is familiar to all, and the resin on Pines and the related trees will keep away almost anything, including bacteria, but a small boy with climbing proclivities. Most of the information here given was obtained from Strasburger's “Lehrbuch der Botanik,” but the subject was suggested by seeing some peculiar lumps on the trunks of the Beeches. There seemed to be no especial reason for their presence until it was noticed that nearly every one had either a dead twig protruding from it or showed some sign to indicate that one had been there. It is evident that a dead branch is in reality a serious kind of a wound, for the decaying wood is in such close connexion with the main stem that there is great danger of the infection being communicated to the whole plant. When the dead branch breaks off close to the trunk the problem is practically the same as when the bark is injured, and new wood is formed around and over the stump and finally encloses it. Many of the knots seen in lumber are simply these old branches that were enclosed in this way. They are darker than the surrounding wood, because they were exposed and had begun to decay. The lumps on the Beeches showed what efforts the trees were making to cover the tiny dead branches. In some cases they were so successful that there was nothing on the surface to show that a twig was underneath. But when they were cut open it was all plain enough, and a little search revealed all stages, from twigs not yet buried to those with the tip still showing, and then the final step, when all trace was gone. In the course of time the knobs disappear, and there is nothing to show that they had ever been there, except when we cut into the wood and see the knot.

The Beech is a tree whose branches are very responsive to light. One close in to the trunk will often grow only a small fraction of an inch each year, while another at the end of a prominent branch in the full sunlight may grow 1 foot or more in the same time. The winter bud-scales of the Beech leave ring-like marks around the twig when they fall off, and by these we can tell the age of the branch. They are most conspicuous on the underside of the twig, for they seem to appear sooner on the upper side, probably on account of the slightly more rapid growth there. Occasionally a twig scarcely a span in length will represent the growth of a quarter of a century, but this does not give a correct idea of the age of the tree, because most of the growth of the latter is at the top, where it has enough light. No doubt, the twig started to grow when the tree was quite small, and it would be of interest to cut into the trunk of some dead tree to see just how far we can trace the branch. The main point, however, is that it is in an unfavourable situation, and in time succumbs, and at last breaks off. When the stump is short the tree has little difficulty in protecting the wound in the way described. The longer stumps are the cause of the formation of the lumps seen here and there. The Beech is not the only tree that gets rid of its superfluous branches, though we do not often see trees with such knobs as we have described. When a tree grows in the open it may have low branches in a healthy condition, but wherever they are crowded together the lower ones die. They are unable to receive enough light, and the upper ones do the work for the entire tree. As fast as they die and drop off

the scar is covered as we have seen. Failure to do this properly and soon enough results in permanent injury, and the decayed portion spreads down through the trunk, giving in time a hollow.

C. E. WATERS, in *The Plant World* (America).

GENISTA VIRGATA.

ONE of the showiest shrubs at Kew at the present time is the above, and in several places it may be seen in full flower. When mature it forms a large bush 15 feet to 18 feet high and 12 feet to 15 feet through, and when in blossom it is a mass of yellow from top to bottom. It is a native of Madeira, and is of very old introduction, though, strange to say, it was to be found in very few trade lists until recently. At Kew there are several very old plants near the Pagoda, and in one place it has become naturalised. Grown from seed it soon makes fine specimens, especially if the shoots are stopped a few times during the first year or two. It is as well to keep the young plants in pots until they can be placed in permanent positions, as transplanting is risky, the tops as a rule being altogether out of proportion to the

the northern portion of Asia, and even on to Japan. In general appearance it is somewhat like the common Elder, but is easily distinguished by the clusters of flowers being pyramidal instead of flat, and by the berries being scarlet when ripe, which takes place soon after the flowering season of the common Elder is past. For some reason or other it often fails to fruit in this country, but this year it is in many cases more thickly studded with berries than is usually the case. Some of the cut-leaved forms, of which branches were shown at Holland House, were also covered with fruits. These cut-leaved forms just alluded to occur plentifully among the varieties of *Sambucus racemosa*, first among them being the variety *serratifolia*, whose leaflets are deeply cut. This character is even more pronounced in *plumosa*, then comes *laciniata*, till the extreme is reached in the variety *tenuifolia*, which has the segments reduced to narrow strips, suggesting in general appearance some of the Japanese Maples. When growing freely these cut-leaved forms are, especially during the first half of the season, very ornamental, and if they can always be induced to berry as freely as in some of the specimens shown, their beauty later

TREE OF MAGNOLIA CONSPICUA SOULANGEANA IN A WOKING GARDEN.

roots. A closely allied species, *G. cinerea*, found in South-west Europe, is also now in flower at Kew. The habit of this is looser than *G. virgata*, otherwise it is very similar. Both species flower at the same time, the earlier blossoms appearing during the early days of June, while some flowers last until the middle of July. Loam, rather light than heavy, is suitable for both, while *G. virgata* is doing well at Kew in very light, sandy soil.

W. D.

MAGNOLIA SOULANGEANA.

THE tree shown in the illustration is *Magnolia soulangeana*, which is growing in the grounds of Hart Hill, Woking, belonging to Mr. T. B. Gabriel. The tree is over thirty years old, and at the time the photograph was taken it was bearing over 3,000 blooms. It is said to be the finest *Magnolia* in Surrey.

THE SCARLET-BERRIED ELDER (SAMBUCUS RACEMOSA).

THIS Elder is of wide geographical distribution, occurring throughout the greater part of Europe,

on will be assured. In addition to the several forms just enumerated there is a golden-leaved variety of *Sambucus racemosa*, viz., *plumosa foliis aureis*, in which the leaves are pale yellow, but become of a golden hue as the season advances. They are in addition fringed as in the variety *plumosa*. It is a very pretty shrub where it thrives, but it will not flourish under such adverse conditions as the golden variety of the common Elder, which is seen at its best (as far as colour is concerned) in a hot, dry soil. A variegated-leaved form of the common Elder (*Sambucus nigra*) is also in cultivation, and a decidedly useful shrub it is, particularly in the neighbourhood of London. An Elder which has only come prominently forward within the last few years is the *Sambucus pubens maxima* of nurseries; the correct name may be *Sambucus canadensis*, but on this point there is some doubt. It forms a bold-growing shrub, not so woody as the common Elder, but still it reaches a height of 6 feet to 10 feet. The flattened flower-clusters are, in vigorous examples, as much as 18 inches in diameter, and, apart from their size, are usually at their best towards the end of August, when all the other Elders are long past. T.

NOTES ON HARDY PLANTS

TWO SISYRINCHIUMS.

CURIOSLY enough there is no mention of either of the *Sisyrinchiums*, with which this note is concerned, in any of the last fifty-two volumes of *THE GARDEN*, which is, I venture to think, a somewhat remarkable circumstance, since both are distinctly pretty flowers. *S. bermudianum* has violet-coloured flowers, which only expand in the sunshine, about an inch across, and borne in great profusion from the late spring for many weeks. It is a fairly common plant in the south-west, and I know it in many gardens where it invariably comes through the winter unharmed, though entirely unprotected. It spreads rapidly, and can easily be increased by division. In "Nicholson's Dictionary of Gardening" its height is given at from 1½ feet to 2 feet, but I have never known it to exceed 1 foot except by an inch or two. *S. iridifolium* is a native of Chili, and was formerly known as *Marica iridifolia*. It bears clear yellow flowers, an inch in diameter, from early in June until the autumn. These flowers are very fugitive, only lasting a few hours in full beauty, but they are produced in such abundance that the plant is never out of bloom. It is rather over 1 foot in height. Both species are doing well in my garden, and are such persistent bloomers that their absence would be a distinct loss. I fancy that *S. iridifolium* is rather rare, as I have only met with it in one other garden. *S. grandiflorum* and its variety *album* are well known and often referred to, and *S. striatum*, also occasionally mentioned, is a coarse plant of no particular merit. S. W. F.

CAMPANULA PERSICIFOLIA MOERHEIMI.

THIS is a valuable addition to our hardy herbaceous plants. It is said to have originated in a seedling bed of Backhouse's variety of *Campanula persicifolia alba* at Moerheim Nurseries, Holland, but is very different, both in habit and appearance. It rarely exceeds 2 feet in height, whereas Backhouse's variety is often over 3 feet high, and its flowers are carried much closer together. The blossoms are pure white, rather flat than bell-shaped in form, semi-double, and about 3 inches across. It is of very hardy constitution, and increases far more rapidly by division than does Backhouse's variety, which is, however, a very beautiful plant. I have this year two dozen flowering plants of *C. p. Moerheimi*, the progeny of one plant that I procured two years ago.

S. W. FITZHERBERT.

DIGITALIS OBSCURUS.

THE species referred to by Mr. Fitzherbert in a recent issue of *THE GARDEN* has never, I think, become widely distributed in English gardens. I grew it about fifteen years ago, but cannot remember for certain where I got the seeds from; I rather think they came from Mr. Thompson of Ipswich. I remember trying to fertilise the spotted Foxgloves with this and with *aurea*, but nothing came to show that the pollen had exercised the slightest influence, and I believe this to be the experience of others who have experimentalised in this direction. In order to make sure I did not allow the plant to be operated on to bear pollen. The flowers were fertilised several times, but not one single pod swelled up. It would therefore appear that the various species of Foxglove have not the slightest tendency to intermingle. A race of Foxgloves with the colour of *aurea* and the stature of our native species would be an acquisition. J. CORNHILL.

LYCHNIS VISCARIA SPLENDENS.

THE double form of this *Lychnis* was uncommonly fine with me this year. On and about the plants I counted upwards of 200 spikes, these being unusually strong, the flowers being large and very fine in colour. My plants are on a raised bed where the drainage is very free, and where

they are fully exposed to sun and air. In light, warm soils this *Lychnis* does very well on the level, but I think that the flowers never take on their true, rich colour unless they get full exposure to sun and air, and the plant has rather a languid appearance as if it were pining in a too confined atmosphere when placed among things of taller growth. Some years ago I was much troubled with a fungus that completely destroyed the vigour of the plants. It came on in the autumn with the first spell of damp weather, the leaves becoming thickly covered with small black spots. I had to destroy my stock, and did not grow it for a couple of seasons. I then got plants from a clean stock, and have not since seen any trace of fungus. J. C.

HEUCHERA SANGUINEA.

THE *Heuchera* described by Mr. Amos Perry in a recent issue of THE GARDEN is, I think, identical with a variety now in bloom with me. I have found the old *sanguinea* to be very uncertain in the matter of blooming, a good-sized specimen frequently not throwing up more than half a dozen spikes. Two years ago I bought in a lot of young plants, and when they came into bloom it was patent that they were seedlings. Here and there one showed the true bright colour of *sanguinea*, but the majority were much paler. I was going to throw them away, but fortunately did not do so, for two of them are flowering with remarkable freedom. The flowers of one are only tinged with red, the other is bright rose, and the leaves are more strongly marked, reminding one of the variegation of the leaves of the Ivy-leaved *Cyclamen*. I shall save seed from these *Heucheras*, and may possibly get something even better. When blooming freely the *Heuchera* is very effective.

J. CORNHILL.

NEW & RARE PLANTS.

BOUGAINVILLEA MAUD CHETTLEBURGH.

WHEN shown by Messrs. William Bull and Sons of Chelsea, at the recent Holland House show, this new *Bougainvillea*, the finest yet intro-

duced, created much interest. Some of the growths exhibited were fully 4 feet long, and bore numerous bunches of showy bracts of a rich rose purple colour and unusually large. The life size of those represented is 2½ inches deep by 2 inches wide. Their large size and rich colour combine to produce a very

striking effect when a well-grown plant is seen. This *Bougainvillea* belongs to the woolly-leaved section, and is, therefore, quite distinct from *B. glabra*, which is smooth leaved. *B. lateritia* appears to be the nearest ally of this new variety. The woolly-leaved section of the *Bougainvillea* have the drawback of not flowering freely, and probably on this account are not so largely grown as the smooth-leaved sorts. *B. Maud Chettleburgh*,

find the space too small for their vigorous growths which make their way through the ventilators, and bloom just as freely where exposed as in the house. Although this new variety would make a beautiful display when grown against a wall under glass or along the roof, it is valuable as a small plant, and for this reason alone will probably quickly become popular. It has received an award of merit from the Royal Horticultural Society. For its

introduction we are indebted to Mr. Chettleburgh, Weststead House Gardens, Norwich, and from him Messrs. Bull and Sons have acquired the whole stock. This *Bougainvillea* may be propagated from cuttings.

PELARGONIUMS.

FORMERLY it was only the show and fancy varieties which were called *Pelargoniums*, but now the zonals, Ivy-leaved, and all Cape species come under the name. It is to the show or regal varieties that these notes refer. These will now be getting past, but there will be time to select for another year, and those who have stock may be reminded that it is now time when they need attention if good plants are to be had for another year. The plants which have been flowering should be placed in the open, and water withheld to ripen them off. It will depend somewhat on the condition of the plants. If they are too fleshy and succulent they must be gradually ripened, that is, only a little water given until the wood begins to show a brownish colour. When properly ripened off, which should not be

later than the first week in August, they should be cut back. I like to cut down as close as possible, and to make the cut just above the eye (or where there has been a leaf).

When the plants have been cut back they should be kept quite dry for a few days, and when the cuts are dried over they may be frequently sprinkled, but very little water given at the roots, and as soon as they begin to start into new growth they should be repotted. Most of the old soil may be shaken out and some of the roots trimmed off. They will usually go back into smaller pots. For potting the soil should consist of two-thirds good fibrous loam, the other third made up of well-rotted stable manure

and leaf-mould, and to this may be added a little bone-meal and some sand. It will depend a little on the loam. Some may not require any sand, but if it is inclined to be heavy a liberal addition will be beneficial. In potting the soil should be pressed fairly firm, taking care that it is made as firm, or rather more so, at the

THE NEW BOUGAINVILLEA MAUD CHETTLEBURGH.

(The bracts are rich rose-purple, large and freely produced in bunches; a few leaves are shown at the top.)

however, has not this fault; in fact, the profusion of the flowers is one of its best features. It blooms splendidly in small pots, although to be seen at its best it needs to be trained over the roof of a greenhouse or stove. *Bougainvilleas* usually flower more freely when grown in a cool house; in fact, the plants often

bottom than on the surface. After potting water should be given sparingly until the plants have made a good start. They may be placed in a pit with the lights off in fair weather, but they must not be exposed to heavy rains, and they are better taken into a house quite early in the autumn. During the late autumn and winter it is most important to give them as much air and light as possible, and as long as the temperature is kept above freezing point the less artificial heat given the better. It is in giving Pelargoniums too much heat in winter that they are often spoiled. Light, air, and plenty of room are essential. Watering requires regular attention. When they are well in leaf they will take up a good deal of water.

Potting on should be attended to; those started early may be ready for larger pots in autumn, but if not done by the end of September they should remain until early in January, and when potted on care should be taken that the soil is in good condition, that is, not too wet or too dry, also that it is not cold. For winter potting it is important to see that the compost is made quite as warm as the temperature of the house where the plants are growing. After plants are in their flowering pots and well established manure may be used, but if they are required to flower early it should not be applied too freely.

INSECT PESTS.

A great point towards success in Pelargonium culture is to keep them free from insect pests. We now have so many good preparations for fumigating with that this is not difficult if it is taken in time. At the first appearance of aphides, or even before they are seen, the house should be fumigated. If done periodically, taking care to select a quiet evening, it will be much better than waiting until the insects have got a good start, when it may be difficult to eradicate them. Some plants may be potted on later in the spring, but for those required to flower early it will be better not to give too much pot room.

PROPAGATING.

The plants, when cut back, provide good cuttings: the short, firm wood gives the best results. The flowering portion may be cut away to where there is a leaf-bud at the base of the old leaves. The cuttings root freely in any light, sandy compost, frequently sprinkling overhead, with very little water at the base of the cuttings until they begin to root, but the soil should not get too dry. I find some go to excess in this matter, and if the cuttings are not actually lost they take much longer to make a good start when kept too dry.

Cuttings put in early in August ought to be ready for potting singly in 3-inch pots not later than the first week in October, and should be stopped as soon as they have made a start. Most sorts may not require any further stopping, or a few of the dwarfs may not require any, as they will branch out naturally. With attention the autumn-struck cuttings make good flowering plants for the following year. Most of those seen in the markets are from cuttings taken the previous autumn, and to get a plant well covered with bloom it may be necessary to take out the first flowering point and let the secondary or side shoots come on together. To succeed well with Pelargoniums they require regular attention at all times of their growth; in fact, this is the secret of all successful plant culture in pots.

VARIETIES.

These are now so numerous and varied that it is better to recommend those who would grow them to select their own while they are in flower, but I will give the names of a few of the best and most distinct: Duke of Cornwall, large flowers, crimson, with a purple shade and light margin to petals, dark blotch on upper petals; F. Kellaway is very similar; King Edward VII., blush pink of a pretty shade; Mrs. A. Hemsley, similar, but not quite so deep in colour; Lord Kitchener, bright red, dark blotch; Mrs. George Gordon, a pretty shade of pink; Lord Cromer, orange-scarlet, crimson blotch; Lady Primrose, bright rose, dark blotch on upper petals; Blue Mabel, purple-blue; Edward Perkins,

bright scarlet, with an orange shade; Eucharis, pure white, with a faint pink blotch on upper petals, one of the best; Queen of Whites, Alice Hayes, Victoria Regina, and Purity are good whites; Hamlet et Ophelia, mauve; New Monarch, rose, dark upper petals; and Lord Roberts, red, with dark blotch. Many others might be added, but the above is a varied selection of good sorts.

A. HEMSLEY.

GARDENING OF THE WEEK.

FLOWER GARDEN.

VIOLETS.

DURING hot, dry weather the leaves should be frequently syringed to ward off attacks of red spider. The stream of water should be forcibly applied to the under side of the leaves, for it is there that the enemy lurks. The plants will also benefit from an occasional watering. A good mulching or frequent hoeings greatly economise labour in this respect. Keep the Violet plants free from runners.

FLOWER-BEDS.

As the plants grow so the work increases. Until the present time there has been an almost unprecedented amount of watering to be done. Lately the sun-heat has been supplemented by hot drying winds, which seem to have distressed plants of all kinds and aided greatly to the labour of watering. In the beds devoted to carpet bedding there is a deal of pinching and stopping to be done. The Alternantheras and Iresines have not grown so strongly as they might have been expected to do. These and any other backward plants should be sprayed with water from a fine rose can towards the end of the afternoon. If the labour can be spared do this twice daily, at an hour's interval. The progress of the plants will be the quicker, and an occasional watering with weak liquid manure will also have good results. Such rapid growers as Mesembryanthemum cordifolium variegatum must be frequently pinched to keep them to their allotted space. The outlines of the design must be kept distinct or the whole will present a jumbled appearance. The flower-beds must be frequently edged and cleared, removing all dead flowers and stalks and seed vessels from Begonias, Geraniums, &c., as these will retard the flowering of the plants. As they fill the space allotted to them, all procumbent plants, Ivy-leaved Pelargoniums, Verbenas, and so forth are the better for an occasional thinning and regulating of the growths. They will be sturdier and flower better, and particularly in the case of the Verbenas. This will keep mildew in check. The hot weather and copious waterings have suited the tall-growing Lobelia cardinalis and its varieties. These are growing most vigorously and require staking. In tying ample room must be allowed, and the tie should be placed under the leaves. These amply repay frequent applications of liquid manure, as also do many of the strong-growing sub-tropical plants. If large flowers are required, Zinnias should also receive assistance, and the flower-buds should be thinned. Mice are very fond of the flowers of the dwarf French Marigold, and unless trapped will quickly disfigure the plants.

HARDY NYMPHÆAS.

The almost tropical summer has been to the liking of the hardy water plants. Nymphæas have flowered more profusely and been brighter in colour than for several years past. To permit the flowers to be seen, the foliage of many of the vigorous growers, especially Nymphæa Marliacea chromata, must be constantly thinned, and as they finally close the flowers should be removed, as the plant will throw its energies into seed production to the detriment of bloom. A long-handled flower gatherer and a light rake will facilitate the removal of the superfluous leaves and faded flowers. If it can be brought into flower under glass the blue N. daubenyana will, under favourable conditions, continue to flower out of doors. For a few days after

removal any plants so treated should be shaded during the hottest part of the day, or, despite the fact that the leaves are on the water, they will burn badly. Water rats occasionally attack the roots of the Nymphæas, but during the summer they usually content themselves with the seed pods, to which they are welcome, especially on large ponds of the native white-flowered Water Lily.

A. C. BARTLETT.

Pencarrow Gardens, Bodmin.

KITCHEN GARDEN.

HERBS.

If these are likely to be in demand during the winter months they may now be cut and dried. Make each sort up into small bunches and place in a dry, airy room free from dust. If the weather should be wet, the herbs when cut may be dried in a vinery. The drying should be carried out slowly; if not, the leaves will drop from the stems and the whole will be useless. Herbs such as Mint and Sorrel may be cut down again for the last time. This prevents the plants from being weakened by seed-bearing. A rich top-dressing will benefit the herb border at this date. Where Camomile is grown the flowers may be gathered when fully expanded and placed to dry in a not too sunny place.

TOMATOES.

Plants in pots carrying fruit will require close attention with water two or three times a day in this hot sunny weather. Late batches, where the fruits have just set, may be assisted with a rich top-dressing, and liquid manure should be given immediately the roots show again. All side growths should be removed, and foliage that may overshadow the fruit may be tied back. The practice sometimes adopted of cutting half the leaves back is a mistaken one unless the season is very sunless. Where outdoor Tomatoes are grown, they will be a success this season if they receive the requisite attention. As soon as several trusses of fruit are set the plants may be stopped and liberal treatment given them. Seeds for winter and spring fruiting may be sown now in a gentle heat, and the plants grown on hardily.

SCORZONERA AND SALSAFY.

Plants from seed sown about the end of May will now require thinning. There is not the same fear of this sowing running to seed, and liberal treatment may be given. These are two vegetables that require good well-manured soil, as fine, large, and shapely roots are not often found. Some reliable chemical manure may be pricked in between the rows, or, what is even better, a good top-dressing of rich farmyard manure. Water should be given in plenty should dry weather again set in.

JERUSALEM ARTICHOKE.

These have now attained a good height. If earthing up has been attended to the crop will be the more easily taken from the ground. Where the stems reach the height of 6 feet they may be topped without injury to the crop. This also prevents the wind from blowing them about so much, as they are rather an untidy subject in the vegetable garden, and an out-of-the-way corner should be given up to them if possible.

Hopton House Gardens, THOMAS HAY.
South Queensferry, N.B.

FRUIT GARDEN.

PINES.

Most of the fruits will have been cut from the earliest Queens. The best suckers should be taken off and the house cleared of the old stools. Thoroughly cleanse the house and get the bed in readiness by adding fresh tan or leaves to induce a steady bottom-heat of as near 85° to 90° as possible to receive the Smooth Cayenne and Rothschild sorts for supplying a crop during the winter. These generally show fruit about this time. Plunge the plants, give plenty of moisture by damping the walls several times daily, and keep a night temperature of 75°, falling to 70° in the morning. Close early with sun-heat, and reduce the fire-heat as much as possible. Allow the

temperature to run up to 90°, and lightly spray the plants overhead at closing time on bright days only. The strongest plants of successions which are intended for starting early and are in their fruiting pots will require careful treatment during the next three months. Keep the bottom-heat steady at about 80° to 85°, and do not allow the plants to become too dry. Freely ventilate early in the day, and keep a fairly moist atmosphere by frequently damping the paths, &c. Close the house early, and keep the plants growing steadily until they require a rest. Later plants of successions which are growing freely should be potted into 10-inch and 12-inch pots, according to the variety, and encouraged to grow freely by keeping the house a little closer for a time and by giving plenty of atmospheric moisture. Shade a little during the hottest part of the day, and lightly syringe the plants overhead. The largest and best suckers should be potted into 7-inch or 8-inch pots; a few may be large enough to go direct into their fruiting pots. These plants must be kept growing steadily by careful treatment as for successions. Fresh suckers should be put in at intervals to keep up a succession and plunged in a bottom-heat of 85° to 90°. Lightly shade and keep close for a time, gradually increasing the ventilation as the plants get rooted through.

THE ORCHARD HOUSE.

The earliest Peaches and Nectarines in these houses will be cleared of their fruit and be in a condition for potting. This must be carefully done, using a compost of good fibrous loam, lime rubble, and bone-meal, and it is very necessary that they should be firmly potted. Afterwards plunge them in a nice open position, lightly mulch to economise labour, and syringe freely morning and evening. When it is necessary to reduce the roots of old trees much they should be kept in a cool, moist atmosphere, frequently syringed, and lightly shaded, when in a very short time new roots will have formed. Then they can be plunged outside and treated as above, and the trees again well established before the leaves fall.

Later trees will now be swelling their fruit fast, and should be liberally treated and never allowed to suffer for want of water. Light top-dressings at intervals of good rotten manure and occasional sprinklings of Thompson's Vine Manure will improve the quality of the fruit. Keep all the laterals pinched in to about the end of July, and do not allow any unnecessary shoots that are not required for the formation of the tree and next year's fruiting.

Impney Gardens, Droitwich.

F. JORDAN.

INDOOR GARDEN.

BEGONIA GLOIRE DE LORRAINE.

PROBABLY of all the winter-flowering Begonias there is none better than this. Well-grown plants will continue to flower for at least six months. During August and September the plants are liable to make more vigorous growth than is the case earlier in the season. To prepare for this place them at once in the pots in which they are to flower, so that when the time arrives they will not be given a check. They are not vigorous-rooting plants, and in consequence require only moderate-sized pots, which must be clean and well drained. A good compost for them is formed of equal parts of good turfy loam and peat, with a very little coarse sand added. Although heavy shading is not advised, it will be necessary to afford them a light protection from strong sunlight, and the atmosphere of the house should be kept moist.

BOUVARDIAS.

While it may be necessary to allow the older plants to flower, it is advisable in the case of the late propagated young plants to nip out the points of the growing shoots to encourage them to break and eventually form bushy plants. Repotting the latter may be necessary, and as these plants appear to like peat this should form the principal ingredient in the compost. For some time yet a cold frame is best for them, as in such a position the growth they make will be strong. Older plants that are to flower early may be placed in a

house where they can enjoy a little warmth with abundance of moisture.

FREESIAS.

Some of the earliest bulbs should now be potted up from which to obtain the earliest supply of flowers. In this case 4-inch pots are the best to use for the purpose, and in a compost of fibrous loam mainly, with a little leaf-soil and sand added, they will grow strong and flower abundantly. Cover the pots with sand or cocoanut fibre to keep the soil moist and to encourage the bulbs to root freely, but immediately the growth is well through the soil remove them to a cold frame.

CINERARIAS.

A mistake frequently made with these plants while young is to allow them to remain too long in small pots, as consequently they suffer a severe check from getting dry at the root. A compost that is light and free suits them best in the early stages, and a position near the glass in a cold frame is an ideal one, but give them shade from the hot sun and sprinkle water freely amongst the pots.

PRIMULAS.

These plants dislike a dry, hot soil. They require a very light shade, with plenty of air: indeed, the frame lights during the night, providing reliance can be placed on the weather, would be better removed altogether, as the leaf-stalks of the plants then would remain short and stocky.

J. P. LEADBETTER.

Tranby Croft Gardens, Hull.

ORCHIDS.

CATTLEYA HARRISONÆ.

THIS fine species will now be throwing up its welcome flowers, and to obtain the best results the plants should be given much light, but sufficient shade to prevent the leaves from becoming discoloured. The early morning and evening sunshine is very beneficial to them, and the bright, hot weather we have had during the past few weeks has promoted a strong and healthy growth. Strong-growing plants will require water very plentifully till the flowering season is over, and it is essential that the atmosphere is kept sweet and buoyant by judicious ventilation. This *Cattleya* is very useful to exhibitors during August and September. The flowers when well grown are carried well above the foliage, and it is of easy culture. Apart from its usefulness to the exhibitor, it is well worth growing in quantity either for cutting or for furnishing the Orchid houses with bloom when flowers in these structures are very scarce. It has also proved a useful parent in hybridising, and I am convinced in the near future many more fine hybrids will be flowered in which this species will figure as one of the parents. After the flowering season is past the supply of water should be gradually reduced, and when the new pseudo-bulb has attained full maturity only sufficient to maintain solidity is required. The two most important items to be observed in their cultivation is to always keep a sweet, buoyant atmosphere and to give them at all seasons a light position.

LÆLIA ELEGANS AND VARIETIES.

These beautiful natural hybrids are somewhat erratic in their season of growth and flowering. Many will now have passed through their flowering season, and these will be benefited by being kept somewhat drier at the roots. Others are now producing their flowers, when abundance of water is needed if the plants are in a healthy state and the pots well filled with active roots. The flowers are produced before the new pseudo-bulbs are matured, so that the diminishing of the water supply after flowering should be very gradual. Like most of the long-bulbed *Cattleyas*, *Lælia elegans* revels in plenty of strong light. Often-times new growths are produced shortly after the flowering season is over, offering the most favourable time to repot if it is required. Use a compost of two-fifths fibrous peat, two-fifths good sphagnum cut up, and one-fifth leaf-soil. Mix the whole well together with some sand and small crocks. Pots are the most suitable. When growing the

plants make very strong roots that prefer a dry receptacle in which to ramify. In the case of pots that are over 7 inches in diameter they should be half filled with rhizomes, using less when smaller pots are used. It is not advisable to pot those at this season that lay dormant after flowering. I prefer to see them wait till the spring before again starting into growth, but many forms of them will persist in growing, and it is those that should now have attention.

CATTLEYA GRANULOSA AND C. LEOPOLDII.

These are now fast attaining full development, and those now throwing up their flowers should be so placed that they have the advantage of much light all round. Until the flowering season is over they will require plenty of water. When many plants are grown this is carried over a rather long season, as each plant as they pass out of flower will require individual treatment, reducing the supply to those that have flowered, and increasing the quantity to others when the flower-buds are visible.

W. P. BOUND.

Gatton Park Gardens, Reigate.

INSECT PESTS.

AMERICAN BLIGHT.

THE present year will long be remembered as one most prolific in insect pests, and never do I recollect having seen Apple trees worse affected with the well-known woolly aphis, or American blight as it is frequently but incorrectly named, as the pest was originally European, and is now cosmopolitan, as it appears to thrive wherever Apples are grown. Old orchard trees in some districts are covered with the white woolly substance, which denotes the presence of the insects, and here the old story crops up again about neglected fruit trees. Those old gnarled specimens, the stems and limbs of which are covered with moss and lichen growths, are perfect nurseries of insect pests, including American blight, and though so far as their own value is concerned they may not appear to be worth keeping clean, there are young trees on every side which suffer through the old specimens being infested.

Often great festoons of woolly matter may be seen suspended from the trees, and, when these are carried away by the wind and deposited on other trees in the vicinity, the insects are transferred as well, and another colony is established elsewhere. Perhaps no one would be very much poorer if American blight did succeed in killing some of the miserable old worn-out trees which it infests, but they seem to linger on in spite of persecution, and it is on young specimens that one may observe to the full extent the damage this pest is capable of doing. When woolly aphis establishes itself on the fresh green shoots of a young Apple tree the sap is drawn out of the bark, which splits, and ugly swelling and excrescences appear. Canker sets in, shoots die back, and if the pest is allowed to proceed on its course of destruction unchecked the result not unfrequently is the death of, at any rate, the ruin of the tree.

It is easy enough to bemoan the sad state of trees now through American blight, and attribute the cause to the season, but the time to make a grand attack on the pest is in the winter. Some proprietors of orchards still think it is worth their while to follow the old custom of whitening the stems of the trees with lime wash, but scores of others do not, and woolly aphis as well as other pests flourish through this neglect. I have not a word to say against lime-washing, except that it makes trees look ghostly; but in the case of young trees, particularly, I would prefer to use the now well-known caustic alkali solution. Half a pound of caustic soda with half a pound of pearl ash and a little soft soap make five gallons of liquor, and by means of a sprayer it can readily be applied to the stems and lower branches of trees when growth is dormant. If the trouble of obtaining the ingredients and mixing them is too great, the

insecticide merchant steps into the breach and supplies the liquid prepared and ready for dilution.

But American blight is not readily obliterated, and even after a strong winter attack it is almost sure to make its appearance again in the summer. It must be harassed again if it is to be kept under, and at this time of the year one cannot do better than obtain a good insecticide, such as paraffin emulsion, and apply it to the affected parts by means of a brush. By an all the year round effort of this character American blight can be kept under, and young trees in an orchard, garden, or plantation may be relieved of the pest. Clearing the country of it is another matter altogether, and a thing impossible without co-operation.

G. H. H.

WIND SHELTERS.

OUR illustration is of an unconventional summer-house erection. It is called a wind shelter, and is an important adjunct to the garden furniture, so-called, in these days of open-air life. This severely plain structure revolves round upon an

applying it with an Abol Syringe. The work is best done in the evening or early morning.

J. CROOK.

THE EARLIEST POTATO—RING-LEADER.

In many gardens earliness is important. Even when the gain is only a few days the grower has a considerable advantage, and, as at this season many of your readers are interested in this vegetable, it may not be out of place to note the value of Sutton's Ringleader for earliest supplies. For years I have grown new varieties to test their earliness and quality, and for some years Ringleader has been our earliest tuber. I do not say it crops as heavily as Ninety-fold, but it is earlier. This year we lifted Ringleader from a south border on June 6, but this is a few days later than a previous record. When the season is considered it is a good one. Of course, this only refers to this part of the country (Brentford). Doubtless near the coast in the south it could be had fit for use in May. Ringleader is a white-fleshed tuber, and, unlike some new Potatoes when quite small, it is

serve no useful purpose to name special sorts that have failed, but they are noted for their earliness, and out of three sowings we did not get a dozen bulbs. One expects at times the earliest sowing to run, as the plant at the start receives a check, but this should not happen to later crops sown in March. Later sowings of Snowball are excellent, but this variety was not sown earlier. I shall give it a trial with the earliest sorts another season.

G. W.

PEA MAY QUEEN IN FRAMES.

MANY cannot grow early Peas under glass or in pots, but my note more concerns the variety May Queen in ordinary frames just given protection at the start. When grown in this way the return is well worth the cost of labour and space. There are now so many good varieties to select from, and especially the first earlies, that to mention any particular one for earliest supplies may not be necessary. As the season of gathering is an important one, any variety only a few days in advance of others is worth more notice. May Queen sown in cold frames in February gave good pods the last week in May. The seedlings were planted out on a sheltered border, and grown in frames from the start. There are other advantages that Peas of this type have over others, and one is the pods are a good size. The Peas in addition have a good Marrow flavour. The only objection to frame culture I have is that May Queen is a trifle tall (3 feet), but this is soon met. We stop at 2 feet, keeping the points pinched. This done early flowering is encouraged and the formation of pods. It is a most valuable variety for first crop in the open.

G. W. S.

A WIND SHELTER IN A SURREY GARDEN.

axle, and may be moved by a child, with the result, of course, that it can be placed so as to give comfort to those within—a grateful boon to invalids, to whom a life-giving medicine is fresh air and sunshine.

THE KITCHEN GARDEN.

THRIPS AND FLY ON PEAS.

IN hot, dry summers these are troublesome to garden Peas, frequently ruining the growth and the crop. The fine Marrow varieties, so useful for late gathering, suffer most. It is in the leaf-tips that the insects secrete themselves, drawing out the juices of the young leaves. For years our crop suffered in this way until we tried syringing the growth early with Abol Insecticide, giving two applications. Care is needed to force the wash into the curled leafage. We use it now every year on our late crops with the best results. We use the wash at a temperature of from 85° to 90°,

dry when cooked and the quality is excellent. It is very distinct; the tubers are long and the eyes very shallow, with a dwarfish haulm. It is valuable for a private garden, as it is a success in pots or frames. For years we grew Sharpe's Victor for earliest dishes, but Ringleader for some years has given us better results, and it is the earliest variety I have grown.

G. WYTHES.

TURNIPS BOLTING IN SPRING.

This season, although not at all a bad one for most vegetables, was the worst for years as regards the early Turnip supply; indeed, a few years ago, when the soil was frost-bound well into March, we had more reliable crops in May. I am aware that much depends upon the variety, the soil, and season, but it has often occurred to me that there must be other reasons for this bolting. Does old seed run or bolt worse than new? I am well aware with such vegetables as Peas and fleshy seeds that age acts most injuriously, as old seed is less vigorous, and with a quick-growing crop like Turnips the seed may influence the crop. It would

have invariably proved satisfactory. The all-important matter is to begin as early as sufficient runners are to be obtained. In my opinion the method of layering the runners in small pots is better either than rooting them in turves or in large pots; they are easily removed without their roots being damaged at all. As to soil, we have found nothing more suitable than good loam passed through a sieve, and a little sand added is an advantage. It is advisable to have all the small pots ready before layering begins. Keep them in the shade, so that the soil does not become baked by the sun.

Five runners from each plant are quite enough as a rule. It is much more satisfactory to select a regular number from many plants than a lot from some and few from others. If too many runners are taken from the same plant they are liable to become blind. If sufficient plants can be obtained by so doing, it is advisable to layer only one plantlet upon each stalk or runner, and that one nearest to the parent plant is generally the best. It happens very often that when two plants upon the same runner are inserted one of them grows

THE FRUIT GARDEN.

STRAWBERRY LAYERING.

THIS important work should be no longer delayed, for if good well-rooted plants are to be obtained by autumn, either for making a plantation or for potting, it is essential to have the layers rooted early. Some gardeners keep a number of plants solely for the purpose of producing layers; they are not allowed to bear fruit at all. No doubt there is a good deal to be said for this plan, but unfortunately most persons are obliged to take their runners from plants which have fruited, and really this seems to make little, if any, difference in the vigour of the young plants. I have for many years taken layers from fruiting plants, and they have invariably proved satisfactory. The all-important matter is to begin as early as sufficient runners are to be obtained. In my opinion the method of layering the runners in small pots is better either than rooting them in turves or in large pots; they are easily removed without their roots being damaged at all. As to soil, we have found nothing more suitable than good loam passed through a sieve, and a little sand added is an advantage. It is advisable to have all the small pots ready before layering begins. Keep them in the shade, so that the soil does not become baked by the sun.

away vigorously to the detriment of the other, which is weak and useless. Great care is necessary not to select blind runners, *i.e.*, those whose centres have apparently ceased to develop. It is almost impossible to avoid layering a few, because some of them become blind after layering, but generally the useless ones can be detected at layering time. They should, of course, be discarded, for nothing is more disappointing than to find many blind plants after all the trouble of rooting and repotting them. An easy way to fasten the runners in the small pots is by means of raffia looped loosely round the stalk near the plantlet, and pressed into the soil with a stick, thus pressing the base of the tiny plant to the soil. Keep them well supplied with water; otherwise they will not make satisfactory progress. They will soon become well rooted if left moist; the evening is the best time to water, although in the hottest weather watering may be necessary two or three times a day.

GARDEN PINKS.

[TO THE EDITOR OF "THE GARDEN."]

SIR,—The common fault with many of our garden Pinks is that they split the calyx, and the petals, instead of displaying themselves to the best advantage, fall about in loose confusion. A keenly imaginative writer once designated such flowers as attractive floral cataracts, but he failed to make converts to his opinion. A white Pink with a non-splitting calyx named Mrs. Lakin is, I think, just the half-way Pink the writer of the article on page 33 of THE GARDEN would term a useful plant. It came among some seedlings of a laced variety, it has well formed, smooth-edged petals, not too many of them, and does not split its calyx; it is dwarf in growth, compact in habit, and free blooming, and it has only a faint trace of colour in the centre. Some of the best rose-coloured Pinks ever raised were Derby Day, Newmarket, and Lord Lyon; they were produced by a Mr. James Clarke of Bury St. Edmunds. They were all of pleasing shades of colour, had smooth-edged petals, good calyces, and were not too full of florets. Lord Lyon is a delightful rosy pink, but of a delicate constitution, a defect which characterised the other two in some degree; I am afraid it would be difficult to obtain either of them true to character. One of the best of garden Pinks is known as Pheasant Eyed, and it has been distributed under the name of Samuel Barlow; at any rate the latter, no doubt, put into commerce in perfect good faith seems to be identical with it. It has handsome medium-sized blossoms, having a bright claret-crimson centre and notched white florets. It does not split its calyx so badly as some others. The black and white Pink is a florist's variety with a dark centre and solid, well-formed, smooth-edged white petals. Formerly there used to be a class for black and white Pinks at Pink shows, but the type, as estimated by the florist, appears to be lost to cultivation. I have endeavoured to obtain it in Lancashire but without success. If restored to cultivation it is likely to reappear as a seedling among laced varieties.

I cannot share the opinion of the writer that the florists' laced Pinks have a muddled appearance in the garden. My collection of Pinks have shown nothing so attractive as a small plantation of laced Pink John Ball, and it is the admiration of everyone who has seen it. I do not advocate the indiscriminate use of laced Pinks in the garden; such large flowered varieties as those of Boiard and Empress of India, with their straggling habit of growth, are not desirable; but it is very different with such varieties as John Ball, Mrs. Darke, and Modesty, as types of laced garden Pinks. A line of Mrs. Darke, the flowers handsomely laced, was one of the border attractions at Old Warden

Park on the occasion of a recent visit, and I could quite understand Mr. W. C. Modral's preference for it. Much can be said in commendation of the laced Pink as a border flower.

R. DEAN.

DIMORPHOTHECA ECKLONIS.

[TO THE EDITOR OF "THE GARDEN."]

SIR,—The communication on the above plant in THE GARDEN of July 16, page 39, will be read by many with considerable interest, and will probably lead to the more general use of the plant for outdoor cultivation, under which condition it seems more suited than for the greenhouse. I can fully endorse what is said about the sturdiness of its growth and the profuseness of its flowering when planted out of doors. I tried the experiment this spring with some plants raised from seed sown late in the spring of 1903 in pots kept in an ordinary living room. All the seeds germinated rapidly, and quite late in the autumn formed plants some 2 feet high; but they showed no signs of flowering. In March of the present year I planted them in the open garden, in a border facing south-west, but shielded from the north and east, when they at once began to form bushy plants, and have borne a profusion of flowers. It is apparent that the *Dimorphotheca* may thus become an important summer-flowering plant for the open garden. With reference to what is said about the confusion of common names with those of *Gerbera Jamesoni* I have found that *Dimorphotheca Ecklonis* is usually, if not always, quoted as the Transvaal Marguerite, while *Gerbera Jamesoni* is known as the Transvaal Daisy.

JOHN R. JACKSON.

Claremont, Lympstone, Devon.

CATERPILLARS ON GOOSEBERRY BUSHES.

[TO THE EDITOR OF "THE GARDEN."]

SIR,—I think it is rather late to try Mr. Wythes' remedy with Hellebore powder as the fruit is nearly ripe. My gardener thought, however, of a plan which has been most successful. Cut a piece of tin in the shape of a large frying-pan, fix a long wooden handle, and cut a slit out from the circumference to the centre, thus:

Then smear the tin with tar, and place it under the bush, using a forked stick to shake the branches, when the greater number of the caterpillars will fall into the trap.

AUBREY SPURLING

NOVEL POTATO PRODUCTION.

[TO THE EDITOR OF "THE GARDEN."]

SIR,—On page 44 of THE GARDEN for July 16 reference is made to what you term "a recently discovered new system of growing young Potatoes during the autumn and winter." To my certain knowledge the system you describe was practised regularly as early as 1844. At that date I was employed under my late brother in the gardens of Wrotham Park, Barnet. The largest tubers of the current year's crop were regularly preserved till the September of the following year in as cool a place as possible, and kept from sprouting until they were buried in finely-sifted dry mould. The position chosen for their growth was in a shed where there was always a genial heat from two furnaces. The young tubers were always ready by Christmas. If my memory serves me rightly, I wrote of this subject many years since in, I think, the *Journal of Horticulture*.

DAVID THOMSON.

[TO THE EDITOR OF "THE GARDEN."]

SIR,—The notes on how to obtain new Potatoes direct from old tubers in THE GARDEN of July 16, page 44, are very interesting, but the plan of doing so is by no means a new or recently discovered one. That Mr. Stanton found it out quite accidentally I can readily believe, since new tubers are often produced in the manner illustrated and described on old Potatoes that have been stored for a year or so under suitable conditions. In THE GARDEN of February 15, 1879, I drew attention to this fact in a short note, with an illustration, after seeing new Potatoes thus grown in a Mushroom shed at Burghley House, near Stamford, by the late Mr. Richard Gilbert, who was well known as a past-master in vegetable culture.

F. W. BURBRIDGE.

THE INDOOR GARDEN.

BOUVARDIAS.

MUCH diversity of opinion prevails as to the best method of treating these plants for autumn and winter blooming. Some prefer to plant the whole of their stock out, while others keep all in pots and grow them in cold pits during the summer months. I have for several years previous to the last two planted out the whole of my stock, lifting the plants and potting again towards the middle of September. I have now abandoned the practice of planting out the established specimens of such kinds as elegans, Alfred Neuner, President Garfield, and Vreelandi, and now keep them in pots throughout the whole of the year and find they answer much the best, as they too often make a quantity of sappy growth when planted out just at the time of lifting, and they generally feel the shift very much. Such kinds as Humboldti and jasmimoides I still plant out and lift again in autumn with as large a ball of earth as possible and utilise one of the old Melon beds in a heated pit for planting them in. Plants lifted in this way do not feel the shift in the least, and they go on growing and producing their bunches of snowy white flowers until near Christmas. For several years I have adopted this plan, and so well am I pleased with the result that I commend it to the notice of all who appreciate the larger flowering kinds of Bouvardias. The greatest drawback to this system of culture is that when the plants have ceased to flower, say about mid-winter, they require to be cut back closely and repotted, and if great care is not taken to put them into brisk heat to start, the losses amongst them will probably be considerable. I have been so disappointed with the meagre supply of flower from the varieties last named when lifted and potted owing to the check given by the disturbance of the roots in getting them into pots that I abandoned it, and am well pleased with the result of planting in pits. The cuttings taken in spring for keeping up the stock of plants I also plant out in a frame from which the bedders have been removed, or a Violet frame, first making the soil in good condition for their reception, and finishing up with a good covering of finely-sifted soil, with a good portion of sand and leaf-mould intermixed. The young plants should be planted into this bed and given a good watering, the lights put on, and shaded for a short time. After they have made a good start the lights should be removed, and the young plants have the points of their shoots pinched out occasionally. In this way they make fine specimens for 5-inch and 6-inch pots. Although these young plants receive a slight check in potting up, they soon recover and make a good succession to those grown in pots the whole of the season.

Those grown in pots are what we mainly depend on for our supply of blooms, and though they do not look so vigorous in the autumn when taken into their flowering quarters, they flower at the point of every shoot. An intermediate temperature suits them best, and well-established plants are greatly benefited by occasional doses of liquid manure and light surface dressings of some approved fertiliser. It is not well to syringe

overhead when there is much bloom expanded, but when there is none an occasional syringe in bright weather will greatly benefit the plants.

After they have done blooming, which, if properly treated, will not be until the spring months, they should be cut hard back and placed in a good temperature to break, after which they should be shaken out and repotted into as small pots as they can be placed, to be subsequently potted into their flowering sizes, using an open compost consisting of loam, leaf-soil, a little peat, and coarse silver sand, well draining the pots and potting firmly. This will cause the plants to make sturdy growth. A frame is the best place for them until they are well established, after which an open situation on a bed of cinder ashes will suit well. Here they may remain until housed at the beginning of September. W. C. C.

CACTUS-FLOWERED PELARGONIUMS.

THE first double-flowered Pelargoniums of the zonal section made their appearance in the latter half of the sixties, and at that time attracted much attention. These early forms were very vigorous in growth, which feature after a while gave way in favour of more bushy varieties, of which good well-flowered examples could be grown in comparatively small pots. After this they became popular as market plants. Within the last twenty years innumerable varieties have been raised, but there was no marked break away to chronicle till the year 1900, which saw the advent of a very distinct form, viz., Fire Dragon, a sport, I believe, from F. V. Raspail. In Fire Dragon the flowers, though double, are composed of narrowish petals, which give a starry appearance to the bloom very suggestive of a Cactus Dahlia, hence the term Cactus-flowered Pelargoniums being applied to this variety and to the newer sorts in the same way. At the Holland House show a group of new varieties was staged by Messrs. W. and J. Brown of Peterborough, and very pretty they were, being in general appearance so distinct from the ordinary double-flowered zonal Pelargoniums. A selection of the best shown would include Mrs. J. Brown, deep scarlet; J. R. Greenhill, soft pink; Lady Roberts, salmon-pink; The Countess, deep salmon; and Scarlet King, bright scarlet. All appeared to be characterised by a dwarf bushy habit of growth, and, while well adapted for pot culture, they are also decidedly promising for bedding purposes. No doubt they will receive a good trial when better known and more generally distributed.

H. P.

THE EDITOR'S TABLE.

WE invite our readers to send us anything of special beauty and interest for our table, as by this means many rare and interesting plants become more widely known. We hope, too, that a short cultural note will accompany the flower, so as to make a notice of it more instructive to those who may wish to grow it. We welcome anything from the garden, whether fruit, tree, shrub, Orchid, or hardy flower, and they should be addressed to The Editor, 3, Southampton Street, Strand, London.

Mr. S. W. Fitzherbert sends from Kingswear, South Devon, flowers of several interesting plants. Among them are four early Gladioli of bright colourings, namely, Queen Wilhelmina, Red Prince, Crimson Queen, and Saumarez. Our correspondent writes: "I have fifteen varieties of these early Gladioli, not counting G. tristis, G. vinulus, and G. Colvillei. The Bride does so well and increases so fast here that I determined to try other named varieties. Planted in light soil mixed with sand all but two have greatly increased, Rose Queen having produced fifty-six spikes from twelve bulbs planted in the autumn of 1902." Mr. Fitzherbert also sends the pretty orange-coloured

Cypella Herberti, which is blooming very freely at Kingswear and daily expanding dozens of flowers, and Digitalis obscurus, on which a note appeared in THE GARDEN on the 9th inst.

FLOWERS FROM SOUTH DEVON.

"L. H." sends from Plymstock many interesting flowers, and from a limestone soil, which suits most things, but is too dry for some good plants. Very fine are the flowering shoots of the beautiful Linaria macedonica, which is described as excellent for cutting and very showy in the border; the useful Galega officinalis alba or white Goat's-Rue, Clematis recta (one of the best of its family), the Prickly Ivy (Smilax aspera), and Dahlia Zimpani, which is also called Cosmos diversifolius, and is quite hardy except for a covering of ashes in winter; its colouring is remarkable, an intense purple, almost black, hence the popular name of Black Dahlia.

FLOWERS FROM CHRISTCHURCH.

Mr. Maurice Prichard sends from his interesting Riverslea Nurseries, Christchurch, Hants, flowers of the following: Kniphofia Buttercup, a pretty form, with a small, dense head of flowers of a pure yellow colouring. A small group of this on the rock garden must be full of charm. Campanula versicolor, a species from Greece, which is not common in gardens; it is very distinct, the flowers appearing in a long raceme, and individually have a quiet and pleasant colouring. The prevailing tone is blue, passing to white, with deep purple base. Its long season of blooming—July to September—is worthy of note. Campanula (hybrid) Isabel is a warm purple colour. Mr. Prichard does not state whether this has been raised at Christchurch, but whatever its origo, it is a good garden plant for its fine colour.

OBITUARY.

MR. DAVID MITCHELL, EDINBURGH.

MR. DAVID MITCHELL, who died recently at Comely Bank, Edinburgh, has been for so long in practical retirement that many of the present generation of gardeners were unaware that he was for some time one of the most prominent Scottish gardeners. Mr. Mitchell, who was in his eightieth year, was a native of Dundee, and after filling several minor appointments, became head gardener, about 1860, to the then Duke of Hamilton at Hamilton Palace. In this important appointment, then one of the leading ones of its kind in the north, Mr. Mitchell did excellent work some forty years or so ago. Extensive improvements were carried out, the whole establishment being practically overhauled and remodelled in the most complete and skilful manner. So satisfactory were Mr. Mitchell's plans when carried through that his assistance was sought when a number of other places in the neighbourhood of Hamilton and elsewhere being laid out to design and carry out the works there also. His skill as a cultivator was equally great, and the many prizes carried off by produce from Hamilton Palace at the leading Scottish shows evidenced the mastery of the details of cultural practice possessed by Mr. Mitchell. Mr. Mitchell afterwards entered the nursery and seed trade in Edinburgh. He was buried in the Dean Cemetery, Edinburgh, on the 18th inst., in the presence of a large number of friends.

SOCIETIES.

A SWEET PEA SHOW.

THE National Sweet Pea Society held its fourth annual exhibition at the Crystal Palace on the 20th and 21st inst., and although some exhibitors complained that the very hot weather had somewhat spoilt the colour of their flowers, a charming display resulted. It was difficult to trace a distinction between some varieties with different names, as shown in bunches, but this was owing to the fact that the hot sun had destroyed their characteristic delicate tints. Chief interest, of course, centred in the new varieties, and among these one was conspicuously prominent. It

was shown by Mr. Henry Eckford, Wem, and is named Henry Eckford. The colour may perhaps be best described as salmon orange tinged with rose. It is quite distinct from anything shown before. In a special class for nineteen bunches of Sweet Peas, in which certain varieties must be shown, Mr. A. G. Hayman, Hapsford House, Frome, won the first prize. His best yellow was the Hon. Mrs. Kenyon; the best pink was Lovely, Duke of Westminster the best purple, and Dorothy Eckford the best white. In the second prize exhibit, from Mr. Silas Cole, Northampton, the lavender-coloured Lady Grisel Hamilton was very beautiful. There was a class in which only one variety of each colour as given in the society's classification tables was to be shown, the collection to consist of nineteen varieties. Thus all those shown were of perfectly distinct colouring. Messrs. I. House and Son, Westbury-on-Trym, won the first prize. Scarlet Gem, Mrs. Walter Wright (rich blue-purple), Senator (purple flake), and Lottie Eckford (white and lavender) were good sorts. In their first prize exhibit of thirty-six bunches Messrs. Isaac House and Son, Bristol, had Miss Willmott (rich salmon pink), Jeannie Gordon (fawn and rose), Salopian (crimson), and Othello (maroon). Mr. C. W. Breamore, Winchester, in his first prize exhibit of twenty-four bunches showed some beautiful sorts, as Agnes Johnston (fawn and blush), King Edward VII. (crimson), and Lottie Eckford (light blue and white). In the amateur's classes Mr. A. F. Wooten, Croft House, College Road, Epsom, won the first prize for twenty-four bunches, distinct, the primrose Hon. Mrs. Kenyon, blue-purple Mrs. Walter Wright, and Countess Spencer rich pink being the best. Dr. Boxall, Abinger Common, Dorking, had the best eighteen bunches, and Miss Beatrice Boosey, The Pines, Bickley, showed the best twelve bunches.

The classes for two bunches of Sweet Peas of one colour were very interesting. It was easy to see at a glance which are the best varieties in the different colours. For instance, Sadie Burpee and Dorothy Eckford were the best whites, Scarlet Gem and King Edward VII. the best crimsons, Janet Scott and Mrs. Knights Smith the best pinks, Miss Willmott and Lady Mary Currie the best orange shades, Lady Ormsby Gore and the Hon. Mrs. Kenyon the best yellows, and Lady Grisel Hamilton and Burpee's New Countess the best lavenders. Sweet Peas lend themselves delightfully to table decoration, and in the open class Mrs. Frank Brewer, Beckley, Sussex, won the first prize with a simple arrangement of lavender and rosy fawn-coloured varieties.

NON-COMPETITIVE.

In the group from Hobbies, Limited, Dereham (gold medal), Rose Dorothy Perkins was a pretty feature, and there were Carnations and Sweet Peas in great variety. Among the flowers shown by Messrs. Henry Cannell and Sons, Swanley, Kent (large silver medal), Chrysanthemum tricolor, with large creamy white blooms, the dark centre surrounded by a ring of yellow, was very striking. Godetia grandiflora rosea fl.-pl., too, was good. Mr. Henry Eckford, Wem (silver medal), showed a lovely lot of Sweet Peas, which included such new ones as King Edward VII. (bright crimson), Gracie Greenwood (rich pink), Emily Eckford (rich deep blue), and Scarlet Gem (crimson-scarlet), all of which should be in every garden. Messrs. T. S. Ware and Son, Limited, Feltham (silver-gilt medal); Messrs. Baker, Wolverhampton (gold medal); Mr. H. J. Jones, Lewisham (gold medal); and Mr. Charles W. Breamore, Winchester (silver-gilt medal), each exhibited splendid displays of the best varieties of Sweet Peas. Messrs. John Peed and Son, West Norwood (large silver medal), sent Gloxinias in many lovely sorts; and Messrs. G. Stark and Son, Great Ryburgh, Norfolk (silver medal), and Messrs. J. Laing and Sons, Forest Hill (silver medal), showed Sweet Peas.

CARNATIONS AT SOUTHAMPTON.

JULY 22.

"It has been a real pleasure to be here to-day to assist at your beautiful show; everyone has received us so nicely and arranged everything so well, and the surroundings are so charming, that it is a real good outing. Some time ago we were afraid the excellent Carnation shows that have been held at Southampton for the last six years would have to be abandoned, but, thanks to the enterprise of the council of the Southampton Royal Horticultural Society, that danger has been averted, and our pleasure has been indeed great to-day to see the vigour that has been put into the matter. We heartily congratulate the council, the special committee, Mr. Garton, and your able secretary, Mr. Fudge, on the splendid exhibition you have got together. A more effective Carnation show will not be seen in England, and as regards quality some of the blooms could not be beaten at Birmingham, and I could not give you higher praise than that." So remarked a gentleman at the lunch in reply to the toast of "The Judges." Notwithstanding that the blooms are backward in the Midlands and that some exhibitors held back their flowers for the Palace show, the aggregate number of entries was nearly 100 in excess of last year.

In the class for twelve flakes and hizarres, distinct, Messrs. Pemberton of Harden Nurseries, Bloxwich, were first with a good lot, including W. Prescott (fine), Gordon Lewis, Thala, J. S. Hedderley, Geo. Reed, Sportsman (good), Geo. Melville, R. Houlgrave, and Damon; second, Mr. Martin R. Smith, Warren House, Hayes, his best being Flaira, R. Houlgrave, Gordon Lewis, Damon, and Lord Nelson.

In the class for six of the same section Mr. J. J. Sheldon, Churchfields, South Woodford, was placed first with J. S. Hedderley, Guardsman, Master Fred, Merton, R. Houlgrave, and W. S. Kiroso; second, Mr. James Fairlie, Avenue Road, Acton, W.; third, Miss E. Best, Andover.

For twelve white ground Picotees, distinct, Messrs. Pemberton again secured first with a perfect stand of flowers, including a grand bloom of Little Phil; second, Mr. Hayward Mathias.

For six of the same group Mr. J. J. Keen of Avenue Road, Southampton, was well to the front with Little Phil. Ganymede, Jno. Smith, Fortrun, Harry Kenzer, and Lady Louisa second, Mr. E. H. Buckland, Southgate Ho, Winchester.

For twelve yellow ground Picotees, distinct, Mr. Martin R. Smith was first, his blooms including Queen Mab, Mariana, Vesena and Mrs. W. Heriot, both fine, and Dalkeith; second, Mr. E. J. Wootton; third, Messrs. Blackmore and Langdon, Twerton Hill Nursery, Bath.

Six blooms of the same: First, Mr. J. J. Keen, with even blooms of Pilgrim, Gertrude, Richelieu, Mrs. Durrant, Child Harold, and Countess Stratham; second, Mr. James Fairlie.

For the class for twelve fancy Carnations Mr. Martin R. Smith came out strong, securing first with good blooms; second, Messrs. Phillips and Taylor.

For six of the same there was keen competition, Mr. James Fairlie securing first with Voltaire, Pagan, Paladin, Amphron, Oakley, and Hidalgo; second, Mr. Buckland; third, Mr. E. Charrington, Limsfield, Surrey.

For twelve Carnations, selfs, Messrs. Phillips and Taylor secured first with fine blooms, including Mrs. M. V. Charrington, Hildegarde, Regina, Dudley Stuart, and Tregonda; second, Mr. Martin R. Smith, with blooms little inferior to the first.

For six blooms, selfs, there were thirteen entries: First, Mr. J. J. Keen; second, Mr. Flight; third, Mr. Fairlie; fourth, Mr. Rowberry.

The point medals offered by Mr. James Douglas in the foregoing classes were won as follows:

Silver-gilt medal for most points in the classes for twelve blooms, Mr. Martin R. Smith.

Silver medal for most points in the classes for six blooms, Mr. James Fairlie.

Bronze medal for most points by an exhibitor who has never won a first prize at Southampton, Mr. J. J. Sheldon.

For single blooms there were eighteen divisions, each with four prizes. A very large number were staged, giving the judges some trouble to select the best, the first prizes being secured as follows: Scarlet bizarre, Mr. Keen with Philgram; crimson hizarre, Mr. Fairlie with J. D. Hextall; purple flakes, Mr. Fairlie; scarlet flakes, Mr. Fairlie with Sportsman; rose flakes, no award. Picotees, heavy-edged red, Mr. Keen; heavy-edged purple, Mr. Fairlie with Amy Robart; heavy-edged rose, Mr. Pemberton with Little Phil; heavy-edged scarlet, Mr. Pemberton with W. H. Johnson; light-edged red, Mr. Pemberton; light-edged purple, Mr. Buckland with Lavinia; light-edged rose and scarlet, Mr. H. Mathias with Fortrose; heavy-edged yellow ground, Mr. Wootton with Mazarin; light-edged yellow ground, Messrs. Blackmore and Langdon with Mrs. Durrant. Selfs, any colour, Messrs. W. Pemberton and Sons with Much the Miller.

Fancy, yellow ground: First and second, Mr. Martin R. Smith, with King Solomon. Fancy, white ground: Mr. Keen with Orion.

The prizes for the premier blooms, selected from the entire exhibition, were awarded as follows: Carnation, bizarre, Mr. J. J. Keen with Robert Holgrove. Carnation, flake, James Fairlie with Gordon Lewis. Carnation, self, Messrs. Pemberton and Son with Much the Miller. Carnation, fancy, Mr. Martin R. Smith with King Solomon. Premier Picotees, white ground, Messrs. Pemberton and Son with Lady Louisa. Premier Picotees, yellow ground, Mr. Martin R. Smith with Vesena.

The classes for undressed flowers, staged in vases, made a good show, and no doubt will be much better another season, when exhibitors have learned how to put them up effectively. For the twelve vases of distinct varieties of self or fancy Carnations or yellow ground Picotees, six in each, there were only three entries, the prizes being secured, in the order named, by Mr. Wootton, Messrs. Blackmore and Langdon, and Mr. W. Garton, jun. No fault could be found with the effective arrangement of these.

In the amateurs' class, for six vases, four blooms in each, there were five entries. First, Mr. Flight, flowers nicely set up; second, Dr. Yeo of Alverstoke; third, Mr. C. A. Linzee. The prizes offered by Mr. W. Garton, jun., for single vases, three blooms of one variety, drew a large entry, just on sixty vases being staged in the six classes. The principal winners were, for white, blush, or pale pink: First, Mr. Martin R. Smith; second, Messrs. Phillips and Taylor; third, Messrs. Blackmore and Langdon. Rose, salmon, or scarlet: First, Mr. James Fairlie; second, Mr. Martin R. Smith. Yellow, buff, or terra-cotta: First, Mr. Martin R. Smith; second, Messrs. Phillips and Taylor. Any dark self: First, Mr. E. J. Wootton; second, Mr. Fairlie. Yellow ground Picotees: First, Mr. M. R. Smith; second, Mr. Wootton. Fancy Carnations: First, Mr. Wootton; second, Messrs. Blackmore and Langdon. The silver medal presented by Mr. James Douglas, Great Bookham, for the most points in the above classes was secured by Mr. Martin R. Smith.

Dinner-table arrangements, the decorations consisting entirely of Carnations, stands of Carnations, and bouquets of the same, were all excellent, Miss Minnie Snellgrove once more securing the honours with her table, which was very elegantly arranged, Mrs. Wootton being deservedly first for the stand with a light arrangement of yellow flowers. Two very handsome bouquets were set up, the first prize being awarded to Miss Wills, 198, Above Bar, and the second to the Fruit and Flower Growers Company, Above Bar.

SWEET PEAS

made a grand show, the competitive and trade exhibits occupying all one side of the spacious pavilion and a good part of the other. The table decorations were especially attractive, Miss Snellgrove being again successful with a very light and beautiful arrangement.

There was a large number of exhibits not for competition, foremost amongst them being that from Mr. W. Garton, Roselands, Southampton (gardener, Mr. J. Martin), who exhibited a very fine group of Malmaison Carnations, also a group of Lilium auratum arranged with Ferns and light Palms, for which he was awarded a silver-gilt medal, and the committee are indebted to that gentleman for the fine Palms and other decorative plants that added so much to the effect of the show.

Messrs. B. Ladham, Limited, of the Shirley Nurseries, staged what was generally considered the finest exhibit they have ever put up, being awarded the society's gold medal,

their bank of flowers occupying the whole of the front of the orchestra. Most noticeable were Romneya Coulteri, Coreopsis Eldorado, Statice speciosa, Perpetual Pinks, Gaillardia (oculata race in ten varieties), Pentstemon Newbury Gem, Lilium chalcodonicum and L. testaceum.

Mr. Breamore of Wichester had a very bright exhibit of Sweet Peas, containing some 150 varieties, for which they were also awarded a gold medal.

Silver medals were awarded to Messrs. Blackmore and Langdon for a very attractive stand, containing some fine Begonias and Carnations; Messrs. Jones and Sons, Shrewsbury for Sweet Peas and Carnations; and Messrs. Toogood and Sons, Southampton, for a very fine exhibit of Sweet Peas.

Awards of merit and cultural certificates were given to Messrs. Cutbush and Son, Highgate Nurseries, for Carnations; Mr. James Douglas, Great Bookham, for Carnations; Jones and Sons, Shrewsbury, for Sweet Peas; and W. H. Rogers and Son, Limited, for a collection of plants. The other non-competitive exhibits were from Mr. W. Garton, jun. (group of Carnations arranged with Ferns and foliage plants), Mr. E. Wills, Shirley (miscellaneous collection), H. Dymot (Petunias), Charles Prince, Ryde, Isle of Wight (seedling Carnation), and Mr. J. Bull, Birmingham (collection of Violets).

Certificates were awarded to Mr. Douglas for new Carnations Duke of Norfolk, Kafir, and Etana, and to Mr. W. F. Linney for a very pretty seedling perennial Sweet Pea.

The receipts were a record for a Carnation show, being £12 more than last year.

SALTAIRE AND SHIPLEY SOCIETY.

THE second annual show of the above was held in Saltaire Park in glorious weather. The committee had increased the number of classes, which brought a larger number of exhibitors and entries, so that the exhibition proved considerably better than that of last year. The day was an ideal one, but the show did not appear to secure the patronage it deserved and which should be obtained as it becomes better known. Roses and other cut flowers were the predominant feature, and the local exhibitors staged many exhibits, showing good culture.

In the Rose classes the first prize for forty-eight blooms, not less than thirty-four varieties, was won by Messrs. A. Dickson and Sons, Newtownards. Some of the best blooms were Mildred Grant, Bessie Brown, Duchess of Westminster, Her Majesty, Erin, Duke of Wellington, Caroline Testout, and Marie Baumann. Second, Messrs. J. and R. Calam, with smaller but well-coloured blooms. For thirty-six blooms, in not less than twenty-four varieties, and for twenty-four blooms, eighteen varieties, Messrs. A. Dickson were again first. For twelve dark Roses, distinct, the Irish exhibitors again had the best flowers of such as Alphonse Sompert, Horace Vernet, A. K. Williams, and Charles Lefebvre. Messrs. J. and R. Calam were second. The last-named were first for twelve light-coloured distinct varieties. In the interesting class for twelve new Roses Messrs. Dickson again showed best. Among the sorts shown were Cambell Hall (a charming pink variety), Lady Ashton, Connaught, and Florence Pemberton. For twelve Teas or Noisettes and twelve varieties of garden Roses Messrs. Alex. Dickson won the first prizes. Among the latter were bunches of William Allen Richardson, Marjorie, Liberty, Meta, Killarney, Crimson Rambler, &c. The silver medal for the best Rose was awarded to Messrs. Dickson for a bloom of Mildred Grant.

Mr. G. H. Mackereth, Ulverston, showed the best Sweet Peas, and Mr. A. W. Whitelock sent the finest hardy herbaceous flowers.

In the local classes, open to residents within twenty miles, Mr. J. Midgley was the most successful exhibitor.

In the amateurs' classes Mr. D. J. Law was first for twenty-four Roses, winning the silver medal for the premier bloom in this section with Bessie Brown, the same exhibitor was first for twelve and six blooms. Mr. A. H. Rigg won the National Rose Society's bronze medal for the best bloom with Killarney.

Groups not for competition were arranged by Mr. G. Ward, Fernhurst, Shipley, Messrs. R. Eichel, and W. Kershaw. Messrs. W. Shand and Sons, Lancaster, had an extensive and interesting table of herbaceous cut flowers. To Mr. E. Wright, the secretary, a word of praise is due for his untiring efforts.

HALIFAX FLOWER SHOW.

THIS show was held in the charming grounds of Elm Wood, by the kind permission of C. Holdsworth, Esq. The exhibits were fully up to the usual standard, those of Messrs. R. Harkness and Co. being especially fine throughout. A special feature of this show consists of the bouquets of Roses.

In the large class, for sixty blooms, Messrs. R. Harkness and Co., Hitchin, won the first prize with a very fine lot. Some of the choicest blooms were A. K. Williams, Gladys Harkness, Horace Vernet, Mrs. Sharnan Crawford, Mme. E. Verdier, Harrison Weir, Ben Cant, Mrs. J. Laing, Bessie Brown, Helen Keller, and Marie Baumann. Second, Mr. H. Drew, Longworth, Berks; third, Mr. W. H. Frettingham, Beeston. The best bloom in this class, which received the National Rose Society's silver-gilt medal, was a very fine Gladys Harkness. Messrs. Harkness had the best thirty-six varieties, three blooms of each, and Mr. H. Drew sent the best twelve Teas, three blooms of each. Messrs. R. Harkness and Co., who were second in the latter class, were first for eighteen distinct varieties, not less than three trusses of each, and for garden or decorative Roses.

Many fine Roses were shown by amateurs, Mr. R. Parke, Bedale, winning the first prize for forty-eight blooms with a splendid lot. Mr. Boyes, Derby, was second. The best bloom in this section was found in Mr. Boyes' exhibit, viz., Mrs. J. Laing, which was awarded the National Rose Society's silver-gilt medal. Mr. Parke was first also for eight distinct varieties, three blooms of each, and for twelve Teas.

Of growers within twenty-five miles of Halifax, open, Messrs. J. and R. Calam, Wakefield, were the most successful.

Of amateurs within twenty-five miles Mr. D. J. Law showed best. Some beautiful bouquets of Roses were shown, Messrs. Bottomley and Buntton, Elland, being the most successful exhibitors. Messrs. Harkness and Co. and Messrs. Calam were the chief prize-winners in other Rose classes.

Mr. A. Makin secured the Coop's silver challenge cup in the local amateurs' section for twelve blooms of Roses. The arrangements were ably carried out by Mr. G. W. Wilson, Salterhebble, Halifax.

CROYDON AND DISTRICT HORTICULTURAL SOCIETY.

THE first of the new series of papers arranged for the present session—July to December—was given at the society's rooms, Sunflower Temperance Hotel, and Mr. J. Cutler, Limes Road, Croydon, very ably discoursed on "Earthworms, and their effects on the soil." Mr. Cutler illustrated how beneficial this lowest order of animal life is to the soil we cultivate. The castings considerably help to fertilise the soil, as they are richer in soluble plant food than before. Mr. Cutler gave statistics of the quantity of earth per acre consumed, which amounts to about fourteen tons. Their average length in this country when fully grown is 6 inches, yet in other countries, and notably Caylon, they grow to 24 inches long and half an inch thick. In England, too, their castings penetrate to as much as 6 feet to 7 feet, so we can understand the great help they are in aerating and creating a constant interchange between the various strata of the soils. Mr. Cutler also spoke of the injurious side of the question. A hearty vote of thanks was accorded Mr. Cutler at the close.

Romneya Coulteri.—I thought it might interest you to see this photograph of Romneya Coulteri from my garden here. I received a small plant two years ago, and from THE GARDEN received instructions how best to grow it, viz., on a sunny grass bank. The man standing by is 6 feet 3 inches high, although not nearly so tall as the plant: the blossoms 7 inches to 8 inches across. I am afraid it is not good enough for reproduction [Unfortunately, not.—Ed.]—M. F. ARBUTHNOTT, Fairlawn, Paignton.

Centaurea suaveolens.—The yellow Sweet Sultan is very useful for cutting. It is grown extensively for market, and is now quite plentiful. It may not be one of the most profitable flowers, but there is always some trade for it, and if only the flowers are kept quite dry they last well; but once wet them they close up, and unless fully exposed to the sun they will not open again. I have found that if laid in the sun without the stems being in water the flowers will keep quite bright, even when the stems are withered up. The white variety Centaurea Margarita is also largely grown, and is most useful, as it lasts so well. The pure white flowers are suitable for almost any floral work. These Centaureas succeed best in good loamy ground. Dry weather sometimes proves trying, but it is remarkable that this season they continue to flower well.—H.

Coccoloba grandifolia.—This fine foliage plant is very rarely met with outside a botanic garden, yet when well grown it forms a most striking object, as was exemplified at the recent Holland House show, for in their group Messrs. Veitch exhibited a specimen which attracted a good deal of attention. The plant shown had a single stem about 6 feet high, clothed with massive leaves nearly orbicular, and cordate at the base. These leaves, which are about 3 feet wide and nearly as much in length, are of a stout, leathery texture, and set closely to the main stem, that is, without the interposition of any pronounced stalk. It attains quite tree-like dimensions, and, though a striking plant for a large structure, will soon get too tall for a small house. This Coccoloba is a native of Tropical America, and is said to have been introduced as long ago as 1690, but, as above stated, it is even now rarely seen. There are several species, but they are all comparatively rare in this country, and, apart from that above mentioned, are of no great ornamental value.—T.

Marriage.—The village of Handsworth was bright with flowers and bunting on the interesting occasion of the marriage of Miss Evelyn Mary Atkinson, elder daughter of Mr. and Mrs. William Atkinson, Birklands, Haadsworth, with Dr. George Crewdson Thomas of Sydenham, and only son of Mr. and Mrs. G. E. Thomas, Oriol House, Bath. A pleasant incident in the gaieties of the celebration was the entertainment by Messrs. Fisher, Son, and Sibray (of which Mr. William Atkinson is well-known as the principal proprietor) of the employees of the firm and their wives. The weather was delightful throughout.

ANSWERS TO CORRESPONDENTS.

RULES FOR CORRESPONDENTS.

Questions and Answers.—The Editor intends to make THE GARDEN helpful to all readers who desire assistance, no matter what the branch of gardening may be, and with that object will make a special feature of the "Answers to Correspondents" column. All communications should be clearly and concisely written on one side of the paper only, and addressed to the EDITOR OF THE GARDEN, 5, Southampton Street, Strand, London. Letters on business should be sent to the PUBLISHER. The name and address of the sender are required in addition to any designation he may desire to be used in the paper. When more than one query is sent, each should be on a separate piece of paper.

Names of plants.—A. R.—A is *Cratægeus Azarolus*; B is an American species, probably *C. coccinea*, certainly not *C. Azarolus*. But these Thorns cannot be recognised with certainty in the absence of flowers and fruits.—W. D.—*Gladioli communis*.—H. E.—*Philadelphus microphyllus*.—A. E. Message.—1, *Spirea discolor* (better known as *S. arifolia*); 2, *Tecoma jasminoides*.

Malformed leaf (A. MACINDOE).—The malformation of the leaf of *Campanula pyramidalis* is curious but not rare, the same thing happening fairly often. On the specimen sent tiny young leaves and a flower-bud were formed on the midrib of the leaf. The salvia you send is *S. rutifolia*.

Use of refuse of acetylene (G. NICOL).—The effect on the crops and soil of some of these large products is so uncertain both in their immediate and future action that I should certainly hesitate to use the refuse from the manufacture of acetylene gas as a dressing for plants, even if mixed as you suggest. I do not imagine it can be of much value under any circumstances for that purpose. I believe it has much the same properties as slaked lime, but has a certain amount of calcium carbide mixed with it.—G. S. S.

Destroying deciduous trees (W. PRICE).—1. This operation is best carried out in winter, as the flow of sap is thus arrested, whereas if done during the growing season the leaves present a miserable appearance before they drop. 2. The flowers of the Lime secrete a quantity of sweet, sticky, honey-like matter, and it is this which drops on the leaves and on the ground underneath the trees.

Grub on Pear foliage (CONSTANT READER).—The grubs on your Pear trees are those of the Pear sawfly (*Selandria cerasi*). They will not do much harm at this season. They make their chrysalides in the earth. Spreading quicklime under the trees would kill any that happened to fall on it. If the attack has been a bad one, it would be worth while to remove about 2 inches of the soil under the trees and burn or deeply bury it.

Dahlias (J. M.).—These now require frequent attention, the extra dry atmosphere which has prevailed of late being against them. Mulching thickly with well-decomposed manure and giving occasional copious waterings must likewise be practised if robust plants and normal well-coloured blooms are expected. Earwigs must now be watched for; although there are as yet no flower-buds of any importance to injure, the pests feed on the foliage and may soon cripple the plants. Some growers use small flower-pots elevated on a stout stick, a small quantity of hay or Moss being put into each pot and these examined daily. We have, however, killed most by placing in the plants 9-inch lengths of Broad Bean stalks, tapping these every morning on the edge of a pail containing boiling water to destroy them.

Grubs in Cyclamen (H.).—The Cyclamen roots you sent were attacked by the grubs of the black Vine weevil (*Othiorrhynchus sulcatus*) or its near relative the clay-coloured weevil (*O. pectus*). The parent beetles feed on the foliage of various plants, Vines, wall fruit trees, &c. They lay their eggs at the roots of Primulas, Cyclamens, Ferns, Strawberries, and other soft-wooded plants, on which the grubs feed. When present in large numbers, as they frequently are, they injure the plants very much. From their position at the roots insecticides are useless. The only way is to pick out the grubs from among the roots. The weevils only feed at night, and to catch them the best way is to spread a sheet under the plants attacked during the day, and after dark to enter the house with a bright light. This will startle the beetles and they will often fall; if they do not, give the plants a good jarring shake and search them well. Tie small bundles of hay or moss round the stems; the weevils will creep into them for shelter during the day, and can be caught in them.

Adiantum farleyense falling (J. M.).—It is impossible to say the cause of your *Adiantum farleyense* falling into bad health; certainly it could not have been the manure, as, according to your letter, the plants were going back before that time. Still, if the roots were in a bad state, and that is most probably the trouble, a powerful stimulant such as that given would do more harm than good. An excess of moisture at the roots, or the reverse, may have been the starting point of the trouble, and with the soil probably sour root action has become weaker and weaker till the plants have reached their present state. When once a plant gets unhealthy it is particularly liable to be attacked by scale. The most satisfactory treatment will in all probability be to turn the plants out of their pots, remove as much of the old soil as possible, and repot in a good sweet compost, say equal parts of yellow loam and fibrous peat, with a liberal sprinkling of silver sand. If the roots are very bad the plants may be put into smaller pots, as the young roots do better when close to the side of the pot than in a mass of soil. Before potting any very bad fronds may be cut off, and the scale cleaned from the remaining ones. This operation is best carried out early in

the year, when the plants are just awakening from their winter sleep, and the healthy roots are then very active; but under conditions similar to yours we should not hesitate to report now, placing them afterwards in the stove. They need to be shaded from the sun, but do best where stood up not very far from the glass in order that they may have plenty of light. Atmospheric moisture is very necessary to the well doing of this Fern. To succeed in the culture of this *Adiantum* it needs a minimum winter temperature of 55 to 60°, as if kept colder than this the plants do not start away vigorously in the spring.

Gladioli (ANXIOUS).—Gladioli will now be making rapid growth, and, provided they get sufficient moisture at the roots, they enjoy a maximum amount of sunshine. Gladioli always pay for an addition of sweet, fresh loamy soil and leaf-mould to the bed or border when planted out in spring, and this can best be done by drawing drills, planting the bulbs, and afterwards filling in with the new compost. Mulching is very beneficial—in fact, imperative—where the plants occupy a warm, sunny position, which they always should do, and, being planted in rows, staking, as a safeguard against rough winds, is best done by fixing a stout stake at each end of the row where they are short ones, and carrying a horizontal rod across from one to the other, afterwards tying each plant to it. Liquid manure the colour of pale ale improves both the size and colour of the spikes, and, where required to remain in good condition for as long a period as possible, a temporary shade may well be erected over them. For church and, indeed general decoration, nothing beats *G. brechenleyensis*.

Genista æthensis (G.).—Flowering during July, and even until August, when the bulk of hardy trees and shrubs is past, this Broom ought, one would imagine, to be one of the best known of the species. But in spite of its great beauty and the lateness of its flowering, it is comparatively rare. Of the Brooms that can be cultivated out of doors in this country, it is the tallest and most tree-like in aspect, growing 15 feet high and forming a main stem 6 inches in diameter. Its mode of growth is somewhat sparse, yet elegant, the thin terete branches being pendulous and bearing scarcely any leaves. What few leaves there are occur at long and irregular intervals on the young shoots, and are each about a quarter of an inch long and quite narrow. The flowers, which are very freely borne, are of a bright yellow, and the plants are in beauty for over a month. The species is a native of Sicily and Sardinia, and one of its habitats is the sides of Mount Etna at altitudes of 3,000 feet to 6,000 feet. It is quite hardy, however, in this country and thrives in almost any soil. Its value as an ornamental shrub may be judged now by numerous specimens that are flowering in the arboretum at Kew.

Pæonies not flowering (W. D.).—These plants as a rule strongly resent removal, and take three to five years to again develop to a flowering stage. You were therefore fortunate in getting any plants to flower in 1903 after planting the previous autumn. As the plants are making "a great show of leaf" we should think all is well. This is discounted, however, by your statement that "the stalks are much thinner," whereas it should be the reverse. Are these thinner stems only on the plants that first flowered, or are they general? If the latter, then planting may be at fault, and you do not say how this was done. Could not you send an average stem growth that we may see the precise condition of it? This, we think, will be the best way to arrive at a more definite conclusion. We suggest this as the time for replanting will soon be here. You may also tell us how the plants were treated when first planted. We would have discouraged the first flowering because the plants had not then obtained a good hold of the soil, and to flower in these circumstances only conduces to after-weakness. Coupled with this, 1903 was not a good year for bud development in these plants, and upon the latter would the flowering or growth this year mainly depend. Before going any further here the soil from the crown of a plant or two, and if crowns are present of the size of the finger-tip, or even approaching to this, you have not much to fear.

Winter Tomatoes (N.).—The chief reason these do not yield full crops during the early winter months is more often than not owing to not starting the plants soon enough in the summer. Unless strong plants, 3 feet at least in height, are well set with fruit by the end of September, at which time they are taken indoors and placed in their winter quarters, it is hardly worth troubling with them, as they would not repay for the room and attention they require. Sturdy plants should now be ready for placing into fruiting pots. Nothing is gained by overpotting the plants, neither should they have very rich soil, or growth will be too free. Nine-inch pots and only three parts filled with soil will meet the requirements of the plants at first, as they can be top-dressed later on. Pot firmly, as this further tends to promote a sturdy growth. The plants should be stood in a sunny position, but not exposed to wind. A piece of slate should be placed beneath each pot to prevent the roots taking to the ashes or other material on which they are standing, as well as to prevent the ingress of worms. Although the plants are all the better for full exposure to the sun so long as they are copiously supplied with water, it is well to shield the pots from its full force, or many of the roots may suffer. It is easily done if the plants are stood in line about a foot apart by laying a 9-inch board against them, which is better than plunging the pots in ashes. It is better to keep the plants to a single stem, affording a stout stake to each, so that growth can be secured against wind as it develops. If the plants have become rather tall before they are potted, it would be wise to twist the stems round the pots, the object being to induce them to form fruit clusters from base to summit. Although it is considered neither necessary nor desirable to syringe Tomato plants at any time, a slight dewing, say twice a week after a very hot day, tends to keep the plants healthy without the risk of encouraging disease. Manure water will not be required until the plants are well furnished with fruit and this has commenced to swell.

Beech hedges (A.).—The Beech makes an excellent hedge on dry, shallow, or what the country people call a "hungry," soil, and soon gets quite dense. As you are probably aware, it retains much of its foliage, though dead—but yet beautiful with its warm brown colouring—all through the winter. This winter leafage helps to break strong winds. Plant the hedge in autumn, preferably as a dividing line in the garden, and get well-rooted trees that have been moved yearly in the nursery, so that they lift with plenty of fibres. Once the hedge is formed, clip it every year, unless a very high screen is desired. There are several Beech hedges in the British Isles, the most famous, perhaps, being the one at Mickleour, in Scotland. The Copper Beech is rarely used as a hedge, but there is one in the gardens of Ashwellthorpe Hall, Norwich; it is 138 yards long, 8 feet high, and about 5 feet through. It was planted about seventy years ago from seedlings, by the then owner, the Hon. and Rev. R. Wilson. The colouring in spring is very beautiful.

To make a small pond.—I have a pond well and constantly supplied by springs, falling in level in exceptionally dry times by not more than 2 feet. I am anxious to make another shallow one supplied from it, to serve as boundary to my lawns, &c., for which the levels are suitable. The soil is sandy loam, with much stone quite near the surface. There is no clay easily available, and I should like some hints about the construction of sides and bottom. I could not afford much wastage of water, but at the same time should like to utilise both pond and margins for suitable planting, therefore I want soil in the pond and damp margins.—W. (Cement, helping the concrete out with the stones that you have handy, the floor and sides of the pond. There is no better way, if no clay is available, and in any case concrete has certain advantages. Consult Miss Jekyll's book "Wall and Water Gardens." There is no difficulty about introducing as much soil on the floor or margins as the plants you wish to grow will require.)

Removing large trees.—We thank you for your kind expressions about THE GARDEN, but it is impossible to assist you unless we have fuller particulars. We give prominence to your letter in the hope that other readers who intend to ask questions may do so in a way to ensure a correct answer. But we can give this general advice about tree lifting, and that is, the operation is not simple, nor one to be undertaken haphazard. It involves much time, labour, and expense, in many cases far more than the worth of the trees. If your trees are from 8 feet to 10 feet high you can lift them, but when they are above that they should be seen by an expert, who would express an opinion as to whether the trees could be safely moved, and also give the probable cost. Trees and shrubs of moderate dimensions can be purchased from a nursery. They undergo a certain process, being regularly transplanted, and brought into fit condition for removal. Our experience is that it is not so often in removing the trees as in planting that the failures occur. A tree may arrive safely in the purchaser's garden and then be killed through careless planting, allotting the work to someone who knows nothing about it. More things are killed through sheer ignorance than many are aware of, and in the hurry to get a garden full of flowers and trees and shrubs in one year the evil is more manifest. A healthy tree well planted should not die, but when jammed into a hole half a size too small for its roots failure is certain. If you will tell us the dimensions of the trees and their names we will advise you further.

Violets in early spring.—I shall be much obliged if you will kindly tell me how to get Violets in early spring. I am greatly interested in the flowers, and have plenty out of doors, but want them quite early in the spring—I mean such varieties as Princess of Wales. Violets are so popular now, and so many beautiful varieties have been raised, that this question may possibly interest others besides me.—C. R. [Precisely this question was asked in the Journal of the Royal Horticultural Society some time ago, and the superintendent of the society's gardens, whose knowledge of Violets is considerable, says that in August or early in September a bed of not less than 1 foot deep of litter should be made and firmly trodden down. On this the frame or frames should stand. Then place upon the litter 6 inches of loam to which a little leaf-mould has been added, and on this plant the Violets, taking care to arrange matters so that the plants are not more than 6 inches or 8 inches from the glass. Give a good watering when all the plants are planted, and if the weather happens to be bright and sunny syringe them lightly overhead once or twice a day. The frame lights should not be put on at all at first unless it be very wet, and then the frames should always be well ventilated, not close shut. When the nights get really cold put the lights on, but even then give plenty—plenty—of air whenever the weather is favourable. The Violet can stand a good deal of cold, but what it cannot stand is a close, stuffy, muggy atmosphere. It almost lives on air. Judgment must be used in watering. Violets do not at all like to be quite dry, but wet, soaking, loose soil they dislike. Therefore water when really necessary, but always in the morning, when you can keep the lights at least open, so that the foliage may get quite dry before night during the short winter days. Whenever the thermometer stands at about 35° or 36° they will be all the sturdier if the lights are taken off altogether for a couple of hours in the middle of the day when the weather is bright and fine. Young plants raised from last spring's runners are much to be preferred to old ones; they produce a greater quantity of larger and more fragrant flowers.]

CATALOGUES RECEIVED.

Carnations, Picotees, Auriculas, and Daffodils.—Mr. James Douglas, Elderside, Great Bookham, Surrey.
General Catalogue of Bulbs.—M. Herb, Naples, Italy.
Strawberries and Small Fruits.—Messrs. Laxton Brothers, Bedford.

ROYAL HORTICULTURAL SOCIETY.

OPENING OF THE HORTICULTURAL HALL BY HIS MAJESTY THE KING.

FRIDAY, July 22, was a red-letter day in the history of the Royal Horticultural Society. The new Horticultural Hall in Vincent Square, which has been built to celebrate the centenary, was opened by His Majesty the King, accompanied by Her Majesty the Queen and H.R.H. Princess Victoria. If the ceremony was brief there was a joyousness and sincerity in the proceedings which augur well for the future. The Hall, fresh from the builders' hands, is commendably light, and the sun shone through the canvas screens on a brilliant assembly of horticulturists and representatives of allied scientific associations.

Although a great work has been accomplished, it must be remembered that £14,000 is still required before the new Hall is free from debt. It is a large sum and an anxious burden to the council, who have worked with unflagging enthusiasm to mark the centenary in a way that future generations can never forget. The building is a witness to the horticultural activity of the early years of the twentieth century, and to the unselfish work of men who have given, and are willing to give in the future, of their substance and labour to the furtherance of practical and scientific gardening in the British Isles. Men who are willing to do this, and to many of whom work is a pleasure and not a necessity, deserve the thanks of everyone interested in horticulture, and not the trade only, but those amateurs to whom the large exhibitions and the fortnightly meetings are both a delight and an instruction.

The history of the society has been written in our pages, and it is recorded in the excellent treatises that have been

published recently by the society. The succinct review by the President, Sir Trevor Lawrence, Bart., gives in a pleasantly lucid way the beginnings, the trials, and the triumphs of an organisation that for present vigour is unmatched, and this result is the outcome of the fostering care of the council. Many who worked loyally in the past have gone to the great unknown, but their labours have helped to build up this great institution.

We are ever mindful of past friends, but those living amongst us deserve their meed of praise, and it is surely Sir Trevor Lawrence, Bart., and the Rev. W. Wilks, the secretary, who have borne the greatest burdens through the long and weary years that have passed since the society was rescued from the trammels of an unhappy and almost disastrous policy. A quiet determination to build firmly on a sure foundation, and that foundation horticulture, brought about the gathering together on July 22 in a crowning work, which men prompted by the right motives in the future will carry on as the years roll by.

There was one figure in this large assembly to whom one's thoughts were instinctively directed, and that the aged Baron Schröder,

whose munificent contribution to the building fund of £5,000 and a further gift of furniture for the famous Lindley Library are fresh in mind. Many years ago the Baron attempted to launch a scheme for a New Hall without success, but the centenary gave an opportunity of again urging the need of something more respectable than a Drill Hall in a narrow and dirty street. To one so devoted in his love for horticulture the opening of the Hall by the King will remain a pleasant incident in a long and busy life, and those who have not subscribed will gratify Baron Schröder if they will do so, to free the Hall from debt before the centenary year closes in the March of 1905.

The arrangements were admirable. Members of the council and others, with green wands in their hands, conducted the guests to their seats between eleven o'clock and noon, when the doors were closed for the reception of their Majesties half an hour later. It must not be forgotten that thanks are due to the council and the office staff for the smoothness of the arrangements, and we may mention by name, apart of course from the higher officers, Mr. S. T. Wright, the superintendent of the shows and of the Wisley Garden, Mr. Frank Reader, Mr. Hutchinson, and Mr. Plowman.

The string band of Lieutenant Charles Godfrey, M. V. O., was stationed in the musician's gallery and played selections of music before and after the opening proceedings, and a Guard of Honour of the Cadet Corps of the boys of Westminster School was stationed at the main entrance to the building.

The King and Queen, who had driven to the Hall by way of Victoria Street and Ashley Gardens, arrived shortly after half-past twelve. Their Majesties were received by Sir Trevor Lawrence, Bart. (president of the society), and by Sir John Llewelyn, Bart. (a vice-president), Baron Sir

INTERIOR OF THE ROYAL HORTICULTURAL HALL.

Henry Schroder, Bart. (chairman of the building committee), Mr. J. Gurney Fowler (treasurer of the society), the Earl of Ilchester, Captain Holford, C.I.E., the Hon. J. Boscawen, Mr. W. Bilney, Mr. G. Banyard, Mr. J. Hudson, Mr. F. G. Lloyd, Mr. W. Marshall, Mr. H. B. May, Mr. A. H. Pearson, Mr. H. J. Veitch, and Mr. A. L. Wigan, members of the council, and the Rev. W. Wilks (secretary), all of whom were presented to their Majesties by the president. The King and Queen were then conducted to the platform, the Home Secretary being present as Minister in attendance.

In the decoration of the Hall for this occasion, as little was attempted as possible, in order to show the exact dimensions and character of the building. The platform was covered in crimson baize and was of hexagonal form, and consisted of three wide steps gradually rising to the main level, which was approached by a wide stairway in the centre. A large Indian carpet with a white ground was placed beneath the two Louis XIV. chairs of carved wood, gilt and upholstered in old crimson damask, and surrounded by similar chairs for the suite, members of council, and others. There was a background of Palms, white Hydrangeas, and Lilies, arranged by Messrs. J. Veitch and Sons.

Among the other guests who were accommodated on the platform were the Right Hon. the Earl of Onslow, G.C.M.G., the Russian Ambassador, the Austro-Hungarian Ambassador, Lord Medway, Lady Lawrence, Miss Lawrence, Sir George Birdwood, K.C.S.I., Sir Cecil Clementi-Smith, G.C.M.G., Sir Thomas Elliott, K.C.B. (Secretary to Board of Agriculture), Sir Thomas Hanbury, K.C.V.O., Sir A. J. Reynolds (Sheriff), Sir W. Threlton-Dyer, K.C.M.G. (Director of Kew), Sir William Treloar, Mr. Burdett-Coutts, M.P., Major Haggitt, R.E., Major Hussey, R.E., Mr. Gerald Loder, M.P., Dr. Maxwell T. Masters, F.R.S., the Rev. Professor Henslow, M.A., and the Rev. W. H. Twining, Rector of St. Stephen's, Westminster. Among other distinguished personages who accepted the invitation of the President and Council to be present were the Earl and Countess Grey, the Countess of Donoughmore, the Viscountess Sherbrooke, the Lady Llangattock, Lady Arbutnot, Lady Musgrave, Lady Faudel-Phillips, the Hon. Mrs. Boyle, Sir James Blyth, Bart., Sir Daniel and Lady Morris, Sir Walter Murton, Mr. H. L. Bischoffsheim, Professor G. S. Boulger, Mrs. Stephenson Clarke, Dr. M. C. Cooke, LL.D., Mr. Jeremiah Colman, the Rev. G. H. Engleheart, Mr. F. du Cane Godman, the Rev. Dr. Gow (Headmaster of Westminster School) and Mrs. Gow, Dr. Rutherford Harris, Miss Lindley, Dr. George Murray, F.R.S., Colonel Wyndham Murray, the Rev. Canon Page-Roberts, Dr. A. B. Rendle, Dr. J. Augustus Voelcker, Professor Marshall Ward, F.R.S., and the Mayor of Westminster.

Sir Trevor Lawrence read the following address:—

May it please your Majesties,—

We, the president, the vice-presidents, the council, and the Fellows of the Royal Horticultural Society—who now number more than 8,000—venture, with our loyal duty and greeting, to welcome your Majesties to our New Hall. The centenary of the society, which was founded in March, 1804, is rendered memorable by the erection of the building in which we are assembled, and by the acquisition, through the generosity of Sir Thomas Hanbury, K.C.V.O., of a celebrated garden, in place of that at Chiswick, which had become unsuitable for the purposes of the society owing to the advance of suburban London westward. The first charter of the society, granted by his Majesty King George III. in 1809, set out the objects for which the society had been founded—namely, “the improvement of horticulture in all its branches, ornamental as well as useful.” Through the collectors sent out by the society during the forty years from 1821 to 1861, great numbers of beautiful and useful trees, shrubs, and plants have been introduced into, and acclimatised in, the British Isles. The success attending these expeditions may be realised when the late Mr. Andrew Murray was able to say, with undeniable truth, in his “Book of the Royal Horticultural Society,” “the results”

(of the work of the society's collectors) “have affected the appearance of all England. Nowhere can a day's ride now be taken where the landscape is not beautified by some of the introductions of the Royal Horticultural Society.” Added to this, professional gardeners have been greatly assisted and encouraged by the help and support of our society in the elaborate and valuable work of hybridisation and selection, by which new and improved varieties of plants, fruits, and vegetables have been raised in vast numbers. The fortnightly shows of the society have achieved a widespread celebrity. At them all the more interesting new plants, as well as the more important results of skilled horticultural effort, are first seen and first submitted to the judgment of the most competent experts in the kingdom. The adherence of the society to the work of promoting horticulture in all its branches can hardly fail to secure the approbation of the garden-loving race over whom your Majesty reigns. This is shown by the rapid increase in the number of its Fellows, which has risen from about 1,300 in 1887 to 8,150 now. Every day witnesses advances in many directions, but no art or science has progressed more rapidly during the last fifty years than that of horticulture. The demand for flowers and fruits has grown to such an extent that it has developed a great and valuable industry, and the countenance which your Majesties have graciously extended to our society has largely assisted in creating, guiding, and helping this valuable national asset.

We take this opportunity of expressing our enduring obligations to your Majesties for the many and gracious visits you have in years past paid to our society's shows—visits which have done much to encourage us in our efforts to foster and maintain in the highest efficiency the science and art of horticulture. And in thanking your Majesties for your presence here to-day and for the warm interest you have ever shown in the society, we desire to assure you that the valuable help the illustrious Prince Consort gave the society in days of serious difficulty—now some forty-five years ago—has never been forgotten.

In the order of the ceremony it was arranged that at this point the following report of the building and appeal committee should be read by Mr. Gurney Fowler, but the report was taken as

read, and was presented to the King by Baron Sir Henry Schröder, Bart.

May it please your Majesties,—

On behalf of the building and appeal committees, we venture humbly to submit the following report on the erection of the building in which we are honoured by your Majesties' presence to-day. For very many years the fortnightly and other shows of our society have been one of the most effective means towards securing the objects we have in view, viz., the diffusion of more correct knowledge of what plants should be grown, and of how they may and should be cultivated. These fortnightly gatherings were first held at the society's early home in Regent Street, and for many years afterwards they took place at South Kensington. When, however, in 1887, the gardens there were surrendered to the Royal Commissioners of the 1881 Exhibition, the society moved their shows to the Drill Hall of the London Scottish Volunteers, at Buckingham Gate, Westminster, where they have been held up to the present time. They have been ever increasingly popular, and the society has enjoyed the favour and support of horticulturists, and of the public generally, without interruption. A few years after the removal of the shows to the Drill Hall, we began to find the accommodation insufficient, the hall being at times inconveniently crowded both by exhibitors (who have often not had sufficient space to properly stage their exhibits) and by Fellows of the society, and others, who have not had proper facilities for seeing and studying the plants shown. At the same time the office accommodation at Victoria Street, Westminster, which has always been very limited, has for many years been wholly inadequate for carrying on the increasing general office and routine work of the society. Your Majesty, as long ago as 1890, addressed the Fellows in the following words: “I sincerely hope your labours to obtain a hall may be successful, for I feel sure it would be of the greatest use and advantage.” Since these encouraging words were spoken the need for the hall has increased beyond all expectation, and the project has never been absent from our hopes and our thoughts; and it is this hall and building, the final result of many long years of hope deferred, but of sustained effort, that your Majesty has graciously consented

EXTERIOR OF THE ROYAL HORTICULTURAL HALL.

to declare open to-day. Much difficulty was experienced in finding a suitable site for the building, but we are happy in thinking that our present situation leaves nothing to be desired. Funds had also to be collected, and more than 1,300 donations have been received from all classes of the horticultural community and others, amounting in all to £26,000. £14,000 still remains to be raised before the society can regard itself as the unfettered possessor of its hall and building fully equipped. The main purpose of the building is the holding of our fortnightly shows, but other interests have not been lost sight of, and we have reason to believe that the Hall will often be in demand for numerous other purposes. In addition to the Hall, we have now ample office accommodation and a proper home for the Lindley Library, which is of such great use to all students of horticulture.

The King replied to the society's address as follows: In the name of the Queen and myself I thank you for your loyal and dutiful address. I am very glad that you have at length obtained a suitable hall for your beautiful and interesting shows and adequate accommodation for your library, and for the performance of the official work of the society; and it is with great pleasure that the Queen and I are here to-day to declare these new buildings to be open. We are pleased, also, to be able to congratulate the society upon their having acquired the garden to which you allude, and for which you are indebted to the goodness of Sir Thomas Haubury. The love of horticulture has increased immensely in this country within the last century, owing in part, no doubt, to the greatly extended facilities enjoyed by our people for visiting rural places; and no science deserves more encouragement than that which tends to promote the study of the art of gardening, and to stimulate a taste so wholesome and elevating as the love of trees and of flowers. Our visits to your exhibitions have always given us great satisfaction; and I remember, and am touched by your

allusion to, the interest which my dear father took in your society. The Queen and myself wish that every success may attend the opening of this New Hall and its adjoining premises, and trust that the centenary which we are celebrating to-day may prove to be the occasion of an accession of prosperity to the Royal Horticultural Society.

Congratulatory addresses on behalf of the Société Royale d'Agriculture et de Botanique de Gand (Belgique) and the Horticultural Society of Prussia were presented by Dr. Maxwell Masters, F.R.S., on behalf of Comte de Kerchove de Denterghem, and Baron von Cramm and Professor D. L. Wittmack respectively. A congratulatory address was presented from the National Rose Society by Mr. Edward Mawley, the honorary secretary. These addresses were taken as read. Mr. Edwin Stubbs, the architect, was then presented to the King, and submitted plans of the offices erected in conjunction with the Hall.

His Majesty next, at the request of the president and amidst cheers, declared the Hall open in the following words: "I declare this magnificent Hall now open."

Lady Lawrence then presented a bouquet of Orchids to the Queen, and Princess Victoria accepted one made of Malmaison Carnations from Miss Lawrence. This closed the proceedings, and their Majesties left the Hall.

[We have received from Mr. Henry Cannell, Swanley, Kent, a copy of a pamphlet written and distributed by him in 1890, pointing out the great need of the Royal Horticultural Society for a proper home, and expressing the wish that "we hope to live to see the day when we have a hall worthy of the Royal Horticultural Society."]

THE FIRST SHOW IN THE ROYAL HORTICULTURAL HALL.

The first exhibition of the Royal Horticultural Society in the New Hall, which was opened on the 22nd inst. by His Majesty the King, was held on

Tuesday last; the National Carnation Society held their annual show on the same occasion, occupying half the Hall with their exhibits. The remaining space, however, was filled with miscellaneous exhibits of plants, flowers, and fruits, chief among the latter being a collection of nearly 100 dishes of Gooseberries in eighty-seven varieties, which was awarded the Hogg Memorial medal. Orchids were not numerous shown, although several new and interesting ones were among them. Hardy and tender plants and flowers were well represented, and altogether the first exhibition in the New Hall may be said not to have been unworthy of it. In the afternoon a lecture on "Orchids, Varieties and Hybrids," illustrated by limelight views, was given by Mr. John Bidgood. One hundred and twenty candidates were elected Fellows of the society.

ORCHID COMMITTEE.

Present: Mr. Harry J. Veitch (chairman), Baron Sir Henry Schroder, Bart., Messrs. James O'Brien, de B. Crawshaw, H. J. Chapman, H. A. Tracy, W. H. Young, J. G. Fowler, H. Little, W. Boxall, F. J. Thorne, J. Wilson Potter, H. Ballantine, A. A. McBean, F. W. Ashton, John Odell, H. T. Pitt, Richard G. Thwaites, Norman C. Cookson, Frank A. Rehder, J. Charlesworth, Jeremiah Colman, H. M. Pollett, and James Douglas.

Messrs. Charlesworth and Co., Heaton, Bradford, had some beautiful *Vanda coelestis* in the centre of their group, which included several excellent hybrid Cattleyas and *Laelio-Cattleyas*. *L.C. callistoglossa* was very handsome, and *Brassia-Cattleya digbyana*, *C. gaskelliana* alba, and *Brassia-Lelia purpurata-digbyana* were other beautiful things. *Dendrobium filiforme*, *Calochortus sanderiana*, and *Cypripedium* Mrs. Herbert Druce (*niveum* × *bellatulum*), too, were shown, making a group full of good plants. Silver-gilt Flora medal.

Messrs. Sander and Sons, St. Albans, in their group of Orchids showed very good *Cattleya warriniana*, *C. Vulcan* (*Mossie* × *schroderiana*), *C. gaskelliana* alba, *C. Shakespeare*, *Laelio-Cattleya hutchleyensis*, *L.C. Atalanta*, and others, as well as *Saccolabium retusum* (very beautiful), *Dendrobium superbum*, *Catasetum macrocarpum viride*, several *Cypripediums*, *Dendrobium filiforme*, *D. fytchianum*, *Vanda limbiata*, *Polystachya leonensis*, and other well-flowered Orchids. Silver Flora medal.

Messrs. Hugh Low and Co., Enfield, exhibited very fine *Cypripedium gigas cordeanum*, *C. l'Ansoni* (*Morgane* × *rothschildianum*), *C. Maudie*, *C. shillanum*, *Phalaenopsis violacea* (sweetly scented), *Lycaste tricolor*, *L. leucantha*, *Dendrobium cruentum*, *Odontoglossum williamsianum*, *Bollea celestis*, and *Cattleya Mary Gratrix*. *Mormodes buccinator aureum*, with bright orange flowers, and *Brassavola digbyana* were other plants of more than ordinary interest and beauty in this group. Silver Flora medal.

J. Colman, Esq., Gatton Park, Reigate (gardener, Mr. W. P. Bound), showed a small group of Orchids, in which were *Sobralia Veitchii*, *Cattleya Harrisonii*, *Phalaenopsis amabilis*, *Stanhopea Wardii*, *Cypripedium callosum* Sanderi, *Lycaste leucantha*, *Nanodes Meduse*, and a good plant of *Lelia xanthina*. Silver Bank-sian medal.

Two splendid plants of *Oncidium lanceanum* were shown by W. W. Mann, Esq., Bexley, Kent.

H. T. Pitt, Esq., Stamford Hill, N., showed *Sophrocattleya chamberlainiana* Rosslyn var., *Cattleya thurgoodianum*, and *Odontoglossum Uro Skinneri* album. Cultural commendation.

Masdevallia harryana alba was shown by Messrs. A. J. Keeling and Sons, Westgate Hill, near Bradford.

Francis Wellesley, Esq., Westfield, Woking (gardener, Mr. Hopkins), sent *Cypripedium harveyianum* (Stonet × *leanum*) and *Lelia Iona ignescens* (*tenebrosa* × *dayana*), with rich, velvety purple lip and bright purple sepals and petals.

Cattleya gigas var. *White Queen* was shown by W. N. Enckinshaw, Esq., Hesse, Hull (gardener, Mr. Barker). It is a handsome flower, sepals and petals pure white, with a rich purple lip.

E. W. Beckett, Esq., M.P., Wood Lee, Virginia Water (gardener, Mr. G. Bartlett), exhibited a cut raceme of a *Renanthera*, supposed to be *coccinea*, from Japan, a very handsome species, with rich orange-red flowers.

OPENING OF THE NEW HALL BY HIS MAJESTY THE KING, WHO WAS ACCOMPANIED BY HER MAJESTY THE QUEEN AND H.R.H. THE PRINCESS VICTORIA.

THE GARDEN

No. 1707.—Vol. LXVI.

[AUGUST 6, 1904.]

AVENUES.

SO much has been written from time to time on this subject that it is a difficult matter to say anything new respecting it. As with almost everything else, avenues have had to submit to the caprices of fashion; at one time they have been advocated, at another denounced. During the eighteenth century it was as much the fashion to abolish or break up lines of trees as it was the custom a century earlier to plant them in that way. But if it had not been for the avenue planters of the sixteenth century many grand old English residences would have been shorn of what we consider nowadays to be among their finest features. There is an imposing grandeur about most of these old avenues; the massive boles of the trees and their ponderous limbs overhanging and meeting have their counterpart only in the vaulted roof of our grandest Gothic cathedrals, and the gloomy shade that invariably accompanies such an avenue imparts to it quite an air of solemnity.

The worst things that have been said against avenues are that they are formal, and that as a rule they cut up places and destroy all breadth of effect; also that there is a monotony about them that makes all places look alike, however diverse their surroundings—all certainly strong objections, for nothing is worse than formality in garden design, though parallel lines of trees may in certain cases be in strict conformity with the immediate surroundings. Besides, as has just been stated, there is a certain degree of stateliness in formal lines of grand trees such as cannot be obtained by other means, and if the long gradation of perspective leads to a definite object in the distance, nothing can well be more appropriate. The second objection—that avenues cut up the place—is simply a question of proper position. We have seen some avenues where they do not interfere in the least with the surroundings, that is, as regards shutting out a view or destroying breadth of effect; but where an uninterrupted avenue cuts up a beautiful park into two distinct portions, such as the Long Walk in Windsor Park, then it is objectionable. The position of an avenue cannot in all cases be determined by any arbitrary rule; on the contrary, the peculiarities of the situation and the exigencies of the case must be taken into consideration. The objection that avenues give to all places an appearance of sameness when laid out in a stereotyped way is also a

valid one; nothing could well be more formal than avenues radiating in all directions from the house or some other principal object as a centre. There are, happily, but few examples of this way of dealing with avenues to be seen at the present day, at least in this country, though they were plentiful enough till the dawn of the English or natural style of gardening.

In making an avenue there are various points to be considered; the soil, locality, and climate must be taken into account, and the class of trees best suited for the purpose should always be planted. Had these matters been considered we should not now see so many bad examples of avenue planting as at present exist. If a quickly formed avenue be required it is useless to plant such slow growers as Oaks, and if a narrow overhanging one be the object in view the Lombardy Poplar is not the tree to select. One of the chief essentials of a perfect avenue is that it should be composed of a single species or variety, for if otherwise the slightest difference in growth or tint of foliage will be plainly discernible when the trees are ranged side by side. Uniformity of size is another point to consider also, and at the time of planting all the trees should be well balanced both in root and top, and of straight growth.

The choice of any particular kind of tree for an avenue is a matter of taste, but among the deciduous class the following should be placed in the foremost rank, viz., the Horse Chestnut first, then the Lime, Spanish Chestnut, Beech, Elm, and for street planting the Western Plane and the Acacia, particularly the variety *bessoniana*, which differs from the rest in being very compact in growth, never forming the ugly wide-spreading boughs which characterise the typical form. The Lime is objectionable in a town, as it has a tendency to turn rusty before autumn has well set in. The majority of old avenues in this country are composed of Elm, Lime, Horse and Spanish Chestnut, Oak, and Beech, but to these may be added the Sycamore, False Acacia, Plane, and the various Poplars, including the Lombardy, which latter is very distinct in character, owing to its vertical growth and towering height. Twenty years ago it was the fashion to plant avenues of conifers, but unfortunately the majority of them are unsuitable. The result of ill-considered planting of avenues is seen in many parks to-day, and the result simply of the conifer craze that existed in the past.

LILIES AT KEW.

THE Japanese *Lilium Hansonii*, which has petals that appear to be carved out of solid wax, has been, as usual, very fine this season, but in common with many of the earlier-flowering sorts it is now long past. Of the species that flower during the month of July the North American Panther Lily (*L. pardalinum*), which is strongly represented at Kew, has yielded a fine display, particularly the clumps in the Rhododendron beds, where the young shoots are sheltered from the cutting winds in spring, and the bases of the stems from the sun later on. On the evening of a hot summer day, when the sheaves of stems with their crowd of gracefully-recurving, bright-coloured blossoms were lit up by the rays of the declining sun, they formed one of the most striking pictures that I had seen for some time. The Panther Lily is very prolific in varieties, or perhaps I should say varietal names, for there is practically no difference between many of them. Certainly they do not show such a marked divergence from each other, and from the typical form, as the allied *L. superbum*, the varieties of which are seldom, if ever, classified.

Burbank's Lilies (for this appears a better definition than *Lilium Burbankii*) have this year been very fine, but for all this it is a source of regret that they were ever distributed in such a way. We were told that they resulted from intercrossing *L. pardalinum* and *L. washingtonianum*, but I have in every instance failed to find any traces of the latter. Some of those at Kew are *L. pardalinum* pure and simple, while the others in every way suggest a hybrid between this just-named species and *L. Parryi*. These are among the most vigorous of all the Burbanks. These species with creeping rhizomatous bulbs are particularly well suited for associating with Rhododendrons, as a soil largely composed of vegetable matter just meets their requirements, whereas another species now at its best is only seen to advantage in a good deep loam. This is the Scarlet Martagon (*L. chalcedonicum*), whose Turk's-cap-like flowers are of a bright sealing-wax red tint. It, in common with *L. candidum* and *L. Martagon*, is more frequently met with in a flourishing state in cottage and farmhouse gardens than in more pretentious establishments, the principal reason being that they greatly resent disturbance at the roots, and once established they remain unmolested, occupying perhaps the same ground that they have done for generations. It is long since I have seen the pretty little upright-flowered *L. philadelphicum* so fine as it has been this year at Kew, a small round bed being dotted with numerous spikes of its bright-coloured blossoms.

In the Himalayan portion of the Temperate house are fine specimens of *L. auratum macranthum*, or *platyphyllum*, *L. Henryi*, and *L. sulphureum*. In this structure, which is

unheated except during severe frost, *L. auratum* seems to have a congenial home, at all events I saw no traces of that mysterious disease so fatal to *L. auratum* out of doors. The variety *macranthum*, or *platyphyllum*, just alluded to, is a very fine form, with large broad leaves and massive saucer-shaped blossoms.

Of *L. Henryi* little need be said, for though of comparatively recent introduction it has proved so amenable to our climate that it is to be met with wherever a collection of Lilies is grown. Already we have a hybrid (*L. Kewense*) between this species and *L. Brownii* Chloraster. The third to mention of those in the Temperate house at Kew is *L. sulphureum*, which, when first introduced from Upper Burma some fifteen years ago, was distributed under the name of *L. wallichianum* *superbum*. This is represented by a fine clump, the stems of which average about 6 feet in height, and are well furnished with foliage. From the axils of the leaves on the upper part of the stem bulbils are produced after the manner of the Tiger Lily. The long trumpet-shaped flower is white, tinged with reddish brown on the exterior, while the tubular portion of the inside is yellow.

After passing in review these different Lilies one comes to a group which has long puzzled me, and concerning which there are many conflicting opinions. I refer to those classed under the heads of *Brownii* and *japonicum*, which, in my opinion, at least need revision. Take first the case of *Lilium Brownii*, which is in all respects a well-marked Lily. It has been long grown in this country, and is now and has for years been largely cultivated by the Dutch, but for all this its early history seems to be unknown. At Kew the Lily grown as *L. Brownii* is the *L. japonicum* Colchesteri of the "Kew Hand List," also known by the name of *L. odorum*. The fact that it is mistaken at Kew for *L. Brownii* should be sufficient evidence that the two are nearly related, yet *Brownii* is considered a distinct species, and the other a form of *L. japonicum*. This last name is in the "Hand List" referred to as the correct title of the Lily so long grown in gardens as *L. Kramerii*, between which and its so-called variety Colchesteri the only affinity is that they are both members of the same section of the genus *Lilium*. Again, the Lily known as *L. Brownii leucanthum* recently flowering at Kew is indistinguishable from *L. sulphureum*. If *L. Colchesteri* or *odorum* is a variety of *Kramerii* then the better way will be to reduce the species of *Lilium* to five, corresponding with the sub-genera, and make all the other varieties of it, for surely *L. rubellum* is far more nearly related to *Kramerii* than either *L. Colchesteri* or *Alexandrie*, yet the distinctness of *L. rubellum* is never questioned. It seems to me that matters would be much simplified by discarding the mythical *L. japonicum* and including Colchesteri in the *Brownii* section. H. P.

NOTES OF THE WEEK.

FORTHCOMING EVENTS

August 9.—Royal Horticultural Society's Meeting in New Hall, Vincent Square, Westminster.
August 10.—Royal Botanic Society's Annual Meeting; Ventnor, Sevenoaks, and Bishop's Stortford Flower Shows.

August 11.—Taunton Deane Horticultural Show.
August 13.—Sheffield Horticultural Show.

August 16.—Exmouth (two days) and Clay Cross Horticultural Shows.

August 17.—Shrewsbury Floral Fête (two days); Tynemouth (two days) and Calne Horticultural Shows.

The Gardeners' Royal Benevolent Institution and the Press.—At a meeting of my committee, held on the 22nd ult., the following resolution was unanimously adopted, which I was desired to forward to you: "That the best thanks of this meeting be tendered to the Editor of THE GARDEN for his kind services rendered to the institution at all times, and especially in connexion with the recent successful and record festival dinner in aid of the funds."—GEORGE J. INGRAM, *Secretary*.

Montbretias at Belgrove, Queens-town.—The following hybrid Montbretias are flowering in Mr. Gumbleton's garden at Belgrove: *Aureole*, *Le Pactole*, *Tête Couronnée*, *George Davidson*, *Grenade*, *Germania*, *Victor Welker*, *Flamboyant*, *Etoile Polaire*, *Europa*, *Gloire de Celle St. Cloud*, *Globe d'Or* (double-flowered), *Transcendant*, *Pottsi grandiflora fl.-pl.*, *Messidor*, *Fantaisie*, *Monsieur Jacquean*, *Surprise*, and *Rayon d'Or*.

Sweet Pea Scarlet Gem.—This is one of Mr. Henry Eckford's novelties for 1904, and it answers the expectations formed of it. It has a broad, bold, upright standard, the other parts of the flower in keeping, the colour bright scarlet-crimson. With me it is a strong grower, producing its blossoms in pairs. Probably in a stronger soil than mine three flowers may put in an appearance on a stem. I regard it as an excellent addition to the rich-coloured Sweet Peas.—R. D.

Carnation Germania.—This yellow self Carnation, which was distributed by Mr. Ernst Benary of Erfurt many years ago, was seen in good character at the recent exhibition of the National Carnation Society at the Horticultural Hall. It lacks the size of *Daffodil*, *Cecilia*, *Mrs. M. V. Charrington*, and other new varieties, but it comes in refined character, and needs but little dressing for the exhibition stage. It lacks the vigour of constitution of some of the newer varieties, but it will be grown as a self yellow for some time to come.—R. D.

Potato Ringleader.—I am pleased to see that Mr. Wythes has nothing but praise for this Potato. I grew it when it first came out, have never failed to do so since, and have recommended it widely, as it possesses all the properties of a desirable early variety. It may not suit some of our leading vegetable exhibitors, because it is not large enough, but if any of the large show tubers were cooked with Ringleader the latter would be first easily. For frame culture it is excellent on account of its dwarf haulm, earliness, and good quality. Another point about this Potato is that it cooks well in October as well as July. What other early variety can the same be said of? May 28 is the earliest date I have dug here.—E. MOLYNEUX, *South Hants*.

Glasgow Botanic Gardens.—On the occasion of the meeting of the twenty-second annual congress of the Sanitary Institute, held in Glasgow recently, the members of the institute were entertained by the corporation of the city at a garden party in the Botanic Gardens. The gardens were looking almost their best, and much gratification was expressed by many of those present at the success attained in growing many plants under such adverse conditions as prevail in the smoke and fume-laden atmosphere of the city. The beds were bright and effective, while the many rare plants indoors attracted much notice. The *Nymphaeas*, of which there is a large collection, both inside and in the pond outside, were greatly admired. Mr. James Whitton, the superintendent of the city parks, deserves high credit for the improvements effected within recent years in the Glasgow Botanic Gardens.—S.

Ivy on walls.—It is strange anyone can cherish so apparent a delusion that Ivy upon walls generates dampness or has any tendency whatever in that direction. There is, I am aware, great difference of opinion upon the point, but I cannot see and have never heard advanced a single sound argument, or been shown an example to prove that it tends to keep walls damp. The most casual observer would seem to draw conclusions of an opposite nature. The Ivy clings to the wall by myriads of roots, and these would quickly absorb

any moisture there present. If a wall is properly built and has become dry, it cannot afterwards become moist except from atmospheric influences, whilst, if covered with Ivy, the mantle of foliage would shield it from rain, even driving rain that thoroughly wets naked walls, and if by chance any water penetrated through the leaves, there are the stem roots ready to absorb it. Obviously the wall must be drier and warmer. I do not know if anyone would support the theory that it generates dampness upon the assumption that the Ivy with its main roots in the soil is pumping up water into stem and leaf in order to sustain life and promote growth. None of this moisture would be parted with except by evaporation through the medium of the foliage, and under influences and in a manner that could not affect the wall.—A.

Fuchsia triphylla.—Although this Fuchsia was discovered on one of the West Indian Islands as long ago as the end of the seventeenth century, and is the species on which the genus is founded, it is only within the last few years that it has been introduced to this country. It is one of the most distinct and beautiful in the genus, its flowers being of a brilliant orange-red. They are produced in dense, drooping racemes from the ends of the shoots, each flower measuring 2 inches to 3 inches in length. The foliage is also very handsome, having a deep reddish purple tinge, especially on the under surface. In regard to cultivation, this species differs somewhat from the rest of the Fuchsias, and cannot be said to be so easily grown as they are. It is of tenderer constitution, and although it will grow and flower to a certain extent in an ordinary greenhouse, it thrives much better when given a higher temperature, and may even be grown in a mild stove heat. Judging by the distinct and rich colour of its flowers, it will no doubt prove a valuable subject for hybridising.

Cornflowers.—Whatever the charms of the rare and costly flowers of the season may be, the Cornflower of our fields is one of the best, and we should like to see every gardener giving it a good place. There is no more valuable subject for cutting. Strong autumn-sown plants grown in good soil are well worth having for the sake of cutting alone, and a bed or several lines of Cornflowers should be raised every year in the nursery or reserve ground, if not elsewhere. The bunches of the blue variety, which has been such a favourite this season, have a Gentian-like vivacity of tone, which nothing else resembles or comes near. No garden in which flowers are valued should ever be without a mass or a few tufts of it.

French Horticultural Society of London.—On the 28th ult. the members of this flourishing society and a number of friends paid a visit to Mr. Harry Veitch at East Burnham. The company, numbering nearly sixty persons in all, were met at Slough Station by Mr. Veitch and conveyed in brakes to his home, where a welcome repast was served in a marquee on the lawn. Time being short there were no speeches, but a very hearty cheer was given to the host and hostess on leaving. Mr. Veitch personally conducted the party round his garden and grounds, and much interest was evidently excited in the minds of the young foreigners as the various objects were inspected. The house, partly built by Grote the historian, has been added to of late years, and is a charming home situated in one of the most delightful parts of the country. Leaving East Burnham, under the guidance of Mr. Veitch, the company mounted the brakes again, and passing through Burnham Beeches proceeded to Dropmore. Here they were met by Mr. Page, the gardener, and were shown round the flower garden, the glass houses, and the grounds, where due note was taken of the many fine trees and shrubs. The weather was fine, and the outing much appreciated by all those who were able to accept Mr. Veitch's kind invitation.

Royal Horticultural Society.—One hundred and twenty candidates were elected Fellows of the Society on the 26th ult. These included the Duke and Duchess of Portland, the Countess of Gosforth, the Countess Russell, the

Dowager-Duchess of Sutherland, the Viscount Baring, Lady Knightley of Fawsley, Sir Samuel Montagu, Bart., Lady Collins, Lady Corbet, Lady Dunglass, Sir W. B. Forwood, Vice-Admiral Sir George Nares, Sir Condy Stephen, the Hon. Mrs. Elliot, Mr. Alfred Ashworth, and Mrs. Reginald H. Cholmondeley. The next show and meeting of the society will be held in the new Hall on Tuesday next, when a medal will be specially offered for a collection of cactaceous plants.

Glasgow and West of Scotland Pansy Society.—This society had its annual exhibition of Pansies, Violas, Pinks, herbaceous plants, and Roses in the Trades Hall, Glasgow, on July 20. The number of entries, which amounted to over 500, showed an increase over last year, and the quality was generally good. Mr. John Smellie, Busby, was again successful in winning the championship gold medal with forty-eight magnificent blooms of fancy Pansies. This is the sixth time that this trophy has been won by the same exhibitor. The silver cup for twenty-four fancy Pansies was won by the expert Pansy grower, Mr. Charles Kay, Gargunnoch. The attendance of florists was large, and showed that the interest in these flowers in the West of Scotland is still very keen.

Swertia perennis.—For half shady spots or peaty beds, one of the best plants in flower at present is the charming *Swertia perennis*. It is a very interesting perennial plant belonging to the Gentian family, and produces spikes 2 feet to 3 feet high of prettily spotted grey-purple flowers. When the clumps are large it makes a fine show, and as the basal leaves are always interesting, it is well worth possessing by those having proper accommodation. It is propagated by division, which may be readily done in the autumn months.

Lilium philadelphicum.—The limited number of Lilies belonging to the Isolirion or upright-flowered group are all natives of Europe and Asia, except that at the head of this note, *Lilium philadelphicum*, and the nearly related *L. Catesbæi*. *L. philadelphicum* is of wide geographical distribution, occurring as it does naturally through Canada and the Northern United States, stretching westward to the Rocky Mountains, and southward along the Alleghenies to North Carolina. From this one might expect it to thrive here, but for some reason or other it is rarely met with in a flourishing state, though from its beauty and distinctness it well repays any extra attention that may be bestowed upon it. A small circular bed at the back of the Palm house at Kew has this July been much admired for the fine display of *L. philadelphicum*. The slender stems, from 1 foot to 18 inches in height, are furnished with small, narrow leaves, arranged for the most part in regular whorls, while the terminal umbel consists of two to four or five flowers. These are about 3 inches across, the segments being of an orange red colour, marked with yellow at the base, and freely spotted on the basal half. A distinct feature of this Lily are the stalked segments of the flower, which give to it a singular appearance, by which means it can be readily detected from any other species except the allied *L. Catesbæi*.—H. P.

Buddleia variabilis veitchiana.—For many years the only fairly large representative of the genus *Buddleia* was the Orange Ball Tree (*B. globosa*), which was introduced from Chili as long ago as 1774. It still stands out as the only New World species that we have in our gardens, for most of the *Buddleias* are natives of China, the Himalayas, Tibet, and adjoining regions. Some of them, notably the gorgeous *B. Colvillei*, are too tender for outdoor cultivation in this country, but in a fairly sheltered position *B. variabilis*, at all events in the London district, is a delightful shrub. Even if it dies back during the winter young and vigorous shoots are pushed forth freely from the old wood, and they develop and flower the same season. The leaves, which vary considerably in size, are lanceolate in shape, bright green on the upper surface, and on the under side clothed with a whitish felt-like substance. The flowers, which are borne in long terminal panicles, are more or less of a lilac shade, but in

this respect there is quite sufficient variability to suggest the specific name. The variety *veitchiana* is greatly superior to the type, being more robust, with larger flowers and panicles, while the colour is also brighter, being a kind of deep lilac or violet-mauve, with an orange centre. It was given a first-class certificate by the Royal Horticultural Society in August, 1902, and formed a very conspicuous feature at the first meeting in the New Hall on July 26. It is also in fine condition on the herbaceous ground wall at Kew. *Buddleia variabilis* itself is a native of China and Tibet, and seeds of it were, I believe, first sent to Europe by M. l'Abbé Soulié, who forwarded them to France in 1893. It was in time distributed by M. Lemoine of Nancy. The variety *veitchiana* is one of the many good things that we owe to the enterprise of the Chelsea firm in sending out Mr. E. H. Wilson to explore the little known districts of Western China.—H. P.

The Foam Flower.—For many seasons the Foam Flower has been striving to express itself in my rock garden, but not until this spring has it justified its reputation. It often happens that one thinks slightly of a plant because it happens from one cause or another to be unhappy in its habitat, and so it was with my group of Foam Flowers. Had I discussed its merits with anyone before this spring I should have spoken of it as an over-rated plant, never having seen it elsewhere, so I am the more ready to make the *amende honorable*; hence my little picture of it, which by no means does it full

human habitation, and were growing in the open, just on the outskirts of a wood. I should be glad to know whether any of your readers who are interested in the botany of the southern or south-eastern parts of this island have ever found or heard of *G. cruciata* as being found under similar conditions. I have never seen any allusion to it as a possible "denizen" in any book on British botany, whether general or local. *G. cruciata* is, I suppose, "common" in the Alps, though I have not very often come across it, and have never found it in any abundance either in Switzerland or the Tyrol; nor, though it has the reputation of being very easy of cultivation, has it ever flourished much in my garden, and has certainly never seeded. I see in Grenier and Godron's "Flore de France" that it is common in all the mountainous parts of France, except the south and south-west, being (probably) absent from the Pyrenees.—J. C. L., Kent.

Lantana salviaefolia.—The different *Lantanas* seem year by year to become more popular both as pot plants for the greenhouse and for bedding out during the summer months, but they are nearly always seen as dwarf bushes. In No. 4 greenhouse at Kew one form—*Lantana salviaefolia*—is treated as a pillar plant, the slender shoots disposing themselves in a pleasing and informal manner, and being plentifully sprinkled with rounded clusters of lilac-tinted flowers, it stands out as very distinct from any of its associates. All the *Lantanas* are of easy propagation and culture; indeed, in the tropics some of

COLONY OF THE FOAM FLOWER (TIARELLA CORDIFOLIA).

justice. I have this group at the foot of a fine shrub of the Gum Cistus in the rock garden, and very dainty it looks against the dark green leaves. In the fading light of evening it has a fairy-like appearance, reminding me of a group of shrubby *Spiræas* in miniature. Possibly the increased rainfall of last year and of the early spring has given it the chance of distinguishing itself for which in the previous droughty seasons it has sought in vain. Division every two years, I fancy, is good for its health, besides being an easy method of increasing it. Perhaps some other reader of THE GARDEN will give his experience of the behaviour of this charming plant and the conditions under which it has prospered.—SYDNEY SPALDING, *South Darenth, Kent.*

Gentiana cruciata, a remarkable botanical "escapade."—A few days ago a lady whose residence is situated on the chalk formation in this county—what we usually call "the North Downs"—sent me a good bloom of this plant, which she had found in the course of a country ramble, with the remark that it seemed an uncommon plant—apparently a *Gentian*—of the name of which she was ignorant. She has since written to me to say that there were, close to the plant from which the flower was picked, another plant, apparently of blooming size, but without signs of flower, and from ten to twelve seedlings close to it, none further than about a foot off. The plants were found at least half a mile from any

them are among the most troublesome of weeds. Many garden varieties have been raised of late years. Particular forms are increased by cuttings in the spring after the manner of a *Fuchsia*, but seedlings are also much grown, the selected strains being very good.—T.

Two good Spiræas.—Of the shrubby *Spiræas* those with pinnate leaves are few in number, but among them is the stately *Spiræa lindleyana*, which is one of the most valuable of late July and August flowering shrubs. It is also one of the largest of the *Spiræas*, reaching as it does a height of 10 feet to 12 feet or even more, with a spread of branches greater than this. An isolated specimen well furnished with its handsome pinnate leaves is a beautiful object throughout the season, and as summer advances the flowers render it even more striking. The individual flowers are comparatively small and ivory white in colour. They are borne in large, terminal, plume-like panicles, and when at their best are most imposing. For an isolated position on the turf where the soil is fairly moist there are few, if any, shrubs more valuable than this *Spiræa*. A newer species much in the same way is *Spiræa Aitchisoni*, which differs from *S. lindleyana* in the flowers being whiter, the leaves of a deeper green, and the smooth stems being reddish. Both these species are now in flower at Kew. *Spiræa lindleyana* is a native of the Himalayas, and *S. Aitchisoni* of Afghanistan.—T.

Potatoes destroyed by frost in July.—A number of Potato growers on the north coast of Sutherland had their crops destroyed or greatly injured by a severe frost on July 20. In one district frost was experienced on June 28, and the Potatoes were only recovering when the later one destroyed them.

Yuccas at Finsbury Park.—The Yuccas at Finsbury Park are very fine just now. Several species are grown, but the most conspicuous of the whole series is *Yucca recurva* or *Y. pendula*. They are growing in what is known as the Rosery, near the Manor House entrance to the park, and they are a source of considerable interest to the thousands of visitors to this well-kept garden. Individual specimens of this beautiful *Yucca* are isolated on the grass, and their noble form is seen to advantage. One seldom sees so many specimens in flower at one time. The imposing *Yucca gloriosa* is also in flower. This distinct plant has a hand-

or three hot and dry summers previously. Seeing that last summer was a distinctly moist one, and that this was followed by a mild and moist winter season, his pet theory has been completely upset by the unexpected display this summer. Mr. Melville is anxious to elicit information on this point, and would be pleased to hear what other readers of THE GARDEN have experienced in this respect. He believes in the publication of one's failures as well as one's successes, as by these means information may be elicited that may be valuable to the whole community. Notwithstanding the hot and dry weather, the flower-beds, by the constant use of the hose, are looking very well and affording much pleasure to the visitors who throng the walks in their periods of leisure.—D. B. CRANE.

Royal Scottish Arboricultural Association.—A number of the members of the Royal Scottish Arboricultural Association had a short tour in Perthshire, beginning on July 20.

Among the places visited were Murthly and Scone, where many interesting specimens were seen. A general meeting was held at Perth on July 22, when the following awards for essays were announced: Bronze medal to Mr. Gilbert Brown, Killarney, Beaulieu, for essay on "The Output of an Acre of Nursery Ground"; silver medal to Mr. A. Moeran, Portumna, Galway, for essay on "The Sylvicultural Advantages of Underplanting"; and a silver medal to Mr. J. M. Murray, Kingswood, Murthly, for essay on "Diseases Affecting Trees." A conference on the report of the departmental committee on Forestry was held, and a discussion on the destruction caused by caterpillars to the Oak took place. A large party of the members left on July 23 *en route* for France, where they were to spend about a fortnight inspecting the woods near Paris and Nancy.

ROSE GARDEN.

ROSE BENNETT'S SEEDLING

THE two illustrations we give are interesting as showing the growth made by Bennett's Seedling Rose in two years. The photographs were sent by Mr. S. Heilbut, Holyport, near Maidenhead, in whose garden the plant is, and this year it has been a picture of flowers. Bennett's Seedling is one of the fine old Roses which one is apt to neglect in the search for novelties, but they must not be forgotten. As a weeping variety it is, as shown, very beautiful.

COMPANIONS TO CRIMSON RAMBLER.

It was generally thought that when Aglaia, Thalia, and Euphrosyne were introduced they would prove to be excellent varieties to plant with the

gorgeous Crimson Rambler. That they failed in this object is now well known, for their season of flowering is finished before Crimson Rambler commences. What then shall we plant with the latter? I think it will be admitted that recourse must be had to the valuable but somewhat old groups of Ayrshires and Evergreen Roses. Where can we find a more beautiful companion to Crimson Rambler than in *Félicité Perpétue*, or Bennett's Seedling, or *Myriantes renoncule*? These are so delightfully free both in growth and blossoming that they quickly form huge pillars if planted in well prepared, deeply trenched soil. Pillars of these grand Roses some 15 feet in height may be had in five or six years, especially if the plants are on their own roots. There are other good varieties among these groups of which mention might be made, especially such as *Leopoldine d'Oléans*, *Splendens*, *Ruga*,

and *Virginian Rambler*. Flora is somewhat earlier, although it is one of the best. Other good companions to Crimson Rambler are *Dorothy Perkins*, *Helène*, *Waltham Rambler*, and *Psyche*. Naturally where pillar and arch Roses are planted extensively a prolonged flowering period is aimed at, consequently early flowering sorts are in request as well as those which flower later.

AMATEUR TEYSSIER.

THIS lovely Rose deserves all the high praise which, I think, Mr. Goodwin bestowed upon it last year. I thought at one time it was too near its parent *Souvenir de Mme. Eugene Verdier*, but apparently there is sufficient distinction to justify the raiser in distributing it. The blooms are produced abundantly, and are of a pale primrose yellow, shading to white. They are fairly large, but not too large to be useful in the garden.

ALICE LINDSELL.

THIS is evidently going to be a fine Rose for all purposes. I like the beautiful form, and when the flowers are just opening the lovely pink centre with creamy-white outer petals portrays a most attractive blending of colours. The abundance of buds, stiff growths, branching out with numerous shoots, make this Rose most useful for garden decoration, and when freely disbudded it will make a grand sort for the show box.

GENERAL NOTES.

COUNTESS CAIRNS.—The loose semi-double but large-petalled flowers of this beautiful novelty find many admirers, especially among those who plant for effect in the mass. The fine clusters of bloom of the tint of *Camoens*, with the strong growth of *Caroline Testout*, are both good points in a bedding Rose, and judging from the basketful exhibited at Holland House we have in Countess Cairns a most useful Rose, either in the garden or forcing house.

Louis Ricard.—I was surprised to read the note regarding this Rose in THE GARDEN recently. I quite agree with Mr. Molyneux that the variety is "really dark," but beyond that I should not go. If the variety possessed the beautiful form of *Charles Lefebvre*, we might then say we had obtained a Rose of sterling merit, but I doubt whether *Louis Ricard* will survive the usual two or three years' trial of a new Rose. I rather think it will be consigned to the vast majority of undesirables. There is without doubt room for good dark Roses, but unless a new variety surpasses something already in existence it is not wanted. There was a variety introduced, I believe, at the same time as *Louis Ricard*, namely, *Commandant Felix Faure*, that possesses some good points. It is a really good colour, the petals lit up with vivid scarlet: it is free-flowering and also grows well.

John Ruskin.—This handsome Rose will be very welcome, although it seems to be more of a Hybrid Perpetual than a Hybrid Tea. It reminds me much of *Jeannie Dickson* in colour, but one can see a deal of Mrs. W. J. Grant in its habit. The petals are stiff, arranged in a conical form, and the flowers are delightfully fragrant. The growth is very good, certainly as free as *Jeannie Dickson*, and altogether the variety possesses merit of no mean order.

PHILOMEL.

THE AURICULA—AUGUST.

AURICULAS are now showing signs of renewed activity, after a time of comparative rest since the flowering season. Presuming that the plants were potted in May, all those requiring more room should be shifted into larger pots, and every encouragement given to their growth for the production of a fine truss of bloom in the coming spring. Young vigorous offsets taken at the time of potting, and also seedlings, should be potted on. Seed may be sown as soon as ripe, or kept till early spring. Time is saved by the

ROSE BENNETT'S SEEDLING (TWO YEARS AGO).

some and branching stem, bearing an immense number of almost white flowers. The plants of this *Yucca*, as well as that of the first-mentioned species, are from seven to ten years old, and they appear to revel in the not too pure atmospheric conditions that prevail within a radius of three or four miles of the City of London. In the borders there are several examples of the stemless species known as *Yucca flaccida*. This is a charming plant, and the most is made of it at this establishment. Again, of *Y. gloriosa* there is a fine specimen of some thirty years of age, and this is now an immense clump with numerous crowns. There is always one or another of these in flower. Mr. Melville is much interested in the flowering of these *Yuccas*. He has always held to the theory that to induce the *Yuccas* to flower satisfactorily it was necessary for the plants to experience two

former method, as seedlings may with care be brought into flower within a year. Green fly must be kept down by fumigation. A sharp look-out must be maintained against the depredations of a small maggot which bores a hole into the heart of the plant, and unless detected will quickly destroy it. A small green caterpillar sadly disfigures the foliage by eating small holes in the leaves, and if not destroyed causes serious injury to the plants.

Bishop's Stortford.

W. SMITH.

NOTES ON HARDY PLANTS.

BORDER AND ALPINE FLOWERS AT STIRLING.

ONE of the best private collections of hardy border and alpine flowers in the neighbourhood of Stirling, N.B., is that belonging to Mr. R. Kidston, and cultivated in his garden at Clarendon Place there. The garden is not very extensive, but it is well kept by Mr. Kidston and his gardener, Mr. Sparks, and in consequence the plants are successfully grown. In front of the house there are some rock plants suitable for a shady position. These comprise such things as Saxifrages and other plants which will thrive under these conditions. The border flowers are principally representative of the best genera and the finest species and varieties. Thus there is a choice collection of

Liliums, noticeable among them being *L. Hansonii*, *L. testaceum*, and others. Among the *E. theophrasti* were such forms as the fine variety of *E. fruticosa* named *M. Cuthbertson*, which is superior to the one generally called in gardens *E. Youngi plena*. *Centaureas* are well represented, and include the pretty *C. dealbata*, a species not sufficiently grown as compared with the more popular forms of *C. montana*. There is an unusually good collection of the taller *Thalictrums*, and the *Phlomis*es are represented by such species as *P. tuberosa* and *P. russelliana*. *Potentillas* and *Phloxes* are in considerable numbers, and *Veratrum*s are represented by *V. viride* and *V. nigrum*. The *Phyteumas*, not too often seen in gardens, include such species as *Scheuchzeri* and *orbiculare*, both good border flowers, and one observes also species of *Hemerocallis*, *Rudbeckia*, *Helenium*, *Dictamnus*, *Geranium*, *Epimedium*, *Spiraea*, *Polemonium*, &c., as well as the best border *Campanulas*. Mr. Kidston is frequently adding to this collection, and some of the flowers were brought by himself from various parts of the Continent. The alpine flowers are mainly cultivated in an excellently constructed rockery in a separate part of the grounds. There is a splendid plant of the rather difficult *Phyteuma comosum* doing unusually well. There is also a remarkably fine plant of *Schizocodon soldanelloides*, though not so highly coloured as I have seen it. The rather scarce but pretty *Iris lacustris* is well grown, along with *I. cristata*, a general favourite when in bloom. A good plant of the true *Campanula Raineri*, not often met with, is noticeable, while there is also a remarkably fine plant of *C. Allioni*, with *C. pulla*, *C. G. F. Wilson*, *C. garganica hirsuta*, and others of the choicest of the

dwarfer *Campanulas*. The fine *Cypripedium spectabile* flowers splendidly, and is apparently well established at the base of the rockery, and a carpet of *Gypsophila cerastoides* makes a good effect with its white, dark-lined little flowers.

The dwarfier *Gentianas* are also generally doing well, while such good *Geraniums* as *argenteum* and *sanguineum lancastriense* may be taken as representing the other dwarf members of the genus here. *Primulas* are largely grown, and comprise a number of good species, while there is an extensive collection of choice *Saxifrages* of various sections, together, with an unusually good one of *Sempervivums*. *Sedums*, *Anemones*, *Dianthus*es, *Onosma taurica*, *Veronicas*, and other good alpine plants are in large numbers in this well-managed rock garden, while *Helianthemums*, *Olearias*, *Genistas*, *New Zealand Veronicas*, and other low shrubs help to furnish it at all seasons. The glass accommodation is not large, but sufficient to keep the conservatory bright at various seasons and to undertake the propagation of alpine plants. The garden is a most interesting one, and notable not only for

what it contains, but also for the high cultivation which generally prevails. S. ARNOTT.

FLOWERS FOR WET AND SUNLESS PLACES.

FEW gardens can boast of spots where the sun never shines at any time of the year, but most gardens have places where it does not shine for six months of the year, and for only a short time during the remainder. Such places are not to be despised; in fact, they are valuable, as there are plants which do best there. Where such places are sunless by reason of the nearness of trees they are sometimes very dry in the summer, but where the shade is caused by dwellings, outbuildings, or walls they are usually moist, especially if the soil is heavy, such as we get on the boulder and London clays of the east of England. This article will treat of hardy and easily-grown plants that will thrive in damp and shady positions. These are many alpine which do well in such places, but most of them need some preparation of the soil such as is found on a recently made up rootery or rockery, and do not last long if the ground is at all heavy. I have actually seen the *Gentiana acaulis* recommended for such places, the writer saying that "it will grow anywhere." I could at least name some places where it will not grow. Where there is an almost sunless border against a wall it is using the space to very good advantage to make it a rockery or a rootery and cover it with Ferns, putting *Primroses* and *Polyanthuses* and other species of *Primula* amongst them which will bloom when the Ferns have no leaves; if the rockery is carefully prepared with soil and a good proportion of leaf-mould mixed with it—at any rate, with the surface-soil—then many of the choicer alpine may be grown upon it, and many of the old-fashioned flowers will thrive there, such as *Hepaticas* and *Auriculas*. But the rockery is a subject by itself, and we will here deal entirely with level borders or beds.

It has been stated above that some plants thrive better in these shady positions than in more favoured ones. A notable instance of this is the *Dicentra spectabilis*, specimens of which I have seen 3 feet to 4 feet high and 6 feet through in the most shady positions, remaining in beauty until July, whereas in sunny positions it is generally over by the end of May. It pays for good feeding as much as anything, and should have a change of position, or, at least, of soil, after three or four years. The *Solomon's Seal* (*Polygonatum multiflorum*) is another similar instance. I have seen its handsome shining leaves in full beauty in August in a corner of the garden where, as far as I know, the sun had not shone for fifty years, and the stems were 3 feet to 4 feet long. This and the preceding are very fine when cut for mixing together in large vases. Both of them cover a good deal of ground when growing vigorously without really occupying it, and early spring-flowering bulbs like *Snowdrops*, *Corydalis bulbosa*, and *Crocuses* may well be grown near them, or the ground round them may be carpeted with the *Moneywort* or *Creeping Jenny* (*Lysimachia Nummularia*) or *Veronica repens*, the brilliancy of the yellow blossoms of the former being very effective amongst a mass of greenery, quite lighting up dark places.

The *Winter Heliotrope* (*Petasites fragrans*) is much appreciated in mid-winter, and its large Colt's-foot-like leaves are not without beauty in the summer; but it is a dangerous thing to introduce anywhere near shrubs, as it spreads feet, or even yards, in a single season, and the moister the ground the better it likes it. Such old-fashioned favourites as *London Pride*, *Lilies of the Valley*, *Primroses*, *Polyanthuses*, *Daisies*, and *Pansies* are only mentioned because their omission would be remarkable. The *Leopard's Bane* (*Doronicum plantaginifolium*) is very showy in April and May, with its large, yellow Daisy-like flowers, and it will grow well in all positions, and perhaps a little more compactly in the full sun, but it is a valuable plant for wet, shady places. The best sort is the variety *excelsum* (syn. *Harpur Crewe*). The *Hellebores*, which include both the Christmas and the Lenten *Roses*, form a large shade-loving class,

ROSE BENNETT'S SEEDLING (PRESENT YEAR).

and require some little care in many soils, though we are often told that they will grow in any good garden soil. One of the secrets of their culture is to leave them undisturbed. The Funkias, or Japanese Plantain Lilies, are essentially shade-loving plants, for if exposed to the hot sun the spikes of bloom very often wither by the end of June or beginning of July. They are grown more for their foliage than for their flowers. They should be divided when the crowns get at all congested, making new plants of the outside pieces and throwing the old middle part away. If the plants are put in groups of half a dozen spring-flowering bulbs may be grown between them, and the Funkia leaves will cover up the space later.

One of the most beautiful things for shady places is the Japanese Anemone, and the best is the single white, especially the variety called Honorine Joubert.

A charming little low-growing plant for moist places is the *Spiraea filipendula* fl.-pl. A hot June sun will often shrivel up the blossoms before they open. Its foliage is very beautiful; it pays to divide it every two or three years. The old-fashioned red Paeonies, too, will do well without much sun, especially if there is moisture, in which case they will remain green throughout the summer, and look like low-growing compact shrubs if they are kept tied up, and that should be done before the wind and rain has beaten them down. They are gross feeders, and if large heads of bloom are wanted, and these in great numbers, they cannot be fed too well. Good plants for an edging are the perennial Candytuft (*Iberis sempervirens*), London Pride, Daisies, Veronica repens, and some of the Saxifrages. The old-fashioned Columbines do as well in wet places as anywhere else, but the long-spurred ones do not as a rule. The hardy perennial yellow Mimulus (*M. lutea*) makes a brilliant show in May, but does not last long. No amount of wet harms it. Other plants which are more or less suitable are the Trilliums or Wood Lilies, the Winter Cherry, though in unfavourable autumns the calyces do not colour so well as in more sunny places, Hepaticas, if the soil is not too heavy, herbaceous phloxes, various forms of *Scilla campanulata*, Foxgloves, Periwinkles, especially the small blue and double pink varieties, Orange Lilies, &c.

It will thus be seen that the choice of plants for wet and sunless positions is by no means a very limited one, and it is hoped this article will be the means of enabling some of your readers to make better use of such places than they have hitherto done.

ALGER PETTS.

TREES AND SHRUBS.

THE ROCK ROSES.

ROCK ROSES, or at least a few of them, are known to all who have an interest beyond the common things one sees in gardens, for apart from their wondrous flower beauty they have a peculiar interest, having been tended with loving care by Parkinson as early as the beginning of the seventeenth century, at which period several of the finest Rock Roses we have in our gardens now were first introduced from the sunny South. They are, in fact, true old English garden flowers, for there is scarcely one that could be called a modern introduction. Judging from what we gather from old garden books, they must have been more numerous fifty or sixty years ago than they are now, for when Sweet wrote his monograph of the *Cistinia* in 1830 there were numerous kinds grown then that have disappeared from even our botanical gardens, ousted, no doubt, by newer, if less beautiful plants. The rarity of Rock Roses in gardens nowadays is doubtless due to the unfortunate tenderness of the majority of the species, and it is evident that we do not, as a rule, take the trouble to grow and care for tender open-air flowers as the early gardeners did. In these days of cheap greenhouses there seems to be no middle course between the absolutely hardy and the tender class of plants that will not thrive outside

a glasshouse. But we deprive ourselves of much beauty in our gardens, not only by the exclusion of Rock Roses, but by a host of beautiful warm climate shrubs and plants that only require protection during our long and often severe winters. Even in our great national garden at Kew the means of growing to perfection the Rock Roses and plants of a similar nature is still a desideratum, for there is no place between the open rockery and the great temperate house, which is quite unsuited for the growth of shrubs that must have free root room and all the sun and air it is possible to give them from the close of winter till the end of autumn. An admirable plan of growing Rock Roses was that adopted by that keen lover of plants, the late Mr. Joad, in his richly stocked garden at Wimbledon. He had a long sloping bank thrown up against a low wall, facing south, the soil being open and well drained. On the surface were great boulders half buried in the soil, and around these he planted his *Cistus*es and other half hardy shrubs. In winter he had a contrivance for protecting the plants by erecting a movable framework, over which he stretched canvas, and this was quite sufficient to protect his Levantines, Australians, and New Zealanders, as he used to call them, from injury by frost. From spring to early winter you saw nothing of the winter-protecting apparatus, and I need scarcely say that the bank was always full of interest, and during the height of summer it always had a kaleidoscopic effect of colour, always changing, always bright.

Such a simple plan might be adopted by anyone who wished to have a good collection of Rock Roses and plants of kindred nature; but in mild localities, and with a light, warm soil, many of the *Cistus*es may be grown on an open, well-drained rockery. Miss Jekyll grew numerous kinds to perfection on a simple raised bank, and I shall not forget the brilliancy of her *Cistus* bank when I saw it once in July. The conditions then for these plants are a light soil, thoroughly drained, raised, and sloped to the south, and screened from the cold winds of winter and spring. In hilly gardens these conditions occur naturally, and if there is a sunny retaining wall, such as occurs on a terraced slope, that is just the place to plant the Rock *Cistus*es that have a low spreading growth. In the rock garden at Kew some species, such as *C. corbariensis*, *C. monspeliensis*, and *C. hirsutus*, have been growing for some years, and planted as they are, high and dry, they escape the damp and cold of winter without much harm.

Without attempting a full and detailed account of the Rock *Cistus*es now in cultivation, I will mention some of the best that could be grown well in any garden in the neighbourhood of London and south of it, and even in more northerly gardens where the soil is light and the situations naturally mild, such as those near the sea, and without much trouble beyond planting them well at the outset and taking care of them during the winter.

The two largest growing kinds, and at the same time the hardiest, are the Ladanum Gum *Cistus* (*C. ladaniferus*), and the Laurel-leaved Rock Rose (*C. laurifolius*), both extremely beautiful. The Ladanum Gum *Cistus* was introduced from Spain by Parkinson in 1629, and has been in our gardens ever since. It is an evergreen shrub of somewhat erect growth, and rises when full grown 5 feet or 6 feet in height. It may be recognised at once by the deep green on the upper surface of the leaves, and by the whiteness of the undersides. The profusion with which it flowers during June and July makes it one of the most beautiful in the genus. The blossoms, each nearly 2 inches across, with white crumpled petals, are conspicuously blotched with yellow. In the variety *maculatus* the petals are adorned with a large deep crimson blotch. For several weeks at midsummer this species is an object of great beauty, so profuse are the flowers, and as it is the hardiest of all the *Cistus*es, it may be grown in a mass as a lawn shrub. The spotted variety (*maculatus*) is, I think, one of the finest of all open-air shrubs, and is one of the few obtainable in nurseries.

C. laurifolius has larger and paler green leaves than *C. ladaniferus*. The flowers also are white

and blotched with yellow. It is a larger growing and hardy shrub, and makes a beautiful object on a lawn in a group with others.

C. florentinus.—Among the dwarfier species perhaps this is the most beautiful, but unfortunately it is not often seen in gardens, although its spreading growth is very charming and distinct. Its flowers are each 2 inches across with snow-white petals blotched with pale yellow at the base. It blooms plentifully in June and July. It is an Italian plant, and in close affinity with the Montpellier Rock *Cistus* (*C. monspeliensis*), which, as its name implies, grows wild about Montpellier. This has been in English gardens for over two and a half centuries, since the time of Gerard. The flowers are smaller than those of the Florentine *Cistus*, but are also white and plentifully produced.

C. clusi is a lovely little shrub from Spain and Portugal. It grows from 1 foot to 2 feet high, and forms a compact, dense mass of foliage, and at midsummer is covered with snow-white blossoms. Other white-flowered species to be found in good collections include *C. hirsutus*, *C. salviaefolius*, *C. lusitanicus*, *C. latus*, *C. cyprinus*, *C. corbariensis*, *C. populifolius*, and *C. obtusifolius*. These are all worth growing, but those who seek to make a collection will find that there are numerous other white-flowered species to be added to this selection.

The species with purple flowers are few, and all should be grown on a *Cistus* bank. The best known is

C. purpureus, the large purple-flowered kind that one frequently meets with in warm southern gardens. It is a free-growing bush, reaching 3 feet or more in height, having large and more or less wrinkled leaves of pale green. The flowers are large, of a bright reddish purple, with a crimson or deep red centre, and are borne in clusters of two or three from June up till the end of August.

The Cretan *Cistus* (*C. creticus*) is dwarfier and more tender than *purpureus*. It also has wrinkled leaves, and the large purple flowers have yellow blotches at the base instead of crimson. *C. villosus* may be distinguished at a glance by the Sage-like leaves, and when in flower by the more or less lilac-purple flowers. It grows about 3 feet high and makes a dense bush. Similar, if not identical with it, are *C. incanus* and *canescens*, and a few others with purple flowers, including *C. crispus*, could be added to make a full collection.

THE SUN ROSES.

Besides the true *Cistus*es there are some species of *Helianthemum* (the Sun Rose) that are known in nurseries and sold erroneously as *Cistus*. These include *H. formosum*, the beautiful little yellow-flowered species catalogued as *Cistus formosus*, one of the gems of a large genus. The Sun Roses so closely resemble the Rock Roses, and require the same kind of treatment, that they should be grown together. As a rule they are much hardier, and well adapted for any sunny bank. They have been so frequently described in THE GARDEN that there is no need to allude to them here. Wherever warm sunny banks occur in a garden they should be clothed with such plants as Sun Roses and Rock Roses, remembering that the former are hardy, and require little or no care after being well planted, while the Rock Roses require protection during spells of severe winter weather. It is always advisable to keep duplicates of *Cistus*es and other tender shrubs in pots in frames, so that in case deaths occur the plants may be replaced. There are several hybrid varieties of *Cistus* already in gardens, and if some hybridist turned his attention to them he would doubtless increase the number and perhaps raise hardy varieties if he could intercross with *Helianthemum*. The experiment is quite worth trying.

W.

SEASIDE SHRUBS.

THE number of shrubs that succeed when exposed to salt spray is but limited, and on that account the few that do thrive well under such circumstances are doubly valuable from a planter's point of view. Such is the Tamarisk (*Tamarix gallica*), a vigorous-growing shrub, producing long, feathery branches terminated during the summer by loose open panicles of small reddish

flowers. This shrub delights in a deep sandy soil, well supplied with moisture, requirements frequently met with near the sea, and for such places it is indispensable. This and the Furze form fine bushes even on the most easterly part of the coast of Suffolk. *T. tetrandra* is a scarce Caucasian shrub, and is quite as elegant as the common *T. gallica*, and flowers later, which is its chief value. It is little known apparently in this country, though it is to be found in Continental arboreta. A near ally of the Tamarisk and one that succeeds well under similar conditions, is the German Tamarisk (*Tamarix* or *Myricaria germanica*), a slender upright-growing shrub, which bears great general resemblance to the foregoing, but which only attains about one-half its height and has longer leaves. The Sea Buckthorn (*Hippophae rhamnoides*) is another shrub well adapted for planting in the most exposed spots, as strong winds off the sea have but little effect upon it; indeed, the beautiful silvery appearance of its foliage is much heightened when stirred by the breeze. Besides the glistening white colour of the foliage during the autumn, it becomes laden with bright orange-coloured berries, and when in that state is remarkably handsome. The Sea Buckthorn is a large prickly shrub, which under favourable conditions becomes almost a tree. The tree Purslane (*Atriplex Halimus*) is a loose rambling plant, with brittle, half woody branches and silvery leaves, of little beauty when grown under ordinary conditions, but by the seaside, where plenty of moisture exists, a really valuable shrub; it succeeds perfectly in such places, and forms fine masses totally indifferent to the salt spray. Of this there is a smaller kind, a native of Britain, viz., *A. portulacoides*, but it is insignificant compared with the preceding. Among other subjects fit for seaside planting, but requiring to be a little sheltered from the full force of the wind and spray, may be named many of the Leguminosae, as, for instance, the Spanish Broom, the Laburnum, the white Broom, *Halimodendron argenteum*, and the Coluteae. These are among the most suitable, while, under like conditions, the Elder, Box Thorn (*Lycium europæum*), the Tree Groundsel (*Baccharis halimifolia*), and the various kinds of Lilac will also thrive.

Among evergreens mention may be made of the different varieties of *Euonymus japonicus*, the Arbutus, Laurustinus, and Portugal Laurels, while trees that may be specially noticed doing well near the sea are the Evergreen Oak, Austrian Pine, the Cluster Pine (*P. pinaster*), the Mountain Ash, and Cupressus. All the above are well-tried subjects, and sure to succeed in almost all positions. For planting on the southern coast there is a much wider range to choose from. Even Veronicas there make useful seaside shrubs, and the same may be said of Fuchsias, the lemon-scented Verbena (*Aloysia citriodora*), Myrtles, and the Pittosporums, which form handsome bushes, while by far the finest plant of the beautiful white Heath-like flowered *Fabiana imbricata* that has ever come under my observation was growing in a small garden close to the sea on the coast of Devon. There it formed a large bush, and when in full flower was most conspicuous. P.

WATERCRESS, AND HOW TO GROW IT.

WHETHER seen upon the tea, dinner, or luncheon table, the green, crisp leaves of freshly-gathered Watercress—suggestive as they are of pebbled brook and purling stream—are as pleasing to look at as they are wholesome for eating, and it seems a pity that nowadays so many people should be debarred from using them. The bare idea that they have been cultivated in polluted plots instead of being gathered from the pure water of a running stream is quite enough to set us against them and to prevent us from tasting any, however tempting

the sprigs may look and however carefully we may know they have been washed; but that there is some element of risk in buying and eating unauthenticated Watercress is undeniable. There is only one thing to be done, and, happily, it is easy of accomplishment—it is to grow the Cress ourselves—and anyone can manage it who has a yard or garden and a fair supply of water. A Fellow of the Royal Horticultural Society has recently pointed out one method of growing the healthful Watercress that is very simple. "Choose," he says, "for convenience a spot near a garden tap; take off 4 inches or so of the surface-soil from the plot, say 3 feet by 2 feet, and slightly puddle the sides and bottom with clay, but not ramming it so firmly as to prevent the water percolating sufficiently to avoid stagnation. Nearly fill this artificial basin with good soil, and in early spring plant it with cuttings of fresh green Watercress, obtained from a wholesome source. Keep the soil moist, and the cuttings will soon spread and cover the bed; and if small, clean pebbles can be strewn over the surface they will keep the roots moist and the leaves clean when the heavy rain would otherwise spatter them with mud. Seed can be used if good clean cuttings are not obtainable, but several weeks' growth is gained by planting cuttings."

Another way of growing Watercress in one's own garden has been tried by the writer with good success. In this case the water was supplied continuously, or nearly so, from a large trough that was filled every day, and from which a trickling stream was allowed to run along a little wooden channel on to a sunk square bed where Cress was planted. It grew luxuriantly, and in summer time had a pleasant, cool appearance that was quite refreshing. A few water Forget-me-nots were allowed to grow beside the Cress, but no other flowers. It really was a Watercress bed, made for use, and not a water garden; but in these days when water gardens are so much the fashion it is surprising that the useful and hardy Cress is so generally left out and forgotten.

There is another advantage in growing Watercress ourselves, and not a small one either. We can then be quite sure it is the edible Cress we are enjoying and nothing else that is less wholesome. There is a water-plant whose right name is the Water Dropwort, whose dark green glossy leaves so much resemble those of the real Watercress that it is a wonder mistakes between the two are not more frequent, but sometimes they do happen. Only a short time ago a party of excursionists in Wales, mistaking the one for the other, ate a quantity of these Water Dropwort leaves, with the result that many of them were seriously ill, and in 1900 a gang of convicts working in a ditch near Woolwich had a still worse experience. Seventeen of them ate the supposed Watercress, and according to the correspondent of the *Pall Mall Gazette* nine were seized with convulsions and six died with every symptom of delirium and tetanus, though they had eaten but a small quantity. A very little care and the smallest possible experience, however, are sufficient to eliminate all risk of accident in the gathering of Watercress. The only plant for which it can well be mistaken has hollow leaf-stalks and serrated leaflets, which the true Watercress has not.

In England we do not make nearly so much use of the Watercress as they do abroad. Both in France and Switzerland it is used as a vegetable, being cooked and eaten with broiled steaks and roasted chicken, spread over which it looks pretty and tastes good. With us it is almost always eaten raw. Even so it is worth the trouble of cultivating. By way of an improvement to the simple sandwich, or to add a piquancy to the hard-boiled eggs and bread and butter of the traveller, few things are more desirable in their way than the pungent yet cooling Watercress.

F. A. B.

Genista sagittalis.—Referring to "S. W. F.'s" note in THE GARDEN of the 23rd ult., I may add that I saw abundance of this plant in flower on dry banks in railway cuttings between Sarajevo and Travnik in Bosnia early in May this year.—E. R. BERNARD, *The Close, Salisbury.*

THE FLOWER GARDEN.

PLANTS SUITABLE FOR RUINS, WALL-TOPS, AND OTHER DRY PLACES.

IN speaking of plants for the purposes specified in the heading, it should be borne in mind that, though some may be seen flourishing and happy in such places, it is a very difficult matter oftentimes to plant and otherwise establish them in private gardens. For one thing, when one sees plants flourishing in a wild state in such dry situations, it has come about by the rule of the "survival of the fittest," and though there may be abundance of plants apparently growing comfortably, they may constitute but a small proportion compared with those that have failed to survive; whereas in artificial planting we may bemoan our want of success if we do not succeed with a comparatively few specimens that have engaged our efforts. The closest observer who carefully notes the minutest details as to the conditions under which wild plants are flourishing will be more likely to succeed if he follows the hints of Nature. Of course, if some reasonable provision is not made for the roots and ample care bestowed, as by periodic waterings, when the plants have been put in position so as to sustain life until they get a natural attachment to the stone and soil, nothing less can be expected than that the plants will shrivel up and die the first hot or windy day.

When you can manage to establish flowers on ruins or dry walls you create one of the most interesting and beautiful garden effects; but in setting about a business of this kind, it should be kept in mind as being advisable that, whatever is grown on high places, the plants should have the habit of springing up considerably or drooping over the edges, so as to be visible from the surrounding and lower promenades. It is not always the case that plants which are seen to thrive on and decorate what appear to be dry places and sunny rocks will do for ruins and wall tops, because on such structures there is not the amount of moisture contained in the rooting medium as occurs in natural formations, which get the benefit of moisture by capillary attraction in a greater degree. This point may be proved by anyone who cares to experiment, and the fact may be recalled whilst we are glancing over a few species, one by one, commonly supposed to be suited for walls and natural rocks indiscriminately, and we might as well, whilst considering the species individually, take note of their respective cultural requirements.

ERINUS ALPINUS.—This is a long time before it becomes effective and well established, and often when it means to do so it sows itself better than human hands can do it. A few plants, therefore, should be set at the higher parts.

SAXIFRAGA LONGIFOLIA is often supposed to be a fit subject for dry walls, but according to my experience it is utterly useless for such places; it will do on what seem to be dry rocks that are more cool, and get more moisture by capillary attraction.

S. LIGULATA.—Precisely the same thing may be said of this as the foregoing.

CORYDALIS LUTEA.—This is a very likely plant for walls with crumbling seams or ledges of mortar rubbish, and it may be established by seed or very young plants.

DRABAS will do in tight fissures.

ALYSSEM MONTANUM is a capital thing for walls where a slight depth of soil is provided.

TUNICA SAXIFRAGA may do, but it will require careful planting for a start, and perhaps it would be easier and better to begin with seeds.

DIANTHUS CÆSIS.—I find this an excellent thing for rather flat and broad wall tops, but it should be well packed round with stones and a rather retentive loam, and surfaced with leaf-mould and sand, and it should be periodically watered for the first season.

LYCHNIS ALPINA and **L. LAPPONICA.**—In every way these are manageable and effective.

COTYLEDON UMBILICUS and **C. CHRYSANTHUS**, and one or two other species of the same genus, are

ideal plants for walls and dry ledges. The objection, however, to these is that they are rather costly for a purpose implying somewhat liberal use.

SEDUM DASYPHYLLUM is pretty, but very small, and only fit to be in positions near the eye. Moreover, it is tender in damp climates, and is not perfectly reliable.

S. GLAUCUM is practically for such purposes the same thing as the above, with the advantages of being hardier, a more vigorous grower, and a cheaper plant to obtain in quantity.

SEMPERVIVUMS.—All or any of these are capital for covering crumbling walls with vegetation. The chief thing, however, is to plant them carefully at first. They should be flatly and securely fixed by the aid of small stones and some mortar in a wet state. Unless thus secured, they are soon disturbed by birds or blown away by the wind. To fix the Houseleeks is a business that will not admit of being done in a hurry. It would, perhaps, also be better to plant them in the spring, just when it is due for them to emit their new roots.

A few other plants that I would suggest are *Thymes* of various sorts; the procumbent *Stonecrops* or *Sedums* in considerable variety; not a few alpine *Pinks*; the orange-yellow *Hawkweed* for dry places that are not too sunny. Everybody knows the charming manner in which the *Wall Rue* *Fern* clings and thrives on old mortar. *Alyssum spinosum* is a quaint and curious plant, and often grows into bushes of considerable diameter. I have seen *Campanula rotundifolia* doing splendid duty on the walls of ruins, and it goes without saying that *Wallflowers* and *Snappedragons* can be made happy in the wall garden.

In fissures with careful planting many other things could be made to flourish, but to make them a success such fissures should be carefully examined, and, if necessary, a solid mass of soil to form a bed for the roots should be rammed down firmly; a good mass should also be rammed in as a backing to prevent the roots from being dried up. These provisions should be made before the plants are put into position, and the roots should then at their extremities be inclined downwards, and carefully and firmly covered with good soil. Indeed, I know no form of gardening requiring more patience and skill during the arranging of the plants than the wall garden. W.

TALL FLOWERS FOR CUTTING.

FOXGLOVES take a high place for this work, and a large batch of seedlings in an open part of the pleasure ground has been in request ever since the expansion of the first few spikes. If the size of vases or baskets will permit, it is a good plan to start with a few fronds of some large, bold, hardy *Fern* and allow the spikes of *Foxgloves* to rise, as it were, out of these. With respect to this common but very beautiful flower, let me add that when a good strain is obtained a little seed may be saved each year from the best flowers. *Montbretia crocosmiflora* is just now one of our most useful flowers, and may be used either for tall vases, cutting the spike in its full length, or for small ones, nipping off the side growths. A wonderful wealth of flower is obtainable from an established border of *Montbretias*. They should be planted deeply—nearly 6 inches—in a light, open compost, placing a little sharp sand for the bulb to rest on and pressing it down firmly. Mulch early in the winter with a 2-inch or 3-inch thickness of rough manure or leaf-soil. A batch of *Alstroemerias* is

still in flower, and has furnished for a long time fine long stalks and large heads of the rich orange flowers. It is a pity these are not more extensively grown; there are few better subjects for large dark vases. I transferred a few to a well-prepared border eleven years ago, planting deeply and carefully, and they have steadily increased with each succeeding year until they have quite monopolised the border. Some of the *Spiraeas* are over, but *Aruncus*, *palmata*, and *palmata alba* are still well in flower. The last spikes of *Lilium candidum* have been cut. I experienced considerable difficulty in saving them, the state of the foliage and embryo spike necessitating several dustings with anti-fungoid powder. This won the day, and, although the foliage was brown and nipped, the flower-spikes ran up to nearly 6 feet in height and developed the flowers very well. Large clusters quite 2 feet in length when required are now to hand of *Gypsophila paniculata*. This pays for a

VIEW OF PART OF THE ROCK GARDEN AT BASTON MANOR.

little extra attention at planting time, viz., that the ground should be deeply dug and well worked and receive, if the soil is rather poor, a liberal dressing of rather holding manure. *Helianthus multiflorus plenus* and *Soleil d'Or* are already giving a supply of their yellow flowers with good long stalks. I had these on rather a cold border where they did not get much sun, and the flowers were seldom out until August, but by shifting half of them to a warmer spot they are considerably earlier and the flowering season is also prolonged. Many shades of colour are furnished by the *Pentstemons*; their beautiful spikes of flowers are now utilised to fill places hitherto occupied for some time by the *Foxgloves*. Hardy foliage in quantity is now supplied by *Asparagus*, *Tamarix gallica*, *Taxodium distichum*, and long twigs of *Hornbeam*. Other outdoor plants beginning to be useful are scented *Pelargoniums* in variety and the *Lemon Verbena*. B.

AN INTERESTING ROCK GARDEN.

THE gardens at Baston Manor, Hayes, Kent, are full of interesting subjects, yet the rock garden is decidedly the most attractive feature. Here we find an exhaustive collection of all the most suitable plants, some in low, shady nooks, others high up among large blocks of rock. A large number of the plants were collected by the late Captain Torrens himself, and some are great rarities. The owner, having seen and collected the plants from their natural habitats, knew exactly the positions most suitable for them and the best method of forming the rock garden, and this was evidently his chief delight. The

rockery is formed on a sunny slope. In the background the rocks rise up considerably, but much of it is rather flat or in rising mounds, and rock walls are formed round some of the more elevated positions. In the crevices of one of these walks a collection of *Ranondias* is planted, including *Natalia*, *pyrenaica* and its white variety, also *serbica*. The pretty little *Haberlea rhodopensis* was also doing well.

Above the wall was a fine clump of the double red *Rock Rose* (*Helianthemum*). This has sported back to the yellow of the normal type, but still with double flowers, and the clear yellow is an acquisition. On one plant I noted two distinct colours, and some were a mass of yellow; the large clumps of red were very showy. *Dianthus alpinus* was doing well, and a patch was finely in flower. *Iberis gibraltarica* was flowering freely, *Erodium Reichardi* and *E. hymenodes* also, and other species of the *Geraniaceae* were flowering well, *Geranium cinereum* being very pretty. *Cheiranthus mutabilis*, a large bush, has been in flower for some time. It somewhat resembles *C. kewensis*. The deep blue *Campanula* G. F. Wilson is in fine clumps, also *C. muralis* and *portenschlagiana*, which showed a difference in shade of colour. *Veronica pectinata* and the shrubby *V. buxifolia* were also flowering freely. Another pretty blue flower was *Sisyrinchium grandiflorum*, grown from seed

brought from Canada. *Vaccinium Vitis-Idaea* was very dense-growing with the small leaves overlapping each other, and covered with berries. *Cornus canadensis* was worthy of note as being among the things imported direct. *Gaultheria procumbens*, forming a large, spreading mass with its dark bronzy foliage, was very pretty.

Cotoneaster horizontalis spreading over a rock was full of flower, and will make a bright show with its berries in the autumn; *Cnothera marginata*, very distinct; and close by was a good patch of *Mitchella repens*.

Saxifrages are represented by almost all known species, and many of them were finely in flower. Among those I particularly noted were *caesia*, small white flowers; *valdensis*, erect spikes of clear white flowers; *trifurcata*,

short, curiously cut leaves, spikes of pure white flowers about 8 inches high; *Salomoni*, another distinct and pretty species; *longifolia* was at its best with good spikes of bloom; *Wallacei* (Composi) is a favourite, growing freely in large clusters; *Hosti*, with tall spikes of white flowers; and *ligulata*, with strong flower-stems standing up 2 feet high; *Aizoon minor*, a tiny beauty; *Rhei Improved*, pink flowers; *retusa*, *corriophylla*, *lantoscana superba*, *pectinata*, *luteo-purpurea*, *bryoides*, *macnabiana*, *Guildford Seedling*, and numerous other interesting species.

Thymus serpyllum album and the Back-house variety of *coccinea* were very pretty. In a shady nook were some *Darlingtonias* looking very happy, also some good Ferns, among which were a very distinct *Osmunda* brought from Japan and a fine clump of *Adiantum pedatum*. The Oak and the Beech Ferns were in a thriving condition, and close by here some *Cypripediums*, but spectable was the only one in flower, the others being over. *Linaria alpina* was at its best; *Arenaria montana*, flowering freely; *Hypericum repens*, just opening its flowers; and *olympicum* in full bloom. The *Shortias* do well here, but were out of flower, also the *Soldanellas*. *Silene alpestris* and some dense-growing bushes of *Mitchella repens* with deep green foliage were prominent. *Chryso-gonum californicum*, with pretty yellow flowers, was an attraction. *Dianthus deltoides*, pink,

and the white were pretty. *Morisia hypogaea* is a dwarf plant with pretty yellow flowers. *Gentiana septemfida*, just coming into flower, will make a bright patch of blue a little later. *Gnaphalium aureum* and the *Edelweiss* (*Leontopodium alpinum*) were very fine. *Linum narbonense*, blue; and *L. flavum*, the yellow, were just opening their flowers.

Good clumps of choice *Sempervivums* and *Sedums* were excellent; *Achillea umbellata*, silvery leaves and white flowers; *Edraianthus graminifolius*, *Polygala Chamæbuxus*, *Globularias*, and many other interesting subjects. At the base of the rockery are some small ponds with *Nymphaeas*, which are just opening their first flowers. A fully expanded bloom of *W. Falconer* was very rich in colour; *Laydekeri rosea*, a pretty shade; *fulva* and *Marliacea chromatella* were also in full flower, and these will be followed shortly by other choice sorts. There is always something to be seen in flower in this beautiful rock garden, and no description can fully convey all the interesting features.

A. HEMSLEY.

GRASS WALKS IN SUN OR SHADE.

THE freedom and variety of the walks about our country seats have not been taken such

advantage of as they deserve. It is not only in the flower garden where we may have much beauty of flower, but there are many places better fitted for growing the more beautiful things which do not require continual attention or propagation. Unhappily, the common way of planting shrubberies has robbed many such walks of all grace. The great trees, which take good care of themselves, are frequently all we want, and in the older gardens we often find specimens of uncommon or rare trees, but the usual mixed plantation of evergreens, so common up to our own day, means death to the variety and beauty we may have by grass walks in sun or shade. The shrubs are frequently, for no good reason, planted in mixtures, in which the most free-growing are so thickly set as finally to cover the whole ground, *Cherry Laurel*, *Portugal Laurel*, *Privet*, and such common things very frequently killing all the rest and forming dark walls by such walks. Some of these evergreens, being very hungry things, overrun the ground, rob the trees, and frequently, as in the case of the *Portugal Laurels*, give a dark, monotonous look, while keeping the walks wet, airless, and lifeless.

Light and shade and the charm of colour are impossible in such places with these heavy, dank evergreens. Once one is free from the slavery of these evergreens, what delightful opportunities there are of growing all hardy

GRASS WALKS IN THE GARDEN OF HURSLEY PARK, WINCHESTER.

flowers in broad masses, from the handsome Oriental Hellebores of the early spring to the delicate blues and lavenders of the Starworts in October. Not only hardy flowers, but graceful climbers like the wild Clematis, and lovely corners of light and shade may be made instead of the walls of hungry evergreens. If we want the ground green with dwarf plants, we have no end of delightful things in the Ivies and other evergreens like Cotoneaster, Partridge Berry, and Labrador Tea. There is no need for the labour and ugliness of clipping.

We have lately seen one place alone with many acres of these detestable clipped Lantanas hungry, and so ugly! With these grubbed and burnt, what places, too, for such beautiful things as the giant Fennels with their more than Fern-like grace, and all our strong, hardy Ferns, which want no rocks, with Solomon's Seal and Foxgloves among them.

GARDENING OF THE WEEK.

FLOWER GARDEN.

PILLAR ROSES.

MOST of the Polyantha and other free-flowering Roses are now over, and it is advisable to remove at least a portion of the old wood so as to allow sufficient room for the young growths to receive full exposure to the sun, for unless these growths are well ripened we shall get but a poor display next year.

SUMMER BEDDING.

The present month, while the summer bedding is at its best, is a good time to decide upon the alterations and improvements to be introduced into the scheme for next year's display. A rough plan should be drawn showing the sizes, shapes, and relative positions of the flower-beds, and this should be accompanied by the approximate number of plants required for each bed, so that when the arrangements for next year have been completed and approved of, it will be a comparatively easy matter to make a list of the numbers of the different plants required, and doing so at this early date leaves plenty of time to propagate the stock before the autumn frosts arrive. Care should be exercised, in taking the cuttings, not to make any gaps in the beds. If kept close and shaded from bright sunshine, Coleus, Iresine, Heliotrope, &c., will root freely if placed in a cold frame. Geraniums (Pelargoniums) will be better if placed in the open or exposed in spare frames where the lights can be put on during heavy rains. If these cuttings are sappy they will root better if before insertion they are laid in the sun for a day or two. Providing it contains a fair proportion of leaf-soil and grit, the quality of the soil used is immaterial. The sifted soil from under the potting bench is frequently found to be suitable without any addition. The cuttings, which should rest firmly on their bases, must be firmly inserted. After the first watering a daily sprinkling on dry days will usually be sufficient until the cuttings are rooted.

RANUNCULUS AND ANEMONES.

As the foliage dies away it is advisable in most localities to lift the roots, and, after ripening them by a short exposure to the sun, store them for the winter in a dry place. In the herbaceous borders frequently remove all decaying flowers, and cut down the stems of the earlier plants as their foliage ripens. Many autumn flowering subjects, such as Michaelmas Daisies, Sunflowers, &c., require staking. This, especially with the first-named, should be done as lightly as possible, or the too frequent bunching of the plants will ensue, and the grace of these Asters will be lost. As time and weather permit the borders should be well hoed.

KITCHEN GARDEN.

WINTER SOWINGS.

A sowing of winter Lettuce should be made about this time and another a fortnight later, for winter and spring consumption. A few days lost at this period may mean failure should the autumn be cold and very wet. A good sort to stand the winter is Winter Cos, being quite hardy. In cold, damp gardens it will be necessary to grow the winter supply in frames. These should be filled up to about 8 inches from the lights and the seedlings pricked in 6 inches square. The seed for the above supply should be sown on a south border, and the plants when ready planted out in rows 1 foot apart. Choose a rather dry and sheltered spot for them, and make the ground firm. A few boxes may also be filled with young plants, as they can be lifted into a gentle warmth should the necessity arise. At this time a sowing of Chervil should also be made, it being frequently in demand for flavouring during the winter months. The young seedlings should be thinned out to about 6 inches apart. In cold districts it may be necessary to cover with hand-lights. Land for the sowing of winter Onions should be now prepared and seed got in. Choose a fine day for sowing, and care should be taken to see that the plot is in the right condition before sowing this important crop. The seedlings from the first sowing of Cabbage are now appearing, so a second sowing should be got in, protecting the seeds from the birds as formerly.

CUCUMBERS.

Plants in frames for providing late fruits are now growing freely. Unless great attention is paid to these they will not be worth the labour. If the frames are unheated they should be shut early in the afternoon after the plants have been syringed. Close attention should also be paid to pinching and watering. If Cucumbers are to be in demand during the winter the seeds should be sown now, or the plants raised from cuttings. It is necessary that the plants should be well advanced before winter—and strong and sturdy. The best sort for winter fruiting is Telegraph. If saved from a good stock no other variety surpasses this in vigour and fruitfulness. Plants that have been fruiting through the summer will now show signs of exhaustion. The growths should receive a severe thinning and a fresh top-dressing, applying good turfy loam to which has been added some good fertiliser. Keep the house moderately warm and moist for a few days, and if the plants are sound young growths will soon appear.

PEAS.

In this district early Peas have been a great success, Sutton's Green Gem being an extraordinary cropper. Chelsea Gem, though a finer Pea, has not cropped so well, and several other dwarf varieties have been poor. Green Gem should be noted by any requiring a really good dwarf early Pea. Tall early sorts are now about over, and the stakes may be used on the late plot. Peas are looking much better since the rain, and a good late crop is now assured.

THOMAS HAY.

Hopton House Gardens,
South Queensferry, N.B.

FRUIT GARDEN.

VINES.

THE wood of the earliest Vines which were cleared of fruit last month should now be nearly ripened. If the foliage has been syringed daily, it will soon be changing colour, when less syringing will be necessary. A good syringe, however, in the evening after a hot day helps to keep the house cool and to retain the foliage. Laterals which have been allowed more extension should now be shortened back. If it is intended to make any alteration or additions of fresh material to the borders, this should be carried out, shading and syringing the Vines well for a short time afterwards. If the drainage is good, and no examination of the borders necessary, these should be well watered inside and out, and old Vines given an occasional application of liquid manure to keep the roots in active condition some time longer. Vines in succession houses, as soon as they are cleared of

their fruit, should be syringed with some insecticide thoroughly to cleanse the foliage. Liberal root waterings should be given. Freely syringe the Vines morning and evening, and keep the ventilators wide open day and night. For vigorous young Vines close the house with sun-heat in the afternoon, afterwards opening the ventilators for the night. There is nothing like sun-heat and plenty of air for ripening the wood.

Shade the midseason houses where ripe Grapes are hanging. There is nothing better than their own foliage and a little extra lateral extension. Where, however, this is not sufficient give a light shade by placing fish netting over them. White Grapes require plenty of light to colour them properly. If the shoulders of these show signs of shrinking place a sheet of tissue paper over them. Keep the atmosphere of the house cool and not too dry.

LATE GRAPES.

Danger of scalding of berries of the variety Lady Downe's will now have passed. The houses should now be ventilated freely, and closed early with plenty of sun-heat and moisture. Keep the ventilators closed until 6 p.m. or 7 p.m., when a little top and front air should be admitted for the night. A little fire-heat will be necessary on cold nights and in moist districts. Go over the bunches and freely thin out any berries which are crowded or seedless. Late Vines are generally cropped heavily, and should be liberally treated with supplies of liquid manure until colouring is well advanced, when clear water only will be required.

INDOOR GARDEN.

MALMAISON CARNATIONS.

THE plants that were layered as previously advised are well rooted, and are being potted into 3-inch and 4-inch pots. Every detail in their culture should from the beginning be given full consideration. The pots should be clean, and must be well drained. The compost may consist of two parts good turfy loam to one of leaf-soil, with some sand. Equal parts peat and loam are also recommended. If the latter is strong and retentive add coarse sand and sufficient old mortar rubble to keep it porous. Pot with care and consideration, and, providing the compost at the time is in proper condition water will be unnecessary for some days afterwards; syringe amongst the pots and about the stages, however. The cold frame in which a stage can be fixed so as to raise the layers near the glass is the best position in which to place them for a little time. During the day they will require shade. Except for a few days after potting give plenty of air, and if the weather is favourable at night remove the frame lights altogether.

NERINE FOTHERGILLI MAJOR.

These plants have for a time been stored away to rest, and have been kept very dry at the root. The bulbs are now beginning to send up their flower-spikes, and a small quantity of water may be given. Leaf-growth will soon commence, and then a little Clay's Fertilizer sprinkled over the surface of the soil, together with occasional doses of liquid manure, will assist materially in the development of strong, good growth. As they come into flower remove them from the cool pit in which they have so long been situated to the greenhouse, where they will show to advantage.

VIOLETS.

For an early autumn supply of flowers no time should be lost in getting a batch of the earliest and best plants put into the pit or frame in which they are to flower. In removing them from the border every care should be exercised. In order that they may soon establish themselves in their new position avoid mutilating the roots, and press the new soil firmly about them. A good soaking with water from a rose-can should at once be given, and for a few days keep the frame-lights closed and shaded from hot sunshine.

SHOW AND FANCY PELARGONIUMS.

The flowering season is over, and now cut back the plants to within half an inch of the previous

season's growth. For a few days withhold water from their roots, and when the check through hard pruning has been overcome the plants will soon send forth new growths. More shoots sometimes appear than are required, and the weakest of these should be removed, those that remain being encouraged to grow strong by keeping the plants well syringed and affording them abundance of air and light when in the cold frame.

ORCHIDS.

THE ODONTOGLOSSUM HOUSE.

THIS house will require a lot of attention to keep the plants healthy with such weather as we have had lately. It has been very trying to the cool and moisture-loving Orchids, and so long as it lasts damping down must be frequently carried out in addition to overhead sprayings. It also does good on warm nights to syringe them overhead about 8 p.m. Many of the plants that flowered during the early part of the year are now sufficiently advanced to enable repotting being done. Among those now ready are *O. cordatum*, *O. Halli*, *O. triumphans*, *O. luteo-purpureum*, *O. cirrhosum*, *O. crispum*, and the varieties of the above species. Although we have seen a very great advance during the past few years in the general cultivation of the *Odontoglossum*, I am afraid repotting is often left too late. Those plants given fresh material once a year have generally given us the finest spikes of flowers, yet even the changing of the material is only part of the necessary work. Cutting away of the back pseudo-bulbs is another very important factor. These old bulbs take away much of the substance that should go towards building up fine pseudo-bulbs and strong spikes. During the time they are lying practically dormant they should not be allowed to remain very dry, but just to become fairly so before more water is given. As the new growths advance the supply of water should be gradually increased.

Often the house that is given to these Orchids is not at all suitable. Many think that because they prefer abundance of shade during the spring, summer, and early autumn months a house with a north aspect is suitable. I should say that such an one was the worst possible; it is not advisable to have anything obstructing the light that cannot be removed when desired. The house I prefer is one that runs north and south and has plenty of bottom ventilation and a continuous lantern ventilator on the roof. I often think that detail is not sufficiently thought of, and many houses at the present time in which the plants are not happy could, by having more bottom ventilators, be converted into first-class *Odontoglossum* houses.

Much has been written from time to time on the details necessary to grow these Orchids, yet a great deal requires further enlightenment. Other readers of THE GARDEN may be able to give their experience regarding the structure and cultural details, which would all lead to a better understanding of the requirements of this now popular Orchid.

THE KITCHEN GARDEN.

THE POTATO CROP.

LAST year, about this time, when rain was falling every day, considerable anxiety was felt for the welfare of the Potato crop, and the tell-tale blotches on the leaves, which denote the presence of the dreaded disease, were to be observed on every side. As matters turned out the anxieties were by no means groundless, and Potatoes were among the disappointing crops in the disastrous season of 1903. How do we stand this year in regard to Potatoes? There has been little rain, and it is to be hoped there will be no disease, but will the most important vegetable crop in the garden turn out to the entire satisfaction of growers in general? I doubt it, for though cold

and wet are conducive to the spread of disease, the opposite extreme in the way of drought and burning sunshine is not favourable for the free growth of bine, and without this there can be no full return of tubers.

During the latter half of July Potatoes, like other crops, had a trying time of it, and in particularly light dry soils the tops have ripened off so rapidly that I am afraid the rain which may fall now will have little effect on swelling up the tubers, and they will consequently be small. In many cases I have taken the trouble to enquire into the origin of the seed sets of unsatisfactory patches of Potatoes, and have invariably found that they were of varieties which have been grown and grown in the same district until they are worn out, or else there was something else not quite in order at the time of planting. The fact is, not half enough attention is paid to the important principles which govern Potato culture. Scores of people who are perfectly well acquainted with the importance of frequent change of seed, and care in the preparation of sets for planting, pay little or no attention to these points in practice, and consequently they suffer through failures, particularly in seasons when climatic conditions are not entirely suitable for the Potato crop. Experience teaches us that varieties—even the best of them—cannot be expected to go on indefinitely, and in course of time their constitutions weaken and they fail. It would seem that there is a good deal more to learn about the growing of Potatoes for planting purposes, and doubtless many varieties would last longer in a profitable state if more attention were paid to the change of seed. Of late years many growers have become alive to the excellence of Scotch grown seed Potatoes for planting purposes. Last year, in spite of the ravages of disease, I had as fine a lot of Potatoes as one need wish to see, and I attribute the secret of my success to growing varieties of modern origin, and obtaining the seed from the North. This year I have every reason to feel satisfied with the appearance of the growth of my Maincrop sorts, and though it is never wise to prophesy, I feel sure that I shall lift good crops of Evergood, The Factor, The Crofter, King Edward VII., and others of this order. My own experience is borne out by others, and in the case of nearly all the best-looking patches of Potatoes I have seen, I have found that the seed sets were obtained from another district and different class of soil.

Even the best of seed tubers, however, cannot be expected to give good returns unless reasonable care is exercised in their management; and experience teaches us that in spite of the accommodating character of Potatoes, the man who is usually the most successful with the crop is he who pays attention to every detail in cultivation. Too often seed Potatoes are treated in a most slipshod manner. They are left in heaps to waste their energies in making growths which are absolutely of no use, instead of being carefully stored in such a manner that the forces in the tubers are conserved until the latter are put in the ground. In experiments which have been tried, none are more useful than those which prove how much the yield may be increased by careful selection and proper treatment of the sets prior to planting. As most people are aware, we have entered this year on what may be termed a new phase of Potato culture in the shape of propagation from cuttings and raising crops from plants put out of pots. The sensational boom of new varieties is, of course, responsible for it, the object being to increase stocks of high-priced novelties at express speed. The time has come when we may venture to ask how Potatoes are responding to this kind of treatment, and from reports to hand the outlook is not altogether encouraging. I paid a visit to a garden the other day where some high-priced Potatoes were purchased in the spring, and from these a large number of plants were obtained by means of striking cuttings. The grower now is sad at heart over his novelties, which are the most sickly-looking patch of Potatoes in the garden.

I am told that the people in Lincolnshire are not quite so enthusiastic about Eldorado as they were,

and that many of the breadths of this variety, the plants of which were propagated from cuttings, are presenting anything but a promising appearance. Perhaps one of the Lincolnshire correspondents of THE GARDEN can tell us how far this is correct, because many people just now are anxious to see how cutting-raised Potatoes will turn out. Certainly the weather in the early part of the season was not particularly favourable for plants so raised, and the cold winds of early June doubtless played havoc with crops which were fully exposed. The way in which the varieties that were so cleverly boomed in the spring will acquit themselves this year will not only decide the question as to whether Potatoes in the future will be propagated largely from cuttings, but it will also have an effect on the continuation or the cessation of the boom.

G. H. H.

VEITCH'S SELECTED EARLY FORCING CAULIFLOWER.

FOR early use this Cauliflower is unsurpassed; its regular size, compactness of head, pearly whiteness, and fine flavour recommend it as a first-class variety during the end of May, June, and July. If sown in boxes in a gentle heat early in January, potted off into 3-inch pots, grown on until the end of February in a nice warmth, gradually hardened off, and planted out in a well-prepared quarter the second week in March, it is ready about the end of May and lasts into July, when the variety *Walcheroo* is ready for use.

Warren House Gardens.

C. J. ELLIS.

THE INDOOR GARDEN.

ACACIA BAILEYANA.

IN February of last year I saw for the first time this charming shrub in flower on the steep slopes in the nursery of MM. Nabonnand, frères, Golfe-Juan. It attained a height of about 2 mètres. Long bunches of golden blossom over its very elegant bipinnate foliage formed delightful clusters. *Acacia baileyana* was described by Mueller in Australia in 1887, and introduced later to the Botanic Gardens, Cambridge. The plant had been kept in a cool greenhouse, though in the climate of England and France it should be grown in the hot-house. One can therefore scarcely form an idea of the beauty to which it attains when it grows and flourishes under the sun of the coast of Provence. From a slender though strong stem the branches spring, at first erect, and then spread with the weight of their foliage. They are of a beautiful glaucous green. The leaves, disposed at right angles on the branches, have short petioles, are bipinnate, and bear two or three pairs of short leaflets. The flowers are disposed in loose lateral bunches. *A. baileyana* came originally from Queensland and from New South Wales in Eastern Australia. This newcomer will soon be widely distributed, for M. Nabonnand is multiplying it by grafting upon *Acacia floribunda*. We have also received some good seeds from MM. Haage and Schmidt, seedsmen, Hamburg. This will still further facilitate the diffusion of this pretty novelty, which will vie with *Acacia dealbata*, *cultriformis*, *cyanophylla*, *armata*, and other charming *Mimosas* hardy on the coast of the Mediterranean.

ED. ANDRE, in the *Revue Horticole*.

FUCHSIAS AS BASKET PLANTS.

IN the lists of various plants that are advocated by different writers as suitable for growing in suspended baskets the *Fuchsia* seldom finds a place, yet how beautiful some of the varieties are when treated in this way; for the entire plant in habit, the manner in which the flowers are borne, and the flowers themselves all show their adaptability for such a purpose. For conservatories they are well suited, for they grow quickly, and will, therefore, soon furnish a large basket, while, in common with the same varieties when grown in pots, a succession

of flowers is kept up for some time. The great point to bear in mind with all plants grown in hanging baskets is to allow as good a provision as possible for the roots and to see that they do not suffer from want of water, as in a greenhouse or conservatory they, of course, will dry more quickly than in a stove which is heavily shaded and frequently syringed. A judicious disposition of hanging baskets certainly does a good deal towards relieving the hard and formal lines of the various glass structures in which plants are grown, and loose-growing subjects such as the *Fuchsia* are unsurpassed for this purpose. A good deal of the success or otherwise attending plants grown in suspended baskets depends upon the manner in which these are planted as well as on their after treatment. They must in the first place be thoroughly lined either with broad flakes of moss or with turf, which latter is the better if it is of a tough fibrous nature. The soil used, too, should be such as will give up its nourishment slowly, otherwise it may quickly become exhausted. For such plants as *Fuchsias* a good fibrous loam with an admixture of decayed manure or leaf-mould will be the most suitable. All the material used must, of course, be well secured, and a few pegs will be of service in this respect. A very good plan in filling hanging baskets is, if possible, not to consign them to their elevated position before the plants are established therein, as they can be better attended to when near the ground. The watering of hanging baskets is always an important item, and many cases of failure are attributable to an insufficient amount of water. Naturally enough, if elevated near the glass the atmosphere is very dry, the conditions being, therefore, favourable for red spider, which, unless checked, will soon destroy the beauty of many plants; hence they should, if possible, be prevented from effecting a lodgment on the leaves. If the plants receive an insufficient supply of water they naturally fall a prey to red spider far more readily than would be the case if the roots were well supplied with moisture.

In selecting *Fuchsias* for hanging baskets those of a loose habit of growth should be chosen, as the close, compact-growing varieties, which are the most popular for pot culture, are not nearly so effective when suspended. A few good varieties for this purpose are—with white tube and sepals—*Lustre*, *Mrs. Marshall*, and *Mrs. Bright*. Dark-coloured flowers, single—*General Roberts*, *Lord Elcho*, *Monarch*, and *Mrs. King*. Double—*Sir Garnet Wolseley*, *Beauty of Exeter*, and *Phenomenal*. With white corollas—*Molesworth*, *Gustave Doré*, and *Flocon de Neige*.

Among the many other plants that are available for hanging baskets in the temperature of a greenhouse or conservatory may be especially mentioned the looser-growing forms of Ivy-leaved *Pelargoniums*, both single and double, the *Unique* section of the scented-leaved class, of which the showiest is *Rollisson's Unique*, a beautiful rich purplish coloured flower. If the winter conditions be favourable, this last will bloom nearly throughout the year. *Tropæolums* are very useful, especially such as *Ball of Fire*, *Clibran's Gem*, and *Peter Rosenkranz*. These are propagated by means of cuttings, hence they are more free-flowering in a young state than seedlings. *Achimenes*, too, are really beautiful during the summer months and give but little trouble. Of late years attention has been several times directed to the beauty of some forms of the tuberous *Begonia* when grown in suspended baskets, especially such as are of a loose habit of growth with drooping blossoms. The variety *worthiana*, which is in some places extensively grown for bedding, with its narrow orange-scarlet blooms, is one of the best for this purpose. That evergreen fibrous-rooted form, with rather small reddish salmon-coloured blossoms, known as *undulata* or *glaucophylla*, is a good basket plant, and in a rather higher temperature some of the others can be used in the same way. *Othonna crassifolia*, with thick glaucous flowers and yellow blossoms, does well in a suspended pot or small basket, and *Petunias* often make a goodly show treated in this way. There are many other subjects available for basket culture in the greenhouse, and in the stove the list might be consider-

ably extended. Grass-like plants of a straggling nature look well in baskets, especially in conjunction with other subjects. A good thing and one in general use is the plant known in gardens as *Panicum variegatum*, and another equally desirable for such a purpose but not nearly so well known is *Stenotaphrum glabrum* and its variegated-leaved variety. This *Stenotaphrum* is a creeping growing Grass that will soon cover a considerable space, and suspended it will hang down for some distance.

H.

NOTES ON LILIES.

DURATION OF LILY BLOOMS.

OWING to the hot and dry weather the individual blooms of the different Lilies did not remain long in beauty unless exceptionally situated, but whether exposed to the full sunshine or protected from it, some species retain their freshness for a very much longer period than others. The bulk of the earliest Lilies in the open ground consists of those with erect blossoms, corresponding with the sub-genus *Isolirion* of Mr. Baker, and as a rule they do not remain long in beauty. This feature is especially noticeable in *L. davuricum* or *L. umbellatum*, as it is often called, different forms of which are commonly to be met with. They are very bright and effective when first expanded, but soon become dull, though the petals do not drop for some little time after the change in colour takes place. The dwarf *L. elegans* or *Thunbergianum* is very prolific in varieties, and some of the red ones, notably *biligulatum* and *sanguineum*, change as quickly as the forms of *L. umbellatum*. The richly tinted *Van Houttei* retains the brightness of its colouring much longer than those above mentioned, while the yellow varieties, such as *alutaceum*, *Prince of Orange*, and *Alice Wilson*, change but very little before they drop. Two species of this section stand out as especially noteworthy by reason of the length of time that the flowers remain in perfection. They are *L. bulbiferum*, that flowers much about the same time as *L. davuricum*, but the blooms are brighter and remain in beauty for a very much longer period, and above all the old Orange Lily (*Lilium croceum*), a clump of which with me has been in flower from the middle of June to the end of July. Not only has a succession of bloom been maintained, but each flower retains its beauty for such a long time. This is certainly one of the best ordinary garden Lilies that we possess, as apart from its other features the blossoms are of a very bright and effective tint. Some of the members of the *Martagon* or Turk's-cap group have petals of unusual substance, and they all remain in good condition for a longer period than most Lilies. The yellow-flowered *L. Hansonii*, the Black *Martagon* (*dalmaticum*), and especially *L. chalcedonicum*, which is commonly known as the Scarlet *Martagon*, are all good lasting Lilies. *L. chalcedonicum* is, however, the best of them all in this respect, for the blooms remain in beauty a very long time, and that, too, during what is generally the hottest period of the year, for its usual period of blooming is during the month of July. The small, but prettily reflexed and brightly coloured blossoms of this Lily are very beautiful, and it should certainly be more generally planted than it is. In common with many others, it will seldom flower much the first season after planting. *L. Leichtlini*, a pretty pale yellow flower, plentifully dotted with brownish red, remains fresh for a considerable time, while there are several of about an average duration. Under this head must be included such kinds as *L. auratum*, *L. longiflorum*, *L. tigrinum*, *L. testaceum*, *L. Batemanniae*, *L. Browni*, *L. canadense*, *L. Szovitzianum*, *L. pardalinum*, *L. Krameri*, *L. Humboldti*, and others. The most conspicuous of all the varieties of *L. auratum* is the red-banded *rubro-vittatum* or *cruentum*, which when the blossoms are first expanded is wonderfully bright and effective, but the coloured portion soon changes to more of a dull brownish hue, and it

is then not nearly so attractive as at first. From the fact that they do not flower till the summer's heat is as a rule a good deal abated, all the varieties of *L. speciosum* remain in beauty longer than many of those that bloom earlier in the season, for towards the end of August or in September, and even October, they remain fresh for a very long time. The new *L. Henryi* has much the same substance as *L. speciosum*, and lasts about as long as that does. The stately *L. sulphureum* (the once *L. wallichianum superbum*) is one of the later blooming Lilies, and a good lasting one, but the most noticeable in this respect of all the tube-flowered group is the *Neilgherry Lily* (*L. neilgherrense*), whose long, tube-shaped flowers are of a thick wax-like substance. This is particularly noticeable for its large massive flowers, often borne on comparatively short stems, the late season at which it blooms, that is, the last three months of the year. The short flower-stems frequently met with in this Lily are caused by the fact that in some individuals the stem, after leaving the crown of the bulb, proceeds in a horizontal or even downward direction for some little distance before it appears above ground, and when it does so the flower-stem is sure to be short. In pots the stem will often go to quite the bottom of the pot and come up on the side directly opposite to that where it went down. In speaking of Lily blooms one curious fact may be noted with regard to some forms of *L. washingtonianum*, and that is when first opened the flowers are white or nearly so, but they quickly change to a purplish hue. H.

ORNAMENTAL SEEDS AND THEIR APPLICATIONS.

PROBABLY the Colonial and Indian Exhibition of 1886 will be within the memory of many of the readers of THE GARDEN; still, some of the features of the exhibition may be forgotten, notwithstanding there were at that time, as well as at previous similar exhibitions, many object-lessons on the utilisation of the natural products of our Colonies, which, in consequence of their not forming regular articles of export, have become generally known under the term of "Minor Products." To the development of these a good deal of attention has lately been directed, as it has been shown that such products in the aggregate become of very great importance and of much financial value. Some of these minor products are of such a character as to have special attractions to all those interested in plant products, as they deal largely with the application of seeds and fruits. In the West Indian Court of the Colonial Exhibition each of the several islands of that beautiful group showed a large and attractive series of useful and ornamental articles made from native seeds, barks, leaves, and Ferns, such, for instance, as doyleys of Lace bark, hand-screens, lamp shades, pin-cushions, watch-pockets, work-baskets, and dish mats made of Wire Grass, besides the very varied applications to which the numerous ornamental seeds can be put.

Though this kind of work is sometimes looked upon in the light of ladies' fads, the fact of its being considered worthy of notice in an official publication of the Imperial Department of Agriculture of the West Indies proves that it is a matter of some importance. Thus, under the head of "Fancy Work and Curios," the following paragraphs have appeared in the *Agricultural News*, published at Barbados: "The present age is one in which there is a great demand for curios, and the increasing number of winter visitors to these Colonies should enable aged people and those who are only able to follow light, sedentary occupations to establish quite a small industry in mounting and preparing the ornamental seeds of the West Indies. At Jamaica a Women's Self-Help Society, founded in 1879 by Lady Musgrave, is doing excellent work in this direction. It supplies a large assortment of ornamental articles made from seeds, fruits, and Ferns entirely prepared by its members. The society is possessed of a substantial building that has cost £900 free of

debt. A similar society has lately been founded at Trinidad by Lady Moloney, wife of the Governor. On one occasion, as the result of one day's sale of these articles by the Self-Help Society, a sum of close upon £80 was taken, and at another time a two days' sale realised a similar amount, making a total of nearly £160 in three days—a proof that 'There is evidently something to be done with unconsidered trifles if only deft hands and skilful brains are trained to present them in an attractive and artistic manner.'

The preceding remarks apply only to West Indian products, but as a large number of the plants referred to are found also in other tropical countries, we intend to say a few words specially about ornamental seeds. Before doing so, however, we may perhaps express some surprise that many of them as well as barks and various other tissues are not more widely known in this country than they actually are, seeing that there is no lack of materials available. All that is needed are clever fingers to manipulate them into articles of a saleable nature and a determination to bring them to notice, which can be realised in many ways, such as the working up of the articles themselves either as a pastime or as a business occupation, or the promotion of their sale, in which ladies have so much influence, a fact which has been so fully proved by our reference to the work of the Jamaica Women's Self-Help Society, and in our own country by the action of a combination of ladies for the purpose of promoting Irish and Scotch industries, and, further, in the revival of the lace manufacture in the English counties where it had well-nigh died out.

As an aid towards the fulfilment of the object we advocate we will give a few examples of the material available. Many tropical seeds and fruits are most attractive both in colour and form, and offer a very wide scope for adaptation, such as the pretty little scarlet and black Crab's-eyes as they are called. These are the seeds of a common tropical climbing plant—*Abrus precatorius*—belonging to the order Leguminosae. The seeds and pods are most plentifully produced, so that there is no chance of the supply falling off should a great demand arise for them. In every country where the plant grows these highly ornamental seeds are used for necklaces, ear ornaments, and rosaries, as well as in the decoration of caskets, boxes, and such like articles. A bunch of the dried, twisted pods sufficiently opened to show the brilliant red seeds inside (Fig. 1) makes an excellent addition to a vase of dried flowers, and are used by English people in India as a substitute for Holly at Christmas.

Another leguminous seed similar in appearance to the Crab's-eyes, namely, a bright scarlet with a big black blotch, but very much larger in size, is furnished by *Ormosia dasycarpa*, sometimes known in the West Indies as the Jumbi (Fig. 2). These seeds form splendid necklaces, especially if strung on two strings and the black and red blotches reversed alternately; for mounting in brooches they are also very suitable. Another West Indian tree, having hard red seeds without the black spot, which are specially adapted as a substitute for coral, is *Erythrina Corallodendron*. It is known in the islands as the Coral tree, and belongs to the same natural order as those already mentioned. For brightness and brilliancy of its scarlet seed of the Andaman Redwood tree (*Adenanthera pavonina*, Fig. 3) excels all. The seed is somewhat

lens-shaped, and about a quarter of an inch in diameter, extremely hard on the surface, and very uniform in size and weight. These seeds are commonly used in India, not only for necklaces, bracelets, and other articles of personal adornment, but also as weights in consequence of their uniformity. Set in a mount of gold, either for pins, rings, or brooches, they make an excellent substitute for coral, for it is remarkable that none of these bright colours of seeds fade by exposure to light or from the effects of time. Besides this there is the recommendation that the seeds are Nature's own production, and not a fictitious imitation. A few years ago these seeds were used by a well-known London jeweller, after being mounted in gold as above described. It cannot be denied that for necklaces and such like purposes, there is some little difficulty in boring the necessary holes

MISCELLANEOUS.

CARNATIONS AND PINKS FOR VASES.

NOTHING can be more beautiful or more effective for vases than these popular and very charming flowers, and just at present they are in such great abundance and such infinite variety, that an endless succession of pleasing arrangements can be secured with very little trouble, for these useful blossoms are very easy to arrange. In cutting Carnations for decoration care should be taken to select blooms on long stems, to see that the said blooms are quite fresh, and to exercise discrimination in the matter of the colours chosen. No foliage looks so well with them as their own, and the custom of using this need not become extravagant, as with proper attention to the ends of the stalks the slips may be made to last three weeks or even more. The numerous varieties of the fancy grasses are peculiarly well suited to mix with Carnations, especially *Lagurus ovatus*, *Briza minima*, *Agrostis pulchella*, *A. nebulosa* and *Eragrostis elegans*. The use of flower buds is also to be recommended, and these, as well as the shoots, can be taken from single seedlings, thus saving the choicer varieties. I have before me as I write a dull green Fern pot of Devon pottery in quaint design filled with blooms of a seedling very similar in colour and habit to Mrs. Reynolds-Hole, loosely arranged with its own foliage and cloudy plumes of *Agrostis nebulosa*. The effect is very charming, all the details, both of pot and flowers, being quite in harmony.

In the successful arrangement of flowers for house decoration a great deal depends on the vase or pot. Broadly speaking, coloured glass vases are an abomination. Venetian and Bohemian glasses are, of course, exceptions, also certain examples in delicate shades of yellow and green, which are now being offered at exorbitant prices. But the cheap and nasty articles in vivid reds, blues, and unhealthy-looking mixtures are quite fatal to the beauty of any flowers placed therein. In my opinion nothing can beat good clear glass or artistic pottery in subdued tints. In a glass vase I have just arranged a number of scarlet Carnations, judiciously mixed with white ones, this little group being intended for a dark corner, which it now brightens successfully. For cutting the singles are by no means to be despised, and a pretty combination consists of a pink and white single mixed with Germania. Another very favourite mixture is Uriah Pike, or a similar maroon-coloured flower, with Mrs. Leopold de Rothschild or a similar Pink. As a rule I prefer the fancy varieties to be arranged by themselves; the selfs are by far the best for mixed arrangements, and then the most elegant effects can be obtained by using two varieties only; three or more different sorts will almost inevitably give a garish effect.

MIXED BORDERS.

FROM the present time onwards until the end of the summer and quite half through the autumn is the season for the majority of the larger herbaceous plants, and as the borders will be gay with the flowers of many different families it is a good plan

ORNAMENTAL SEEDS. (Drawn by Lillian G. Jackson.)

1, Crab's-eyes (*Abrus precatorius*), pod and separate seed; 2, Jumbi (*Ormosia dasycarpa*), one seed shows hilum; 3, Seed of Red Sandal Wood (*Adenanthera pavonina*), side and end views; 4, Nicker Nuts (*Cesalpinia Bonducella*); 5, Elowear, as *Ganitrus*; 6, *Fusanus* sp.; 7, Horse-eye Bean (*Mucuna wrens*), side and end view, showing hilum; 8, 9, 10, 11, 12, and 13, Various forms of Job's Tears (*Coix Lacryma Jobi*); 14 and 15, Velvet seeds, two species of *Quina*; 16, Necklace of Velvet seeds.

through which to pass the cords. This is best done by fixing the seed firmly and using a fine drill. Attempts to soften them in water will cause failure, for not only does the coloured skin separate from the cotyledons, but the cotyledons themselves divide and the seed is hopelessly spoilt, besides which the red colour loses some of its brilliancy, and the softening process takes some days to effect. Therefore, perfectly and naturally dried seeds of all kinds should always be selected, the colours and shapes being the most natural under such conditions.—JOHN R. JACKSON, A.L.S., &c., Late Keeper of the Museums, Royal Gardens, Kew.

(To be continued.)

to note the general effect with the view of making improvements in the grouping at next planting time. No one family should have undue prominence, especially if that family is represented by only one shade of colour. A background, for instance, that mainly consists of *Helianthus* in variety or *Solidagos* is apt to be a trifle monotonous. There are very few herbaceous borders on a large scale that are satisfactorily planted at the first attempt; fortunately, most of the inmates bear shifting well, and can also be readily increased by division, and any alterations required can be made after the first flowering season. The great point is to get such work finished, if possible, this side of Christmas, to divide and replant carefully, and to help the plants a little the first season if the weather is against them. Spaces may at planting time be left for those things which will be increased by cuttings and which are not likely to be ready until next spring. For a season or two after planting, if the materials to hand were somewhat scanty, other things have to be introduced to fill the border, but with good cultivation and a little judicious autumnal division the perennials will soon monopolise the space. The only foreigner at the back of our borders this year is *Nicotiana glauca*, and an occasional clump of the same is decidedly effective, the magnificent leaves forming an excellent contrast to the rather small foliage of many perennials, the *Starworts* and *Pyrethrum uliginosum*, for example. For large clumps, when staking is really necessary, there is nothing better than half-inch or three-quarter inch round iron in 5-feet, 6-feet, and 7-feet lengths sharpened at the one end. They are rather expensive at the outset, but, bearing in mind their durability and also their strength and neatness, I think the little extra money given is laid out to advantage. In the wild garden just at present the tall *Phloxes*, *Chrysanthemum maximum*, and some of the *lavis* and the *Novi-Belgi* *Starworts* are in great beauty. Clumps of *Hydrangea paniculata* associated with *Fuchsia gracilis* also make a very effective group.

CORRESPONDENCE.

(The Editor is not responsible for the opinions expressed by correspondents.)

CARPENTERIA CALIFORNICA.

[TO THE EDITOR OF "THE GARDEN."]

SIR,—I wish you would tell me something about this beautiful shrub which I saw in a southern garden recently. There was no one I could ask, but I was told it was the *Carpenteria*. H.

[This, botanically related to the Mock Oranges, we fear is not a perfectly hardy plant except in such favoured spots as the Isle of Wight, the Devon and Cornish coasts, and the warm and southern parts of Ireland. It is one of our more uncommon shrubs that may be successfully grown and flowered in pots, and where kept in a greenhouse temperature it blooms as a matter of course earlier than in the open ground. In the spring, when the majority of outdoor shrubs are only just pushing forth their leaves, a specimen of this *Carpenteria* studded with its large white blossoms is not only a very beautiful object, but quite distinct from its other associates in the greenhouse. It may be kept in health for years in a pot, provided it is after flowering hardened and plunged outside during the summer months and well on into the autumn. If kept under glass altogether the foliage is very liable to be attacked by red spider, which soon causes it to wear a sickly look. The heavy dews so prevalent in early autumn seem to benefit this *Carpenteria* greatly when it is grown in pots, and for this reason it should not be taken under cover before it is absolutely necessary. Treated as a shrub in the open ground or trained to a wall, it is, of course, seen to greater advantage than when confined in pots; still, where not quite hardy there is no reason why it should not be grown and flowered under glass in the manner described. Now that this has become well distributed about the country, it would be useful to hear from

growers of it in different parts as to its behaviour, more especially in reference to its hardiness. September is the best month for propagating this *Carpenteria*, for cuttings of the young growing shoots, if put into pots of sandy soil, will with ordinary care and attention root readily enough. The frame must of course be kept close and shaded till the cuttings strike. An ordinary cold frame is very useful if set apart for the propagation of hardy shrubs during the summer months, for a great many of our most beautiful kinds may be struck from cuttings of the young growing shoots, taken just as they have lost their most succulent character and become moderately firm.—Ed.]

GROWING THE GLOBE ARTICHOKE.

[TO THE EDITOR OF "THE GARDEN."]

SIR,—Will you please give a few practical hints on the culture of Globe Artichokes? Mine planted two years ago seem to grow too luxuriantly; they have huge leaves and are very tall, but the heads are very small and poor eating. Would you advise their being moved to poorer soil?

P.
[Evidently the Artichokes in question are from a poor stock raised from seed and unselected. Though most seedsmen sell seeds from selected types of the Green Globe and Purple Globe forms, a very large percentage of the produce is worthless, so that a rigid selection must be made of the best types when the heads form, and all the rest destroyed. This may mean destroying two-thirds or even more of the seedlings. A better way of getting stock is to buy selected crowns of the purple or green forms, as desired, from a reliable source, and then to take good care not to lose the stock again. By no means should the plants be removed to poorer soil, rich soil and free growth being absolutely necessary for the production of good succulent heads, and if strong-growing plants, such as "P." appears to possess, do not produce good heads, no system of cultivation will make them any better than they are. The cultural details are few, but must not be neglected. Plant in April or early in May, in groups of three, the strongest crowns which can be procured, the groups to stand at least 4 feet apart. The position should be an open one, and the ground should have been trenched and well manured during the previous winter, and if the soil is inclined to be wet or heavy, some light material, such as the ashes from burnt garden rubbish, should be added; or, if this is not available in quantity, leaf-mould and road grit form a good substitute—indeed, any one of the various things which are recommended to assist in making a heavy soil more porous will greatly benefit the Artichokes, and help to prevent their loss during the winter. While the plants are bearing their crop they enjoy liberal floodings of liquid manure, and under this treatment they flourish, and keep on producing successional heads for at least five months of the year. Make it a rule to plant one or two rows every year, as the best crops are given in the second and third seasons, while those newly planted give a late supply. It is a mistake to allow the old stools to remain in the same spot for many years, as they get weak and overcrowded with shoots. As winter approaches the crowns should be surrounded with dry bracken, and as this becomes sodden it should be removed and replaced with fresh material. Some recommend coal ashes and others straw as a protection, but bracken is best. Wet winters are worse than cold ones for the plants, but they suffer most of all when frosts are alternated frequently by wet thaws, and to avoid total losses of valuable stock in such seasons in November some of the strongest crowns should be separated from the stools with a little root attached to each, potted up into 7-inch pots, and wintered in a cold but dry frame, planting them out in May. Old stools may be lifted and divided, the woody portion of the root-stalks should be removed, but each divided piece should have some fibrous roots attached. The bracken or other protective material should be removed from the established clumps in spring as soon as the weather becomes genial, and at the same time a good dressing of decayed manure should be lightly pointed in with a garden fork.

Should the crowns be much crowded, some of the weaker growths should be removed when they become sufficiently advanced, as this will strengthen those left and tend to the production of first-class heads. For light soils seaweed forms a good manure, and, failing this, light dressings of fish manure or of agricultural salt should be given during the growing season.—Ed.]

SOCIETIES.

DUNFERMLINE ROSE SHOW.

The first of the flower shows arranged under the Carnegie Dunfermline Trust took place in Pittencrieff Park, Dunfermline, on the 21st ult. As £170 was given in prizes, in well-arranged classes, the competition was keen and the quality of the exhibits proportionally high. At this show, which is to be followed by others this season, Roses were the chief flowers, and seldom have Scottish lovers of the queen of flowers had a finer lot of flowers placed before them. Hardy flowers, Pansies, Violas, and Sweet Peas, were also very fine, and the classes for pot plants, and for bouquets, baskets, &c., were good, particularly the decorative work. The show was opened by Dr. Ross, chairman of the Trust. Subjoined are some particulars of the winners in the leading classes: Roses, open class, Carnegie Championship prize for seventy-two single blooms: First, Messrs. Alex. Dickson and Sons, Limited, Newtownards; second, Messrs. Hugh Dickson, Belfast; third, Messrs. D. and W. Croll, Dundee. Thirty-six Roses: First, Messrs. A. Dickson and Sons, Limited; second, Mr. Hugh Dickson; third, Messrs. D. and W. Croll. Messrs. Croll were first for twenty-four Roses, and also for twenty-four Teas or Noisettes; Messrs. A. Dickson and Sons being second in each of these classes. In the class for twelve vases of Roses, five blooms in each vase, Messrs. Dickson and Co., Edinburgh, were first. The displays of Roses, in space 10 feet by 5 feet, were excellently arranged, the first prize being won by Mr. Hugh Dickson, Belfast. In the classes for Roses confined to gardeners and amateurs, the leading winners were Mr. W. M. Melville, Newton Mearns, Rev. J. H. Pemberton, and Mr. A. Dalgarno. The amateur classes, though few, were good, the winners of first prizes being Mr. J. Russell, Newton Mearns, and Mr. W. M. Melville. Mr. A. Frater was first for forty-eight fancy Pansies and Mr. J. Paul for twenty-four, Mr. Smellie winning with show Pansies and Mr. A. Brown with Violas. The display of herbaceous flowers, 10 feet by 5 feet, brought out two competitors, the first prize falling to Messrs. J. Cocker and Sons, who had also the first for twelve bunches.

HANDSWORTH HORTICULTURAL SOCIETY.

The twentieth annual exhibition of this flourishing society took place on the 22nd and 23rd ult., as usual, in Victoria Park, several large tents being required to accommodate the exhibits. There was a large attendance. Viscount Morpeth, M.P., the president of the society, was in the chair at a large luncheon party, to which the judges were invited, Lady Morpeth being also present, who subsequently was the principal figure at an opening ceremonial. The Handsworth Flower Show promises to grow into one of considerable proportions.

The schedule of prizes contained a large number of classes, but it is possible to deal with a few of the leading ones only. In that for a group of plants filling a space of 300 feet, Messrs. J. Cypher and Son, Cheltenham, were placed first with one of those square arrangements in which brilliant foliated plants are seen to great advantage. Mr. J. P. Macdonald, gardener to G. H. Kenrick, Esq., Birmingham, was second, and Mr. W. Vause, Leamington, third, both excellent displays. Messrs. Cypher and Son also secured first prize for twelve stove and greenhouse plants, not less than six in bloom; they had a background of four magnificent Palms, two brilliant *Crotons*, *Statice intermedia*, and *Kalosanthes coccinea*, both very fine; *Chironia exifera*, *Ixora Duthi*, &c., Mr. Vause was second, and Mr. Brazier, gardener to J. Martineau, Esq., third. Other open classes for plants were for a group of Tuberous Begonias, also for *Fuchsias*, zonal *Pelargoniums*, *Coleus*, *Caladiums*, &c. In another division there were classes for plants shown by gardeners and amateurs, but time and the crowded state of the tents prevented particulars being taken. Cottagers also exhibited plants.

The open class for cut flowers comprised Roses. The best twenty-four varieties came from Mr. George Prince, Longworth, who had remarkably good blooms, the Hybrid Perpetuals being brilliant in colour; Messrs. Perkins and Son, Coventry, were second, and Mr. F. Dennison third. With twelve blooms of Tea and Noisette Roses Mr. G. Prince was again first with some fine Roses, Messrs. Perkins and Son being again second. Mr. Prince also won the first prize for twelve bunches of garden Roses, having bold and striking bunches of suitable varieties. Mr. J. Mattock, Oxford, was second. These two fine collections formed one of the leading features of the show. Yellow ground and white ground and self Carnations were shown in a few classes, and Mr. A. R. Brown's special prizes for bizarre and flake, and also for white ground *Picotees* brought some pretty blooms.

Sweet Peas were in strong force. Mr. R. Sydenham offered special prizes for twelve varieties, a large number being staged. Mr. W. Marple was first and Mr. E. Deakin second. Special prizes for six varieties were offered by Mr. S. Bennett, Mr. E. H. Cheshire being first and Mr. H. J. Canning second.

Collections of fruit of not less than ten and not more than fifteen varieties brought a fine contribution from Mr. J. H. Goodacre, Elvaston Castle, Derby, who had finely finished Madresfield Court, Black Hambrug, Gros Maroc, and Muscat of Alexandria Grapes, two dishes each of Peaches and

Nectarines, Melons, Plums, Strawberries, Figs, &c. Mr. T. Bannerman, The Gardens, Blithfield, Rugeley, came second; and Mr. J. Read, The Gardens, Bretby, Chesterfield, third. There was also a class for six bunches of Grapes, in which Mr. Goodacre came in first with three excellent bunches of Madresfield Court and three of Muscat of Alexandria; Mr. T. Bannerman taking the second prize. Fruit was also shown by gentlemen's gardeners and amateurs, in several classes, and hardy fruits by cottagers.

Some table decoration classes were also open to all. Chief among them was one for a dinner-table arranged on a space of 8 feet by 4 feet. The Leamington Nursery Company was first, having designs in Orchids, Mr. C. Thomas coming second with an artistic arrangement in Sweet Peas. Bouquets, epergnes, and baskets were also shown.

Vegetables were numerous exhibited and of generally good character, the cottagers making a brave display.

There were many honorary exhibits mainly by the trade, a silver cup, a gold medal, and a money prize being offered. The judges were set a somewhat onerous task. Eventually the silver cup was awarded to Mr. G. Prince for a fine and effective display of Roses of high quality. Messrs. Baker, Wolverhampton, were awarded the gold medal also for a display of Roses, the money prize going to Messrs. Hewitt and Co., Solihull, for a bank of hardy flowers and Carnations in vases. The following were awarded the silver medals of the society: Mr. G. Hancox for a group of fine-foliaged plants; the Vineries, Limited, Leamington, for a collection of herbaceous Philoxes; Messrs. Caw and Co., Hockley, for cut flowers; Messrs. B. R. Davis and Son, Yeovil, for double Begonias of fine quality; Messrs. Jarman and Co., Chard, for Roses, Begonias, Sweet Peas, &c.; to Messrs. Tuplin and Co., Newton Abbot, for Carnations, and to Messrs. Simpson and Son, Birmingham, for Sweet Peas.

HIGHGATE HORTICULTURAL SHOW.

THE forty-fifth annual exhibition of this North London Horticultural Society took place in the grounds of Hillside, Fitzroy Park, on Thursday, the 14th ult. On this occasion there were no less than twelve groups, and in themselves they were a fine feature. Coleus were good, the plants being large, and in some cases well coloured. Exotic Ferns were well displayed, reminding us of the earlier days of the society. Sweet Peas and hardy flowers and fruits were seen in good condition, and the two former subjects in diverse colours. Table decorations were interesting, but the judgment in this class difficult to understand. Amateurs and cottagers showed some remarkably good produce, flowers, fruits, and vegetables each coming in for a large share of attention.

There were two entries in the class for a group of miscellaneous flowering plants. That which won first prize for Mr. H. Hine, gardener to Mr. W. Scrimgeour, Parkfield, Highgate, was a very pretty and tastefully arranged group. For a group of flowering or foliage plants, or both combined, to cover a space not exceeding 50 square feet, Mr. T. L. Turk was placed in the premier position with a really grand group. A striking display was made in the class for a group of plants to consist of exotic Ferns, Caladiums, and Coleus, set up for effect in a space not exceeding 50 feet. In this instance Mr. Turk again was first. Mr. E. H. Chitty, gardener to Mr. S. Hardy, Cholemeley Lodge, Highgate, was an excellent second, his arrangement of the group being distinctly better than that of the first prize exhibit. Another mixed group, of the same dimensions as the others, was a capital display. In this instance Mr. Chitty was placed first. The class for six Coleus, distinct, was a feature in the show. Mr. Hine was a good first with large, well-coloured specimens, and a great improvement on those of recent years. Tuberous-rooted Begonias appeared to have suffered from the effects of the extremely hot weather of late. For twelve plants (six double and six single) Mr. Adams was placed first with plants not so good as usual, and Mr. Turk was second with a poorer set.

The decorative classes were interesting, that for a dinner table decoration being conspicuous. Mr. Turk was awarded first prize for a mixture of pale lavender, salmon, and maroon Sweet Peas, with Gypsophila elegans and suitable foliage and a layer of Smilax over the table cloth, Miss Bella Saunders, Victoria Cottages, Archway Road, N., being second, and Mr. D. B. Crane third. For twenty-four bunches of hardy flowers Mr. G. W. Earp, gardener to Mr. J. S. Sellon, The Grange, Highgate, was first with a beautiful collection of the best hardy plants then in flower. Mr. D. B. Crane was second, also with an interesting series. For twelve bunches of Sweet Peas Mr. Earp was awarded first prize; second, Mr. D. B. Crane, with larger flowers. In the amateurs' section Mr. Crane won the first prize for a collection of hardy flowers (number of varieties not restricted); second, Mr. W. Bignell, Highgate, with a good lot. For a collection of hardy fruits Mr. Earp was deservedly first with a very fine exhibit, Mr. D. B. Crane being placed second. For the same subject in the amateurs' section Mr. Crane was awarded first prize. The cottagers showed well, and it was hard to believe that the produce staged on this occasion was grown within five miles of Charing Cross.

The president (Mr. E. H. Smithett), who on this occasion gave the society the use of his grounds, has for years been indefatigable in his efforts to maintain an interest in horticultural matters.

THE HORTICULTURAL CLUB.

SUMMER MEETING.

THE annual excursion of this club took place on Wednesday, the 27th ult., and, thanks to the genial hospitality accorded to the members and their friends by Mr. and Mrs. Harry J. Veitch and the general arrangements made by that gentleman, nearly sixty spent a most delightful and instructive day. There were, fortunately, only occasional showers, and these were more than counterbalanced by the prevailing freshness of the landscape after the previous heavy rainfall. The party—among which were Messrs. J. Sweet, G. Monro, A. Watkins, C. T. Drury, H. H. Langston, J. Green, G. Paul,

H. E. Molyneux, G. Bassett, J. Assbee, J. Dowie, E. Mawley, W. R. Alderson, H. E. May, G. E. Schoultz, O. Thomas, G. J. Ingram, T. Bevan, J. Walker, C. E. Osman, and E. T. Cook (hon. sec.) with their wives and lady relatives—went down by the 10.55 train from Paddington in two saloon carriages, and, being met at Slough by their host, had a drive by brake to Langley Park, the residence of Sir R. Harvey, Bart., where, by permission, they had an opportunity of inspecting a number of remarkably fine Japanese bronzes, and the renowned Cedar of Lebanon, which forms the chief attraction. This Cedar utterly transcends all ordinary ideas, owing to its immense size and the peculiar decumbent habit of its branches, the lowest of which spread horizontally in all directions, to a great distance, completely covering, with still rapidly spreading foliage, a circle of no less than one hundred yards circumference.

Penetrating this, we reach an enormous trunk, which towers to a great height, sending out similar but smaller branches to some elevation, and finally forming a grand mass of foliage, somewhat more on normal Cedar-like lines. The main lateral branches are seen to be of huge girth in themselves, and resting upon the soil at a considerable distance from the trunk, spread out into wide sheets of vigorous verdure to form the circle aforesaid. To look at this tree one would give it at least a thousand years, judging by ordinary standards of growth, and yet it is computed to be no more than 150 years old, and certainly not 200, as the Cedar of Lebanon had not been introduced into this country so long ago. The next marvel in this garden is an extraordinary example of the Common Spruce Fir, which, though lacking the majesty of beauty of its near neighbour, is probably unique. This, too, appears to have caught the spreading habit of the Cedar, its lowest branches radiating horizontally and resting on the soil. It differs, however, in the fact that a large number of these branches have rooted, and while still attached have formed a ring or rather thicket of good sized trees, more of which appear to be in process of formation. The most curious feature is observed when this thicket is entered, as it can be here and there, when it is seen that each tree is joined to the main trunk by a slender branch an inch or so in diameter and a yard or two long, which at the rooting point suddenly swells out to a foot or more thick, which continues horizontally for a few yards, and then rises perpendicularly to form the tree proper.

The effect is very odd, and shows that so soon as the rooting of the branch was perfected the resulting young tree ceased to contribute an appreciable annual ring to the connecting link. After these, the beautiful collection of Bamboos, &c., was visited and much admired, and the party then proceeded *via* Black Park to East Burnham Park, the seat of Mr. Harry Veitch, where a generous luncheon was provided, also afternoon tea, and Mr. Veitch's beautiful gardens and aviaries were duly investigated. Subsequently the party was driven to Maidenhead, through the renowned Burnham Beeches and the celebrated grounds of Dropmore, and an appropriate end to a delightful day was enjoyed by dinner at Skindell's Hotel prior to the home journey thence to Paddington. That Mr. and Mrs. Veitch's abundant kindness found due recognition in a hearty vote of thanks need hardly be stated.

EAST ANGLIAN HORTICULTURAL CLUB.

THE summer excursion of this club took place on Thursday, the 28th ult. About eighty members and friends journeyed by brake to Framingham Manor House, the seat of J. H. Christie, Esq. They were met at the drive gate by the head gardener, Mr. Kett, who acted the part of guide. Passing through the well-kept pleasure grounds and shrubberies, one could but admire the choice and rare plants to be seen on every side. The aquatic garden, with its borders of Irises, and the large bold plants of the Nymphaeas of many colours, which were just in their fullest beauty, were greatly admired. The Calla, too, is established here. Mr. Kett, amongst other things, grows the Streptocarpus well. Leaving this place the party journeyed to Dunston Hall, the seat of the Mayor of Norwich (G. F. Buxton, Esq.). Mr. Hewer, the head gardener, who had been with the party to Framingham, conducted here, and made the way through the numerous fruit houses. The well-kept kitchen and fruit gardens were next visited. The recent drought had severely hampered the growth of things here, and brought on premature foreshowing of some of the crops, especially of Peas.

In going through the flower garden one naturally looked well at the border which Mrs. Buxton wrote of in THE GARDEN some time ago. Carnations were strongly represented, and carrying practically sheaves of flowers. The lawns and flower gardens were well kept, and the plant houses bright with the choicer subjects of the season, and many cultural points were observed by the observant of the party. At the inn at Mulbarton Mr. Edey had prepared a capital repast, over which Mr. T. B. Field of Ashwellthorpe presided, supported by Messrs. J. W. Church, W. Denington, E. Newell, H. Perry, F. Smith, N. Leeder, F. Myhill, W. Myhill, and other professional and amateur gardeners. Mr. Field, in a short speech, said how pleased he was that the outing had been favoured with such grand weather, and an opportunity had been given of visiting these gardens. He had the greatest pleasure in moving a hearty vote of thanks to the gentlemen who had so kindly allowed the club to visit their grounds. A hearty vote of thanks was accorded to the outing committee, and especially to Mr. W. L. Wallis, the secretary, for the arrangements made.

BASINGSTOKE FLOWER SHOW.

THE twenty-eighth annual exhibition was held in Golding's Park on Bank Holiday. Plants were numerous and good. Mr. Wasley, gardener to J. B. Taylor, Esq., Sheffield Manor, Basingstoke, won for nine specimens; Mr. East, gardener to F. D. Leyland, Esq., the Vyne, Basingstoke, won for the best arranged group of miscellaneous plants with suitable material none too well displayed. Tuberous Begonias were very fine. Mr. W. Greo, gardener to S. E. Bates, Esq.,

Marydown, had the best freely-flowered double varieties Coleus trained in pyramid form were well coloured; the best came from Mr. Green. Exotic Ferns in six varieties were well shown by Mr. Leith, gardener to H. Welch Thornton, Esq., Beaurepaire Park, Basingstoke. Lilioms, especially the lancifolium type, were well flowered. Mr. Green secured first prize for four. Mr. Wasley contributed twelve capital table plants, and won the premier place in the class set apart for them.

Cut flowers were numerous and good, with the exception of Roses; these felt the effects of the recent hot dry weather, as well as the more recent showers. Carnations were exceedingly fine. Mr. Neville, gardener to F. W. Flight, Esq., Costiles, Twyford, Winchester, won for twelve with remarkable flowers. Herbaceous flowers were good. Mr. Hunt won for twelve distinct, and for a collection in a space 6 feet run of tabling.

Fruit was remarkable in point of numbers and quality. In the class for six dishes Mr. Wasley staged exceedingly fine examples of Madresfield Court and Muscat of Alexandria Grapes, Barrington Peaches, Superlative Melon, and Rivers' Early Nectarine. Mr. Hunt, gardener to J. Moss, Esq., Fern Bank, Blackwater, won with Black Hamburg in two bunches. The last-named also won for two bunches, any white variety not Muscat, with Foster's Seedling, good in every respect.

Peaches were quite good. For one dish of fine fruit Mr. Bowerman, gardener to Lord Bolton, Hackwood Park, was first with Alexandra Noblesse, a like honour falling to Mr. Hunt for Nectarines with Rivers' Early.

Vegetables are always good here; Mr. Bowerman with marvellous produce won three first prizes, being followed closely by Mr. Kneller, gardener to Sir W. Wyndham Portal, Malshanger Park.

Messrs. E. Ladhams and Co., Shirley, Southampton, had a non-competitive collection of hardy cut flowers, which added to the interest of the show, and were much admired. Mr. Neville staged two dozen blooms of Carnations in beautiful condition. For these and the preceding exhibit cultural certificates were awarded.

ANSWERS TO CORRESPONDENTS.

RULES FOR CORRESPONDENTS.

Questions and Answers.—The Editor intends to make THE GARDEN helpful to all readers who desire assistance, no matter what the branch of gardening may be, and with that object will make a special feature of the "Answers to Correspondents" column. All communications should be clearly and concisely written on one side of the paper only, and addressed to the EDITOR OF THE GARDEN, 5, Southampton Street, Strand, London. Letters on business should be sent to the PUBLISHER. The name and address of the sender are required in addition to any designation he may desire to be used in the paper. When more than one query is sent, each should be on a separate piece of paper.

Names of plants.—*Sojourner*.—1, Persian Yellow; 2, Charles Lefebvre; 3, Noella Nabonnand; 4, Jean Liabaud; 5, Cheshunt Hybrid; 6, Mme. Clemence Joigneaux; 7, Claude Jacquet.

Tomatoes for winter (W. H. D.).—A few plants raised now will be valuable for a winter supply of fruit. The plants are raised with so little trouble that it is not necessary to say much on the subject. It is useless to sow seeds too late, as, unless the fruits are set before November they will probably not set at all. For early spring fruiting late plants are valuable, as these kept quiet through the winter will come into bloom in February and March. For midwinter supplies plants should have been raised before now and be ready to pot on. Avoid heat, as the harder they are grown the better. Night exposure when there is no frost is beneficial, as the night dews keep the plants clear of insect pests and induce a short, compact growth. As to varieties, Frogmore Selected is an excellent one for winter fruiting. As soon as the seeds are through pot on the seedlings into small pots and keep them growing well; pot when they are well rooted into 3-inch pots, and finally into the fruiting pots. Fertilise the first flowers that open, so as to make sure of having the fruits formed before the dull dark days of winter. From plants which fruit in December it is possible to obtain a second crop in April by getting new growth and feeding the plants well. To do this it is necessary to keep the plants rather warmer after the fruits are gathered. Still, this method is hardly worth practising, as by growing the plants specially for spring fruiting better results are obtained.

The Oleander (ESSEN).—You ought to be able to obtain this shrub from any good nurseryman. There is not a large demand for Oleanders, but a small stock is usually kept. The Oleander is a beautiful shrub that will flower year after year with little attention. Grown in pots or tubs it may be wintered in the greenhouse or conservatory, and during the summer can be placed out of doors in a sunny spot. Such conditions are favourable to the production of blossoms, which expand about July, the plant then being particularly attractive. When in flower they may be allowed to remain out of doors, or removed to the conservatory if they are needed at that period. It is a loose, open-growing shrub naturally, and any attempt to alter its character in this respect will only end in failure. If a specimen is cut back at least one year's crop of blossom will be sacrificed. The cultural requirements of the Oleander are in no way exacting, for cuttings strike readily either in soil, sand, or water if they are kept close for a little while, and they grow away freely in any ordinary potting compost. In com-

mening with young plants the tendency to run up tall and bare should be borne in mind, and to obviate this they must be freely stopped during their earlier stages, as in this way the foundation of an effective specimen is laid.

Marguerite Carnations (NEWTON ABBOT).—In pots these are very useful for late autumn and early winter blooms as Carnations generally are over and so many things in the outdoor garden are past their best. This race is equally serviceable during the spring months, and it is possible to have a good supply of Carnations up to the time they begin to flower in the open ground. From the beginning of March onward they are good in form and colour, and have that delicious fragrance which is almost entirely wanting during the dull winter months. The culture of Marguerite Carnations is simple; it consists in putting them out in early spring in well-worked, fairly enriched ground, and lifting and potting them late in summer or early autumn. Many sow the seed in spring, but we prefer to sow in July in a cold frame. The seed germinates freely then, and the young plants can be kept in a cool house through the winter, coming into the open air in spring. No hardening off is necessary, as is indispensable in the case of plants raised in heat in February, and if planting out for the summer months is to be practised the young plants can be set out a month or six weeks earlier. Healthy young seedlings put out in April will grow into specimens large enough for 7-inch pots, and they will be crowded with buds by the end of the summer. Early planting admits of early lifting, the plants being large enough to pot up by the middle of August. Flower-stems will appear in July, but these must be pinched off, as flowers are not required before October, when outdoor things are mostly over.

Treatment of zonal Pelargoniums (J.).—The plants should now be potted up, using a compost of loam, a little dried cow manure, and plenty of leaf-mould and sand. After potting place them outside in the sun, and do not give much water until they begin to root freely; then a liberal allowance is necessary. So treated the plants make a stouter growth than in frames, owing partly to the fact that more room can be allowed. They are almost sure to push flower-buds at once, but these should be pinched out. The plants may be left in the open until the middle or end of August, according to the weather, when protection must be given. At all times under glass a good circulation of warm air must be kept up around the plants, placing these as close to the roof as possible and giving no shading. If more convenient the plants may be brought on in batches to keep up a succession of bloom, though the same plants will continue to flower for several months. In the meantime, it is true, they are apt to grow a little unshapely, but if only fed at the roots the quality of the flowers is as good at the end of the season as at the beginning. After flowering the plants may be placed in ainery or greenhouse and kept rather dry until June, when they may be cut back, using the prunings for propagation if desired. Double-flowered varieties require rather more warmth to induce them to open freely than single ones, but in a house kept up to 60° Fahr. at night and fairly dry either will be satisfactory. The varieties are too numerous to give anything like a good selection, but as a general rule the English-raised varieties are far superior to the Continental ones.

Freesias (H. J. D.).—Our correspondent asks as to the treatment and culture of these plants, so as, if possible, to have them in flower all the year round. We are afraid we cannot hold out much hope of success in this direction, for the most successful market growers are not able to have them in bloom for more than six months out of the twelve. Freesias have in their native habitat a fixed time for flowering, and in England that is merely accelerated or extended according to the means and method adopted. Potting should commence in July or early August; then continue to put in successive batches of bulbs until the end of October, either in pots of 5 inches diameter or in boxes 15 inches by 10 inches. Such boxes will accommodate four dozen large tubers, which, when planted, should be covered with not more than half an inch of soil, consisting of one half loam, with an admixture of peat, leaf-soil, and sand. The size of pots named will take half a dozen bulbs. It is advisable to put in together all those intended for early flowering, thus encouraging them to form plenty of roots early before placing in the greenhouse. Anything approaching dryness at the root generally ends in failure. A fatal error is often the outcome of stagnant root moisture, due to placing the pots in saucers that are nearly dry, for while with a free drainage the water supplies may be abundant, the other extreme will quickly bring about failure. By early potting and subsequent forcing these flowers may be had for at least six months in succession without scarcely any break. And after this the season may perhaps be somewhat further prolonged by placing the bulbs in dry sand in a frost-proof shed or cellar for planting in a sunny frame about the middle of February. Such a frame, however, will need some preparation, raising the soil a foot above the surroundings. A frame 6 feet by 6 feet will take 200 or 300 bulbs, and in this way, provided the prolonged season of rest is not injurious to the tubers, you may get some flowers.

Blue Hydrangeas (S. B.).—The blue colouring is due to the presence of iron in the soil—at least, that is our experience, and if any reader can disprove it we shall be glad to have his reasons. A well-known gardening authority tried, for the sake of experiment, various recipes for turning pink Hydrangeas blue, but the flowers changed their clear and pretty pink for a dull, washy, magenta-purple, a harsh and unpleasant colouring. One station-master in North Devon, who has a wonderful blue Hydrangea, deluges it every year with water heavily impregnated with iron, and the result is flowers of a clear and attractive shade. The following letter from an old gardener may be interesting to our correspondent: "My father was head gardener to a nobleman for forty-five years. In 1836 I served as a lad in the garden under him, and to produce the blue Hydrangeas we used to collect the shales that fall from the hot iron at the blacksmith's, and mix them with the soil for potting or planting in at the rate of one part of iron to eight or ten of soil, with a little peat and sand added. We had very fair

success, but about forty years ago I found that watering with alum water, at the rate of 1oz. to a gallon of water, was more satisfactory. Secure good plants from old stools or previous year's cuttings, and when the flower trusses begin to show strongly prepare the alum water by crushing the alum and dissolving it in hot water, and when cold it is fit for use. It must be carefully given at intervals of eight or ten days, or about six times before the petals begin to open, when it must cease. It must not be given when the plants are very dry. In this way I have had flowers of a beautiful dark blue colour. It is well to label the Hydrangeas, as if you keep them in the same soil they give blue flowers for years. If the plants are re-potted or fresh cuttings struck the flowers change to the normal pink, and the process must be repeated."

Plum trees on walls (H. JOHNSON).—If the trees have very little fruit on them, as you say, they must be carefully treated, otherwise they will make rank growth, which, if continued late in the season, will lead to the trees being unfruitful another season in consequence of the wood failing to ripen. Stimulants should therefore be withheld, and no water given at the roots unless absolutely necessary. The trees themselves must, however, be kept clean, and after stopping the spur wood and tying in that required for furnishing, give them a thorough washing, and repeat the operation as often as time will permit. Trees which are bearing must be well fed to enable them to carry as heavy a crop as possible, but if the fruits are too close together a little thinning will be beneficial. Look well after young cordon trees and stop all side growths. This is an excellent way of growing the choice dessert varieties, and it is also a quick method of covering walls and any odd corner on wall buttresses. Nearly all varieties succeed growing in this way, the only exception, so far as we know, being Victoria, which gives but poor returns.

An Asparagus destroyer (S. T.).—This is one of the most beautiful of all beetles. It has been found very useful to dust the plants with finely-powdered lime, or to spray them with paraffin emulsion or Paris green. Of course, the two latter cannot be applied until the cutting is finished, as they would render the shoots poisonous. To make the paraffin emulsion, dissolve one quart of soft soap in two quarts of boiling water; while the liquid is still boiling hot, add eight pints of paraffin oil, and churn all together for ten minutes with a syringe. When the oil is thoroughly incorporated with the soap and water, which it should then be, add eight gallons or nine gallons of water, stir all well together, and the solution is ready for use. Paris green should be obtained, if possible, in a paste; use half a pound to every 100 gallons of water. Do not forget to add half a pound of fresh lime to the mixture before using it. Paris green is very heavy, so that the mixture must be kept well stirred, or some of it will be used too strong and some not strong enough. These mixtures are best applied with one of the knapsack sprayers. To cut down and burn all the plants would be the best way of destroying the insect, but it would, of course, weaken the plants. Some of the shoots that are very badly attacked should be removed and destroyed, taking care that the insects do not drop off while the operation is being carried out. Some of the insects might be beaten off the "grass" with a stick and trampled on. There are probably two, or perhaps three, generations of this insect during the year, as eggs, beetles, and fully-grown grubs may be found on the plants at the same time.

Autumn Lettuce (J. K. E.).—You will find that few varieties are better than Hammersmith Hardy Green for August sowing to stand through the winter and furnish an early spring supply. Few things are more appreciated in March and April than early Lettuce, and to obtain these one must not be niggardly in sowing in early autumn. Other varieties worth sowing now are Lee's Hardy Green and Staunsted Park. Of Cos varieties Hardy Bath or Brown Sugar Loaf give good supplies for winter and spring. Intermediate, a cross between a Cabbage and a Cos, has also proved valuable. Winter Green is also good and hardy. An early Cabbage Lettuce sown in February is nearly as early as the autumn-sown Cos. It is useless to sow for spring supplies in places where slugs and snails abound, as these pests soon clear a quarter of plants. We prefer an open bed to that on a south or a narrow border, as the plants are then more hardy and less injured by cold. A well drained soil is necessary for the plants, and thin sowing also. Raised beds in an open position give the best plants for early spring planting. You may sow broadcast in beds if large quantities are needed in spring, transplanting at the end of February or early March to warm borders.

Roses for bedding (PAPER).—There are now so many delightful Roses suitable for bedding and massing that it is exceedingly difficult to pick out five varieties as being the best we could recommend. We certainly should not advise you to plant Beauté Inconstante, for although a few individual buds are of a lovely colour it is not at all constant. The effect in the mass is usually a pale flesh tint, with a few buds of the wonderful colour you admire. We append the names of a few first-rate bedding Roses, all of which are good, and to the five we should advise you to plant we have marked with an asterisk: Mme. Hoste, *Mme. Ravary, Marie van Houtte, Clara Watson, Mme. Abel Chateau, *General Schablikine, *Hon. Edith Gifford, *Papa Gontier, Lady Roberts, Corallina, *G. Nabonnand, Peace, Morning Glow, Sulphurea, Mme. Antoine Mari, Mme. Chedame Guimosean, Mme. Lambard, Caroline Testout, and Marquise de Salisbury. We agree with you that one variety to a bed is best, and we favour this plan, even though there is only sufficient space for six plants. A dozen plants of a kind will make a very nice display. We advise you to prepare the beds well, giving the Roses fully 30 inches deep of good soil to root into. It pays best to do such beds well at the beginning. If Roses grow freely they are not nearly so liable to insect and fungoid pests as those that are starved or overfed with stimulants. Good loam, the top spit from a meadow, cannot be surpassed for Roses, and good cow and pig manure is perhaps the best that can be given, although we always add some quarter inch bones or bone-dust to the lower stratum of soil.

Calceolaria amplexicaulis (T.).—The different varieties of Calceolaria that were at one time largely employed in the flower garden are not grown to anything like the same extent that they formerly were, for they are liable to die off in the height of the season and thus leave ugly gaps.

Galvanised pegs for pegging down (S. K.).—There is no doubt that galvanised wire pegs are injurious to the growths of Roses unless the precaution be taken to paint the wire. We much prefer wooden pegs driven into the ground so that tarred twine may be attached, and by its means the growths are brought down to the desired position.

Woodlice and stove (A. HICKS).—Messrs. Ball and Co., 16, Coleman Street, E.C., have an excellent woodlice destroyer well worth a trial, as it is cleanly and readily applied. You can get it through any seedsman. The old remedy of placing empty pots with cut Potatoes and a little hay over the latter, turning out the pots into water, is good; also, where practicable, watering with weak ammonia water. In frames it is an easy matter to water round the sides without injuring the roots of the Melon.

La France with deformed buds (J. W. LAURENCE).—This Rose is rather sensitive to rain, so much so that its buds often refuse to expand at all after heavy storms. On heavy soils, too, La France often comes bad in form. We should advise you to grow the variety upon Standard Briars and prepare a bed for it of light soil should yours be heavy. It is not advisable to prune this Rose too much; in fact, many growers recommend that the variety be allowed much freedom of growth, merely thinning the heads to prevent overcrowding. You will find bone-meal a better fertiliser for La France than rank manures from the farmyard. Apply the bone-dust early in spring.

Anopteris glandulosa losing its leaves (H. D. P.).—It is really impossible to definitely state a cause for the ill-health of your Anopteris, but we are inclined to think, as you suggest, that the sand must have contained some deleterious substance, possibly salt, which may have caused the mischief. At the same time we have before now seen shrubs struck by lightning, and while, in the majority of cases, the effects are seen either in a violent rending of the branches, or a scorched appearance as if they had been subjected to fire, occasionally the plant dies off much as your Anopteris has done, judging by the leaves sent. The suddenness of the attack is in favour of the lightning theory. There is no fungus to account for the trouble.

Rose leaves destroyed (G. W.).—I cannot say whether the leaves of your Roses have been eaten by weevils or caterpillars, but I should think more probably by the latter. As to the best means of preventing the bushes from being attacked again next year, I should recommend you to remove the soil from beneath the bushes to the depth of 3 inches, and replace it with fresh as soon as all the leaves have fallen, and burn, bury deeply, or throw it somewhere where poultry can pick it over. By these means any chrysalids which may be in it will be killed. The fungus attacking the leaves is the Rose rust (*Phragmidium subcorticatum*), a very common pest in many places. Collect and burn all the fallen leaves and spray the bushes with diluted Bordeaux mixture. Next spring, before the buds have begun to open, thoroughly wet the whole plants with 2oz. of sulphate of copper dissolved in three gallons of water. The little red grubs you found are those of a small two-winged fly; they feed on the spores of the fungus, and are quite harmless.—G. S. S.

Grapes unsatisfactory (E. D. D.).—The Grapes enclosed are a mass of mildew, and we do not see how you can now improve them. Our advice would be to cut off all the bunches and then give the vines a thorough cleansing, using a strong solution of sulphur, and after applying the sulphur shade the vines for a short time. Earlier in the season you could have saved the crop had you applied the remedies you name before, namely, as soon as the mildew appeared; but we fear you allowed the pest to spread. As soon as mildew appeared the house should have been kept drier, ventilation given most carefully, as the disease is aggravated by cold currents of air. Dry powdered sulphur should be dusted over the affected parts as soon as seen, and this failing then use a wash or other aids. The old remedy of well heating the hot water pipes and covering late in the day with a thick sulphur solution is good, and arrests the disease. When your vines are at rest thoroughly clean, and give all parts a good coating of sulphur, also cleanse all parts of house, paint if possible, and when your vines begin to grow give very careful ventilation and watch the supplies of moisture. Look out sharply for mildew and nip it in the bud. Messrs. Bentley, Chemical Works, Hull, have an excellent mildew specific, which we can advise for washing both vines and house in the winter.

TRADE NOTE.

BARR'S DAFFODILS.

IN the bulb catalogue of Messrs. Barr and Son, King Street, Covent Garden, W.C., several new and beautiful varieties of Daffodils are described and illustrated. These are the result of years of labour in cross-fertilisation, and represent a great advance upon the old sorts. We might specially mention Peter Barr, the finest and largest white trumpet Daffodil yet raised; Alice Knight, perianth white, trumpet creamy white; Cleopatra, a fine yellow trumpet, like Monarch, but larger; Henry Vilmorin, a beautiful white trumpet; King Alfred, a large trumpet of a uniform rich golden colour; Lord Roberts, with trumpet flowers of enormous size, golden yellow; Loveliness, white trumpet; Maggie May, a giant Leedsii with white perianth and citron yellow cup; Mrs. George H. Barr, a lovely white trumpet; Peach, apricot-crowned Leedsii, Queen Christina, a flower with broad white perianth and lemon trumpet; Salmonetta, a Leedsii with white perianth and apricot-coloured fluted cup; and White Queen, resembling a white Sir Watkin. In addition, there are descriptions of hundreds of other varieties, and many useful hints on Daffodil culture.

THE GARDEN

No. 1708.—VOL. LXVI.

[AUGUST 13, 1904.]

USEFUL COLONIAL AND FOREIGN FRUITS.

IN these days, when so much is said and written on the subject of "returning to the land," it is well to consider whether the occupation of farming as generally understood may not now be varied or extended so as to have a much wider meaning. To a certain extent this has been done of late years, for in addition to agriculture pure and simple we have long heard of vegetable, fruit, and flower farming, and even the term is sometimes applied to special flowers, as in the case of the extensive Orchid nurseries of St. Albans, but the bulk of the fruits grown on any large scale are those which flourish out of doors during the summer in this changeable climate of ours, such, for instance, as Strawberries, Raspberries, bush fruits, Plums, or even Apples or Pears. In addition to these we include Figs, Grapes, and Tomatoes as examples of extensive culture under glass. Whether such culture could be profitably made to include some of the well-known fruits which travellers only have a chance of tasting in perfection is a thought that may be worth considering, and the experiment in some cases might even be worth risking. It is a suggestion that we therefore offer, and give a short list of such plants as are most useful in their native countries. We are not unmindful that many practical difficulties may present themselves, and it may be said, as has been often said before, that many of the less known fruits might be brought hither in cold chambers by fast-going steamers. This may be so, but it cannot be denied that some of the choicest fruits lose much of their delicate flavour by a sea voyage. How seldom does one get the chance of tasting the delicious pulp of a properly ripened Mangosteen, a chance that may only occur once in the life of any but a traveller. Unfortunately, this chance is not likely to be of more frequent occurrence, for we cannot expect to grow, or even to import, Mangosteens into this country in sufficient quantity to supply the demand that would probably arise. Moreover, fresh grown fruits have always a flavour essentially their own, and for such there will always be a market when the flavour of the fruit is adapted to the British palate, or where that palate can be adapted to the fruit. The following are a few examples of some of the best known fruits that suggest themselves:

Custard Apple or Sweet Sop (*Anona squamosa*).—This fruit is known as the Custard

Apple by Europeans in India and as Sweet Sop in the West Indies. It is a small native tree of the Malay Islands, but is found in many parts of India in a semi-wild state, and is also extensively cultivated both in India and the West Indies, as well as in other tropical countries, for the sake of the fruit, which averages about 2½ inches, nearly globose, but marked on the outside with numerous warts or knobs. The rind is thick, and encloses a mass of firm fleshy pulp, in which are embedded numerous black seeds. In well ripened fruits the pulp has a very luscious taste, somewhat resembling that of Raspberries and cream. The fruits appear to be more valued in India than in the West Indies. In the latter a fermented drink of the nature of cider is made from the juice, while in India the juice is much used to flavour ice puddings. In times of famine the fruit is said to have literally proved the staff of life to the natives in some districts.

(To be continued.)

CHRYSANTHEMUMS.

STIMULANTS FOR THE PLANTS.

SOOT WATER in a weak state is the best thing to apply first to the roots as a stimulant. One bushel of soot placed in a bag to 100 gallons of water will be ample. The water soaking through the soot in the bag becomes charged with the manurial properties. Water used in this manner may be given to the plants every time they require watering for a week, and then it is better to withhold soot water for three weeks, giving them another course after this. The stimulant may be used in conjunction with other liquid manures during the time soot water is in use, but it is not necessary to stop using other stimulants while soot water is being given to the plants.

When using soot water we would advise beginners to be careful. We have seen plants injured through using it too freely. It is far better to use it weaker and often. Chrysanthemums require a change of food, and the stimulants should be varied, using one sort for, say, a week, then have another. To the strongest growing varieties stimulants should be given every time water is required if the plants are well rooted. All stimulants should be used in a weak state to begin with, increasing the strength as the plants grow. If a spell of wet weather sets in for, say, a week together, it is wise to withhold all stimulants for a short time, as extra care is needed in applying water to the roots of any sort. In the case of weak-growing kinds liquid manure should be given occasionally, as over-feeding brings on premature bud-formation or malformation of the petals, caused by forcing the larger outer petals too quickly, and not allowing the centre of the flower-bud to fill up by degrees, as it should do under proper circumstances. When the soil in the pots is approaching dryness is the proper time to apply stimulants.

It is difficult to define the quantity of manure to use for making liquids, as so much depends upon

the requirements of the cultivator. A safer guide is to use the liquid made from animal manures about the colour of brown brandy. Sulphate of ammonia in careful hands is an excellent manure, perhaps unequalled, but the percentage of ammonia contained in the different samples varies so much that it is decidedly risky to use it. It is wise to act safely, that is, give it in a weak state, but often. The cultivator should be quite certain that the pots are full of roots before commencing the use of sulphate of ammonia. The best way to apply it is as follows: Dissolve one tablespoonful in four gallons of liquid manure and apply it to the plants once a week; the alteration in the colour of the leaves after its application can be quickly discerned if they were pale before. The colour of the flowers is also much improved. The pink-lilac flowers and darker shades are rendered much richer by the use of this manure. Some growers sprinkle the ammonia on the surface of the soil and water it in, but this is dangerous to the surface roots of the plants, as they are often burnt by the ammonia. The loss of the surface roots by this mismanagement gives a serious check to the plants.

When the flower-buds are forming in the points of the shoots which are considered the best for each particular variety, no matter whether it be crown or terminal buds, the application of stimulants should cease for a time until the flower-buds are formed and swelling, as during the time the buds are in the embryo state a check to the growth takes place. When to finally stop the use of stimulants of any sort and depend solely on clear water for the finishing of the blooms is a matter about which some growers disagree. Some advise that feeding be discontinued as soon as the bloom buds show colour, but in my opinion that is just the stage when assistance is required to develop the flowers. Continue to feed the plants until the blooms are three parts expanded, then cease the use of stimulants, as it will be found that plants in that stage do not require water nearly so often as those plants which are in a more backward condition.

THE EDITOR'S TABLE.

WE invite our readers to send us anything of special beauty and interest for our table, as by this means many rare and interesting plants become more widely known. We hope, too, that a short cultural note will accompany the flower, so as to make a notice of it more instructive to those who may wish to grow it. We welcome anything from the garden, whether fruit, tree, shrub, Orchid, or hardy flower, and they should be addressed to The Editor, 3, Southampton Street, Strand, London.

SOME BEAUTIFUL SEEDLING CARNATIONS.

One of the most beautiful lot of seedling Carnations we have seen has been sent to us by Mr. E. Carlyon, County Asylum, Fareham, Hants. The flowers are remarkable for their variety of colours, and a few of them are distinctly equal to those already named. What was so noticeable was the freshness of the colours, some pure selfs, others of

the bizarre and flake type, but very few were poor. A pure white, intense scarlet, soft rose, and clear yellow were conspicuous amongst the selfs. Mr. Carlyon sent the flowers just as they were gathered from the plants, and no thinning of the buds had been practised, which makes the size and fullness of the individual bloom the more welcome. Our correspondent writes: "We purchased 10s. 6d. worth of seed from Mr. Douglas, Great Bookham, Surrey, and out of the amount of seed received we had 256 plants. And to look at those growing they put one in mind of sheaves of Wheat. The seed was sown on April 1, 1903, and the seedlings were planted out July 3, 1903. The chairman of the committee thought some of them worthy of a name. He did not think they could be brought to such a perfection from seed. The soil here is very poor indeed. The bed was deeply trenched and liberally manured with well-decayed farm manure and old lime plaster from brick walls and rubbish out of old flues. The first year we planted a vegetable crop, and when those were cleared away the bed was again deeply dug and dressed with lime rubbish and rotted leaf-mould, also road scrapings. The Carnations were planted 2½ feet apart. We have very few single ones out of the lot. There is an average of 200 flowers on a plant."

CAPE PRIMROSES OR STREPTOCARPUS FROM THE OPEN GARDEN.

We receive from a reader of THE GARDEN, Rose Hill House, Ipswich, flowers of the Cape Primrose or Streptocarpus in many beautiful colourings with the following note: "Some of these flowers, hybrid Streptocarpus (Sutton's), came from the greenhouse, but for the last two years this beautiful Cape Primrose has blossomed here in the open. First, the ordinary grey-flowered variety was tried, and succeeded so well that this summer the handsome hybrid strain was tried and is succeeding perfectly, although the heavy rains of last week marred the flowers. The foliage is very soft in texture and delicate in hue, in the younger leaves especially. The plant thrives in leaf-soil and a shaded moist border. As an edging to a bed of crimson Fuchsias or bright-coloured Abutilons it would be charming, and a quite novel arrangement. The blue and grey-blue tones of the Streptocarpus being particularly effective in half shadow, in which also Fuchsias and Abutilons delight. Some of the bright Begonias, too, in partial shade might mass well. Perhaps you may deem the suggestion worthy of a note in your paper."

RARE PLANTS FROM SOUTH DEVON.

Mr. Fitzherbert sends three rare flowers from South Devon, Bowkeria triphylla, Malvastrum lateritium, and Sphæralcea munroana, with the following note: "I send you herewith a few flowers. The white one, somewhat like a Calceolaria in form, is Bowkeria triphylla, a very rare South African shrub. Malvastrum lateritium is a very pretty flower, its pale salmon-pink being set off by the carmine ring round the centre. My plant is about 2 feet high and as much through, and has just commenced to flower. Sphæralcea munroana, formerly Malva Munroi, has smaller cerise-pink flowers. It should be planted in the poorest soil possible or it does not flower freely. It is seen best growing a steep bank or rock. It is a very rapid grower. Sphæralcea munroana is a native of Columbia and Malvastrum lateritium of Monte Video. Both are hardy in the south-west."

NEW WHITE PERENNIAL PEA MOONLIGHT.

Mr. P. H. Mules sends from the Old Parsonage, Gresford, flowers of a very beautiful form of the perennial Pea, white, and in every way worthy of note. Our correspondent writes: "I raised it five years ago from seed; the third year the flowers were wonderful. You will note the arrangement of the pips. They are evenly placed round and up the stem, and then most of the stems (1½ inches in length) carried from eighteen to twenty-two pips. Now the plant is so loaded with flowers that the pips are only fourteen to sixteen, but the beautiful habit is the same. I grow it as a bush. Under

the name Moonlight it has won many prizes. I have placed it in Messrs. Barr's hands for distribution. I also send a spray of Ecremocarpus aurea, a new and most lovely climber."

The Ecremocarpus flower is of a beautiful apricot colouring.

A WHITE SEEDLING CARNATION.

Mr. F. White sends from Keighley a seedling Carnation of purest white, and without the least sign of that objectionable splitting of the calyx which disfigures many otherwise fine varieties. Good as it is we do not think it is worthy of a name. So many beautiful Carnations come from a batch of seedlings raised from the best flowers that it is difficult to surpass them, but the variety sent is worth keeping for cutting, as the plants are strong in growth and the flowering stems long and branching.

RECENT PLANT PORTRAITS.

THE *Botanical Magazine* for August has portraits of *Zingiber spectabile*.—Native of the Malay Peninsula. This is one of the brightest and most ornamental of a not very beautiful family, with spikes of heavily golden-rimmed bracts, out of which issue the flowers.

Panda pumila.—Native of Sikkim. This is also known under the synonym of *V. cristata*, and is, perhaps, the least showy of a handsome family. It is seldom met with in cultivation, and the specimen figured came from Glasnevin Garden—the Irish "Kew." Its flowers, however, are not without beauty.

Thunbergia primulina.—Native of Eastern Tropical Africa. This is a very pretty greenhouse plant of shrubby habit of growth and foliage, covered with minute silvery hairs. Its flowers, produced at the axils of the leaves, closely resemble the common Primrose.

Tecoma shirensis.—Native of Tropical Africa. This is also known under the following synonyms: *T. Whytei*, *T. nyikensis*, and *Tecomaria shirensis*. This is a shrub of vigorous growth, with handsome bunches of yellow flowers, deeply veined with orange. It somewhat resembles *T. capensis*, but is a much finer and more ornamental plant.

Euphorbia ciperina.—Native of South Africa. This is a succulent plant of no beauty, and is of merely botanical interest.

The August number of the *Revue de l'Horticulture Belge* figures

Sanseria Laurentii.—Native of Central Africa. This is a handsome golden variegated stove plant which has not yet flowered, but which is well worth growing for its foliage; also

Rose Frau Karl Druschki, said to be the first and only really pure white Hybrid Perpetual in existence. W. E. GUMBLETON.

NOTES OF THE WEEK.

FORTHCOMING EVENTS.

August 16.—Exmouth (two days) and Clay Cross Horticultural Shows.

August 17.—Shrewsbury Floral Fête (two days); Amlwch, Burwash, Tynemouth (two days), and Calne Horticultural Shows.

August 18.—Aberdeen Horticultural Society's Show (three days); Kingsbridge and District Horticultural Society.

August 19.—Devon and Exeter Horticultural Society's Show at Exeter; Flamborough and District Horticultural Society.

August 20.—Small Heath Horticultural Society.

August 22.—Warkworth Horticultural Society.

August 23.—Royal Horticultural Society's Meeting in New Hall, Westminster; Royal Oxford Horticultural Society's Show; Brighton Horticultural Society's Show (two days).

Flower and vegetable trials at Wisley.—The suggested trials in the Royal Horticultural Society's Gardens at Wisley in 1904-5 are as follows:—*Floral*: Violas, six plants

of each variety, to be sent in February, 1905; Carnations, same quantity and time; Cactus Dahlias, two plants of each, to be sent in May, 1905. *Fruit and Vegetables*: Plums, bush trees, to be sent in by the end of October of this year; Apples, the same; Peas, half a pint of seed of each variety, to be sent in by February, 1905; Potatoes, twenty tubers, and Broccoli, half an ounce of seed, both on the same date; Tomato, twenty seeds of each variety, to be sent in by August 30 next, for winter trial. All the above are to be addressed to the Superintendent, R.H.S. Gardens, Wisley, Ripley, Surrey: if by rail, per L.S.W.R. to Horsley Station.

Windstorm in North Wales.

To-day (the 6th inst.) is the roughest day for wind I have known for years at this season. The damage that has been done in this part of the country is sad. Orchards of Apples and other fruits are completely stripped. What was promising to be a record year is now one of wreckage and disappointment, not only for gardens, but farmers also. Otherwise the season has been an excellent one, and all that could be wished for. To be deprived of such in the course of about five hours is a serious loss.—J. S. HIGGINS, *Rdg Corwen*.

Opening of the Goldie Park, Maxwelltown, N.B.—On the 30th ult. the new Goldie Park, Maxwelltown, Kirkcudbrightshire, was formally opened by Provost Chicken, the ceremony of opening the two rustic bridges across the stream being performed respectively by Mrs. Chicken, wife of the Provost, and Mrs. Bowie, wife of the Burgh Surveyor; while the College Road entrance was opened by Mrs. Dobie, wife of the Town Clerk. The park was purchased with the proceeds of a legacy left in 1852 by the late Miss Goldie, Summerhill, which has been accumulating at interest until lately, when a suitable piece of land came into the market. The park has been well laid out, and it is intended that it should be still further embellished by additional planting. It is very conveniently situated, and will be a considerable boon to the inhabitants of Maxwelltown, the largest burgh in the county, although they have already the privilege of possessing several rights of way over charming walks in its neighbourhood.

British Gardeners' Association.

The hon. secretary *pro tem.*, Mr. W. Watson, Kew Road, Kew, writes: "Kindly allow me to remind readers of your paper who are interested in the British Gardeners' Association that the committee of selection cannot proceed further until the sum of £250 has been secured to meet the cost of a central office in London, a paid secretary, and other expenses, and 500 members have joined the association. Of the £250 required about £100 has been subscribed or promised, whilst the number of applications for membership up to the present is less than it should be. Expenses so far have been more than covered by donations received for the purpose. We are, therefore, in a position to keep donations towards the £250 and entrance fees and subscriptions untouched until the association is established on the lines prescribed by the prospectus. Forms of application and copies of the prospectus may be obtained from me. Candidates should send copies of their testimonials, or a stamped addressed envelope for their return if originals are sent. Entrance fees and subscriptions will be returned to candidates who are not elected. Secretaries of gardeners' societies are invited to co-operate with us in the effort to establish an association of professional gardeners by inducing their members to join it and by holding meetings for the purpose of making its aims and objects known. Arrangements will be made by the committee for a series of meetings in various centres for the purpose of more fully explaining the objects of the association and increasing the membership. It is hoped that the association will be brought up for discussion by every gardeners' society throughout the kingdom during the coming winter. It is only by the exercise of perseverance and patience and a determination on the part of all qualified gardeners to combine that the desired improvement in their conditions can be brought about."

Tufted Pansy Bessie.—This is a very good hot weather variety, standing well through it, and maintaining a continuous display of flowers. It was raised and introduced by Mr. William Sydenham, Tamworth, in 1901. The raiser describes the flower as a blush self and rayless, and this is a fairly accurate description of its colour. In certain seasons the flowers are sometimes edged and reticulated, and they are then very charming. From the earliest period in the flowering season this variety has done exceedingly well, and as the plant has a capital constitution and a good habit, it may be recommended for bedding.—D. B. C.

Tufted Pansy Marion Waters.—When recently looking through a collection I came across a beautiful group bearing the name of the variety under notice. The colour is very distinct, a pretty shade of blush lilac. It is an excellent bedding plant, having a tufted growth. The flowers are of good size, circular in form, and borne on erect stems in the greatest profusion. A fine orange eye also adds to their attractiveness, but there is a tendency to sport under certain conditions.—D. B. C.

Tufted Pansies and the weather.—Although the weather for some time past has been hot and dry, it is astonishing how well the plants have succeeded, although the quality of the flowers has left much to be desired. The recent heavy rains, however, have changed all this, and though only a few days have since elapsed, the tufted Pansies are fast regaining their former happy condition. Some sorts stand the heat much better than others, and none to-day look better than such sorts as Duchess of Fife, Goldfinch, and Ardwell Gem. It does not follow, either, that because a bloom possesses plenty of substance in its petals that it is necessarily one for hot weather. As a matter of fact, several of the stouter-looking flowers were the first to succumb. On the other hand, several of the more flimsy-looking flowers passed through the ordeal of the trying heat remarkably well, and this should certainly be a point in their favour. A good mulching at this period is highly beneficial, and that this may not present an unsightly appearance the coarser materials should be passed through a sieve with a broad mesh. In a little while the plants will overgrow the mulching material and develop a mass of growths.—D. B. CRANE.

Scholarships for young gardeners.—Three scholarships to young gardeners will be awarded during this month by the University College, Reading. Candidates will be required to pass a simple examination in English, arithmetic, and the elements of horticulture. In awarding the scholarships, previous training and experience will be taken into account. Successful candidates will be required to attend from October 1 next, to September, 1905, the course of instruction in the horticultural department and the gardens of University College, Reading. Each holder of a scholarship will be paid 15s. a week, and will, in addition, receive free instruction. Candidates must be of not more than twenty-two years of age, and must have worked for four years in public or private gardens. The course of training will include: Practical horticulture, theory of horticulture, account-keeping, correspondence, and general business methods, lectures and practical work in botany and chemistry in relation to horticulture. The scholarship holders will be prepared for the Royal Horticultural Society's examination. Certificates of proficiency will be awarded on the work done during the course and on the results of an examination held at the end of the course. Applications for scholarships must be made at once on scholarship forms to be obtained from the Registrar.

A new Raspberry.—The new Penwill's Champion is worth a note for its free cropping, growth, and large fruits. It was sent from Devon (Totnes) to the Holland Park show, and is said to be a very fine late variety. There is ample room for a new late Raspberry of the character of the new Champion, as in some soils the Raspberry if a poor grower soon dwindles, and the crop is wretched. Any variety that will fruit late into

the season is valuable. The introduction a few years ago of the excellent Superlative was a great gain, and this will fruit late if specially pruned. The newer variety is not unlike the last-named in shape, colour, and size, but the fruits are not so sweet, and the foliage from cut specimens sent is different. Though the fruits sent on the 26th ult. to the meeting at the new Horticultural Hall were less acid, they were excellent, and produced abundantly on the branches. The fruit in question on the 12th inst. received an award of merit, and will doubtless, after trial in other parts of the country, receive a higher award if it grows as freely as at Totnes. It was considered a great gain by many growers.—G. WYTHES.

New Strawberry The Latest.—Messrs. Laxton have given us so many excellent new Strawberries that I feel sure they will raise a still later one than the one named. There is room for a good late Strawberry, as it will be seen that The Latest was shown on the 12th ult. at Holland House, not at all an unusual period. I wish Messrs. Laxton would give us a Strawberry of the President type that would fruit well into August—I mean in the southern part of the country. It would be a great boon.—G. WYTHES.

New Strawberry Givon's Late Prolific.—This variety has been our best latest Strawberry this season. Where large quantities of Strawberries are grown, and these in season as long as possible, the new Givon's will be valuable for the latest supplies. I do not say it is the latest Strawberry grown, as by the side of Eleanor or Oxonian it was ripe at the same time, but the quality was so much superior to the older varieties; indeed, the only merit attached to Eleanor is its lateness and free growth in poor soils. Givon's Late Prolific is a handsome fruit: it is a dark red, though not nearly so dark as Waterloo, which is one of its parents, but having a firmer flesh. With me it is not a strong grower, but it fruits very freely, and grown on a north border it extends the Strawberry season until the end of July. Of course in heavier soils and in the northern part of the country it would be much later. Like all late Strawberries, I find much better results follow where the plants get ample attention in the way of moisture, and in light land the crop soon suffers. In planting select a cool site and on the flat, a sloping border is too dry.—G. W., *Syon*.

Rose Brunonis (the White Indian Rose).—One of the most interesting features in the Norfolk and Norwich Rose Show, held on the 7th ult., was a vase of this delightful old Rose, exhibited by Mr. W. Chittleburgh, gardener to Colonel Rous, of Worsted. This is one of the most handsome of all our climbing Roses. The flowers are pure white in clusters, with a yellow centre. This Rose is quite worth growing if only for its foliage, the dark green colour of which contrasts beautifully with the pure white petals. It is of a very vigorous habit, and to grow it well it is necessary to give it plenty of room. It is well adapted for covering the stems of old trees, and it has been known to cover a house in about two years. All lovers of single Roses should grow it.—T. B. FIELD.

Notes from Vomero.—*Rudbeckia hirta vomerensis* is an improvement on the old *R. hirta*. The flowers are larger, with broader petals, which are sometimes turned as in the Cactus Dahlia; the colour varies from light canary yellow to gold yellow; sometimes the outer half of the petals is canary yellow and the inner half darker. With the black disc and yellow anthers it is a very striking colour. For cutting the flowers are more elegant, not at all so stiff as those of the type. *Erysimum pachycarpum*: This old Wallflower is reintroduced by Mr. C. Sprenger from the Himalaya. It is better than the well-known *E. perfoliatum*. It is a perennial, but is best grown as a biennial. Sow the seed early in autumn, and the seedlings will flower the following summer. They produce a great many long racemes with deep orange, sweet-scented flowers. An excellent plant for the rock garden. *Hemerocallis middendorffiana*: I have much admired this fine plant. Never before have I known the true species. *Hemerocallis minor, flava*, and also *disticha fl.-pl.* are sometimes

cultivated under that name. The leaves are broad and light green, the plant is a dwarf bush, and on the top of the flower-stalk are six to ten flowers, formed as a head, not elongate as the other varieties, between the very broad bracts. The flowers resemble somewhat *H. aurantiaca major* in colour and size, but are more elegant and finer; the petals are recurved, so that the bloom is more open than that of *aurantiaca major*: a fine velvet orange colour. The single bloom is open from sunrise to evening, but buds will open in water. *Angelonia integrifolia*: The old *Angelonia grandiflora* is an old favourite in the garden, and I hope that this new species will be also seen more in the future. In pots and in half shady places it grows very well from June to November. The spikes bear an immense quantity of well-formed flowers, lilac, marbled and spotted with dark purple. The leaves are glossy green. A very pretty plant when in flower, and well worth growing for market.—W. MILLER.

The white Everlasting Pea (*Lathyrus latifolius albus*).—During the past few weeks this fine climber has been one of the prettiest subjects in the hardy flower garden. It has been very truly described as "one of the hardest and most easily cultivated of plants," and except for a little attention in the way of staking, or in assisting its vigorous growths to develop, little else is done. We have some immense clumps, each bearing innumerable sprays of flowers. Although up to the present the weather has been very hot and dry, our plants, which were raised from seed about five years ago, appear to have revelled in the summer. There is no more charming sight in the garden than these plants running riot over a rustic arch, or as I once saw it at Gravetye Manor, over an old wall. In the latter position the plant appeared to have found its natural home. These Peas have never failed to ripen seed with me, and in the late summer or early autumn there is an abundant supply of good, well-matured seed to perpetuate the plant.—D. B. CRANE.

Nasturtium Liliput Snow Queen.—This is one of the novelties of the season, and is represented by a very dwarf compact growing type, the blossoms small in size, and of a creamy colour, approaching white. It appears to be a little delicate in constitution, but those who are on the hunt for novelties will no doubt find it interesting. Messrs. W. W. Johnson and Son, seed merchants, Boston, have a good form of it under the name of Daylight, which seemed to be approaching nearer to the white than the type. It is possible that improvements may come with careful selection. Efforts have been made in the past to secure a white dwarf *Nasturtium*, and with the strain known as Daylight it seems possible to be realised. We associate the colours of yellow, scarlet, and crimson more particularly with the *Nasturtium*, though other shades have been developed of late years.—R. D.

Silene Schafta.—A very free-flowering alpine of a branching character and a capital plant for masses, either on the rockery or in the border. It is not an early flowering species, like *S. pendula*, and therefore adapted to spring bedding, for in these arrangements it would not give satisfaction. Its flowering period is from July to September, and during this period its blossoms are produced in great numbers, and that continuously. The colour of the flowers is rosy-purple, and a mass is very pleasing. Some two year old plants from seeds have during the past two months put forth thousands of their pleasing flowers. These were put out when a few months old in an ordinary light loamy soil and an open position as a margin to some herbaceous beds. Here they quickly formed capital tufts and a few flowers twelve months ago, but this season they have been quite a feature. This is but one of the many instances which may be cited of purely alpine subjects, too frequently found starving in small pots, enjoying the freedom of being planted on the level ground where many are evidently far better accommodated.

Moss Roses.—Considering the popularity of Moss Roses, it is somewhat surprising that they are not more generally grown in amateurs' gardens. Everyone admires a bunch of half-expanded Moss

Roses, though, apparently, it is not everyone who possesses a garden that cares to grow them. Why such should be the case is a mystery, but it is, nevertheless, a fact, and I would here push forward the claims of these beautiful Roses. There is no reason whatever why they should not be as extensively grown as the Hybrid Perpetual or Tea-scented kinds, or, at any rate, every rosarian should possess at least half a dozen bushes in his or her garden. There is nothing difficult about the culture of Moss Roses, they being as easily managed as the more common kinds. Their principal requirements are a good sunny position, fairly rich soil, and judicious pruning. If these essentials are forthcoming the bushes will not fail to produce a plentiful supply of lovely Moss-covered buds.—C.

Visitors to Kew.—Between July 31 and August 2, 112,022 persons visited the Royal Botanic Gardens, Kew.

ORNAMENTAL SEEDS AND THEIR APPLICATION.

(Continued from page 97.)

OF a totally different colour and character from the seeds before referred to is that known as the Nicker Nut (*Cesalpinia Bonducella*), a leguminous plant of tropical countries, the pod of which is covered with hard woody spines containing three or four seeds about the size and shape of common marbles and of a slatey grey colour (Fig. 4). The testa or outside coating of the seed is extremely hard and stone-like, and wherever the plant is common these seeds are used for ornamental purposes, being often strung alternately with the red *Ormosia* seeds for necklaces and bracelets. In a closely allied species (*C. Bonduc*) the seeds are more elongated or oval and yellow or orange coloured, or even black or nearly white. Cut in half and mounted in gold or silver they would make excellent decorative buttons for ladies' use, or for the tops of hat-pins or similar applications. Perhaps, however, the best natural heads for hat-pins are the fruits of *Elaeocarpus Ganitrus* (Fig. 5) and of some of the Australian species of *Santalum*. The former is a large Indian tree belonging to the natural order Tiliaceæ, and known in India as the Bead Tree on account of the hard, bony, tubercled Nuts being generally used in India as beads; when rubbed up with oil or roughly polished they are of a chocolate-brown colour, and are well set off in a socket and cap of gold through which the pin may be made to pass. These fruits are frequently to be seen utilised in various ways in Indian jewellery, and in addition to the species mentioned *Elaeocarpus lanceifolius* and *E. tuberculatus* are also applied to the same purposes. Of a somewhat similar character, though sufficiently distinct in being more regularly globular, more evenly pitted, and of a light brown colour, are the fruits of the Australian *Santalums* or *Fusanus* (Fig. 6), which are also occasionally seen in curiosity shops mounted for use as jewellery. The capabilities of their extended application are, however, very great. A seed with the very appropriate name of "Horse-eye Bean" is furnished by a tropical climbing plant of the Leguminosæ. The common name is obtained from the similarity of the Bean to the eye of a horse, in size, shape, and general appearance (Fig. 7). It is furnished by a species of *Mucuna*, probably *M. urens*. In its dried state it becomes extremely hard, and being of some thickness it lends itself admirably for manipulation into small boxes by removing the cotyledons and mounting the hard testa with a binged gold or silver rim. In this manner excellent appendages can be made for watch-chains, or a half seed properly mounted would make an interesting and unique brooch.

Space, however, will not allow me to enlarge upon the material, but before closing attention must be directed to some of the smaller seeds more suitable for use as trimming for ladies' dresses, and for this purpose some of the smaller varieties of the well-known ornamental seeds known as Job's Tears, the

produce of a grass (*Coix Lachryma Jobi*) are specially adapted (Figs. 8, 9, 10, 11, 12, 13). The hard, shiny, globular form, about the size of a large Pea and looking more like earthenware beads than any natural growth, are common enough in most tropical countries, but even these might find an extended use in more civilised centres, though they are often seen in the windows of fancy jewellers made up into necklaces or bracelets. It is, however, to some of the Indian forms that special attention may be directed, not because no efforts have hitherto been made to introduce them to English trade, for at the time of the Colonial Exhibition before referred to they were introduced to the notice of manufacturers of the so-called bugle trimming as a substitute, or rather as an improvement on the glass beads used for that purpose, as being much more durable from their non-liability to break. Their varied shapes and sizes and natural white colour are strong recommendations, besides which, as was stated at the time, they are capable of taking stains, either black or of bright colours.

In conclusion, we will refer only to another remarkable seed which, so far as we know, has never been seen in this country except in the cases of museums, but which, from its being densely clothed with a permanent velvety tomentum of a rich chocolate-brown, would make a charming and entirely novel dress decoration. These seeds are the produce of small trees or shrubs belonging to the natural order Guttiferæ and to the genus *Quiina*. The seeds of two species are shown in the illustration (Figs. 14 and 15), and a necklace made of the large seeded form is also shown (Fig. 16). Unfortunately, the trees producing these velvet seeds are somewhat rare, consequently they are not easy to obtain in large quantities; but those of your readers who have friends or correspondents in Jamaica, Trinidad, or British Guiana would be repaid by obtaining from them a few, if only sufficient to make a necklace.

In these notes we have taken only a few of the best examples as an introduction to a subject of much interest, and one which also might be made of much importance.—JOHN R. JACKSON, A.L.S., &c., Late Keeper of the Museums, Royal Gardens, Kew.

THE FLOWER GARDEN.

SOME PRETTY HARDY ANNUALS.

AN annual has been described as a plant the seeds of which are sown, while the plant grows, blooms, and dies within a few months. But it is possible to convert annuals into temporary biennials by sowing the seeds of some, such as Sweet Peas, Shirley Poppies, *Eschscholtzias*, *Silenes*, *Limnanthes*, &c., in the autumn, and having them in flower earlier than when sown in March and April. *Eschscholtzias* especially come very fine in spring when sown in autumn. The late Mr. Anthony Waterer of the Knap Hill Nursery, Woking, used to take great pride in his autumn-sown *Eschscholtzias*, and they glorified his garden in the spring months by the size, richness, and profusion of their golden blossoms. I had recently, in Lincolnshire, an opportunity of inspecting a trial collection of hardy annuals, and made notes of those which were in full bloom during the third week in July. Among them were the double forms of *Acroclinium*, viz., *roseum* and *album*, with their single counterparts also, 1 foot or so in height and full of blossom. The *Antirrhinums* may be included among annuals, though biennial and even perennial in character; if sown in March the plants will bloom bountifully the same season. Asters were not yet in bloom; they were late in getting a start. *Bartonia aurea* produces large yellow blossoms freely, but the habit of growth is straggling; still, it

is very effective in a mass. *Brachycoma iberidifolia* (the Swan River Daisy) is worth mention on account of its pale violet-blue colour and freedom of bloom. *Cacalia coccinea* is a showy and free annual; the colour of the small blossoms is orange and crimson. The Candytufts form a pleasing group of annuals, but as they produce seeds freely the period of bloom is not prolonged. The best are the Carmine, Dunnett's Crimson, large White Spiral, and the new Rose Cardinal. Among the *Centaureas*, the purple and white Sweet Sultans are most useful for cutting for decorative purposes; a fine form of the white named The Bride is being introduced by Messrs. Jarman and Co., Chard.

Of the annual *Chrysanthemums* there are the single and double forms of *C. coronarium*, the double white and double yellow being the most popular. *C. carinatum* (tricolor) is represented by a number of varieties, such as *burridgeanum atrococcineum*, &c., and there are certain newer named varieties, but none of them can be depended upon to come quite true from seed; still, whatever form they take they are bright and effective. There are double varieties of *C. carinatum*, but they do not appear to be so popular as the single-flowered. *C. segetum grandiflorum* is a fine form of the yellow Cornflower, showy, and excellent for cutting from. *Clarkias* are numerous; one of the best is the double crimson form of *C. pulchella*; the purple and white are also both good. The Tom Thumb varieties are also double-flowered. *C. integripetala marginata* and its double variety, rose, bordered with white, are also pretty.

Collinsia bicolor is an old but very popular annual, and so is *grandiflora*. *C. verna*, a charming blue, is now rarely seen; the seeds should be sown on slightly elevated spots in the open as soon as ripe, and then it is lovely in early spring. The climbing *Convolvulus major* can be had in several varieties, and they form charming objects in the border. One of the most showy of blue annuals is *Convolvulus minor monstrosus*, but all the dwarf *Convolvuli* are very pretty. *Cyanus minor* Emperor William is a fine deep blue form of the Cornflower; it should be sown in a mass to have it in perfection. Too much cannot be said in praise of the Indian Pinks (*Dianthus chinensis*), and especially of those two fine types *Heddeggii* and *laciniatus*; their large blossoms are extremely showy, while there are double-flowered varieties for those who prefer them. The *Eschscholtzias* are highly attractive; the deep golden crocea, the dark orange Mandarin, and the rose and white Rose Cardinal are three of the best. But to see crocea in all its beauty seeds should be sown in the open in autumn. The *Godetias* form a large group of annuals, and especially those of the *Whitneyi* type; they are of generally compact growth and great profusion of bloom. Lady Albemarle, Lady Satin Rose, gloriosa, and White Pearl among others are very gay subjects. Nor must the *Helichrysums* be overlooked, were it only because of their usefulness in winter decorations. The Larkspurs also are among the gayest of hardy annuals; there are tall and dwarf varieties to select from, while the old blue, branching though of loose growth, supplies a great mass of bloom.

The *Lavateras*—*rosea splendens* and *alba splendens*—can be bracketed with the crimson *Malope grandiflora* and its white variety; they produce large and striking blossoms. *Linum grandiflorum rubrum* is one of the freest and most showy of crimson-flowered annuals, and there is a white variety also; an annual variety of the colour of the perennial *L. perenne* would

be a great acquisition. Of the annual Lupins the yellow is one of the best, being dwarfier in growth and free of bloom. *L. nanus* is a charming blue-flowered annual, and should be in every selection.

Mignonette, being so fragrant, is a universal favourite. The Crimson Giant is a good sort of compact growth; Golden Queen, when represented by a good strain, is an excellent companion to it; the Golden Machet is a little larger in the spike; and for pot culture the Red Machet is one of the best. The Nasturtium has many representatives, tall and dwarf. Of the latter section Empress of India, intense crimson; Golden King, deep golden-yellow; Beauty, bright orange-crimson; and Terra Cotta are the best. An interesting novelty in dwarf Nasturtiums is known as Liliput Snow Queen, of dwarf, compact habit, the flowers creamy sulphur, bleaching to white.

No garden can be without Sweet Peas, and the choice of varieties is great. New varieties are constantly being added, and some of them are distinguished by increased size and novelty of colour. The practice of sowing so thickly in rows is a mistake; the branching habit of the Sweet Pea is to a great extent lost. The Bush Sweet Pea is an American selection, and scarcely worth growing. The Cupid Sweet Peas are found to flower best from home-saved seeds. The two earliest Sweet Peas are Earliest of All and Mont Blanc; these are quite a week in advance of any others. Of the annual Poppies the Shirley type are deservedly popular, and they bloom with increased fineness when sown in autumn. There are some fine double varieties among the Carnation Poppies, that known as the Victoria being especially good. The Tulip Poppy, intense scarlet, is a dwarf-growing but extremely striking single-flowered type. Where there is a warm, sunny spot and a light soil the gorgeous Portulacas may be sown with advantage; they are sun-loving plants. The Rhodanthes also do well on a similar situation and soil.

The Salpiglossis has been fittingly named the Orchid among the hardy annuals, the improved large-flowering varieties being both brilliant and varied. They should have an open sunny position. The compact varieties of *Schizanthus pinnatus* are charming annuals; they should have liberal treatment to be seen to the best advantage. *S. wisetonensis* appears to be too delicate for the open ground, but it makes a charming cool greenhouse subject. The varieties of *Silene pendula* are useful annuals, and sown in the autumn with *Limnanthes Douglassii* make attractive spring beds. The miniature Sunflowers are of tall growth, but they make a good display and are very free of bloom. The varieties of *Viscaria cardinalis* and of *occulata* are bright and showy, and the *Whitlavia grandiflora* and *Gloxinoides* deserve a place in the garden.

I have by no means exhausted the list of hardy annuals. I have been content to select the most desirable of those which bloom in July and August, without making any pretensions to furnishing a complete list. R. DEAN.

SEEDLINGS OF SAXIFRAGA LONGIFOLIA

MR. J. WOOD, Hardy Plant Nursery, Kirkstall, Leeds, writes: "I send you a photograph of some beautiful seedlings of *Saxifraga longifolia*. The blooms are not all open on the stems in the picture,

but are just now presenting a pretty effect here. The seed for these germinated some three years ago, and was to have produced the type *S. longifolia*, but owing to cross fertilisation with other choice sorts growing near at hand, the seedlings presented the appearance of containing some six or eight distinct forms even in their foliage. A number have bloomed this season, and quite fulfil expectations. Some stems are packed with perfect pyramids of blossom in the manner of *S. longifolia*, the individual blooms, however, being larger than those of the Queen of Saxifrages, and dotted uniformly with pink spots. The foliage of this form is broader and more ligulate than that of *S. longifolia*, seeming to point to a cross with *S. macnabiana*. A great advantage is gained in the fact that these seedlings propagate themselves more or less freely by offsets, thus ensuring a more constant and reliable supply of bloom than is the case with the type, which seldom lives after flowering."

AN UNDERCLIFF GARDEN.

LAST summer I had the good fortune of being permitted to inspect a most interesting garden on the Undercliff, Isle of Wight, namely, Belvedere,

and there the rock crops out of the soil, offering excellent sites for Agaves, Aloes, and other succulents, of which a large number are grown.

Asparagus Sprengeri is quite at home in the open. *Bouvardia triphylla* was a blaze of scarlet flowers. This has been in the open for five years. *Buddleia Colvillei* was represented by two fine specimens about 10 feet in height in full bloom.

Belvedere is the only garden in which I have met with the South African shrub or tree *Bowkeria triphylla*, which is not mentioned in any botanical dictionary that I have consulted. Here there are two examples, the largest about 7 feet in height. Both were bearing numerous buds at the time of my visit. I was told that the flowers are white. On a rocky ledge *Campanula G. F. Wilson* was a mass of deep purple flowers about 2 feet across, and I noticed *C. punctata*, but rarely seen in gardens. *Cantua dependens* is a fine shrub about 5 feet in height against a low wall. This flowered last year. *Cephalanthus occidentalis* (the American Button-wood) was in good growth, as were *Cestrum* (*Habrothamnus*) *elegans* and *Chorizema cordatum*. The Mexican *Cleome speciosa*, the well-known conservatory plant *Clivia miniata*, and the pretty *Cytisus purpureus incarnatus* were doing well. The orange-flowered *Digitalis obscura*, mentioned

SEEDLINGS OF SAXIFRAGA LONGIFOLIA AT LEEDS.

St. Laurence, the property of Mrs. Gwytherne-Williams, and on the 1st ult. I was enabled to renew my acquaintance with it. Notes have from time to time appeared in THE GARDEN on plants grown at Belvedere, and on page 193, Vol. LXII., Mrs. Gwytherne-Williams gave a list of the tender shrubs and plants cultivated there. The following notes have no pretension to be exhaustive, and merely draw attention to a few of the rare subjects seen during a too brief tour of inspection. The day was a perfect one, and the beauty of the garden was enhanced by the white wave-crests, raised by a fresh westerly breeze, glistening in the sunshine on the blue expanse of sea below. Facing due south, and protected on the north by the sudden rise of perpendicular cliffs, the garden offers an ideal home for tender plants, and its capabilities in this respect have been taken full advantage of.

Among the many climbers on the house I noticed a strong plant of *Mandevilla suaveolens*, *Clematis* *Nellie Moser*, and *Actinidia arguta* in flower. On the lawn the best of the Water Lilies are grown in a small ornamental pool, in one corner of which is a plant of *Crinum aquaticum*. Through the sloping garden below a shallow streamlet ripples, adding much to its interest and beauty, and here

by Mrs. Gwytherne-Williams on page 53 as having been brought from Granada, was in bloom, and the South African *Diosma* (*D. gracilis*) had formed a healthy little shrub. *Diplopappus filiformis* was 6 feet across. *Embothrium coccineum*, so common in Cornish gardens, was present, as was *Eriostemon buxifolius*, an Australian shrub bearing rose-coloured flowers.

Gazania latiflora was evidently quite hardy, there was a fine specimen of the Australian *Hakea suaveolens*, the Japanese *Halesia hispida* was bearing its fringed white flowers, and the Myrtle-like Australian *Hypocalymna robustum*, which bears pink blossoms, was looking well. Of *Kniphofias* I noticed *K. Northii*, *K. multiflora*, and *K. quartiniana*, the fine-foliaged herbaceous *Kitaibelia vitifolia* was 6 feet in height, and *Kunzea peduncularis* was pointed out. *Lagerstrœmia indica* had formed a bushy shrub 3 feet in height and 5 feet through; *Lagunaria Patersoni*, a shrub or small tree from Norfolk Island, which bears large solitary flowers, was 5 feet high; *Lasiandra* (*Pleroma*) *macrantha* was growing well; and the Australian *Leptospermum bullatum*, *Ledum palustre*, *Leonotis Leonurus* from the Cape of Good Hope, *Leucanthemum* (*Chrysanthemum*) *nipponicum*, *Ligularia macrophylla*, a strong-growing

perennial, with large glaucous leaves and yellow flowers, were inspected. That well-known inhabitant of our glass houses, *Libonia floribunda*, was evidently happy in the open garden, as was the Chilean *Lobelia Tupa*, and the North American shrub, *Lythrum alatum*, was bearing its deep pink flowers.

Megacaryon orientale was much after the style of the *Echiums*, and *Micromeria græca* is chiefly remarkable for the almost ammonia-like exhalation which is emitted from its bruised leaves, and which is sometimes strong enough to bring tears to the eyes. It is almost impossible to keep cats away from this plant, as they are intensely fond of rolling on it. The Australian *Melaleuca densa*, *Myrosma cannaefolia* syn. *Calathea Myrosma*, and *Osteomeles anthyllidifolia* from the Pacific Islands, the last bearing its white, fragrant, Hawthorn-like blossoms, were viewed. The giant Bellflower *Ostrowskia magnifica* was present, and of *Pentstemons* I noted *P. cordifolius*, *P. glaber*, 4 feet by 6 feet, and *P. tubiflora*, a pretty species 2 feet 6 inches high, with white flowers. The rarely-seen *Poinciana* (*Cæsalpinia*) *Gilliesi* was represented, *Polygala oppositifolia* looked particularly healthy, and on the rocks *Putoria calabrica* was growing freely. *Romneya Coulteri* was bearing its splendid white crêpe-like blossoms, set off by the central golden bosses, and *Salvia dichroa* from the Atlas Mountains was very striking, great branching plants over 6 feet in height, holding numerous spikes of lavender-blue and white blossoms; *S. angustifolia* was also grown.

Solanum crispum had formed a huge bush by a trellis, *Sparmannia africana* was growing strongly, as was the South African *Sutherlandia frutescens*, which bears handsome scarlet flowers. Three little plants worthy of notice were *Trichonema* (*Romulea*) *speciosum*, whose rose-coloured flowers were expanded; the South African *Tulbaghia violacea*, displaying the last of its pretty lavender-blue blossoms; and *Wulfenia amherstiana* from the Himalayas, which bears spikes of bright blue flowers.

Among the bulbous plants were *Bletia hyacinthina*, *Brodiaea laxa*, many Cape bulbs, including *Brunsvigia Josephinee*, *Cyrtanthus McKenii*, *Ixias*, *Sparaxis*, and *Freessias*, the last increasing freely from self-sown seed; *Ismene Macleana* from Lima, *Cumingia campanulata* from Chili, *Chlorogalum pomeridianum* from California, *Hippeastrum* hybrids in flower, *Eucomis pallidiflora*, *Calla elliotiana* and *C. Pentlandi*, and *Pancratium illyricum* with numbers of self-sown seedlings springing up around the parent plants, while in shaded nooks *Cyclamen persicum* was at home. Of climbing plants may be named *Mannetia bicolor*, *Pueraria thunbergiana*, the rare Australian *Brachysea acuminatum* bearing scarlet flowers, the Jalap Plant (*Exogonium* [*Ipomœa*] *purga*), *Ipomœa rubro-cerulea*, *Lonicera tatarica*, *Hydrangea scandens*, and *Rosa gigantea*, which, however, has never flowered.

Numbers of succulents are well grown on the outcrops of rock. Amongst the many *Aloes* I noted *A. Cerra* in flower, and in the good collection of *Agaves* *A. Victoria Regina*, *Opuntias*, *Cacti*, *Echinocacti*, and *Mesembryanthemums* are also grown in quantity, *M. tigrinum* in the last-named genus attracting attention by its striking foliage.

S. W. FITZHERBERT.

TREES AND SHRUBS.

IMPROVEMENT OF EXISTING WOODS.

HOW to improve woods that are suffering either from neglect or, what is perhaps more common, over-attention, is a question that no one can attempt to decide without a knowledge of these two facts about trees: (a) All trees grow in height during youth and put on girth later; (b) some sorts thrive under the shade of other trees.

(a) Trees that are still putting on height fast are in the pole forest stage, and the forester can do with them very much what he likes. Some sorts

naturally grow to stem, others to crown, and the latter especially need crowding in youth or they will develop a branching top and become formed trees too soon. The Oak may be taken as a type of this class of tree. If given too much room when young it grows into a miniature formed tree with a very short stem; just like an Apple tree in fact. To prevent this, to make it confine its growth chiefly to the stem, it must be crowded during youth. The British system of mixing Oaks with Larches, wrongly called nursing and in reality a temporary mixture, is one way, and a good way, of drawing Oaks upward. Whether the Larches are called nurses or not the principle is the same; the Oaks must be crowded during youth or they will not make long stems. When once they have had their height-growth stopped by over-thinning nothing the forester can do will bring them back to the pole forest stage. He can thicken the boles, but he cannot make them longer. On land of poor quality for Oaks long boles cannot be expected under any circumstances, and, as Oak knees and Oak bark are no longer of great value, it is doubtful if it would pay to keep Oaks on such land at all. On land of good quality the forester should not be content with short boles even in standards over coppice, though he cannot expect to get them quite as long under this system as under High Forest.

(b) Light-demanders (such as Oaks) cannot maintain good canopy for any length of time, and therefore should sooner or later be underplanted whether they are grown in dense or open woods. The effect of underplanting is not only to perfect the canopy and so improve the soil, but also to make the stems grow more cylindrical.

With these two principles to guide him the forester may now see what, if anything, he can do to improve his woods. If an Oak wood is still in the pole forest stage he must first decide whether he will open it out or keep it dense, and he will thin more or less, or not at all, accordingly. The chief thing to avoid is the attempt to make an open wood of Oaks that have been left so long dense that they ought to remain dense. But the usual class of wood that is in need of improvement is that which consists of Oaks that have passed into the tree forest stage. As a rule they are past improvement, not one tree in ten being worth saving. They are too far apart for dense culture, and their crowns are too badly developed for standards. Here it seems that the best thing is for the forester to harden his heart and make a clear cut of the worst places if not of the whole wood. Here and there groups of fairly good trees may be found which might be worth underplanting, but as a rule the trees worth saving are few and far apart. The system known as "High Forest with Standards" might come in here if the trees to be left are likely to stand the exposure. A thin wood of Oaks that is past improvement might be used as a protection wood for a thick crop of young trees, chiefly shade-bearers or moderate shade-bearers, Silver Spruce, and Beech, or Sycamore, Douglas and the black and Weymouth Pines.

Another typical wood in need of improvement is the small over-thinned Beech wood in exposed sites on chalk. It may be underplanted with Beech or Silver, and a broad belt of the same planted round it. A Spruce wood about twenty-five to thirty years old and containing only about 500 or 600 trees to the acre, is sometimes barbarously thinned, although every tree in it is branched down to the ground. It should be planted up at once with shade-bearers or moderate shade-bearers. The original Spruces are ruined for good clean timber, but the new planting should do well. A Larch wood that has been left too dense, a common mistake with us, should be thinned with caution. No dominant tree should be cut out, however bad its shape. Only dead and suppressed trees should go, and underplanting should accompany every thinning. The result will be an underplanting of uneven age, but the canopy must be preserved at all costs. The underwood should be Beech or Silver, or both, and, in the larger gaps and more sheltered parts, Douglas. Spruce is not recommended as an underwood either for Larch or Oak. All thin woods that have a dense growth of

Brambles, Bracken, Heather, Whortleberry, &c., under them should be underplanted. The more valuable the crop is the more important it is that it should be underplanted. In the wood, on a well-drained slope sheltered from the morning sun in winter, and from the afternoon sun in summer, a piece of ground may be enclosed as a nursery for the young trees until they are large enough to plant out. Large plants will be wanted to plant in Bracken or Gorse, but in Brambles or Heather smaller ones will do. The nursery should be kept clean, but it is generally a mistake to clear all the weeds away before planting out the young trees. Weeds in reason are useful not only as nurses but also as a protection from rabbits and hares.

The general result of improving woods by underplanting will be to make them "hollow underneath" from the sportsman's point of view. This will not matter so much to the modern big shoot man who drives his pheasants, for he can always keep patches of holding cover where he wants it; but it will spoil the woods for the old-fashioned sportsman who likes to do his own beating. As, however, the old class of shooter will soon be extinct, this is of small moment. A more important objection to the improvement of our woods, more important because it is more often raised, is that they will lose their beauty. Beauty is so much a matter of taste that it is useless to argue about it. It is enough to state that for a forester the sample British wood has no beauty. Certain glades and park-like tracts should of course be preserved, for they are things which all admit to be good of their kind and worth saving. But a mismanaged wood of ill-grown and unhealthy trees smothered with weeds and dying by inches, though under certain conditions of light it may provide an artist with a picture, cannot be said to have thereby earned any more right to existence than a field of Poppies or a ruined barn, or any other of the many signs of agricultural distress that delight the æsthetic eye. Disease and death do not appeal to the forester; his standard of beauty is health. And it is possible that in time even the artist may discover that a healthy wood has a beauty of its own. —SIR HAROLD G. HEWETTY, Bart., in *An introduction to the Study of Forestry in Britain*.

PLANTING EVERGREENS IN SUMMER.

I AM not aware that anything new can be said in favour of planting evergreen trees and shrubs during the summer months. The questions bearing on this matter are two—the probable results as compared with spring planting, and the effect that a hard winter has on newly-planted subjects. As regards the first, I have no hesitation in saying that the best results will be obtained from summer planting in all cases where the plants to be moved exceed 6 feet in height, provided they have only to be moved from one part of the grounds to another; but in the case of large plants that have to be brought long distances by railway, I should prefer to wait until the middle of September. When practicable, I prefer to prepare all the plants to be moved if they have stood in the same position more than four years, and if they exceed a height of 6 feet. The preparation should be made in the previous October, and should consist in digging a trench round the stem of the tree 2 feet deep and 1 foot wide. The distance that this trench must be from the tree will depend on its age and size; for a tree or evergreen shrub 8 feet high, the inner side of the trench should be 2 feet from the stem all round, and the width should be in proportion to the height. In digging out the trench all roots met with should be cut clean asunder; the trench may then be filled in again and left in that state. It will be found, when the time arrives for removing the tree thus operated on, that every root cut asunder has broken out into a mass of fibres, and it is considered that these fibres are of far greater benefit to the tree after removal than the single root would have been if left undisturbed until the time of lifting. Experience proves this, for in practice I find that all trees or shrubs prepared in the way just described suffer much less than those not so treated; in fact, the percentage

of living trees thus managed is far in advance of that of the other.

The question as to the effect that a hard winter has on newly-planted trees is one that demands the serious attention of intending planters. It must be taken for granted, I think, that a shrub or tree only recently removed is not in so good a condition to withstand the severity of a long winter as one that had not been disturbed. In my own experience I have had trees removed during the late summer months that have stood to all appearance sound and healthy up to the time when severe frost has set in, then become brown in the foliage, and ultimately die. This, however, to my mind does not to any serious extent injure the cause of summer planting, because it is only in the severest winters that trees suffer thus. On the contrary, it cannot be too well known that there is a decided gain by adopting summer planting. If a tree is moved towards the end of July, it will in a great measure have completed its growth for the year; and if moved as soon as it has done that it will get, other conditions being favourable, pretty well re-established before growth commences next season, and under ordinary circumstances it may be expected to make a fairly good growth the first year after removal; but in the case of autumn or spring planting it generally takes the whole of the next season to recover, and makes little or no growth.

There is just one particular time in the summer eminently favourable to removal—I mean that period of the tree's first summer growth when it comes to a standstill. Many trees make two

growths in a year, and the best time to move them is in the interval between the first and second growth. A little observation will enable anyone to detect when that time occurs, but as the habit of different trees varies, the selection of the time for removal may extend over three or four weeks, according to the character of the subjects to be operated upon. J.

NOTES ON HARDY PLANTS

SEDUM CÆRULEUM.

A SHORT time ago, when going through the delightful garden of the Misses Blackburn at Park House, Kirkcudbright, I saw the exquisite little blue Stonecrop in flower. It is now many years since I first made its acquaintance, and I still recollect the pleasure it gave me when in full flower. *Sedum cæruleum* is practically unique among the Stonecrops. It forms a neat little plant, not more than 2 inches or 3 inches high as a rule, and is plentifully adorned with beautiful little blue flowers. In some respects it reminds one of *Ionopsidium acaule*, but it is, I think, even prettier than that little annual. Seeds of *Sedum cæruleum* are not over plentiful, but they are to be obtained from some of the leading firms, and should be sown thinly where they are to bloom in April or May. The seedlings should be well thinned out, and when this is attended to good plants, such as those at Park House, will be secured.

SISYRINCHIUM BERMUDIANUM.

I was pleased to see the note on *Sisyrinchium* from "S. W. F." in THE GARDEN of July 30 (page 76). There is a good deal of confusion in the nomenclature of these plants, as may be seen from the synonymy in Mr. Baker's "Handbook of the Iridæ." In that work it will be observed that Mr. Baker gives *S. bermudianum* as one of the synonyms of *S. angustifolium* of Miller, the latter being *S. anceps* of gardens. Mr. Baker also describes the true *S. bermudianum*, but I find that *S. angustifolium* is still being sold for *S. bermudianum* in some nurseries, and the writer has received it under that name. It seems to me that the plant figured as *bermudianum* in Maund's "Botanic Garden" is *S. angustifolium*, but what is the one which Maund figures as *S. bermudianum majus*? S. ARNOTT.

HUNNEMANNIA FUMARIFOLIA.

This beautiful Mexican member of the Poppy family is now particularly handsome with me. It was, apparently, introduced into this country in 1827, but was little grown until a few years

ago, when it was sent out as an annual, and it was as an annual that it received an award of merit from the Royal Horticultural Society in 1898. Nicholson, however, in his "Dictionary of Gardening," gives it as a half-hardy perennial, and three years ago, when staying at Pezance, I saw some plants in Mr. T. B. Bolitho's garden at Trewidden that had come through two winters in the open without protection. My single plant, that I procured as a seedling last year, passed through the winter unharmed, although entirely unprotected, and is now a bushy specimen rather over 2 feet in height and as much through, and is bearing some two dozen fine flowers that measure 4 inches in diameter, fully an inch larger than those in the coloured plate which appeared in THE GARDEN (page 536, Vol. XXXI). It is probably only in exceptionally favoured sites and in mild seasons that it would be possible for this plant to pass through the winter unharmed in the open if unprotected, since Messrs. Robert Veitch and Son of Exeter tell me that they invariably lose it in the winter, and a friend who lives close to me found that none of his plants survived last winter. The superiority of a two year old plant to a seedling is, however, so marked that I consider the *Hunne-mannia* is well worth protection during the winter by hand-lights or frames. The large, bright yellow flowers, with their rich orange anthers, standing aloft on tall stems above the grey-green *Eschscholtzia*-like foliage, have a charming effect.

CAMPANULA GARGANICA ALBA.

The white form of *C. garganica* is a charming little plant for a pocket in the rock garden or for covering a rough stone edging. The small, star-like flowers are flat and borne in such profusion as to cover the plant in the months of June and July. Though the purple-flowered type is pretty, the white variety is more attractive. It succeeds in sun or semi-shade. The form known as *C. garganica hirsuta* has hairy leaves, and is rather more vigorous than the type. Of this plant there is also a white variety.

GLADIOLUS TRISTIS VAR. SULPHUREUS.

This charming *Gladiolus* is but rarely seen in gardens, yet it is one of the most attractive of its family, with its soft, pale yellow colouring, and is particularly valuable owing to the earliness of its flowering period, for mid-April generally sees it in full bloom in the south-west. Although it is odourless during the day, as evening approaches it becomes deliciously fragrant, thirty or forty flower-scapes scenting the air with a perfume almost *Magolia*-like. The leaves are Rush-like, and when cut horizontally show a section like a cross in form. Though a native of Natal, it appears perfectly hardy in the south-west, even when planted only 3 inches beneath the surface and entirely unprotected. The corms increase very rapidly from offsets, and by the middle of July the leaves have withered. A coloured plate of this *Gladiolus* appeared in Vol. XXVIII., page 58, of THE GARDEN under the title of *Gladiolus sulphureus*. According to "Nicholson's Dictionary of Gardening," however, *G. sulphureus* is a synonym for *Babiana stricta sulphurea*, a plant that is only 9 inches in height, whereas with me the strongest scapes attain a height of 3 feet 6 inches. Nicholson describes *G. tristis* as having the three upper segments of the flower spotted with minute reddish-brown dots, a form which I have never seen; and in Vol. LII., page 301, of THE GARDEN there appears a photograph sent by Mr. Greenwood Pim showing *G. tristis* with a band of purplish-black stretching up the centre of each of the three higher petals. This form I know well, as it is the one that is apparently always sent out when *G. tristis* is ordered, all of my friends whom I have advised to get *G. tristis* having been supplied with it. Mr. W. Watson, in the article which accompanied the coloured plate, explains this variation, for he writes: "*G. tristis* is very variable. It is said to vary in the colour of its flowers from pure white to almost wholly purple." He further says: "The plant represented in the plate and called *G. sulphureus* is merely a large-flowered, self-coloured

GLADIOLUS TRISTIS VAR. SULPHUREUS.

variety of *G. tristis*." The plate, however, hardly does justice to the plant, as, although it gives a good representation of the individual flowers, it depicts only two on a scape, whereas I have had as many as five blossoms on strong scapes, all of which were expanded at the same time. The variety of *G. tristis* called *sulphureus* is far more attractive than the striped form, and doubtless is superior to the spotted type mentioned by Nicholson, and to the purplish forms alluded to by Mr. Watson. Intending purchasers should therefore specify in ordering *G. tristis* that the variety *sulphureus* should be supplied.

CAMPANULA LACTIFLORA.

THIS is one of the finest of the border Campanulas. From its specific name one would expect its flowers to be white, but their colour is a pale lavender-purple in the majority of cases, though considerable variation occurs in the tint of the flowers in individual plants, the colour ranging from deep purple to almost pure white. It is a very robust grower, often attaining a height of 6 feet, and bearing enormous heads of flower. Numerous seedlings spring up around old-established clumps, and these often vary somewhat in colour of bloom. It is of the easiest possible culture, and is the best Campanula for growing in the shrubbery, seedlings springing up beneath low shrubs, spearing their branches with their flower-spikes and blossoming finely above their heads. At one time this plant was known as *C. celtidifolia*. Being a native of the Caucasus it is perfectly hardy.

HERBERTIA PULCHELLA.

THIS pretty little Chilean Irid has just flowered with me in a narrow border of light soil in front of a wall facing south-west. The blue Tigridia-like flowers are sweetly scented and last but a day. The bulbs that I procured were evidently not full-sized ones, as the plants only attained a height of 5 inches and bore but one flower. *Cypella Herberti*, from Buenos Ayres, growing next to the *Herbertia*, has, on the other hand, made marvellous growth, some of its flower-stems being 3 feet 2 inches in height. It is in full bloom, and has been so for a month, numbers of fresh flowers expanding every day. It appears likely to continue in blossom for a considerable time.

BRAVOA GEMINIFLORA.

THIS Mexican bulb is now in full flower in a sunny, wall-backed border, and is an exceedingly pretty sight. Its tallest flower-stems are just 3 feet in height and hold about twenty blossoms. The drooping orange-red flowers are very effective, and, unlike the Tigridias, retain their beauty for a lengthened period. The lower flowers are borne singly, but the upper ones are in pairs, hence the plant's specific name. It was introduced into this country more than sixty years ago, and is said to grow in the mountains of Mexico at a height of 7,000 feet. It appears hardy in the south-west, for I have known it in a garden in that district for some years.

THE ROSE GARDEN.

ROSE CLIMBING WHITE PET.

THIS is a delightful pillar Rose, and has all the attributes of a satisfactory garden variety. It is very free-flowering, and if given fairly good treatment it grows well. The accompanying illustration is from a photograph taken in the Royal Gardens, Kew; the plant is one of many that were planted two or three years ago to cover a pergola of iron uprights connected by chains. All the pruning necessary is to cut away sufficient of the old wood that has flowered to make room for the new. Climbing White Pet is at its best in late June and early July, it is purely a summer flowering Rose, but its non-perpetual character

is perhaps more than compensated for by the wealth of its bunches of white flowers that make such a lovely display while they last.

WALL ROSES AT GLAMIS CASTLE, N.B.

AMONG the many features of interest in the fine gardens of the historic Glamis Castle, the seat of the Earl of Strathmore, in Forfarshire, are the wall Roses. Mr. Wilson, the gardener, has made a good selection both of the older and the newer sorts, and they are generally doing well. Among those noted on a recent visit were Bouquet d'Or, Bardou Job (unsurpassed in its class), William Allen Richardson (of splendid colour), Vivid, the favourite *Homère* (quite hardy here), L'Idéal, Mme.

Where, for instance, is there a Hybrid Tea that can surpass a pillar of the old Hybrid Perpetual Anna Alexieff, or the still beautiful Abbe Bramerel. We should prize these old Roses if only for their delicious fragrance. I gathered recently a handful of that old Rose Paul Perras, and the fragrance from it was most noticeable. Who would willingly lose the old red Rose Sénateur Vaisse or the once popular Jules Margottin? No; whilst every opportunity should be afforded to make plantations of the present day favourites, the old Roses should not be entirely crowded out or neglected, for they, like all Roses, pay for attention.

ROSE PHILADELPHIA RAMBLER.

IT WAS much pleased with this variety as seen at Holland House recently. The colour is decidedly deeper than Crimson Rambler, and the form of the individual flower is more perfect. I am told there is also a perpetual flowering tendency, if so it will be a real gem. Perpetual flowering rambles are only a question of time. The Rose garden in autumn is a delightful place, but what will it be when we shall have arches and pillars as brilliant then as they now are in June and July?

ROSE JEANNE BUATOIS.

THIS fine hybrid Tea does not appear to be much known. It bears a magnificent bloom quite large enough for exhibition. The colour is white with faint lemon tint, form globular, flowers very deep and substantial. It is rather impatient of wet, and although a profuse bloomer one could not recommend this Rose for garden decoration as better than the beautiful white varieties already so well known.

ROSE AURORE (CHINA).

WHILE lacking the profuse flowering habit of Laurette Messimy, this charming variety is steadily coming to the front rank as a decorative Rose. The colour alone would secure it popular favour, every orange-yellow bud is so exquisitely formed; in fact, for all practical purposes it is a Tea Rose. The ruby-coloured foliage and wood are in themselves a beautiful feature, which loses none of its effect when this Rose is massed near grass. It is a variety worth planting largely in the autumn.

ROSE LADY CLANMORRIS (H.T.)

THIS beautiful Hybrid Tea has a flower as large as any of the varieties grown, with, perhaps, the exception of Mildred Grant. They are also of good substance, which is a valuable trait in an exhibition Rose. Modern varieties are exquisitely beautiful in form and colouring, but there are not many that can claim exhibition standard. The colour of Lady Clanmorris is creamy white, with delicate salmon centre, the edges of the petals being margined with pink. This variety, too, has a pleasing fragrance.

P.

ROSE MRS. J. LAING.

THIS fine garden Rose has been flowering delightfully with us, the plants having been put in as late as April last, and there is a brilliant promise for the autumn. Of course to the rosarian no variety is more familiar, as it is usually well represented at the exhibitions and in the garden also. It is well to recall that this Rose was raised by the late Henry Bennett, who gave us Viscountess Folkestone and many other Hybrid Teas, but, unfortunately, when on the threshold, so to speak, of his great work of hybridising Roses he died. Mrs. John Laing has rose-coloured flowers, not very strongly fragrant, but there is a suspicion of a sweet Rose perfume, and it is excellent in the border, where it forms a dense, strong, and leafy bush. It is important in the search for novelties not to forget these fine old garden Roses. We were looking through a large collection recently and Mrs. John Laing was conspicuous for the strength of its stems and clear fresh colouring. We have a group of it, and have gathered many bunches for the house. It is always wise to relieve newly-planted Roses of their flower burdens; it saves their strength for the autumn display.

ROSE CLIMBING WHITE PET AT KEW.

Alfred Carrière (a most useful one), Carmine Pillar, Dorothy Perkins, Alister Stella Gray (one of the most useful here), and many more. These Roses are admirably cultivated at Glamis, and give great quantities of bloom.

S. A.

ROSE GLOIRE DES ROSOMANES.

FOR brilliant colouring this old Rose is hard to surpass. Perhaps in pillar form it is seen at its best. The more modern Rose Grüss an Teplitz is more brilliant, but then we do not obtain such an early display as with Gloire des Rosomanes. I am more than ever convinced that we must not allow these old Roses to drop out of cultivation as they are threatened by the advancing Hybrid Tea.

NEW AND RARE PLANTS.

ANGRÆCUM INFUNDIBULARE.

AT the first meeting of the Royal Horticultural Society in their new hall on the 26th ult. Lord Rothschild (gardener, Mr. Dye) exhibited this remarkable Orchid, then flowering for the first time under cultivation in this country. The plant shown was collected on the Victoria Nyanza, Uganda, in 1902. Although this *Angræcum* has never before flowered under cultivation in Britain, it was first found some forty years ago in West Africa, but dried specimens only of it were sent home.

The specific name has reference to the remarkable inverted funnel-shaped lip; the broad frontal lobe is white and the mouth of the throat is green. The lip tapers gradually, and extends behind and upwards as far as the base of the flower-stalk. At the end of this there is a tail some 3 inches or 4 inches long. The greenish sepals and petals are convolute, rolled back so as to meet almost all along the margins. The Orchid committee awarded a first-class certificate to this plant.

GAILLARDIAS.

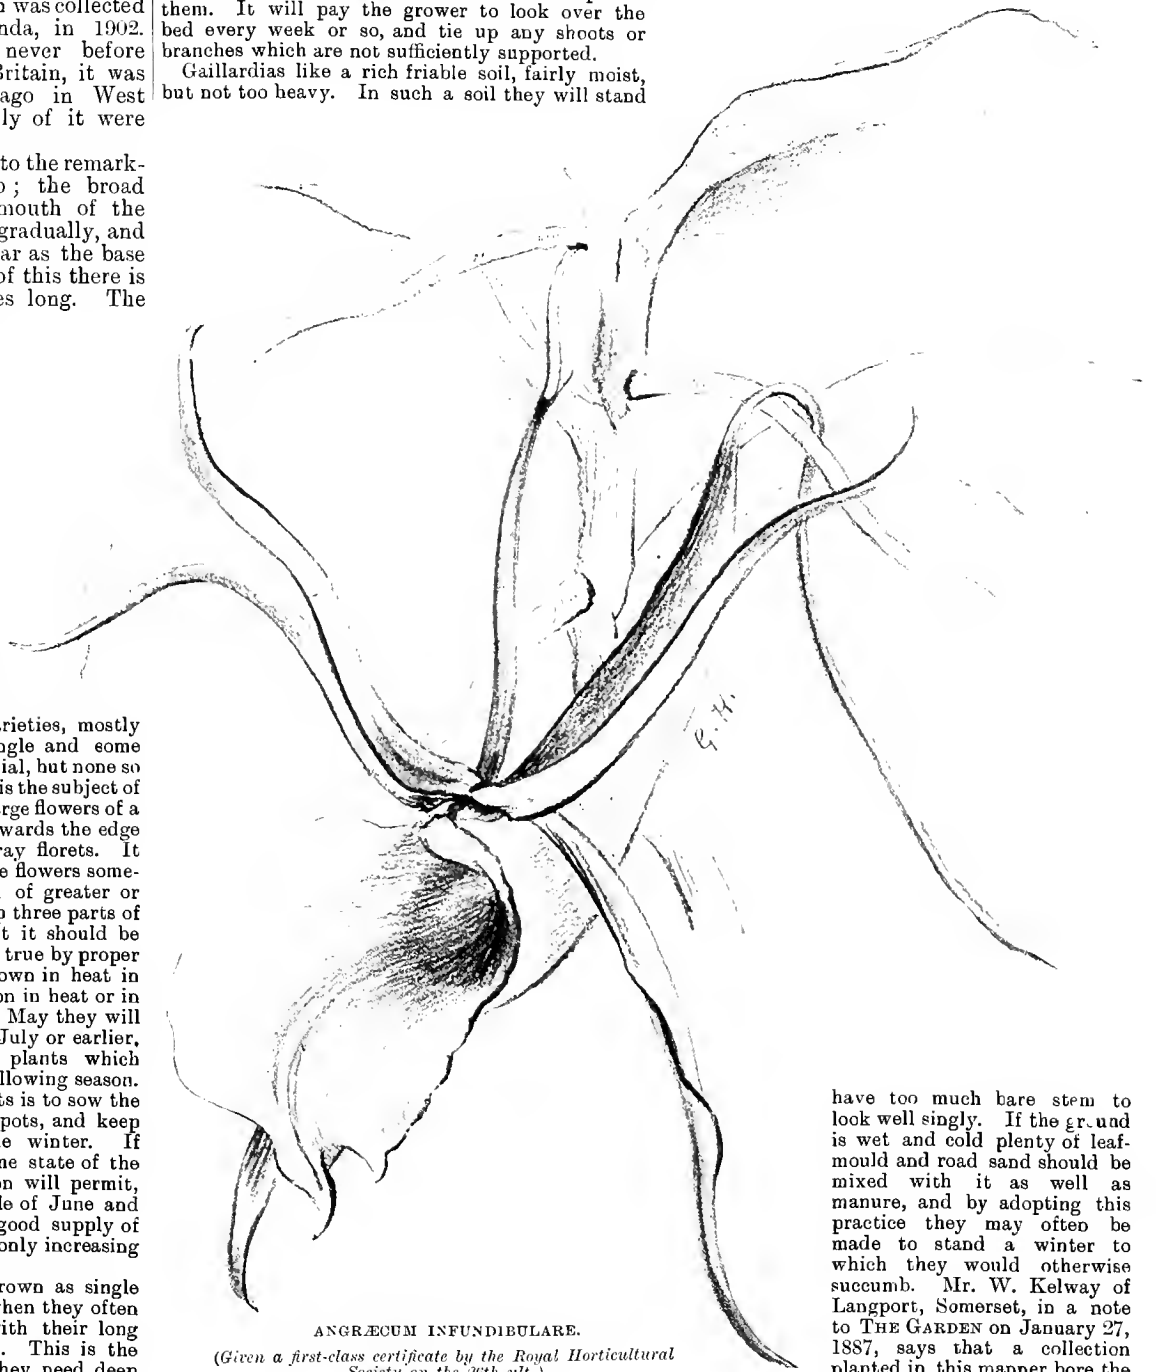

GRAND perennial plants are the *Gaillardias*, scarcely equalled by any other, either in the length of time they blossom or in the profusion of flowers they produce for cutting. There are several species of *Gaillardia* and many varieties, mostly hybrids of *G. grandiflora*, some single and some double, some annual and some perennial, but none so fine as *G. grandiflora maxima*, which is the subject of this article—a single variety, with large flowers of a fiery red colour shading to gold towards the edge of the petals, or, more correctly, ray florets. It sports a little, the red portion of the flowers sometimes being a clearly defined band of greater or less width, and sometimes taking up three parts of the length of the ray florets. But it should be possible to obtain the seed perfectly true by proper isolation of varieties. If seed is sown in heat in February, and the seedlings grown on in heat or in a cold frame till the beginning of May they will come into bloom by the middle of July or earlier, though there are generally some plants which refuse to run up to flower till the following season. A much better way of rearing plants is to sow the seed now, pot them off into 3-inch pots, and keep them in a cold frame through the winter. If planted out as early in March as the state of the ground or the mildness of the season will permit, they will be in bloom by the middle of June and will last till October, providing a good supply of cut flowers the whole time, cutting only increasing their floriferousness.

One sometimes sees *Gaillardias* grown as single specimens on a dry mixed border, when they often present a very poor appearance with their long bare stems and their side branches. This is the worst place possible for them, as they need deep digging and rich manuring, neither of which are possible on a mixed border; and they also need a good supply of moisture, which is not possible in the summer time if the hungry roots of strong-growing perennials like *Phloxes*, *Michaelmas Daisies*, *Sunflowers*, &c., are within reach. They should be given a piece of clear ground, which has been dug two spits deep and well manured, in the winter if possible, so that it has time to settle down before the spring, thus inducing a stronger and less succulent growth. In such a soil

they should not be planted more closely together than 2 feet, as with such a root run and abundance of plant food they will make fine plants 3 feet high with a number of strong shoots, some of them as large as whole plants grown under indifferent conditions. It often pays to thin out these shoots, as they are apt to crowd each other and become weak, and so get broken by the wind. They need a good deal of tying up in any case, and this should be done early. The central stem of each plant should have a stake fixed to it, while the stronger side growths should have stout 3-foot sticks put to them. It will pay the grower to look over the bed every week or so, and tie up any shoots or branches which are not sufficiently supported.

Gaillardias like a rich friable soil, fairly moist, but not too heavy. In such a soil they will stand

ground will have become rather exhausted by the previous season's display. If the soil is wet and cold the plants cannot always be trusted to remain through the winter. In any case, if a good supply of these flowers is wanted year after year it is well to sow a packet of seed every summer and do away with a bed which has bloomed two seasons, putting out the new plants in a different place. Bold groups are best for making a display, as the plants

ANGRÆCUM INFUNDIBULARE.

(Given a first-class certificate by the Royal Horticultural Society on the 26th ult.)

the winter without any protection, and, though no trace of them may be seen during the winter, in March or April a thicket of shoots will spring up from the crowns, and these should be thinned as early as possible so as to get good strong stems. These will flower by the end of May in a favourable season, a time when cut flowers are not at all too plentiful. Some thoroughly rotted manure should be spread among them in the early spring and just lightly worked in with a trowel, as the

have too much bare stem to look well singly. If the ground is wet and cold plenty of leaf-mould and road sand should be mixed with it as well as manure, and by adopting this practice they may often be made to stand a winter to which they would otherwise succumb. Mr. W. Kelway of Langport, Somerset, in a note to *THE GARDEN* on January 27, 1887, says that a collection planted in this manner bore the drought of several successive

summers better than any other herbaceous perennial grown at Langport, and stood the winter so well that not 3 per cent. suffered.

Gaillardias make a good bed, though for the purpose *G. grandiflora compacta*, growing only about 1½ feet in height, is to be preferred. Sometimes they are pegged down, and when good strong plants are put in so that there are plenty of side shoots a very beautiful effect is obtained, the ground being completely covered and the whole

bed a mass of blossom. Gaillardias are easily propagated from cuttings, which are best taken in the early autumn, and put round the sides of pots in a sandy soil, and these set in a cold frame. They should be left so till the spring, when they may be planted out in their permanent positions. Cuttings, however, never produce such large robust plants as seedlings. In the profusion of bloom produced, and the consequent abundance of seed heads, they resemble Sweet Peas, and all these dead blooms should be picked off at frequent intervals, thereby much prolonging the display. From a bed of only eight or ten plants I was able last summer to cut a double handful of blooms every week from June till the end of September, sometimes twice a week, much to the delight of my friends.

ALGER PETTS.

GARDENING OF THE WEEK.

FRUIT GARDEN.

PEACHES.

REMOVE this year's wood that has fruited and all superfluous growths, so as to give next year's bearing wood full exposure to the sun. Syringe the trees heavily every afternoon. Do not allow them to become at all dry at the roots; the surface may appear wet from daily syringings, and the soil near the roots be dry. Liquid manure should be given to all trees that require it, especially to old ones that have carried heavy crops of fruit. Any trees in this house that are making too strong growth or not fruiting satisfactorily may require root-pruning, and should be attended to as soon as the first leaves commence to fall or even earlier. The trees should be kept well shaded and freely syringed for a short time afterwards. Thoroughly cleanse the trees with the hose-pipe or an insecticide if necessary to clear them of red spider. Give full ventilation with plenty of liquid manure to old trees.

LATER HOUSES.

Gather ripe fruit and keep up a constant circulation of cool dry air. Later trees, which are carrying heavy crops of fruit, should be well mulched and have liberal supplies of liquid manure or clear water given them. Thoroughly syringe the trees on all favourable occasions, and elevate the fruits by placing pieces of lath under them to give full exposure to the sun. Close the houses for a few hours after syringing in the afternoon, and afterwards admit air for the night to obtain good colour and high flavour.

FIGS.

The pot trees for early forcing next season should have every attention in watering and syringing to have the wood well matured by the end of next month. The trees should be placed outside in a sunny position when the wood is fairly well matured and freely syringed until the leaves fall. Thin the fruit freely on trees carrying a second crop or they will be small, and give diluted liquid manure at short intervals. Later trees in cool houses must be well mulched, liberally fed, and freely syringed on bright days. Any trees that require repotting should be attended to as soon as they are cleared of their second crop of fruit; at the same time be careful not to overpot the trees if they have fruited well. Use good fibrous loam, lime rubble, and burnt ash, with a sprinkling of bone-meal, and plenty of drainage.

STRAWBERRIES FOR FORCING.

The earliest plants which were potted last month are making good progress. Any plants which still require potting should be seen to at once and kept in the shade a few days, then placed in an open position on a good ash bottom, and carefully treated as advised in previous calendars.

Impey Gardens, Droitwich.

F. JORDAN.

ORCHIDS.

COLAX JUGOSUS.

This beautiful cool house Orchid is well worthy of a place in all collections, the new growth being

now forward enough to enable any repotting or surfacing to be done, using a compost made up of equal parts of fibrous loam, peat, leaf-soil, and sphagnum, mixed with some sand and small crocks. Ordinary flower-pots are well suited to their requirements. Place over the bottom a few clean crocks, and complete the drainage by nearly half filling the pots with rhizomes. Keep the compost sufficiently low to allow of a surfacing of sphagnum. Plants newly potted will require very little water for some time. The warmest end of the cool house or the coolest end of the cool intermediate house is the temperature in which it should be grown.

ZYGO-COLAX VEITCHI, WIGANIANUS, AND AMESIANUS.

These beautiful hybrids that have been obtained from the foregoing species crossed with the Zygo-petalums are much better growers, and may be treated in the same way as advised for Colax jugosus. The new growth is generally rather earlier, so that when repotting is necessary it must be done a little sooner.

ONCIDIUM CONCOLOR.

This is one of the most attractive Orchids. Its pendulous racemes of soft yellow flowers are freely produced during the spring months. This species has the unenviable reputation of soon deteriorating in this country. Good culture is of vital importance, yet discretion is of equal importance if the life of these free-flowering Orchids is to be prolonged. Plants that have flowered freely and long often do not make good pseudo-bulbs. Now it those are again allowed to flower heavily the constitution of the plant will be impaired. If, however, those that have failed to produce good bulbs were given a rest for a season by removing the flower-stems as soon as visible the plants would be able to recuperate themselves. In the past the receptacles used have been shallow perforated ones; these should be discarded and preference given to ordinary flower-pots that are provided with holes by which they may be suspended. Half fill them with chopped rhizomes, and use a mixture of two parts fibrous peat, two parts sphagnum, and one part leaf-soil mixed together, with some small crocks and coarse sand. Pot moderately firm, keeping the base of the leading bulbs slightly lower than the rim of the pot, surface with sphagnum, and suspend them in the cool intermediate house. Water very carefully until the new growths have taken hold of the fresh material. Some are not yet ready for potting, especially those that flowered late, but when the new growth is about 2 inches high is the best season for the work.

Gatton Park Gardens, Reigate. W. P. BOUND.

KITCHEN GARDEN.

CAULIFLOWERS.

WHERE this vegetable is in demand as early in the season as possible, seeds should now be sown. Winter the plants in frames. Two sowings should be made—one now and another a fortnight hence. If the autumn should prove mild, the second sowing will probably give the better plants for transferring to frames. In this garden Walcheren proves the best sort for this system, it being hardier than any of the others, and much less subject to "buttoning." The seed should be sown thinly, so that the plants may be sturdy and hardy from the outset. Although birds are not so troublesome at this season, it is safer to net the seed-bed. The plan of wintering Cauliflower plants is being discarded by many gardeners, as some of the extra late Broccoli provide heads till the earliest Cauliflowers are fit to cut; but, as the Broccoli crop may be ruined by a severe winter, it is well to be on the safe side. A fine new Cauliflower has been tried here this year named Mont Blanc. It was planted out at the same time as those wintered in frames, and was fit to cut about ten days before any other. The heads, though not large, are of the purest white, and of its being the earliest there can be no doubt.

CELERY

is now growing rapidly, and will require frequent attention. Should this very dry weather continue

for any length of time, Celery, unless receiving copious waterings, will be very liable to run to seed early. It is better to go over the trenches about every three weeks, adding a little soil each time instead of a heavy earthing of several inches at once. If the trenches have been well treated with good farmyard manure no chemical manure need be given, except a dressing of soot. Before the work of earthing up is commenced all side growths and a few of the bottom leaves should be removed. At this time the soil should not be made too firm, and the surface should be kept loose and open, to allow as rapid growth as possible.

GENERAL WORK

will chiefly consist of plying the hoe among all growing crops. As soon as ground is cleared of Potatoes, Cauliflowers, &c., all the remaining stems, leaves, and stumps should be removed. If Potato disease has appeared the stems should be at once removed from the garden and burned. If vegetable land is not too plentiful second cropping will be necessary. Late Broccoli may still be planted, as well as Savoys, Kales, and Cabbage, on ground cleared of Potatoes and other early crops. Inspect all plots of winter crops, filling up the blanks. Give a slight earthing up to Savoys and winter Cabbages. Remove flower-stems from Rhubarb and the seed-vessels from Seakale, to encourage the formation of good crowns for forcing.

MISCELLANEOUS.

IN PRAISE OF RICHARD HARRYS.

A PLANTER OF ORCHARDS.

SAVE in the writings of some Elizabethan antiquaries little record is to be found in English literature of the name of Richard Harrys. It has not even been inscribed in that great book of fame, the "Dictionary of National Biography." Yet I think the Irish fruiterer to King Henry VIII. deserves a humble place, at least, among the famous men of the earlier part of the sixteenth century. It may be said of him that he found England a wilderness, and made a considerable part of it a rich and pleasant garden.

The land was then an expanse of green desolation, overrun with sheep. As Camden said, these animals, that used to be gentle and timid, had grown so wild and ravenous that they devoured men, and laid waste fields, homesteads, and towns. This may appear an extraordinary fact in natural history, but it admits of quite a simple explanation. Landowners, having discovered that the rearing of sheep was more easy and profitable than tillage, owing to the expansion of the wool trade, usurped the common lands, evicted their tenants, and converted their estates into immense pasture grounds. Farms, churches, and hamlets disappeared in the waste of verdure; and England was for ever bereft of that numerous class of peasant farmers who, in France and other foreign states, have done much towards the solution of the agricultural problem. It has been calculated that out of a population of 5,000,000, 670,000 persons were left without employment.

While the poor starved, the rich lived largely on Flemish and French produce. But the King's fruiterer could not see why England should not have at least orchards of her own, if not cornfields. In the year when the lesser monasteries were suppressed, and the homeless peasants in the poorer districts rose in formidable insurrection, he did the little that in him lay towards founding that period of comparative prosperity and internal peace which culminated in the latter part of Queen Elizabeth's reign. Of greater importance, perhaps, than his undertaking in itself was the fact that its wonderful success incited men to exploit in other ways the fertility of the soil, and so brought back more people to the land. Harrys' achievement is related in the quaintest manner by William Lambarde, in "A Perambulation of Kent," a work which, composed in 1570, has the distinction not only of being

the first of our county histories published, but of still remaining one of the most interesting and best written. The story occurs in a description of Tenham parish, which is worth citing:

"Heere have wee, not onely the most dainty piece of all our Shyre, but such a Singularitye as the whole Brittish Iland is not able to patterne. The Ile of Thanet, and those Easterne parts, are the Grayner; the Weald was the Wood; Rumney Marsh is the Meadow plot; the Northdownes towards the Thamyse be the Conygarthe, or Warreine; and this Tenham, with thirty other parishes (lying on each side this porte way, and extending from Raynham to Blean Wood), bee the Cherrie gardein and Apple orcharde of Kent.

"But, as this at Tenham is the parent of all the rest, and from whome they have drawn the good iuice of all their pleasant fruite: So is it also the most large, delightsome, and beautifull of them. In which respect you may phantasie that you now

our Lord Christ 1533, obtained 105 acres of good ground in Tenham, then called the Brennet, which he divided into ten parcels, and with great care, good choise, and no small labour and cost, brought plantes from beyonde the Seas, and furnished this ground with them, so beautifully as they not onely stand in most right line, but seeme to be of one sorte, shape, and fashion, as if they had been thorow one Mould, or wrought by one aod the same patterne."

Seven years after the planting of the New Garden, as it was called, £1,000 worth of Cherries was produced from thirty-two acres of land. Rumours of such extraordinary crops created an interest in the growing of fruit in the remotest parts of England; and country gentlemen, having obtained grafts from Tenham, were soon able to say to their friends—

"You shall see mine orchard, where, in an arbour,
We will eat a last year's Pippin of my own grafting,"

as Justice Shallow, with the honest pride of a man who was at least a successful gardener, remarked to Falstaff. The New Garden was then what John Webster said all fine works of translation were—a paradise into which were gathered the treasures of the world. Apple grafts from France, Cherry and Pear grafts of various sorts from the Low Countries flourished there, and probably the new Plum trees from Italy, which were introduced about the same time. So skilfully were the trees selected and planted that the first foreigner to write on fruit growing in England, Milton's versatile friend from Poland, Hartlib, said that our Cherries, Apples, and Pears were still the best of any, although it seemed to him that we had lost somewhat of the art of orcharding since the days of Harrys.

Harrys' actions, truly, smell sweet and blossom in the dust. What a glorious monument he now has in the orchards extending from Kent far into the Midlands and the West Country! On a fine day in spring the prospect from Boughton Hill, four miles west of Canter-

bury, over the parishes mentioned by Lambard, from Blean in the hollow southward, to Rainham westward by the Medway, and Tenham northward by the Swale, is still one of the fairest and goodliest in the kingdom. A grey church tower and some dark red roofs, showing above the mass of bloom, mark the site of the villages, while, were it not for their tall, white-capped oast-houses, many of the old farmsteads scattered in between would be hidden by the flowers of their fruit groves. So bleak by contrast seem the bare brown fields where young Hop-shoots are beginning to twine about the bristling poles, that one regrets that Kentish farmers should have turned so many of their orchards into Hop grounds in 1552, only nineteen years after Harrys had made northern Kent into a garden as beautiful almost in

summer and autumn, when the foliage is hung with ripe fruit, as it is when dressed with the pure blossom in spring—*Longman's Magazine* (August).

GRASSES FOR WINTER.

Most Grasses and wild plants that are suitable for drying for decoration during the months of the year when flowers are difficult to obtain are now ripe enough for cutting, and most of us will be thinking of replacing our last year's stock. The Cat's-tails (*Typha latifolia*) are perhaps the most useful of aquatics, and are very effective. If cut in time, and just now they are about right, they will last from one season to another, but if left too late they will burst. A very suitable plant to use in conjunction with the *Typha* is *Arundo conspicua*, one of the most beautiful of our tall, reed-like Grasses. Its graceful silky plumes mixed with the brown tail-like spikes of the *Typha* look very handsome. It should be used in preference to the Pampas Grass, except for high wall decoration, being much lighter. The Aquatic Grass (*Poa sp.*) must not be forgotten, for it is light and strong, and dries well. The feathery tufts of the Cotton Grass (*Eriophorum vaginatum*) may also be used with good effect. A very valuable addition to our collection is the *Eryngium*. There are many varieties to choose from. They last almost any length of time, but gradually lose their colour. While uncut they should be well tied up to prevent the stems from growing in fantastic curves, which may be awkward in decorating. Another large and ornamental genus of plants is the *Echinops*, or Globe Thistle. The blue or white florets look very pretty among Grasses, &c. All the above-named flowers and Grasses may be effectively combined in a terra-cotta vase about 18 inches in height. The Cat's-tails and the *Arundo* can hardly be cut with too long stems. An arrangement of this kind is a charming finish to a corner of a drawing-room. If colour be desired, nothing is so showy as the large seed-pods of the Gladwyn (*Iris foetidissima*), showing the large orange-red berries. The common Teazel (*Dipsacus sylvestris*) would also give a touch of light colour when the flowers are freshly cut.

For smaller vases and for mixing with fresh flowers, the ornamental flowering Grasses are invaluable. *Agrostis nebulosa* and *A. pulchella*, the Quaking Grasses (*Briza*), Turk's-head (*Lagurus ovatus*), and *Eragrostis elegans* are the best. These are all annuals, and may easily be raised from seed. They should not be gathered until they are fully open, or they will shrivel and curl up. *Typha minor*, also the bright crisp flowers of the Everlastings (*Helichrysum*) and the lighter *Rhodanthes* are very useful to give solidity to arrangements of the finer Grasses. The *Helichrysums* and the *Rhodanthes* should be gathered when but partly opened and hung head downwards in a cool place till the stems are dry. None of the above should be put into water at all when they are cut for drying.

THE FRUIT GARDEN.

THE LOGANBERRY.

AMONGST the various fruits which have been lately introduced into our gardens the Loganberry may be said to be the most valuable, for it is both hardy and prolific, producing in abundance fine fruit of remarkably good flavour. This plant is a hybrid between a red Raspberry and one of the finer varieties of Blackberry from America. The fruit is very much like an enormous Raspberry in appearance, but with a darker bloom and a longer shape, the flavour being specially luscious, and, at the same time, pleasantly sharp. It produces its fruit on the growths of the previous season, in the same way as the Raspberry, and should be cultivated on much the same lines, cutting out the old wood yearly in autumn and training the long shoots, which

THE LOGANBERRY.

see *Hesperium Hortos*: if not where Hercules founde the golden Apples (which is reckoned for one of his Heroical labours) yet where our honest patriote Richard Harrys (Fruiterer to King Henrie the 8.) planted by his great coste and rare industrie, the sweete Cherrv, the temperate Pippyn, and the golden Renate. For this man, seeing that this Realme (which wanted neither the favour of the Sunne, nor the fat of the Soile, meete for the making of good Apples) was neverthelesse served chiefly with that Fruit from forrein Regions abroad, by reason that (as Vergil saide), *Pomaque degenerant sucos oblita priores*: and those plantes which our ancestors had brought hither out of Normandie had lost their native verdour, whether you did eat their substance or drink their iuice, which we call Cyder, he (I say) about the yeere of

are thrown up from the base in arches, by tying them to those of the next plant, which should be placed about 5 feet away. Rich mulching (with cow manure in a light soil) will enable the fruit to swell properly. This mulch should be laid down in March when the fresh growth begins, the fruit being produced in June, before the Raspberries are ripe. The thorns of the Blackberry are fortunately absent from its stems, which are covered with small red spines. The foliage is handsome and vigorous, and no blight appears to attack it. There is no doubt that this plant will be most popular when it is better known. It is, however, not possible to propagate it by seed, as this has a tendency to revert to the original parent types, so that it cannot be relied upon to produce the true Loganberry, which should be propagated by suckers in the same way as the Raspberry. Loganberries are not likely therefore to be too plentiful for some years, and all who can grow this delicious fruit should not fail to plant it in October.

EARLY SUMMER PLUMS.

OUR first early Plum this season was freestone Sturt, which is one of the late Mr. Rivers' seedlings, and, in addition to its earliness, it is a sure cropper. In our light soil it is one of the most reliable. The fruits are not large, but sweeter than many of our later kinds. The raisers describe it as a dessert Plum, but the flesh, though pleasant, is not rich; rather, it is very juicy and sweet. The tree in bush form makes a dwarf growth, but our best fruits are obtained from walls. Here we lay in new wood freely every year, and the trees bear very well indeed. I have gathered this fruit earlier than July 25, but even that is early for fruits of this kind. It is a reddish purple and roundish, and is both useful for dessert and cooking. In small gardens where there is not room for many kinds of fruit I would certainly advise this one on account of its earliness and sure cropping. The next on my list is Early Favourite, another of Messrs. Rivers' seedlings, and this variety is not so much grown as the Early Rivers', or, as it is more commonly known, Rivers' Prolific. I have seen the Favourite grown under the name of Prolific, but there is a good deal of difference in the quality of the fruits, and Favourite is the earliest. There was a good tree of this variety on a west wall in the Royal Horticultural Society's gardens at Chiswick, and it was always admired for its good quality and earliness. This is a true dessert Plum, whereas Prolific is a kitchen fruit. This variety does best on a wall, and grown thus I have had ripe fruits by the middle of July. I do not advise it as a bush or standard, but grown on a low wall it is excellent and does not make a rank growth. The fruit is a roundish-oval of medium size, purple, and has a refreshing flavour, a freestone, and a good dessert variety. The next is the Prolific, named above. This is rightly named, as it is a very free bearer and a good bush or dwarf standard. Many give it wall culture for early supplies, but we grow it otherwise. It is a splendid cooking Plum, and, though not large, it is valuable for its free cropping. The fruits are under medium size, and it is excellent for preserving. At times it crops so freely that it is well to gather the fruits daily and as early as possible. Grown in the open we usually get ripe fruits by the end of July, and in quantity the first week in August, but the fruits do not keep long when quite ripe. The above are the three best early Plums we grow, and doubtless in later localities they would be quite as valuable.

Syon.

G. WYTHES.

PEACH WATERLOO.

THIS was our earliest Peach this season, the first fruits ripening on a south wall on the 23rd ult., and since that date we have gathered daily. We have had Waterloo earlier than the date noted above, but this year the trees were much later in setting, which was a gain, as not only is there a

very good crop, but the quality is excellent. Many fruit-lovers prefer an open wall Peach to forced fruit, and one cannot be surprised when the season is favourable, as with well-grown fruits on walls there is the flavour that is wanting in forced fruits. As regards the value of the very early Peaches I do not say they are equal in quality to our mid-season ones, but they are valuable in gardens where Peaches are not forced, and Waterloo is one of the best; it is quite six weeks earlier than Royal George and three weeks before Hale's Early, two of our best wall trees. It is brilliant in colour and of fair quality. For open walls Amsten June is also excellent. This season Waterloo preceded it. Both are valuable July Peaches, and, though the trees are less robust than the later kinds, they always crop well, but should be allowed ample room to extend. Severe pruning does not promote good health, and we find it an advantage to allow the terminals ample space.

S. H. B.

SUMMER PRUNING.

THERE are few operations in relation to fruit culture that are more interesting or present worthier aspects for study than the practice of summer pruning. To very many growers who operate on their trees by shortening back their summer shoots the process is little more than one

FASCIATED STEM OF LILIAM HANSONII.

of ordinary routine. They seldom ask themselves why the practice is adopted or what is the nature of the physical change which takes place when, by the shortening of a shoot in the late summer, there is a marked difference in the leaf-buds left on the portion of the shoot remaining. Under ordinary conditions did the shoot remain intact until the leaves had fallen every leaf-bud on it would, beyond maturing to enable it to become a wood producer the following year, yet remain practically the same and dormant. But when the shoot is, at the end of July or early in August, shortened back to some four or five leaves, a distinctive change in the back or basal buds begins. The first part of the change is seen in the increase in the size of the leaves attached to the shortened shoot, and these elaborate elements which serve to create from previous mere wood-buds those that will ultimately become fruit-producing buds or spurs. The point bud, however, is as a rule an exception, as that receiving the full flow of sap from the main stem is forced into growth, and that growth will be strong or otherwise according to the period of the summer at which the shortening of the shoot takes place. If done early in July, before the wood has become hardened, very strong new growth will result, and the conversion of the back buds

into fruit-buds is greatly minimised. If the shortening be done some three or four weeks later the wood will have materially hardened, and any second growth resulting will be less strong, and can easily be checked by pinching this new shoot at the second leaf joint. No further growth will then result, and the basal buds will be busy utilising the materialised sap from the leaves in building up fruitful germs. It is possible in this way to entirely change the nature of a tree, which strongly rooted in the soil continues from year to year to produce surplus wood shoots alone and no fruit, into one that creates little superfluous wood and good fruit crops. But this process of conversion is not of a sudden character. It is not the work of one year. The change of wood-buds into fruit-buds is only partially effected the first season, but enough has been done to prevent those buds thus partially converted from again becoming mere wood producers. The following season completes the change, and obscure buds then become prominent fruit-buds or spurs. All the winter pruning in the world will never effect this object, as in such case the base buds left on hard cut back shoots simply produce wood shoots again, and so on indefinitely. Even with the knowledge in relation to fruit culture now prevalent it is as painful as it is surprising to note how many apparently healthy trees continue year after year to be mere wood producers instead of being fruitful. Even root pruning, a very drastic operation for the purpose of checking sap flow from strongly entrenched roots, and thus also checking wood production, is far too little practised. Summer pruning is essentially a much less laborious operation, but is one needing much time. Root pruning is heavy work, and is always, unless done with great care, attended with some risk to the trees. Summer pruning has to be succeeded in the winter by a further operation, when all shortened shoots have to be cut back to two buds, as these are ample to form a spur for fruit production.

FASCIATED FLOWER OF LILIAM HANSONI.

[TO THE EDITOR OF "THE GARDEN."]

SIR,—Last summer my two bulbs of this useful Lily flowered very satisfactorily, the two spikes bearing respectively sixteen and fourteen blooms; but this year they have done far better, and have quite startled me and my friends by their performances. Five spikes were sent up, four of which were as good as one could wish, bearing as they did eleven, eleven, fourteen, and fifteen blooms; but the fifth, with massive fasciated stem and huge flattened-out head, carried no less than fifty-nine flowers, all perfect. I never saw such a head on any Lily before.

THINNING FRUIT IN CAPE COLONY.

[TO THE EDITOR OF "THE GARDEN."]

SIR,—I notice a letter in your last issue received here (June 11) by "Industria" headed "Fruit in Britain," in which he refers to the question of thinning fruit. He quotes a case in this colony where a very heavy crop in some extensive orchards received their thinning from natural causes and greatly benefited thereby. From this it might appear that thinning was not generally practised here, whereas the contrary is the case. In this and neighbouring districts, where most of the largest orchards of the Western Province are situated, it is the rule and not the exception amongst the English farmers (and I am glad to say that our Dutch neighbours are beginning to follow our example), and, in fact, is looked upon as second only in importance to pruning. Personally I have charge of 15,000 fruit trees, about half of which are in full bearing, and a considerable portion

of the rest cropping. Last season I went over these at least three times and picked off literally tons, and it certainly paid, as small fruit was unsaleable and the jam factories closed down. The varieties operated upon were mostly Plums, Peaches, and Apricots, and to a smaller extent Pears and Apples. For most of the trees ladders had to be used. Wages are, I believe, as high or higher than at home. We pay 2s. 9d. and 3s., and even 3s. 6d. a day for coloured labour, which has to be most carefully supervised.

There would, no doubt, be great difficulty in thinning the old orchards like the Kentish Cherry orchards with their "forest" trees, but in all modern plantations, where presumably the trees are kept low as they are here, it should be a simple matter, and would probably repay growers even better than it does with us, as in the London market, which receives the pick of the world's produce, quality is everything. The wind certainly does a good deal of thinning for us in most seasons, but, unfortunately, it is not sufficiently discriminating to be depended upon. One thing also is certain—that a well-thinned tree suffers less from high winds than one on which heavy clusters of fruit are hanging unevenly over the surface and frequently on the tips of the branches.

LIONEL BAKER.

WILD FLOWERS AT SPITZBERGEN.

[TO THE EDITOR OF "THE GARDEN."]

SIR,—It may be of interest to some of your readers to know that here in latitude 78° beautiful flowers are plentiful. Apparently all that the plants wait for is the melting of the snow from the lower ground, when immediately, as if by magic, the daily allowance of twenty-four hours bright sunshine and perfect purity of atmosphere brings to visible life the millions of plants which look so dead. At half a mile from the shore the land was like a moor when the Heather is in full bloom, and on landing we found that the colour was given by acres of plants of *Saxifraga oppositifolia*, each plant being a solid mass of bloom. A closer examination showed many other interesting plants in flower, amongst them a very bright *Ranunculus* and other yellow-flowered plants. The dwarf Rushes and Grasses were interesting, as also was the only "tree" on the islands, viz., the "Polar Willow" (probably *Salix reticulata*), the flowers of which were only just showing. The extreme height of this tree was 1 inch! It was fascinating to see what a lovely garden Nature when left entirely alone can make, under conditions that would seem impossible to any human gardener. The plants mentioned, and many others, were growing amongst the brightest coloured masses conceivable, within a stone's throw of glaciers 150 feet in height at the water's edge, and with snow still lying all around, notwithstanding the fact that the summer here is now nearly over. On a very small island in Recherche Bay there were masses of *Dryas octopetala* in full flower, although on what may be called the mainland that plant was only just showing signs of life. Evidently that little island was comparatively warm, and for that reason chosen by the birds for nesting purposes, for there were innumerable nests of the eider duck and other sea fowl amongst the flowers, all giving an additional interest from the point of view of a lover of Nature.

A. KINGSMILL.

THE ALMUG TREE.

[TO THE EDITOR OF "THE GARDEN."]

SIR,—I notice that Professor Henslow, in his interesting note on page 73, says that the above tree, frequently mentioned in those portions of the Books of Kings and Chronicles that treat of the reign of Solomon, might possibly be the Yew. He may be right, but I hardly think so. We read that "the navy of Hiram that brought gold from Ophir brought also Almug trees in great abundance." Now it is generally, if not universally, accepted that the Ophir of Scripture was not, as the old commentators put it, in India, but in Eastern Africa, in that part explored some years ago by

Theodore Bent, where traces of the ancient Phœnician workmen were discovered in the old gold workings. If the Yew was there in quantity in those old days it should still exist. Is that so? Again, we also read that of the Almug or Algum trees not only the wood for musical instruments was fashioned, but they furnished material for terraces and pillars. If the latter is to be accepted literally, the trees would not only be of very substantial size at the base, but should have a big stem some 20 feet or 30 feet high, which hardly coincides with our experience of the Yew, but is more in keeping with the growth of the Atlas or Deodar Cedars. I have wondered if the ships skirted the northern coast of Africa and obtained their supplies from the Atlas Mountains. It is a most interesting subject this connexion of the sylva of olden times with ours of to-day, and I for one should be very pleased with further information on the matter. It may be noted that the Deodar Cedar has been suggested as the Almug, but as this is indigenous to Northern India it is hardly possible it could have been shipped in quantity to Palestine in those times.

E. L. BURRELL.

LEAF-CURL IN PEACH TREES.

[TO THE EDITOR OF "THE GARDEN."]

SIR,—Can you tell me of any cure for leaf-curl in Peach and Nectarine trees? The trees are on a south wall in a midland county, no protection is given, soil rich loam. The disease has only given trouble of late years, but now infects both old and young trees and every kind.

B.
[Blister or leaf-curl on Peach and Nectarine trees is caused by a fungus known as *Exoascus deformans*. Although of an infectious nature, it is powerless against trees growing under glass, even if these were moved from an open wall in the autumn after a bad attack in the spring. Nor are trees so liable to it the first season after they have been transplanted from a house to an open wall as they are in after years. Spraying with strong fungicides is sometimes recommended as a preventive, and if tried this should be done once before the buds burst and again soon after the fruit is set, but more harm than good may result unless the greatest judgment is exercised in the matter. Cold winds are largely responsible for the mischief done, and the best protected trees are the least affected by leaf-curl. Peach walls ought to be furnished with glazed copings and an arrangement of blinds and cords, using these on cold days as well as nights to ward off cutting winds. Thus carefully protected there will be very few blistered leaves, and the trees pay well for the outlay and trouble taken with them. We have a number of young trees in pots for forcing. They are arranged in an exposed position in a large bed, and it is

worthy of note that only the rows of trees on the north and east sides are affected by leaf-curl. All the curled leaves should be kept gathered and destroyed, and the swollen ends of shoots cut away. If this is done in good time, fresh growths develop quickly and mature sufficiently to flower freely the next spring.]

WINTER SPINACH.

[TO THE EDITOR OF "THE GARDEN."]

SIR,—This is an important crop in most large gardens; it is also one that repays for any extra labour spent in the preparation of the ground as well as the sowing of the seeds. At this date there are several plots of ground available for this crop, and it may well follow Potatoes, Peas, Broad Beans, or Cauliflower, and in most cases all that is necessary now is to give a moderate dressing of soot or wood ashes, dig it a spade deep, and allowing a few days before forking back. Use wooden rakes to level the ground and collect stones, sticks, &c., and then draw shallow drills with a triangular hoe 15 inches apart. If the ground is very dry at the time of sowing moisten the drills with a long-spouted water-can a few hours before, as Spinach comes through most irregularly, and often fails altogether in very dry weather. Make the ground fairly firm, fill in the drills with the feet, and rake all evenly over, which is all that is necessary until the seedlings appear, when a dusting of fresh slaked lime should be given late in the evening to keep off slugs, which are very partial to Spinach, and quickly clear a few rows if left to themselves. Repeat this as often as found necessary. In thinning the crop allow plenty of space for each plant, 6 inches to 9 inches being none too much, as, should a hard winter set in, the plants, when some distance apart, are better able to withstand such weather than crowded weakly plants would be. As regards varieties, I have found the round or summer variety to stand the winter quite as well as the Prickly, but the Long Standing Prickly is decidedly an improvement on the type, and should be given a trial. Two or three sowings should be made, the first one about August 12 or 14, the second ten days later, and a third sowing the first week in September, the intervening sowing usually turning out the best.

Bicton, Devon.

JAMES MAYNE.

CARNATIONS IN A LEWES GARDEN.

THE accompanying illustration shows a very fine collection of Carnations grown by Miss Shiffner in the garden of Coombe, Lewes. It includes all the best varieties in cultivation, and the plants are in excellent condition. One large house is devoted

CARNATIONS IN A LEWES GARDEN.

to their growth, and many plants are in the open. The following varieties are amongst those grown: Lady Hermione, Mrs. Nicholson, Copperhead, Ivo Sebright, Mrs. Guy Sebright, Herbert J. Cutbush, Cecilia, Sir Bevis, Daniel Defoe, Agnes Sorrel, Miss Shifner, Midas, Bomba, Mrs. W. Lawson, and many others. The challenge cup in the group was presented by Mr. J. Colman last year and won for the first time by Miss Shifner. It was given for the best group of cut blooms arranged on a 4 feet square table at the Brighton summer show. Miss Shifner also has a house of Malmaisons, and has bought the entire stock of a yellow one raised by Messrs. Low, which she hopes to bring out next year.

SOCIETIES.

THE MIDLAND CARNATION AND PICOTEE SOCIETY.

THE annual exhibition of this society was held, as usual, in the Show House of the Botanical Gardens, Edgbaston, Birmingham, on the 4th and 5th inst. No more suitable place for such a show can be found in the county of Warwick; there is abundance of light, overhead are the festoons formed by *Bougainvillea glabra* or *Lapageria*, round the sides. Fuchsias and other plants form a background to the flowers, the tables are narrow, and there is no waste of space as at the Drill Hall. The arrangements made by Mr. Thomas Humphreys, the curator of the gardens, were excellent and much appreciated. Carnations and Picotees shown on paper collars were superb, with the one exception of the selfs, which through flowering early were a little thin and undersized. The bizarre and flaked Carnations and the white ground Picotees were excellent, pure in the ground, stout in texture, perfect in form, and finely marked. The yellow grounds and fancies were also very fine indeed, and a large number of single blooms were staged.

Carnations, selfs.—The best twelve blooms came from Mr. R. C. Cartwright, King's Norton, who had bright flowers of Her Grace, Carabas, Seagull, Enchantress (a very fine rose self), Benbow, Mrs. Guy Sebright, Sir Bevis, Germania, Ensign, Cassandra, Barras, and Comet. Mr. A. B. Brown, Handsworth, who had John Pope (a very fine new rose self), Avalanche, Mrs. E. Hambro, Gloriosa (a very fine bluish variety), Sappho, &c., was second; and Mr. C. H. Herbert, Acock's Green, was third. There were nine competitors with six selfs, Mr. W. H. Parton, King's Heath, taking the first prize with W. H. Parton (a very fine and new rich maroon flower), Seagull, Benbow, Sappho, Mrs. E. Hambro, and Germania. The Rev. C. A. Gottwaltz, Droitwich, came second, having John Pope, one of his own raising, very fine; third, Mr. W. H. Twist, Yardley.

Picotees, yellow grounds.—These were very finely shown, Mr. A. W. Jones, Stechford, taking the first prize with Lady St. Oswald, Isolt, Gronow, Lucy Glitters, Mrs. W. Heriot, Chryseis, Coquette, Peri, Countess Verulam, Lord Napier, Gertrude, and Dalkeith, an excellent selection; Mr. C. F. Thurstan came second, also with very fine blooms; and Mr. C. H. Herbert third. There was a very keen competition with six blooms, Mr. W. H. Twist taking the first prize with Gronow, Alcious, Lady St. Oswald, Daniel Defoe, Countess Verulam, and Gertrude; Mr. W. H. Parton was a close second; and Mr. J. Mitchell, Walsall, third.

Fancy Carnations.—Splendid blooms of these were shown, Mr. R. C. Cartwright taking the first prize with twelve blooms, Voltaire, Professor Cooper, Ormonde, Queen Bess, Amphion, Galileo, Hidalgo, Emperor, Persens, Cantracie, and Ivo Sebright, another fine selection; Mr. A. W. Jones was placed second with flowers scarcely inferior to the foregoing; and Mr. A. R. Brown was third. There was a very keen competition also with six blooms, much the same varieties being exhibited.

Picotees, white grounds.—Better flowers had not been seen for years; the quality was very fine. Mr. F. W. Goodfellow, Walsall, was first with superb blooms, among which were red edges, Brunette, John Smith, and Thos. William; purple edges, Ganymede, Fanny Tett, Lavinia, Mrs. Openshaw, and Pride of Leyton; rose edges, Favourite, Mrs. Payne, Mrs. Sharpe, and W. H. Johnson; Messrs. Pemberton and Son, Walsall, were second; and Mr. A. R. Brown third. With six blooms Mr. J. Edwards, Manchester, was first with purple edges, Ganymede, Fanny Tett, Lavinia, Mrs. Beswick, and Mrs. Openshaw; and rose edge, Lady Louisa; Mr. W. H. Twist was second, also with very good blooms.

Carnations, flakes and bizarres.—These were very pure and finely marked. The best twelve came from Messrs. Pemberton and Son, who had scarlet bizarres Robert Houlgrave and Robert Lord; crimson bizarre, J. S. Hedderly; pink and purple bizarres, Geo. Rudd, Sarah Payne, and William Skirving; purple flakes, Gordon Lewis and Geo. Melville; scarlet flakes, Flamingo and Sportsman; rose flakes, Merton and Thalia. Mr. C. H. Herbert was a close second, and Mr. C. F. Thurstan third. With six blooms Mr. J. Edwards was placed first, having varieties already named, and Mr. E. C. Rossiter came second.

Single blooms.—This part of the show is always one of great interest, five prizes being offered for the best flowers in each section. We will content ourselves with naming the three best, though in some cases one variety took two and sometimes three prizes. Scarlet bizarres: Admiral Curzon, which has been in commerce more than fifty years; Robert Houlgrave was second and third. Crimson bizarres: Arthur, a very fine new variety, J. S. Hedderly, and J. D. Hextall; pink and purple bizarres, William Skirving with Geo. Rudd second and third. Scarlet flakes: Guardsman first and second, Sportsman third. Purple flakes: Gordoo Lewis was

placed first, second, and third. Rose flakes: Rob Roy, Mrs. Lord, and Mrs. Rowan.

Picotees, light red edge.—John Smith, Brunette, second and third. Light red edge: Thos. William, first, second, and third. Heavy purple edge: Mrs. Openshaw, first and third, Fanny Tett second. Light purple edge: Pride of Leyton, first and second, Lavinia third. Heavy rose edge: Mrs. Payne, Apsie, Lady Louisa. Heavy scarlet edge: Mrs. Holden, W. H. Johnson, second and third. Light rose edge: Favourite, first and second, Nellie third. Yellow Picotee, light edged: Pilgrim, first and third, Lord Napier second. Y.P. heavy edge: Lucy Glitters, Isolt, and John Whitham. Fancy yellow ground: Queen Bess, Monarch, Hidalgo. Fancy any type: Ivo Sebright, first and third, Millie second. Carnations (Selfs), white: Mrs. Eric Hambro, first and second, Much the Miller third. Blush Seagull, first and second, Blushing Bride third. Yellow Germania first, second, and third. Buff: Mrs. R. C. Cartwright, first and second, this is a fine new variety of a salmon buff colour; Benbow second. Rose: John Pope, a fine new flower, Carabas second and third. Scarlet: G. W. Crane, Isinglass second and third. Dark crimson and maroon: W. H. P., a very fine maroon-crimson flower, first, second, and third. Purple Cassandra, Richard Dean, new dark purple Jupiter, any other dark self: Jocelyn, first and third, Lady Jase Grey second, both of heliotrope shades.

Undressed flowers.—This term is scarcely correct, as the schedule sets forth that "although a little dressing of the petals will be admitted, as little dressing as possible is desirable, the object of this class being to stage the flowers as naturally grown, apart from a petal shifted here and there where it improves the beauty of the flower." Complaint was made by the judges that this limitation had been exceeded, and the calyx manipulated. Of course the difficulty lies in accurately defining the exact amount of dressing permitted and no more. In four classes the blooms were staged singly in small vases, and in eight other classes they were in threes. Mr. Cartwright had the best twelve selfs, Mr. A. R. Brown was second; Mr. W. H. Parton had the best six, the Rev. C. A. Gottwaltz being second; Mr. A. W. Jones had the best twelve fancies, Mr. C. H. Herbert being second; Mr. Parton was again first with six, and Mr. Twist second. The varieties shown in the foregoing classes were substantially the same as those already named, and the same remark applies to the classes in which three blooms were shown. The best twelve blooms of selfs, yellow grounds, and fancies came from Mr. A. W. Jones, Mr. A. R. Brown being second; while Mr. Parton had the best six varieties, Mr. A. Chatwin being second. The remaining six classes were for three blooms only of one variety, and in each of these there was a good competition.

Premier blooms.—The selection of these entails upon the judges a large amount of labour, their selections being as follows: Bizarre Carnations, C. B. Arthur, from Mr. R. Sydenham; flake, P. F. Gordon Lewis, from Mr. E. C. Rossiter; Picotee, white ground heavy edge, P. E. Mrs. Openshaw, from Mr. Goodfellow; white ground, light edge, red edge Thos. William, from Messrs. Pemberton and Son; yellow ground, heavy edge, Dalkeith, from Mr. A. W. Jones; yellow ground, light edge, Childe Harold, from Mr. W. H. Parton; fancy, yellow ground, Queen Bess, from Mr. A. W. Jones; self, W. H. Parton, from Mr. R. Sydenham. Three premiers were selected from the undressed flowers: Self, Much the Miller, from Mr. T. R. Ward; yellow ground Picotee, Mrs. W. Heriot, from Mr. A. W. Jones; and fancy, Henry Gough, from Mr. A. R. Brown.

Floral decorations took the form of arrangements with Sweet Peas on small tables, some pretty designs being set up, especially that from Mrs. Martin, which was awarded the first prize; and there were shower bouquets, sprays, and button holes. Mr. Robert Sydenham offered special prizes for twelve bunches of Sweet Peas. Mr. T. Jones, Ruabon, taking the first prize with some of the finest blooms we have seen this season.

Several miscellaneous collections were staged. Messrs. Gynn and Sons, Otton, had a fine bank of cut flowers (silver-gilt medal); Messrs. Hewitt and Co., Solihull, had the same, and an attractive collection of Carnations in vases (silver-gilt medal); Mr. W. A. Watts, St. Asaph, had a fine display of long stemmed Carnations set up in vases (large silver medal); Messrs. B. R. Davis and Son, Yeovil, had very fine Begonias (large silver medal); Mr. M. Pritchard, Christchurch, had an excellent collection of hardy flowers (large silver medal); Messrs. Dicksons, Chester, had the same very tastefully arranged (large silver medal); Mr. J. Lambert, Southport, had a very pretty collection of cut Carnations (silver medal); Mr. S. Mortimer, Farnham, had an artistic arrangement with Cactus Dahlias (silver medal); Mr. G. H. White, Worcester, had a bank of hardy flowers (silver medal); Mr. V. Slade, Taunton, a fine collection of cut zonal Pelargoniums (silver medal); and there were a few smaller collections.

LEICESTER, ABBEY PARK.

THIS exhibition is quite unique in its way, as it is in the hands of the Corporation, and managed by a committee of aldermen and councillors. There is no membership or subscription list, but *pro rata* entrance fees are paid by all exhibitors. The expenses of the show are defrayed from these, and the takings at the gates and any surplus goes to the parks' committee. The show was held in the Abbey Park on the 2nd and 3rd inst. The secretaryship is held by Mr. J. Burton, the superintendent of the Abbey Park, and he is also the manager of the show.

Plants were represented by stove and greenhouse specimens, Ferns, &c., but they are not a strong point at Leicester, but groups arranged for effect are a prime feature, Mr. James Cypher of Cheltenham putting up one of his elaborate arrangements and taking the first prize; Mr. W. Vause, Leamington, was second.

Cut flowers largely preponderate, and there are keen florists among the Leicester folk. Excellent Roses for the time of year were shown by Messrs. A. Dickson and Sons, Newtownards, Belfast, who were first with thirty-six blooms,

with twenty-four, and also with twelve Teas and Noisettes; Mr. H. Drew, Longworth, a new aspirant to trade honours, taking most of the second prizes. The best twelve blooms of one variety of Hybrid Perpetuals, the Irish firm were first with Frau Karl Druschki; Mr. Drew coming second with Mrs. J. Laing; and these exhibitors were similarly placed with twelve Teas one variety. Messrs. Dickson having Lady Roberts; and Mr. Drew White Manan Cochet. The best Rose in the open classes was Star of Waltham, shown by Messrs. Dickson and Son. In the amateur division for Roses, the principal prizes fell to the lot of the Rev. J. H. Pemberton and Mr. Whittle.

Carnations and Picotees were a good feature. In the open division Mr. R. C. Cartwright of King's Norton and Mr. A. R. Brown, Handsworth, won the leading prizes, showing very good blooms indeed. In the amateur division there was a very keen competition, excellent blooms being grown in and about Leicester.

Stove and greenhouse cut flowers were well shown, and bunches of hardy flowers, zonal Pelargoniums, annuals, &c., were also good. Floral decorations consisted of bouquets, baskets of flowers (these were a very fine feature indeed), buttonholes, and sprays. In the amateurs' division there was a large display, and generally of good quality. The cottagers' tent was a flower show in itself, plants, cut flowers, fruits, and vegetables being very good.

Fruit was a fine feature, and in both classes for eight dishes Mr. J. H. Goodacre, Elvaston Castle Gardens, was first, one collection having a Pine-apple; in the other it was not allowed. Very fine Madresfield Court, Black Hamburgh, and Muscat of Alexandria Grapes were staged, also excellent Peaches, Nectarines, Plums, &c. Mr. J. Read, Bretty Gardens, was second in one class; and Mr. J. Brown, Market Rasen, in another. Mr. Goodacre's first prize four bunches of Grapes were Madresfield Court, Black Hamburgh, Gros Maroc, and Muscat of Alexandria. Mr. J. Swanswick was second, having distinct from the foregoing Muscat Hamburgh and Duke of Buccleuch. Mr. Goodacre was first with two bunches of Black Hamburgh and two of Muscat of Alexandria; and with two of Madresfield Court he was also first with two bunches of any other white. Mr. Brown was first with Foster's Seedling in the class for any other white. Peaches, Nectarines, and the commoner fruits were well shown. Vegetables were finely shown in many classes.

Miscellaneous exhibits were numerous and good. Gold medals were awarded to Mrs. Carnall, Messrs. Mackinnon, Fulton, F. Bonnskill, W. Bentley, and Dobbie and Co. Silver medals: Messrs. W. J. Barrow, C. Warner, Harrison and Son, C. Holden, Clibran and Son, W. L. Pattison, A. Day, F. M. Bradley, and W. J. Brown, all for varied and interesting contributions.

NEWBURY HORTICULTURAL SOCIETY.

THIS society held its fifty-sixth annual show on the 1st inst., and it was a great success in every way, there being a much better gate, more entries in the classes for fruit and cut flowers, and greater all round excellence; indeed, the committee who worked so hard to make it so great a success well deserve the good results for their labours.

The large plant class only brought forth two good collections, one in bloom and the other foliage, the first named being staged by Mr. Surman, Donnington Grove Gardens, and the latter by that veteran exhibitor, Mr. Charles Ross, Welford Park. These two exhibitors, in their respective classes, also being first for the best specimen plant in bloom and the best foliage plant.

Fuchsias made a grand show, though we have seen larger plants, but not better than the first lot, which came from Mr. T. Surman, Mr. Glox second. Begonias were numerous, both single and double, and in each class Messrs. Clark, J. H. Hobson, and Surman were the successful exhibitors in the order named. Gloxinias formed a large class, and the plants staged were above the average. Messrs. C. Surman, C. Ross, and T. Surman being the leading exhibitors. For table plants Messrs. Zeith, Ross, and J. Howard received the awards in the order named. At this show a special feature is made of the groups arranged as a model conservatory decoration, the awards being given for the most artistic display. There was no lack of exhibitors, the premier award being secured by Mr. J. Howard, Benham Park Gardens, with a splendid lot of plants in bloom and nicely shaped, so that the effect was very pleasing. Mr. C. Ross was a close second, but here a much greater use was made of foliage plants. Roses, though fully late for them, owing to the heat, were well staged in the open class, Messrs. George Cooling and Son, Bath, was first, and Mr. J. R. Trauter, Henley, second, the prizes in the amateur classes going to Lady Sutton and Mr. H. Smith.

Table decorations, always a great feature at Newbury, Inst no ground, as, though there was a little less space occupied, the quality was superior. The arrangements were better. Mrs. C. Stradling was a good first, using Sweet Peas, and Miss L. Harrold second. There were some good bouquets and buttonholes in the ladies' classes. Sweet Peas in the open class were not plentiful, Messrs. Smith and Surman being the leading exhibitors. Dahlias made a fine exhibit. Mr. Tranter was an easy first with splendid doubles, Messrs. Bosley, Maher, and Filewood taking the remaining awards in the order named. Carnations also were equally fine and well staged, Mr. A. Galt, Aldermaston Court Gardens, being an easy first, and Mr. Ross second. There was a spirited competition for twenty-four bunches of cut flowers, and some were staged loose in glasses, but those in bunches, though less artistic, were of excellent quality, and Mr. H. Smith was first. A special award was given for some choice blooms to Mr. Zeith, Beaupre Park Gardens, this collection being much admired.

Fruit was excellent in nearly all the classes; for a collection Mr. J. Howard was first, having good Grapes, Nectarines, and Moor Park Apricots; Mr. Maher, Yattendon Court Gardens, being second. Mr. Howard had the only Pine-apple and the best black Grapes; Messrs. Maher and Surman being second and third. Messrs. T. Surman the best Black Hamburgh, and Mr. Galt staged splendid Muscats.

Messrs. Ross and Galt had the best dessert Apples, and Messrs. Ross, Galt, and Bosley the best cooking.

Vegetables made a splendid display. These were very numerous. The cottagers' classes also were very fine. For a collection for Messrs. Sutton's prize there were five competitors. Mr. Howard being a good first and Mr. T. Surman (Donnington) second for the open class. Messrs. Keep (Aldermaston), Mara, and C. Surman were the leading exhibitors. The attendance was very large, the show being held in Goldwell Park, an ideal spot, and in addition to the horticultural display there were other attractions.

ROYAL HORTICULTURAL SOCIETY. ORCHID COMMITTEE.

PRESENT: Mr. H. J. Veitch (chairman), Messrs. J. O'Brien, W. H. Young, H. Little, H. M. Pollett, de B. Crawshaw, W. Boxall, F. W. Moore, M. Gleeson, T. W. Bond, J. Douglas, W. Cobb, J. G. Fowler, H. Ballantyne, H. Tracey, and F. Wellesley.

There was but little work for this committee. Mr. H. Wellesley, Westfield, Woking, submitted *Cattleya Eldorado* crocata superba, blush mauve, orange lip; *Cattleya Patrocinii*, Westfield var., purple, regularly spotted with a deeper shade, and *Cypripedium Heiro* Elendside var., a well-marked form.

From Mr. F. W. Moore, Royal Botanic Gardens, Glasnevin, *Bulbophyllum Hamelini* (from Madagascar), a dense spike of small flowers with an offensive odour. Botanical certificate. A most interesting species.

Messrs. Sander, St. Albans, staged a good group in which the *Cypripedium* were an interesting feature. C. Lord Derby, C. horneyanum, C. Transvaal, C. rothschildianum, C. Haynaldi chamberlainianum, C. A. de la Laisse, and others being very pretty. A large plant of *Vanda Lowi*, carrying four long racemes, each with about two dozen blooms, was conspicuous, also *Angraecum eichlerianum*, *Cattleyas*, *Laelio-Cattleyas*, and others. Silver Flora medal.

Messrs. Charlesworth and Co., Bradford, had a very pretty group of choice things, including *Brassia-Cattleya gigas* digbyana, *Laelio-Cattleya Callistoglossa*, rich in colour; *Cattleya Iris*, *Brassia lawrenciana*, *Epidendrum aromaticum*, very sweet; *Cycloches chlorochilon*, *Laelia Zanthina*, *Vanda cernua* in fine condition, and other fine plants. Silver Flora medal.

Messrs. Thomas Cripps and Son, Tunbridge Wells, showed a large group of *Disa grandiflora*, varying in colour a little but all in splendid condition. Silver Banksian medal.

Messrs. J. Veitch and Sons, Chelsea, had an excellent group of *Cattleyas* and *Laelio-Cattleyas*. Silver Banksian medal.

Messrs. H. Low and Co., also had a small miscellaneous group, including some very fine *Cypripediums*, *Laelias*, and others.

FRUIT COMMITTEE.

Present: Mr. A. H. Pearson (chairman), Messrs. J. Cheal, A. Dean, H. Parr, L. Castle, H. Wright, O. Thomas, F. Q. Lane, C. Norman, Alfred Rivers, C. Mortimer, G. Kelf, and W. Poupert.

The most important exhibit came from Mr. C. Foster, University College, Reading, who filled a 50-foot length of table with a fine collection of vegetables and some fruit. Good samples of about twenty sorts of Potatoes were shown; of Carrots, Early Gem and new Red Intermediate were good; Onions Bedfordshire Champion, Crimson Globe (highly coloured), and Ailsa Craig; of Runner Beans, good samples of Hill's Prize and Best of All, the last named a very fine Bean, Canadian Wonder being also good; Cauliflower Magnum Bonum, and Beetroot Long and Round were good. Several good sorts of Tomatoes were shown, viz., Polegate, Winter Beauty Champion, and Holmes' Supreme, also the pale pink Peachblow; Cucumbers in several sorts, all good fruits; Melons included Ringleader, Sutton's Scarlet, and others; Nectarines, the Japanese Wineberry, and other fruits, the whole forming a most interesting exhibit, for which a silver Knightian medal was awarded.

Mr. G. Kelf, gardener to Miss Adamson, Regent's Park, N.W., showed a collection of about ten sorts of Plums, viz., Golden Gage, Kirke's, Early Transparent Gage, Emperor, and others, all well-ripened clean fruits. Silver Banksian medal.

Mr. W. A. Cook, Shirley Park, Croydon, showed a seedling Tomato of good shape and substance, of the colour of Peachblow, and ripe fruits from the open of Ansdun June Peach.

Mr. H. Parr, Trent Park, New Barnet, submitted Melon Trent Park to the committee, but failed to gain an award; also six large Tomatoes, which weighed 5 lb., and said to be a very heavy cropper.

Mr. C. T. Elliott, gardener to Sir A. K. B. Osborn, Bart., had good samples of Apple Mr. Gladstone. Mr. W. Roupell, Harvey Lodge, Roupell Park, also showed good samples of the same variety.

Messrs. Rivers and Son, Sawbridgeworth, showed Plum Golden Gage and their new Peach Peregrine, represented by fine, well-ripened fruits.

From the Royal Horticultural Society's Gardens, Wisley, a most prolific small red Plum was sent, the branches shown being loaded with fruit.

Mr. J. Hodges, the Ruspier Vineries, Faygate, had well-finished examples of Grapes Gros Maroc and Alicante.

Mr. F. G. Crampton, Gate House, Sissinghurst, showed Potato Southern Star, a clean, well-shaped kidney variety.

No certificates were given by the fruit and vegetable committee.

FLORAL COMMITTEE.

Present: Mr. H. May (chairman), Messrs. C. T. Drury, R. Dean, C. Bick, James Walker, R. C. Notcutt, C. J. Salter, Charles Jeffries, George Gordon, Amos Perry, Charles Dixon, W. Howe, J. Jennings, C. E. Pearson, H. J. Jones, W. P. Thomson, E. H. Jenkins, W. J. James, Charles E. Shea, and William Cuthbertson.

A group of *Brainea insignis* from Messrs. J. Hill and Son, Lower Edmonton, was very pleasing. Graceful in its spreading habit, the young fronds of a broozy hue, the three dozen

or so plants forming the group created a distinctly good effect. The species is from Hong Kong and the Kasir Hill district of India, though rarely sent from the latter. Supported by *Davallia platyphylla* in the background and smaller Ferns as a groundwork a good result was obtained generally. Silver Banksian medal.

Hardy flowers as Phloxes, Lilies, Sunflowers, perennial Marguerites, and other such things formed the exhibit of Messrs. William Cuthbert and Sons, Highgate, N. Such Phloxes as *Fiancée*, white; *Roi des Eclanches*, white; *Iris*, violet-purple; *Comedia*, lilac and white; *Mrs. E. H. Jenkins*, one of the finest of the white decorative Phloxes, with coccinea and Coquelicot among the crimson-scarlet sorts were among the best.

Messrs. William Bull and Son, Chelsea, had a group of Tree Ferns, *Dicksonias* and *Cyatheas* principally. Of the former, *D. glauca*, with the rolled-up pinnae of the young fronds very prominent; *D. antarctica* was represented by a fine pair; while *Cyathea medularis* and *C. dealbata* were both of fine stature. The larger plant of *Cyathea medularis* had a trunk of at least 9 feet. Silver Banksian medal.

The group of *Lilium speciosum* in variety from Messrs. R. and G. Cuthbert was a very fine feature, the white form largely predominating, and all with 4 feet to 5 feet stems, and often ten or a dozen flowers. Handsome heads of *Phlox Fiancée*, with *Lilium longiflorum* and Ferns occupied the groundwork, and formed a margin to the whole. Silver Banksian medal.

Messrs. J. Cheal and Sons, Crawley, contributed hardy flowers, as Phloxes, Sunflowers, Eryngiums, Montbretias, and the like in company with *Dahlias* of the Cactus type, &c. Some charming sprays of *Tamarix odessana* were also noted.

Mr. M. Prichard, Christchurch, Hants, in an interesting lot of hardy things included *Sedum pulchellum*, *Veronica longifolia* rosea, *Scabiosa caucasica* alba (very fine), and *Rudbeckia purpurea*.

A pretty lot of Montbretias, of which *Flair Jaune* (yellow) and *Germania* were good, *Rudbeckia Golden Glow*, *Helianthus grandcephalum striatum*, *Clematis coccinea*, many *Gladioli*, *Emerocallis Dr. Regel* (an exquisite pale orange), *Senecio Clivorum*, *Oenothera bracteatum* (a tall, Thistle-like plant), *Solidago Buckleyi* (very dwarf), and *Kniphofia Lemon Queen* (very fine) were among the best in a very nice collection.

Tuberous Begonias were largely shown by Messrs. Veitch and Sons, Limited, Chelsea. Those of the ornamental-leaved section were very fine, such as *President Carnot*, *Arthur Mallet*, and *Isabella Bellon*. *Begonia Washington*, double crimson, very dwarf and compact, was in flower in good condition, the whole being associated with *Palms*, *Ferns*, and *Panacra* fragrans. A pretty lot of annuals were also from Messrs. Veitch, and these included *Brachycome*, *Linaria* of several kinds, *Godetia*, *Calliopis*, &c. *Eudelia variabilis* *veitchiana* and *Senecio clivorum* were also well shown. Silver Banksian medal.

The *Gladioli* from Messrs. Kelway and Son, Langport, filled one of the long central tables, and constituted an especially fine feature. Bold spikes in many colours, together with fine staging, showed to advantage. Some distinct ones are *Bona*, yellow; *Sir W. Scott*, crimson; *Ajax*, rose-salmon, deeper base; *Arthur Toms*, scarlet, a widely winged form; *Lord Milner*, rosy salmon; *King of Gladioli*, scarlet, extra fine; *Erantford*, salmon, with purple flaked tips; *Empress Frederick*, soft yellow and crimson throat; and *Golden Sceptre*, a very fine yellow. There were many others, probably seedlings, of much merit. Silver-gilt Flora medal.

A collection of cut Phloxes came from Messrs. Gunn and Sons, Olton, Birmingham. Many sorts were shown representative of the best known kinds in general cultivation.

Phloxes and other hardy flowers came from Messrs. Barr and Sons, Ditton. Phlox *Mrs. Jenkins* and *Fille d'Ève* were fine white varieties. *Spigelia marilandica* is not often seen in such good condition. Hardy Water Lilies were plentiful, and among other things we noted *Gladioli*, *Delphiniums*, &c. *Gladiolus dracecephalus* is a bronzy spotted and flaked sort on a yellow buff ground. It is a very striking plant with freely branching spikes.

Sweet Peas were finely shown by Messrs. Dobbie and Co., Rothsay, about a dozen excellent vases being staged. *America*, Duke of Westminster, Countess Spencer (pink), *Pink Fiar*, Countess of Radnor, *Stella Morse* (yellow), *Queen Victoria* (soft yellow), *King Edward VII.* (rich carmine-red), and *Jeannie Gordon* (peach and cream) were of the best. These were from the Bute nurseries. A vase of pods was shown from the Essex seed farms, showing how late the Scottish flowers are compared with the southern, a very interesting point to observe. Silver Flora medal.

Mr. Mortimer, Farnham, Surrey, had a most tastefully arranged exhibit of *Dahlias*, Cactus and show kinds, in vases and on boards, the former rendered attractive by a free intermingling of *Gypsophila paniculata*. Many sorts were not fully open. There were also many seedlings in the group, some of much promise, and, considering the dry weather, the flowers generally were of excellent quality. Silver Flora medal.

Mr. Amos Perry, Winchmore Hill, had a most extensive exhibit of hardy flowers in excellent condition. *Helianthus pumilus magnificus*, *Pentstemons*, *Veronica bachelensis*, *Campanula* (*Platyodon*) *grandiflorum*, *Helianthus Golden Ball*, *Polygonum baldschuanicum*, Phloxes, *Aster Thomsoni*, *Aster palustris* (very fine), *Eupatorium cannabinum*, *Potentilla nepalensis*, *Catananches*, &c., were all in imposing masses. Hardy Water Lilies also were shown in great abundance.

Border Carnations were shown by Mr. Douglas and Mr. Martin Smith. These were very fine.

A very beautiful lot of cut *Streptocarpus* came from Lord Aldenham, Elstree (gardener, Mr. Beckett). The flowers were set up in small glasses and were in many varieties, blue, violet, white, pink, rose, and others. Cut *Pentstemons* were also from the same source, and showed a good strain of these useful garden flowers. Silver Banksian medal.

Mr. H. B. May, Edmonton, filled a long table with plants of a hardy and half-hardy character, in which the forms of

Campanula isophylla and their allies were well represented; of these *Campanulas* alone five distinct forms were staged, *C. isophylla* (type); *C. i. gloriosa*, large flower; *C. i. alba*, white; *C. i. Mayii*, probably the best of the coloured forms; and *C. i. superba* a deep blue variety; *C. balchinensis* was also well represented. Silver Banksian medal.

Some good border Carnations came from Mr. H. W. G. Morris, Chipping Norton, Cyril Morris, a good yellow ground fancy; Admiral Togo, yellow ground, with crimson border and flakes; and Roy Morris, a magnificent scarlet of perfect form and colour.

Cactus Dahlias *Fairy*, white; *England's Queen*, large white; *J. B. Ridley*, orange and yellow; *Ella Kraemas*, peach; *Goliath*, cardinal red; and *W. P. Wright*, crimson-scarlet, were from Messrs. James Stredwick and Son, St. Leonards-on-Sea.

AWARDS.

Campanula hybrida Isobel.—A showy *Campanula* of the *Carpatia* section, with a leaning to *C. c. pelviformis*. The colour is deep violet-blue, the broadly opened flowers of good substance. The plant as shown is 9 inches high, and very free flowering. From Mr. M. Prichard, Christchurch, Hants. Award of merit.

Begonia Washington.—A double flowered kind with crimson-scarlet flowers on quite short stalks, and not more than 9 inches high. The plants were full of flowers. In all probability the variety will bed out with good results. Exhibited by Messrs. James Veitch and Sons, Limited, Chelsea. Award of merit.

Gladiolus Valdora.—A large and handsome sort with spreading flowers, white suffused and flaked red and pink, the lower petal pink, tipped with yellow in the throat, and freckled with scarlet. From Messrs. Kelway and Son, Langport, Somerset. Award of merit.

Gladiolus Miss Zena Darc.—Creamy white, the lower petals lemon yellow, and distinctly lined with red, the same colour pervading the base of the flower. From Messrs. Kelway and Son. Award of merit.

Dahlia Radium (Cactus).—A very finely-formed flower of orange and fawn with yellow centre. The florets are prettily curved and fluted. From Messrs. James Stredwick and Son, St. Leonards-on-Sea. Award of merit.

OBITUARY.

MR. RICHARD GORTON.

NORTHERN and Midland florists are mourning the death of this gentleman, who ably represented the older school of florists in Lancashire. Few men knew the points of a flower better, and he warmly insisted upon their observance. Of late years the alpine *Auricula* was his special favourite, and he raised some highly-refined varieties. He attended the exhibitions of florists' flowers, and especially those of the northern section of the National *Auricula* Society. He had outlived most of his horticultural contemporaries in Manchester. He was attached to outdoor sports, and was one of the original members of the Lancashire County Cricket Club. Mr. Gorton died at his residence, The Woodlands, Eccles, on the 2nd inst., aged seventy-two years.

MRS. WILLIAM RICHARDSON.

THE death of the wife of Mr. William Richardson, the well-known foreman at the Hassock's Nursery of Messrs. W. Balchin and Son, took place on the 2nd inst., after a short illness, at the age of forty years, leaving a young son. Those who have from time to time enjoyed her kind hospitality will, with her bereaved husband, mourn her loss.

MR. JOHN HINDE NEWBERRY.

It is with deep regret we record the death of Mr. John Hinde Newberry, which took place very suddenly on Thursday, the 4th inst., in his sixty-fourth year. Ten days previously he had been under an operation which had apparently been most successful. Only the night before his death he was most cheerful and looking forward to resume his duties at an early date, but a very sudden relapse took place, from which he never recovered. For over forty-five years he had been in the employ of Messrs. Hugh Low and Co., formerly at the Clapton Nursery, and recently at Bush Hill Park Nurseries, Enfield. Few of the horticultural trade are unacquainted with his well-known handwriting, and most visitors to the nurseries during the past forty years have come into personal contact with him. He came to Clapton in 1859 from Upwey, Dorchester, where his father carried on a nursery, and John Hinde was not only a most excellent correspondent book-keeper, but a thoroughly practical man, few being able to handle spade or knife better. He was

interred at Edmonton Cemetery on Saturday, the 6th inst., a good many of the old Clapton and Bush Hill friends attending the funeral. He leaves four sons and three daughters and a large circle of friends to mourn his loss, his wife having died two years and a-half since.

ANSWERS TO CORRESPONDENTS.

RULES FOR CORRESPONDENTS.

Questions and Answers.—The Editor intends to make THE GARDEN helpful to all readers who desire assistance, no matter what the branch of gardening may be, and with that object will make a special feature of the "Answers to Correspondents" column. All communications should be clearly and concisely written on one side of the paper only, and addressed to the EDITOR OF THE GARDEN, 5, Southampton Street, Strand, London. Letters on business should be sent to the PUBLISHER. The name and address of the sender are required in addition to any designation he may desire to be used in the paper. When more than one query is sent, each should be on a separate piece of paper.

Names of plants.—W. J. G.—Yes, *Trachelium cornutum*.—J. J.—1, *Carduus heterophyllus*; 2, *Campanula rapunculoides*; 3, *C. michauxioides*; 4, *C. Trachelium*. **Vanda corulea** (H. W. SIMS).—The specific name of this orchid would imply that the flowers are sky blue, and of some varieties this is a true description, but there are many plants of the species in cultivation not deserving the name, the blossoms being nearly white. Unfortunately, the deeper coloured forms are not usually so vigorous as the lighter ones. Although this orchid is now common in collections, those who have secured good deep-coloured forms should be careful of them. Cool treatment has been advised for this species, but we have always had better results by keeping the plants in the cool end of the Cattleya house in a light, airy position. Like the majority of the genus, this *Vanda* must have abundant rooting space, but the compost must be sweet and open, fresh sphagnum, a little peat fibre, and plenty of charcoal being the most suitable material. It requires copious supplies of water at the roots while growing, but during the winter very little will suffice.

The Celery maggot (W. H. D.).—This is the season at which the Celery maggot is often most troublesome. Light sprinklings broadcast of soot and wood ashes over the foliage may prevent the fly from striking it, but when once this has occurred and the maggot is present, nothing short of actual hand-picking will free the plants, as the pest is located between the tissues of the leaf, where no insecticides save those which would permanently cripple the growth will reach it. The plants should be regularly watched, and if any traces of the insect are seen, hand-picking should be immediately and carefully performed. Sometimes a second attack is not made, but should this be the case, the picking must be again resumed.

Lancashire Gooseberries (A. J. K.).—There used to be a prejudice against what are termed Lancashire Gooseberries, but a better acquaintance with them and a fuller knowledge of their good qualities when well ripened in the sunshine have caused a demand for them to spring up that is likely to grow. Many of the big Gooseberries when well ripened are superior in flavour to the little berries thought so much of in the past, but we need not dwell on this, as these Gooseberries will find their way into every garden. The Gooseberry is an English fruit, and it is one specially suited to the climate. The foreigner cannot compete with us in the production of Gooseberries, and we should think in a very full season Gooseberries might be exported (probably they are) to some of the countries where the climate is not so suitable. At any rate, there is sure to be a demand for bushes of the best of the Lancashire sorts. The grower for market relies chiefly upon two sorts—Whitesmith and Crown Bob. There is often a difficulty in getting supplied with these sorts after Christmas, as the demand has been so great. Of late years other sorts have come into competition. Wintham's Industry is thought a good deal of, and Jerry's Early Kent has acquired a local reputation that is likely to grow. And we have no doubt as the large Gooseberries become generally grown that there are others which may be grown for profit. The Green and Red London are thought a good deal of, and Speedwell, Ironmonger, and Broom Girl are good flavoured sorts. In making new plantations of Gooseberries, the site must be well prepared. The land must be trenched 2 feet deep at least and be fairly manured, and the sooner this work is done now the better, so that the land may have time to settle and get mellowed by exposure before planting. In a general way Gooseberries are planted too close to each other. If the land is trenched 6 feet square, as where hushels of fruit are wanted the close pruning system had better not be adopted. Keep the growth fairly thin, but leave a good length of the young wood to bear fruit.

Pæonies not flowering (W. D.).—We thank you for your prompt compliance with our suggestion. The plant is obviously quite healthy but weak, and this may be due to one of several causes, primarily, however, to planting at a wrong season, and much weakened material. We imagine there has been neglect to the older plant from whence your present stock was obtained, and if so recovery would be slower than usual. We incline to this view by reason of the number of stems now existing, and half the number would have been more satisfactory and calculated to give an earlier flowering. As, however, it is not unusual for freshly planted Pæonies to take from three to five years to recover and

attain to a good flowering, and as the planting appears well done, we think you had better wait patiently. We hope to deal with the subject more fully shortly.

Grapes unsatisfactory (YANTIE PLACE).—The Grapes sent are badly rusted. This was caused by the sulphur on the tender skin of the berries in their early growth. Sulphur in any form is not safe until the berries are nearly full grown; even then it should be carefully applied. Next season you must thoroughly cleanse both vine and house to get rid of the mildew. Wash and paint pipes, walls, and every part thoroughly, and it would be advisable to start the canes a little later and ventilate most carefully.

A sparrow-trap.—Can you tell me the best sort of sparrow-trap or other means of getting rid of these pests? They have almost entirely driven away the swallows and house-martins that formerly built under the eaves of my house. If you can recommend a good sparrow-trap, would you also tell me the maker to whom I should apply?—F. J. Unfortunately, there is no really efficient sparrow-trap. Of course there is the common and cruel gin, but one by one catching of these wholesale marauders is of no practical use. Then there is the trap made on the principle of the lobster pot—easy to get into but hard to get out of. As a rule this will catch a few sparrows when it first is set, but soon the clever birds learn that it is dangerous, and decline to have anything to do with it. But a good deal can be made out of the sparrows' predilection for Ivy-covered walls. They roost in numbers in such places, as well as make their nests in them. For catching them at roost the plan is to have a wide net supported by two long poles. Go quietly up to the Ivy where the birds have been observed to roost—of course, after they have settled in at night—then, clapping the net over the Ivy, you have the birds in the net as they try to fly out. In this way you may catch many. Or, again, you may take advantage of the sparrows' propensity to crowd together over a handful of corn. If you throw down a handful of Oats in the yard and station a man with a gun loaded with small shot in an outhouse, he will often get a chance to "pot" a good many at a shot as they cluster round the Oats. But this trick can only be played at the same spot about once in three days, for the birds get very suspicious. The most severe harrying of all may be done in the nesting season. It may be done most effectually, if your heart is hard enough to let you do it, by giving instructions that all sparrows' nests (and the Ivy-covered walls and trees, again, are the great places for them) are to be left until the young birds are nearly ready to fly. If the nests be harried at an early stage it only means that the parents go away and breed somewhere else. It is horrid to have to suggest such slaughter of the innocents; but the innocents, unhappily, grow guilty so soon that one has to take drastic measures. It should always be remembered, after a successful pot shot, or a good bag in the net, that sparrow pie is excellent.)

Plants for a sea marsh.—Could you or any of your readers inform me what, if anything, will grow on a sea marsh? A small river runs through an endless marsh in an estuary near here (South Wales), and the banks look so bare that I first planted Willows and then young Alders, but neither have done any good. The marsh is frequently covered with salt water. Any suggestions will greatly oblige.—G. (The best plant of all for a salt marsh is the Sea Lavender (*Statice Limonium*), which covers large tracts in such places in the east counties. We have seen breadths of it, and the effect of the plants in flower is excellent. It grows with the utmost freedom, and remains in beauty for many weeks. *Aster Tripolium* the Sea Starwort is another good thing, 2 feet in height. When often covered by sea water it loses the pale lilac ray florets, but the yellow disc florets seem to be enlarged, and the whole plant has a handsome aspect. This should be planted in quite free groups. Its colouring is decided, and not in the least degree harsh. *Artemisia maritima* is a neat whitish plant with finely-divided leaves. *Suaeda frutescens* is a handsome, almost shrubby plant, looking like a prosperous Heath, but it is rather rare. All these are natives of the salt marshes, and thrive with frequent submersion in sea water. The handsome Reed (*Phragmites communis*) also does well in salt ditches. These plants are probably (with the exception of the Sea Lavender) not to be had in nurseries. A stock will have to be specially collected in some of the well-known salt marshes. But there may be some local condition, such as the frequent shifting of layers of mud, that would prevent even these plants thriving, as we do not otherwise understand why some of them at least are not already present.)

A fruit selection.—I much desire a selection of all kinds of fruit—Apples, Pears, bush fruits, &c.—for my garden, and I was strongly advised to write you about the matter. It may be early to ask, but I wish to get the trees in good time. Probably such a selection will be helpful to other readers who may be contemplating planting a fruit garden. I want about half a dozen of each kind of fruit. The soil is good.—B., *Middlesex*. [This letter is very vague, but as our correspondent simply asks for a selection of fruits, we give this, in the hope that it may also be useful to others. Of desert Apples, choose Irish Peach, ripe in August; Ribston Pippin, but do not plant it in wet soils; King of the Pippins, a very free-bearing variety; Cox's Orange Pippin, Cockle Pippin, and Blenheim Orange. Get the trees on the Paradise stock. Of cooking Apples, choose the following trees on same stock: Frogmore Prolific, Warner's King, Lane's Prince Albert, Sandringham, Bramley's Seedling, and Wellington. Dessert Pears: Doyenne d'Ete, Williams's Bon Chrétien, Louise Bonne de Jersey, Marie Louise, Doyenne du Comice, Winter Nelis, and Thompson's. All the fruits in this selection ripen in the order named. If you wish for a cooking Pear—we mean for stewing—Catillac is as good as any. Of dessert Plums, Early Favourite, the Greengate, Jefferson, and Coe's Golden Drop are good; and of cooking Plums, Pond's Seedling, Magnum Bonum, and, of course, the free-cropping Victoria. Peaches: Hale's Early, Stirling Castle, Princess of Wales, and Violet Hative. Nectarines: Early Rivers', Elruze, and Lord Napier. Cherries: Early Rivers', May Duke, Governor Wood, and, of course, Morello on a north wall. Strawberries: Royal Sovereign,

La Grosse Sucrée, and Latest of All. Gooseberries: Warrington, Red Champagne, and Wintham's Industry. Raspberries: Superlative, Yellow Antwerp, and, if you care for yellow-coloured fruits, Belle de Fontenay for autumn fruiting. Currants: Of white, choose White Dutch; of black, Lee's Prolific or Carter's Champion; of red, the Red Dutch and La Constante. We have given you a restricted list; of course, it may be considerably extended if so desired, but we strongly advise you not to have too many kinds. Remember also how important it is to find out the kinds that succeed well in the neighbourhood. If, for example, Wellington Apple is generally a success in your district, make a note of it, and any varieties that have proved failures reject. In this way you profit by the experience of others.]

Pond foul (S.).—It is not easy to answer this question without knowing something of the size of the pond and the nature of the fouling. We do not think it likely that chalking the floor of the pond would have much effect. Liming it well would kill for the time being any germs that were in it, but, of course, the inflowing water would slack the lime, and the foulness would soon cover it again. Nor do we know of any plant that would have the effect desired. If the foulness be caused by inflowing sewage it ought to be possible to deal with this in bacteria tanks before it comes to the pond, and probably this would be a better way than establishing the bacteria in the pond itself. If the pond is small and lends itself to the treatment, it might be useful to restrict its width and depth so as to increase the speed of any stream running through it.

Restoring a bowling-green scorched by Sun (B.).—If, as you say, portions or patches of your green have been so scorched that they are quite decayed, it will be useless to hope that in such places grass will grow again. There is no better remedy than that of tilling these patches and replacing them with fresh turf. But we infer that the patches were so scorched because the soil beneath is in fault—perhaps too shallow and hard, perhaps too poor. Possibly that may be the case with much of your green. When such greens are made, too often not enough care is taken to well prepare the soil beneath by thoroughly working it first. There seems to be fear lest the grass should grow too strong. A free use of the mower soon corrects that. When you have done what is advised, and at once, get basic slag and pour it over the green at the rate of 3lb. per rod area, following by an equal quantity of sulphate of ammonia in May.

Old Furze bushes (ENQUIRER).—It is doubtful if Furze bushes so old as those described will grow again from the root if cut right down, but if they are in a place where it is not convenient to replace them by young bushes, it might be worth trying. In a wild state the habit of the Furze is to be a bush of not very long life. When it attains the size described it usually dies. We think it probable that the wild or single Furze may shoot again if cut down, but that the double may not do so. It is always advisable to keep these bushes cut back from time to time in a younger state, when they make more shapely bushes and their lifetime is much prolonged. If they are cut down, it should be in the winter, not later than February. On sandy soils nothing is of more importance, both for plants and shrubs (excepting those only that like as much dry heat as we can give them), than to mulch the surface of the ground.

Strawberries grown in barrels.—I have heard so much about the advantages, and otherwise, of growing Strawberries in barrels, that I should be greatly pleased if you would kindly give me some information about this method of culture. There is no doubt that the system wants thoroughly explaining. Some of my friends declare it is a mere fad, but I have heard good reports of this way of growing Strawberries.—A. [Much nonsense has undoubtedly been written about growing Strawberries in barrels. There is something in it, and to those who have little or no garden space it is certainly important. We believe it is an American idea, and has the merit of novelty. The fruit ripens rather earlier than the crop out of doors, and it is a good way to get a few early fruits, the quantity, of course, depending upon the number of barrels used. The best position for the tubs is a sunny corner, say against a greenhouse, where, sheltered from cold winds, the fruit is developed as rapidly as possible. There are three tiers of holes in each barrel, six holes in a tier, and the plants are put in at the same time as the barrel is filled with loam, this being done about the month of February. The top is also planted, and the necessary watering of the plants is done from overhead. By growing Strawberries in this way the fruit is not soiled, and can be readily protected. Our correspondent plants in February, but we should have thought this season was the best. Those who intend to grow Strawberries thus must have very strong plants to begin with, specially selected, and of vigorous kinds, such as Royal Sovereign, President, and Vicomtesse Héricart de Thury. These make a large growth, and the holes for them should be quite 5 inches or 6 inches across; about half that width is sufficient for those of smaller growth, such as Frogmore Pine. Remember how important it is to thoroughly drain the soil, which otherwise would get quite sour. In some cases three 4-inch boards are fastened together in the centre of the tub, with holes bored in them, but filled with hay. This ensures a sweeter condition of the soil, as water passes away readily. Put drainage in the bottom of the barrels, make the soil firm, and at the time of the fruit swelling weak liquid manure will be helpful. The barrels should be raised a few inches from the ground, and it is very easy to turn them about so that the plants receive an equal share of light.]

GARDENING APPOINTMENTS.

MR. JOHN BUTLER, for some years gardener to the Earl of Ancaster at Normanton Park, has succeeded Mr. Walters as gardener to Miss A. de Rothschild at Waddesdon Manor. MR. J. G. MURRAY, Royal Gardens, Kew, as Horticultural Lecturer, Durham University College.

*. The Yearly Subscription to THE GARDEN is: Inland, 15s.; Foreign, 17s. 6d.

THE GARDEN

No. 1709.—Vol. LXVI.

[AUGUST 20, 1904.]

THE APPLE HARVEST.

LAST year about this time the majority of growers, both private and commercial, were bemoaning the fact that they had no Apples, and the fortunate few who had a crop were congratulating themselves at the prospect of the prices it would fetch. Matters turned out just as they promised, and while it lasted home-grown produce commanded a good price, but it did not last long, and before the winter was over it was almost impossible to buy British fruit. In spite of the general failure, however, the country was not short of Apples, for foreign growers were quick to realise their opportunities and sent fruit into the markets in quantities which were perhaps never before heard of, and with the result that, except in the cases of those people who only relish home-grown fruit, the Apple famine in this country was not seriously felt.

The Apple harvest has begun again, and the outlook is far different from what it was a year ago. Generally speaking crops are good, and in private gardens there will be no need to transform the fruit room shelves into receptacles for odds and ends, as all the available space will be required for the Apples. One has no fault to find with the private garden culture of Apples in this country, and if every phase of fruit production were as good we should be far more self-supporting in this useful commodity than we are. In private establishments one meets with the same run of recognised varieties. Generally speaking, pruning and other cultural operations are well understood by private gardeners, and care is taken in storage, so that the supply lasts over as long a period as it possibly can. The fact is gardeners take a personal interest in fruit culture as being an important part of their business, and by putting technical knowledge into practice the best results are obtained.

On the commercial side of Apple culture a very different state of affairs exists. There are some, of course, who make it a speciality, and by producing the best examples obtain the best prices, but when one considers the number of Apples that are really grown in this country it is surprising the small source of profit to the cultivators, and how little they do towards supplying the million with this useful food commodity. It is during the autumn and early part of the winter that one sees how a big Apple crop is disposed of. Growers seem possessed of one great anxiety—to get rid of

their fruit at any cost, and irrespective of prices they rush it into the market in far greater quantities than customers can take, just as though Apple growers had no other object in life but to get rid of their produce with all possible despatch. The result is obvious. For a time there is a glut of fruit, but no matter how heavy the crop is home-grown Apples are invariably scarce towards the end of the winter, and then the foreigner with his nicely graded and well packed examples steps in and smiles at the puny attempts of the Britisher.

How many people who have fruit to sell think of selecting their best examples of late-keeping sorts and storing them till the rush is over, and customers are anxious to buy? Some do, of course, but they are few in number. Then there is the question of varieties. Big Apple crops are of no great benefit to either growers or consumers, because half the produce is not of marketable quality.

Anyone travelling through the splendid orchard districts in the West of England at this season may see the branches of trees on every side wreathed with Apples, and the casual observer might be disposed to think what a good thing the heavy crop must be both for the farmers and the people who live in crowded town areas and have to buy the fruit they consume. The heavy crops might be doubly beneficial if conditions were different, but as it is the question is doubtful, to say the least of it. Look at the condition of the trees to begin with. Here and there one sees good and properly tended orchards, but for the most part the trees are old, crowded, gnarled, and Moss-covered; in short, worn-out relics of a past generation, and the part they play in the fruit supply of the country can never be an important one. The varieties, too, are of a mysteriously mixed character, and in the cases of the oldest trees they are mostly of local origin, and the destiny of the fruit obtained from them is the cider mill. It would appear from reports that there is a possibility of the revival of the cider-making industry, on account of the wholesome character of the beverage when properly made, but cider-making must be conducted on a system if it is to be a thriving industry, and the varieties of Apples most suitable for the purpose should be grown.

Only a limited number of varieties are required commercially, and if by one great sweep the whole of the common local and inferior sorts could be done away with and

replaced by good recognised varieties, both producers and consumers would be better off. One can hope for nothing sudden or radical, however, in the way of changes, and it is only as the old trees die one by one that the inferior varieties will pass away. The present generation of planters is fortunately aware of the importance of growing only high-class varieties, and considering the number of trees which have been planted during the past few years, one can look forward with some confidence towards a better era of Apple culture in the future.

One may blame the farmer in Apple-growing districts which are far removed from market centres for the laxity of his methods, but he is not without his excuses. He asks what is the good of spending time and capital over fruit culture when railway rates and other charges prevent the selling at a profit. There may be grounds for the excuses and the state of affairs is lamentable, for does it not point to a deplorable want of co-operation on the part of producers. It is not by individual effort working alone that foreigners have captured the markets of Great Britain, but by a combination of forces, strong and weighty enough, purely through co-operation, to remove the obstacles which stand in the way. The temperament of Englishmen and the habits and customs of rural life seem to be in the direction of individualism rather than combination, but even though we pay the foreigner a high compliment by adopting his methods, we can readily afford to do it in the interests of the home industries, which are so important to the country. With final reference to the Apple harvest, when we consider the wants of the millions and compare them with the home productions the fact that the danger of glut exists in seasons of plenty shows that there is something wrong.

THE EDITOR'S TABLE.

WE invite our readers to send us anything of special beauty and interest for our table, as by this means many rare and interesting plants become more widely known. We hope, too, that a short cultural note will accompany the flower, so as to make a notice of it more instructive to those who may wish to grow it. We welcome anything from the garden, whether fruit, tree, shrub, Orchid, or hardy flower, and they should be addressed to The Editor, 3, Southampton Street, Strand, London.

GLADIOLI FROM LANGPORT.

Messrs. Kelway and Sons send from Langport Nurseries a superb collection of Gladioli, showing the fine hybrids that have been raised by them of recent years. This work we are glad to see is being followed with even keener zest to-day, and the novelties shown at the meeting of the Royal Horticultural Society on Tuesday, the 9th inst., were evidence of this. In the gathering for our table were the following, and in each instance the spike was tall, strong, and the flowers widely expanded to show the beauty of their colouring: Mrs. J. Laing, a pure and beautiful cerise; Sir Chas. Warren, damask red, a lovely shade; Mr. Chamberlain, cerise, splashed with white; Alice Wood, pale lemon; Ian Kelway, crimson, with white centre; Miss Wade, white, heliotrope tips; Countess Crewe, white, centre mauve; and Rock Sand, deep scarlet.

WATSONIA ARDERNEI, SALVIA HORMINUM, AND ROSA RUGOSA HEPS.

Mr. Crook sends from Forde Abbey Gardens, Chard, flowers of this *Watsonia* gathered from plants in the open garden. They were grown in pots under glass during the winter, but planted out when all fear of frost was over. Our correspondent also sends the Clary (*Salvia Horminum*) from seed sown in spring, and it gives a fine mass of colour in the garden in summer and autumn. The fruits of *Rosa rugosa* were very fine, and cut from a bush 3 yards to 4 yards across growing on the turf, and associated with the white variety.

MUTISIA DECURRENS.

Mr. Fitzherbert sends from Kingswear, South Devon, flowers of this beautiful climber with the following note: "This climber has produced a dozen of its handsome flowers this summer with me, the rich orange blossoms, $4\frac{1}{2}$ inches across, with their gracefully reflexing ray florets appearing almost scarlet in colour in the sunshine. In the spring of 1901 I procured a small plant which grew well through the summer, but suddenly collapsed after two days' heavy rainfall in September. I wrote to the Rev. Henry Ewbank, in whose garden I had previously seen the plant, asking him if he could suggest a reason for its sudden death. He replied that he suspected the cause to be excess of water at the roots, as he had lost a plant owing to the gardener over-watering it. Through the whole of 1902 I endeavoured unsuccessfully to obtain another plant. The firm I procured my first one from was unable to supply it, and I met with no better success elsewhere. One day I saw at a friend's a small plant in a pot which I was told had been bought of a local nurseryman, whom I at once visited in order to get a similar plant. I found, however, that not one remained, but was told that a plant should be procured for me. After waiting three weeks or so I received a letter informing me that neither at home nor on the Continent was a plant of *Mutisia decurrens* to be obtained. Early in 1903, however, I had two plants from different sources almost simultaneously. I determined to plant them against the gable end of a small stone shed over which large mesh wire-netting was strained at a distance of 3 inches from the wall. On this *Polygonum baldschuanicum* was trained backwards and forwards, so that the gable was entirely covered with foliage in the summer. The soil on either side of the *Polygonum* was taken out to a depth of 2 feet and 1 foot of broken bricks and stones put in, so that thorough drainage should be assured, and 1 foot of loam, peat, and coarse sand placed over the drainage. The plants were very slow in making a start, but, when they once began to move, continued to grow right through the autumn and winter, reaching the top of the gable, about 7 feet from the ground, in May. One day in the autumn I noticed that the top 6 inches of one plant was withering, and fully expected the whole to collapse as my first one had done. However, after I had cut off the flagging portion the mischief was stayed, and the plant threw out a strong side shoot from near the top. The two *Mutisias* ascended behind the wire-netting, so that their stems have been entirely

shaded the whole summer and are brown and leafless, the only foliage being where they have surmounted the gable and are clinging to two dry, twiggy branches that have been firmly fastened to the netting below. The gable faces south-west, and is flanked by a high wall on the south-east 6 feet distant, while on the north-east is another high wall 8 feet distant, and on the north-west stands a house 15 feet away, so that the position is a very sheltered one. The plants enjoy the sun from 11 a.m. until 3.30 p.m. A writer in *THE GARDEN* a few years ago spoke of the *Mutisia* sending up suckers freely, but there is no sign of a sucker from either of my plants, and the raiser of one of them told me a few days ago that no sucker had appeared since he detached mine from the parent plant over two years ago, so that the appearance of suckers cannot evidently be counted upon. Being a native of the Chilian Andes, the *Mutisia* might well be considered tender, but at least three instances are recorded in old volumes of *THE GARDEN* of its succeeding unprotected in the open as far north as Scotland."

NOTES OF THE WEEK.

FORTHCOMING EVENTS.

- August 22.—Warkworth Horticultural Society.
 August 23.—Royal Horticultural Society's Meeting in New Hall, Westminster; Royal Oxford Horticultural Society's Show; Brighton Horticultural Society's Show (two days).
 August 24.—Harpenden Horticultural Society's Show; Colwyn Bay and District Horticultural Society; South Manchester Horticultural Society.
 August 31.—Reading Horticultural Society's Show; Bath Floral Fête.
 September 2.—National Dahlia Society at Crystal Palace (two days).
 September 6.—Royal Horticultural Society's Committee.
 September 7.—Hull Horticultural Association (two days).
 September 14.—Royal Caledonian Horticultural Society's Show, Edinburgh (two days).
 September 20.—Royal Horticultural Society's Committee; National Rose Society's Autumn Show.
 October 5.—National Chrysanthemum Society's Show at Crystal Palace (two days).
 October 12.—Royal Botanic Society.

The Royal Horticultural Society.

Forty-nine new Fellows were elected at the general meeting of the society on Tuesday, the 9th inst., including the Hon. Mrs. Evelyn Cecil, Mrs. de Chapeaurouge, Baron Donner, Mr. B. S. Faudel-Phillips, Captain R. A. F. Kingscote, the Hon. Mrs. Herbert Lawrence, the Lady Malcolm of Portlough, Lord Oxmantown, and Mrs. Wordsworth (Salisbury). The next ordinary exhibition and meeting of this society will be held on Tuesday next, when Professor Boulger will deliver a lecture on "The Preservation of Wild Plants."

Cherries.—In the interesting article on Richard Harrys (page 110) a quotation is given in which it is said that the sweet Cherry was introduced into England by Harrys. Disraeli, in "Curiosities of Literature," in a chapter on the introduction of exotic flowers, says that Pliny mentions the introduction of the Cherry tree into England. I cannot find the passage in Pliny, and should be obliged to anyone that will give me the right reference.—ELLACOMBE.

Fruit trees in pots at Bishop's Stortford.—Messrs. Rivers always show such good pot fruit trees that great things are always expected, and the group of pot trees sent to Bishop's Stortford show was unusually fine. Special mention must be made of a magnificent Cherry, the centre plant of the group, a very fine tree, and laden with fruits. The variety was Bohemian Black Bigarreau, which I have never seen so fine as on this occasion. The trained pot Vines were a special feature; they carried very fine bunches with well-coloured berries. The variety

was Gradiska, a Grape that does well without heat, and belongs to the Sweetwater section. Plums also were very fine, and these comprised Oullin's Golden Gage, Blue Rock (a large rich flavoured sort), and The Swan (a large red fruit valuable for cooking). Smaller trees of the Emperor Francis Cherry were laden with fruit; this is a most useful pot Cherry, it rarely fails, and the trees fruit very freely in a small state. Peaches were very fine, and there was no lack of other fruits, such as Apples, the well-known Peasgood's Nonsuch being the finest. The plants were perfect specimens and the fruits large for the time of year. There were several new varieties that will doubtless be heard of in the future.—G. WYTHES.

Scottish Pansy and Viola Association.—The usual monthly meeting of the above society was held on Wednesday, the 10th inst. The following were the awards:—Fancy Pansies—first-class certificates: Mrs. W. Sinclair (Dobbie and Co.) and Emmie Bateman (Dobbie and Co.); certificates of merit: Peggie Smith (Dobbie and Co.), Dr. McDermott (Kay), Jessie L. Arbuckle (Kay), A. K. Brown (Kay), and Miss Turnbull (McLauchlan). Show Pansies—first-class certificate: Mrs. Fife (Dobbie and Co.), white self; certificates of merit: Katie (Dobbie and Co.), yellow self; A. W. Paterson (Dobbie and Co.), white self; Jane Stirling (Dobbie and Co.), primrose self; and Jessie Findlayson (Kay), white ground. Violas—certificates of merit: Lady Grant (Fraser), Mrs. James Lindsay (Campbell) and Effie (Dobbie and Co.). Certificate of merit: Chrysanthemum Thomas Cullen (Johnstone), a sport from Mytchett White. First-class certificate for Lobelia: Blue Jacket (R. and A. Aitchison).

Irish Gardeners' Association.—A large party, representing the Irish Gardeners' Association and Benevolent Society, recently inspected the gardens at Kilruddery, Bray, by kind permission of Lord Meath. The grounds are notable for some excellent specimen conifers, Evergreen Oaks, and Yew, Lime, and Beech hedges. These range from 12 feet to 20 feet in height, and with grass vistas present a charming sight on a summer's evening. In the way of fruit culture, perhaps the most notable feature was the collection of Lemon trees, heavily laden with that valuable fruit.

A flower show in Clerkenwell.—The Quakers' Old Meeting House, close to St. John's Gate, Clerkenwell, was made gay with plants on Saturday, the 13th inst., it being the occasion of the annual flower show. Some 400 plants were given in the spring to families residing within the area, and a large number of these were exhibited for prizes on the above date. The district covered by the show is a very populous one, and many of the plants were grown under great disadvantages. Several prizes were offered for Fuchsias, Geraniums, Musk, Lobelias, *Nicotiana affinis*, *Petunias*, &c. A contribution of plants to help the display was sent from Gunnersbury Park. From other sources came cut flowers. Mr. Percy Waterer contributed a large basket of herbaceous Phloxes and other flowers; the quality of the Phloxes was excellent, and the basket was much admired and appreciated. The Mayor of the borough attended the show in the evening and distributed the prizes, among them some special prizes given by his Worship. In the course of the afternoon some window boxes and back gardens were judged in the most congested parts and prizes awarded.

Pansy Duchess of Sutherland.—Among bedding Violas this is a perfect gem, a soft bluish mauve in colour, and a very pleasing and attractive shade. Many Pansies become somewhat weedy in autumn, the flowers gradually dwindling in size, but this variety maintains its size and beauty to the last. Newly-planted Rose-beds in conspicuous places, carpeted with Pansies the first season, greatly improve the appearance of the beds, provided the colours harmonise with the Roses. If the plants are weak it will help them to keep the Rose buds picked off. A number of beds treated in this way at Kew have been very effective, especially the Pansy under notice.—A. OSBORN, Royal Gardens, Kew.

The Cactus house at Kew.—It will interest those who take more than a passing glance of the many beautiful things in the Royal Gardens, Kew, to know that the Cactus house is being entirely rebuilt.

Indigofera decora alba.—This pretty little shrub is now in flower in the open garden, its racemes of white, pea-like blossoms drooping among the bright green pinnate leaves having a charming effect. The type is a native of China, and, therefore, might fairly be expected to be hardy, but curiously enough it is more tender than *I. gerardiana* or *floribunda*, whose habitat is said to be India. This is often to be seen as a spreading shrub in the open, far distant from any wall, in gardens in the south-west. The subject of this note is far more rarely met with, and I know of but few specimens in the open. One of these is grown under the name of *I. floribunda alba*, which is certainly a mistake, as its leaves are quite distinct both in colour and size from those of *I. gerardiana* or *floribunda*.—S. W. FITZHERBERT.

Crassula coccinea in the open.—This brightly flowered South African plant, a favourite subject for conservatory decoration, succeeds admirably in the open in the gardens of Tresco Abbey, Isles of Scilly. In the neighbourhood of Penzance I have also seen it planted permanently in the open and doing well. Last year I thought I would try it in South Devon, and the large plant I procured in the spring came through the winter unharmed, and is now in full flower, bearing sixteen bloom-trusses, which range in size from 2 inches to nearly 5 inches in diameter. Three plants, of which the *Crassula* is one, make a pretty picture at the present time. Over a ledge rather more than 3 feet in height falls a veil of *Convolvulus mauritanicus* about 4 feet in width, which touches the path below, and is completely covered with wide-spread, lavender-blue flowers in the sunshine. Immediately above is the brilliant scarlet of the *Crassula*, and a trifle higher is a patch of *Campanula carpatia pelviformis*, about 18 inches in diameter, which is carrying several dozen French grey, saucer-shaped blossoms about 2 inches across on upright stems a foot or so in height. All these plants are now at their very best, and being in close company show each other off to the best advantage.—S. W. FITZHERBERT, *South Devon*.

A hybrid Hedychium.—There was recently flowering in the Temperate house at Kew a very fine hybrid *Hedychium*, the result of intercrossing the Himalayan *H. angustifolium* with the fairly well known *H. gardnerianum*. Planted out in a bed, the plant had attained a height of 5 feet, and carrying as it did two large spikes of bright orange-scarlet blossoms it presented a most striking and at the same time uncommon feature. This hybrid is scarcely likely to be as hardy as *H. gardnerianum*, which last can be placed out of doors during the summer months, and it will survive the winter well if simply protected from actual frost. Another hybrid of the same genus is *H. wilkesianum*, whose parents are *H. gardnerianum* and *H. coronarium*. The beautiful flowers borne by many members of the Scitamineae, to which the *Hedychiums* belong, make it surprising that they are not more generally represented in gardens, as except the Cannas they are very seldom seen, yet the members of the following genera are very beautiful regarded only from a flowering point of view: *Alpinia*, *Costus*, *Curcuma*, *Kempferia*, *Roscoea*, and *Strelitzia*, with others. Speaking generally they are of easy culture, the principal consideration being pretty liberal treatment, especially as to the supply of water during the growing season. Those that pass the winter in a dormant estate should at that time be kept moderately dry.—H. P.

Geranium Paul Crampbell.—As a bedding plant this variety has undoubtedly come to stay, for the more it is seen the more will it be grown. It is a robust grower, the huge trusses being crimson-scarlet in colour, a shade lighter than Henry Jacoby. In some of the public parks, notably Hampton Court, Kensington Gardens, and Kew, the brilliant colour is very conspicuous. Unfortunately, like many other plants, it has two names, and it was exhibited as Meteor at the Drill Hall last year. For the greenhouse it is also

very useful and free flowering. During the recent heavy rains, while the trusses of other varieties have been shattered, Paul Crampbell is little the worse.—A. O.

Clerodendron fallax.—As a group the *Clerodendrons* exhibit considerable diversity of form, many of them being vigorous climbers, while on the other hand some are quite bushy. The majority of them are remarkable for the beauty of their flowers, that at the head of this note being one of the showiest of all. It is seen to great advantage when the young plants are grown on freely and confined to a single stem, as in this way it reaches a height of 3 feet to 4 feet, the lowermost half of which is furnished with large heart-shaped leaves, and the upper portion consists solely of a large, erect, broadly pyramidal-shaped panicle of blossoms, which are vivid scarlet in colour. It is very easily propagated both by cuttings and seeds, and succeeds best in the temperature of an intermediate house, as if kept too warm the foliage is very liable to be attacked by red spider. The flowering season is not limited to any particular period of the year, but the finest display is in July and August, at which time good well-flowered examples are very valuable for the embellishment of the greenhouse or conservatory. It is a native of Java, and has been long grown in this country. Another and a most desirable member of this section of *Clerodendrons* is *C. myrmecophilum*, a comparatively recent introduction from Singapore. As might be expected, it needs the temperature of a stove for its successful culture. The flowers are orange-amber in colour.—H. P.

Tufted Pansies in baskets.—Last year, for the second time, we grew tufted Pansies in baskets, with the object of illustrating their value for massing in the outdoor garden. Last year's efforts were distinctly successful, and led us to hope that this method of exhibiting was one worth repeating. For this reason the experiment was continued during the present season, and the display made by plants grown in this way has been in every way satisfactory. Tufted Pansies, with that dwarf and compact growth that should always characterise the plants, are well represented in this way. The practice of setting up tufted Pansies in wired sprays, as frequently seen at the leading shows, is certainly most attractive, but at the same time is misleading. The habit of plants bearing many of these fine flowers is often coarse and ungainly, and they are also less free flowering and consistent than the really true tufted sorts. Quite recently I was carefully going through a large collection of these plants, and paid special attention to sorts that have during the last few years received awards from some of the special societies across the Border. The results were most disappointing. The individual flowers certainly were very large and handsome, but the habit of the plants was quite unsuited for border displays. Everything seems to be sacrificed to the quality of the flowers.—D. B. C.

The Violetta or miniature flowered Pansies.—Beyond what the late Dr. Charles Stuart did in raising this new type of the tufted Pansies, when he gave us the original in *Violetta*, and a few others subsequently, very little else has been done. Some eight or nine years ago I was fortunate enough to raise half a dozen interesting varieties, but for want of attention I regret to say they were lost. During the last year or two I have endeavoured to obtain stock of the few varieties of other raisers, from one source and another, and now have a few of the prettier sorts in fair quantity. These plants have been flowering profusely for the past six weeks, and advantage has been taken of the warmer weather of late to make several crosses. *Violetta* has been largely used as the seed-bearing parent, and already several excellent pods of seed have been harvested. There is also a very pretty deep blue sort, the name of which I am unable to trace, that has provided excellent material with which to work upon. Queen of the Year, another of Dr. Stuart's gems, is a variety that I had great hopes of. None of the crosses have, so far, taken, but fortunately a pod or two of seed has been found which insects

have successfully fertilised. Should it not be possible to obtain more seed this season, I have reason to believe that that already harvested will provide many pleasing variations from the varieties already catalogued. These miniature flowered tufted Pansies or *Violettas*, as they are often called, are invaluable in the alpine or rock garden. They develop into charming little tufts, and as the summer approaches these are studded with dainty sweet-scented flowers.—D. B. CRANE.

Nature Study Course.—A course for helping those who are desirous of furthering their knowledge of Nature Study was held at the Horticultural College, Swanley, from the 1st to the 13th inst. Rambles in the country under the guidance of naturalists were the chief feature. An excellent introductory address was given by the Hon. Sir John Cockburn, K.C.M.G. Mr. J. C. Medd and the out of door superintendent, Miss Turnor, gave demonstrations and instruction in simple gardening. Mr. Finn superintended the investigation of bird and insect life in the woods and fields, whilst on alternate days Mr. Tabor (resident science lecturer) lead excursions for studying wild flowers, trees, grasses, &c., in their different environments. An introductory lecture on the life-history of the bee was given by Mr. Herrod, F.E.S., followed by practical demonstrations and investigation of their homes by Miss Dunham Massey (first-class bee expert, B.B.K.A.). Many pleasant and instructive days were thus passed. The college is 17½ miles from London. Application for forms of entrance and further details to be made to Miss Sieveking, honorary secretary, 17, Manchester Square, London, W.

Scottish Horticultural Association.—A large number of the members of the association visited the Craigmillar Nurseries of Messrs. Dicksons and Co. on the 30th ult. They were received most cordially by Mr. W. H. Massie, one of the partners of the firm, and spent a most enjoyable and instructive time in inspecting the many leading features of this large establishment. Mrs. and the Misses Massie entertained the company to tea, and before leaving, on the call of Mr. J. W. M'Hattie, president of the association, hearty votes of thanks were given to Mr. and Mrs. Massie, the Misses Massie, and the firm of Messrs. Dicksons and Co. for their kindness. On the evening of Tuesday, the 2nd inst., the usual monthly meeting was held in Dowell's Rooms, Mr. R. W. E. Murray, Blackford House, one of the vice-presidents, occupying the chair. The table was not so well furnished with exhibits as usual, but some were of great interest. Among these we may note Messrs. Dobbie and Co.'s, of Rothesay, new fancy Pansies and Violas, several of which promise to be great acquisitions to the garden, decorative Roses, border flowers, and a number of beautiful annuals; Messrs. James Grieve and Sons, Redbraes, had a number of good Carnations, Violas, and other flowers; and Mr. John Downie and a few others also sent some good exhibits. Messrs. Dobbie and Co. received a first-class certificate for *Chrysanthemum maximum* Princess Henry. In the unavoidable absence of Mr. Peter Barr, V.M.H., Mr. William Smith, gardener to the Earl of Stair, Oxenford Castle, kindly gave an excellent paper on the culture of stone fruit on walls. It was full of valuable information, and was well received by the members, who gave Mr. Smith a hearty vote of thanks.

Hybrids of Fuchsia triphylla.—The note on the delightful little *Fuchsia triphylla* (page 86) concludes with the remark that it will no doubt prove a valuable subject for hybridising. It has already been employed for this purpose, and some seven or eight years ago a very pretty form made its way into English gardens from the Continent, sometimes under the name of *F. triphylla superba*, and at others as *F. triphylla hybrida*. Though it had come under my notice previously, I was greatly struck with a charming group of it three years ago in the Temperate house at Kew, and thought after such an attractive display that it would become more common, but it is still rarely met with. I fancy this neglect is chiefly owing to the plant requiring different treatment from most *Fuchsias*, so that when just

associated with the others the result is not always satisfactory. The variety in question is a hybrid between *F. boliviana* and *F. triphylla*, and as this last is a native of the West Indian Islands it needs at least an intermediate structure for its successful culture. The requirements of the hybrid are about the same, that is, the plants should from the beginning of the season be grown in an intermediate temperature till about midsummer, when they can be removed into the greenhouse. If stopped freely when young this variety forms a neat, bushy specimen, with the deep green leaves marked with bright red veins. The flowers, which are borne in effective clusters, are over 2 inches in length, and scarlet-crimson in colour. There is a second variety of the same origin not much removed from the preceding, but the growth is rather denser and the flowers somewhat brighter. The name is Mary.—H. P.

Begonia Washington.—This tuberous-rooted variety of *Begonia*, which was prominent in Messrs. Veitch's exhibit at Holland House, is a delightful little pot plant, and it should also prove of considerable value for bedding. It is dwarf and compact, and the bright green leaves are a setting to the brilliantly-tinted blossoms. These last are by no means large but perfectly double, and in colour bright vermilion-red. This variety was distributed by M. Lemoine of Nancy some two years ago, so that as yet it is by no means common in gardens. Another of the same section from the same source is Lafayette, with bright crimson-scarlet blossoms. It was sent out some years previous to Washington, and is very much used for bedding. The flowers are double. A form with single blossoms, Count Zeppelin, is a good deal of the same hue and very free blooming. These sturdy growing compact varieties are much superior as bedding plants to the very large flowered forms, as these last droop so much, especially when wet, that a good deal of their beauty is lost.—H. P.

Begonia Count Zeppelin.—This is one of the best double tuberous *Begonias* for bedding. It is only about 9 inches in height, the small scarlet flowers being produced in great profusion. A bed of it alone, as at Kew, near No. 4, is very effective, but it is even prettier with some other plant to show off the brilliant flowers. A very happy and pleasing combination is obtained by mixing it with *Leucophyta Brownii*, and dot plants of *Fuchsia macrostema variegata*, about 18 inches in height. Should it be necessary to work up a large stock, several inches of the tops of the shoots should be cut off when the plants are lifted from the beds in autumn. Dibble them thickly in cocoanut fibre in a warm house. Small bulbils will be formed at the base before the tops die off, and these, if started early in spring, make nice plants for bedding out the following summer. It is also very useful as a pot plant for the greenhouse.—A. OSBORN.

Microglossa albenscens.—Among the huge number of Composites hardy in this country comparatively few are of a shrubby character, and of the limited number the best known are the *Olearias* or Daisy Trees of New Zealand, *Cassinea fulvida* more frequently met with as *Diplopappus chrysophyllus*, also a native of the same region, and the Southernwood (*Artemisia Abrotanum*), which is familiar in cottage gardens. This *Microglossa*, a member of the same order, is very seldom met with, yet it is a decidedly pretty shrub when in flower, and its value in this respect is increased by the fact that its flowers are borne during the latter part of July and well on into August, at which time flowering shrubs are by no means numerous. It is closely related to the *Asters*, and indeed has been known by the name of *Aster albenscens*, but was figured in the *Botanical Magazine* as *Microglossa*, under which name it is grown at Kew. Decidedly less woody than many shrubs, it dies back a good deal during the winter, but the shoots that are pushed out towards the base reach a height of 3 feet to 4 feet and flower well the first season. It is of erect growth, and the branches are clothed with lanceolate-shaped leaves, and terminated by dense flower heads, some 6 inches across, while after these are past supplementary ones develop just below. The individual blossoms are about one-third of an inch in diameter and of a

pleasing lavender shade, but in this respect there is a certain amount of variation. It is a native of the Himalayas, and was introduced therefrom over twenty years ago. In the light warm soil at Kew it does well.—T.

Anomatheca cruenta.—This is a lovely small bulbous plant; its growth much resembles that of an *Ixia*. The flowers are bright scarlet and crimson. As it is a native of Cape Colony it will at once be understood that it does not need a warm house. The last week in July I saw this in splendid condition in the open garden at Bovey House, near Seaton, Devon. It was growing in a large bed on a south border with a wall at the back, and was a mass of flowers, which will continue evidently for many weeks. I was told that the seed was sown where the plants are blooming. In a garden near Honiton it is used as an edging to a border, and is perfectly hardy there. Evidently it is nearly hardy, seeing that the bulbs under notice have never been lifted, and nothing could look more vigorous. This is a charming plant to grow for cut flowers, and one that should be more known.—J. CROOK.

The Capar (Capparis spinosa).—This South European plant is of especial interest from the fact that the *Capars* of commerce are furnished by the unopened flower-buds, but it is in addition well worthy of consideration for its flowers. It forms a sturdy bush that reaches the height of 3 feet or so, and is clothed with roundish ovate deciduous leaves. The flowers, borne as a rule in July and August, are in general appearance somewhat suggestive of a *Hypericum*, except that they are white, with the long prominent filaments of a purplish hue. To flower well it needs full exposure to the sun, and the protection of a greenhouse in winter. Trained to a low wall in front of the Economic house at Kew, and sheltered by a frame during the winter, it yields each recurring summer a charming display of blossoms, and though the individual flowers do not last long they are so numerous as to keep up a display for some time. The date of its introduction is given as 1596, but it is seldom seen except in the south-west of England, where it will survive the winter against a wall.—T.

THE FLOWER GARDEN.

EARLY-FLOWERING CHRYSANTHEMUMS.

IT is not too early to talk about the prospects of the early-flowering *Chrysanthemum* season, as within another month the plants should, in many instances, be in full blossom. As a matter of fact, we have been able to make a gathering of *Chrysanthemums* for some weeks past, but have now come to the conclusion that this is a result that cannot be regarded with any real satisfaction. July and early August are far too early for most people to appreciate these plants in flower, as there are so many other things in beauty. This type of *Chrysanthemum* belongs to the early autumn. At one time the best of the so-called early-flowering sorts came into bloom in October. With the advent of Mme. Marie Masse and a few other Continental introductions, rather less than ten years ago, a change came. These plants began to flower in the latter half of August, and for many weeks they improved and made a bright display outdoors, and it is of the outdoor varieties I wish to speak. With the sports of the variety already mentioned we now have quite a group of the early-flowering *Chrysanthemums*, and each one has the same excellent qualities as the parent variety itself. It is an ideal outdoor *Chrysanthemum*, as it is strong and branching in growth. One may cut constantly without materially interfering with the beauty of the display, so abundant is the flowering. Of the Mme. Marie Masse family there are the following members: Horace Martin (glorious yellow), Crimson Marie Masse (chestnut), Rabbie Burns (cerise-pink), Ralph Curtis (cream), and, if we may depend upon the catalogue description of the most recent sport, we have a pure white addition to the family. These sports, together with the lilac-mauve blooms

of the parent variety, give a beautiful series of colours, sufficient variety, in fact, for many small gardens. These plants have been freely used by the hybridiser, and numerous sorts of a high order of merit are being distributed each succeeding spring from the progeny of the successful crosses. The majority of the better sorts flower in September and October. Unlike many other outdoor plants, these hardier *Chrysanthemums* are of the simplest culture.

All through this warm summer weather the plants without artificial watering have succeeded remarkably well. Owing to boisterous winds at different periods during August the growths should be kept securely tied or rather looped to the stakes inserted for their support. Looping the growths is far better than the practice so many follow of tying in the growths tightly; the former method preserves the grace and beauty of the plants. The hoe is still used freely between the plants to sweeten the soil. This latter practice appears to contribute more to the well-being of the plants than any other item of culture, and they never fail to respond to such welcome treatment. As the soil is still very dry 1 inch or 2 inches below the surface, we are now giving copious applications of clear water to the roots, following this with a generous supply of weak liquid manure.

Highgate, N.

D. B. CRANE.

PENTSTEMONS.

It is very disappointing when, having raised a quantity of young plants of *Pentstemons* from seed early in the spring, planted them out, and had a fine bloom from them in the autumn, to find the winter, either because so wet or so severely cold, has either destroyed the plants absolutely, or has so maimed them that they are almost useless henceforth. Those who have a greenhouse or a frame may get over the disappointment somewhat if plenty of cuttings have been taken off during September and put into pots, stood on a shelf or in some moderately shaded part of the frame, and there nicely rooted. Such young plants potted up singly in the spring, and later planted outdoors, make capital substitutes for the old plants which the frosts have destroyed. When, however, the old plants do survive the winter unharmed, then the many strong shoots sent up from the stems of the plants produce such clusters of bloom as to excel materially anything that can be obtained from young seedlings or cutting-made plants. But it is not difficult to have, apart from the cutting-made reserve, a quantity of young plants to stand the winter if a sowing of seed be made within the next few weeks. *Pentstemon* seed does not germinate very rapidly and plant growth is rather slow, so that if seed be sown at the end of July or early in August it is not probable that the seedling plants will be by the end of November at all too large to keep, as they are in a frame or under a handlight for the winter. The best course would be to dibble them out from the seed-bed or pans into a frame thickly or else under handlights. When once rooted very little protection will suffice to keep them safe through hard weather. In the spring these plants, lifted carefully with small clusters of roots attached and as carefully planted out, will soon develop into strong-blooming ones and make a fine display all through the early summer, a spring sowing coming on to make a succession. Practically, *Pentstemons* should always be treated as biennials, but consideration has to be given to the fact that they are not always so hardy as true biennials should be.

The *Antirrhinum* is pretty much in the same way as the *Pentstemon*, for both are somewhat soft-wooded and are apt to die wholesale under the effects of severe weather. Snapdragons are so prolific of seed that they may be easily raised at almost any time, and although with these, as with *Pentstemons*, no plants produce such a fine display of bloom as do strong ones that have been safely wintered outdoors, yet dead ones may readily be replaced by seedlings raised by an autumn sowing. As to the raising of *Pentstemons* from seed, it is best always to obtain a really good stock. There is such a wide difference now between good and

indifferent strains that only those familiar with the former can understand how great is the advance made in the flowers. Once a good strain is secured it is easy to retain and even to improve it. Something, perhaps much, has been done in the direction of improvement by cross-breeding, but very much also has come from selection, and it is open to any amateur grower of Pentstemons to select the very best flowers, mark them each year, and save seed from these alone. In that way it will be found easy to greatly improve any stock. Any new grower of Pentstemons, however, will do wisely to make as good a start as possible with a fine strain, as it is sheer waste of time to go over the ground which others have long since traversed, when the results of their labours may be had in seed form at a trifling cost. Very much improvement has also been effected in the habit of growth of the Pentstemon, but yet there is still room for further progress in that direction. A.

NOTES ON LILIES.

LILIUM LONGIFLORUM.

WHAT a pity it is that this species refuses to accommodate itself to our English climate! It was, I think, almost the only Lily that the late Mr. Wilson could not induce to thrive in his Wisley Garden; in fact, I never remember seeing a single flower of it there. It seemed strange that in a place where even that delicately-constituted aristocrat *Krameri* was induced to retain perennial vigour, the apparently much more robust *longiflorum* was a failure. My experience, which I believe is shared by Lily growers generally, is that one must treat the Lily in the same manner that one has to treat Hyacinths, that is, by bulbs annually. Imported bulbs planted in good soil will throw up strongly, but there is something in our climate that prevents them finishing off their growth in a way that will enable the bulbs to produce good blooms the second year. It is not that they die away, but the growths are too much multiplied, so that in the case of bulbs that have been established several years one may see half a dozen small stems producing among them two or three flowers. Either soil or climate, perhaps both, prevent that concentration of vigour which is necessary for the formation of strong flowering bulbs. Although this Lily is so unsatisfactory in English gardens generally, I am not sure but what it might be grown with success in some parts of the kingdom. We are only just beginning to recognise the potentialities of our soil and climate for the production of bulbous flowers, which for so many years have been furnished by Continental growers, and which it was thought could not be grown good enough for trade purposes in this country.

Not so many years ago we imported nearly all the Crocus and Snowdrops we needed. Now they are grown in large quantities in Lincolnshire, the quality being very good. Tulips have been taken in hand with equally satisfactory results, and there are hopes that even Hyacinths will be dealt with in the same manner. Soil and climate vary so much in the British Isles that we may yet see such Lilies as *longiflorum* and *speciosum* produced at rates that may enable us in a great measure to be independent of importation from foreign countries. We have now come to the time of movable glass houses which can be shifted from one crop to another as the season advances. With their help it is more than possible that many bulbous flowers could be cultivated to a higher degree of excellence than is possible when they are fully exposed to the vagaries of our English climate. To florists engaged in the wreath and cross trade *L. longiflorum* came as a boon and a blessing, the form and exquisite purity of the blooms lending themselves so well to that kind of work. For pot culture one cannot well get the bulbs cared for too early. Get them as soon as they come into the traders' hands, so that they may feel the influence of the warmth of our English autumn. There is a vast deal of

difference between potting Lily bulbs in September or October and doing so at the close of or at the beginning of the year. The difference is that in autumn the soil retains a considerable amount of summer warmth, so that root production is much facilitated. Roots are put out with freedom and are working into the soil by the time that late potted bulbs are beginning to make them. This means that by the time growth commences roots are then in abundance, the natural consequence being that the flowering stems come up strong and healthy and able to yield flowers of good quality. In proportion to the foliage Lily flowers are very large, and, looking at the slender stems and narrow leaves, one wonders how they are able to develop so many blooms of fine quality. The strain on the plant must be great, and it is only when means are taken to ensure the formation and continuous health of fibrous roots in quantity that the full glory of the Lily can be realised.

The compost found most agreeable to this Lily is fibrous loam, with a liberal addition of leaf-mould, or, better still, manure that has been turned over frequently for a couple of years. In this most

NOTES ON HARDY PLANTS.

ARUNDO CONSPICUA.

ARUNDO CONSPICUA has done so well in my garden this year that I have had it photographed, and in the hope that it may be of interest to you and your readers I send you a copy. The longest plume measures 12 feet 10 inches, and the plumes extend over 16 feet. There are fifty-eight plumes. It was photographed by Mr. Donald Massey of Bognor.

A. J. MACLAVERTY (Colonel).

The Hawthorns, Bognor, Sussex.

HEMEROCALLIS CITRINA AND ITS HYBRIDS.

This new *Hemerocallis* has given new blood to the Day Lily family. The finest hybrid is *Hemerocallis* Sir Michael Foster (*aurantiaca* major × *citrina*). Leaves evergreen, often with a blue

NEW ZEALAND REED (*ARUNDO CONSPICUA*) IN THE GARDEN OF COLONEL MACLAVERTY, BOGNOR.

things root with freedom, and it gives the nourishment necessary in the earlier stages of growth. In growing Lilies in pots it is customary to leave space for a top-dressing of a couple of inches of light rich soil into which roots push from the stems, thus aiding the development of the blooms. If the compost is used in a moist condition little or no water will be needed for some time after potting. When only loam of a very tenacious character can be obtained it is well to add a little peat in the form of lumps of the size of a pigeon's egg. Peat is naturally antiseptic, is a safeguard against the compost coming into a sour condition, and induces the multiplication of fibrous roots. I do not know of a fairer sight than a house 100 feet long filled with this Lily, the foliage of a rich green down to the pots, topped with highly developed blooms. In the London market gardens I have never seen this Lily grown on stages, but invariably on the earth, the constantly rising moisture from which is undoubtedly grateful to the plants.

J. CORNHILL.

shade, elegantly recurved, and at the base red, grows bushy, and even without flowers is a fine plant in the border. The flowers are sweet scented and clear yellow. The inner petals are large and undulate, while the outer are smaller and not undulate. The flower is open for a day, and artificial crossing is needful to obtain seed. This is one of the finest hardy hybrids this year, and should be cultivated in every garden. *Hemerocallis* Baroni (*Thunbergii* × *citrina*) has the elegant growth of *citrina*, but the flowers are clear lemon yellow, tubular, only the outer half being widely open. Sweet scented. *Hemerocallis* Müllerii (*Thunbergii* × *citrina*) is not so tall as *citrina*, the flowers dark yellow and widely open, and the petals small but well formed, also sweet scented. *Hemerocallis* ochroleuca (*Thunbergii* × *citrina*) has the form of *citrina*, but the flowers are smaller, clear yellow in colour, and often light greenish. The three outer petals are recurved, but the three inner ones are smaller and spreading. It is a very curious flower. These plants like plenty of water

and manure. Once a week water them with a solution of cow manure and nitrate.

Naples.

WILLIAM MULLER.

SALVIA DICHROA.

This handsome *Salvia* is apparently very rare in cultivation, for there is no mention of it in the last fifty volumes of *THE GARDEN*. In "Nicholson's Dictionary of Gardening" its height is given as from 2 feet to 3 feet, but with me and in another garden where it is grown it is fully 6 feet in height. The flower-spikes are about 3 feet in length, and the individual blossoms are lavender blue, the middle lobe of the lip being white. About 9 inches of the spike is in flower at the same time, but as the lower blossoms fade the upper ones expand, so that the spike bears bloom for some weeks. Being a native of the Atlas Mountains in North Africa the plant is perhaps of doubtful hardiness, but in the south-west passes through the winter unharmed even when totally unprotected. In a flower-spike that I cut recently there were forty-eight fully expanded and half-opened blooms, while the total number of flowers and unexpanded buds on the spike were 175.

S. W. FITZHERBERT.

DIANTHUS GIGANTEUS.

This tall-growing species in good soil sometimes reaches a height of 4 feet, with stout stems swollen at the nodes, clothed at intervals with pairs of long bright green leaves sheathing at the base. The flowers are numerous, and crowded in a close hemispherical head, the surrounding bracts being quite leaf-like. The dark red flowers are toothed and bearded. It is a perennial, slightly woody at the base, and is found among the rocks by the seaside in Eastern Europe.

W. L.

USEFUL COLONIAL AND FOREIGN FRUITS.

(Continued from page 101.)

K E I APPLE (*Aberia Caffra*).—This is the fruit of a shrub which is common in the eastern districts of the Cape of Good Hope and in Kafirland, where the plant is much grown for hedges, in consequence of its being covered with numerous strong spines, so that when once it becomes established it forms an impenetrable fence. The small golden yellow, Apple-like fruits when ripe are much used by the natives for making into a preserve. In the green state they are so extremely acid that they are then prepared for table as a pickle without vinegar. We are unable to give a personal opinion as to the capabilities of the perfectly ripe fruit in a raw state, but from a knowledge of the preserve made from Kei Apples the flavour has certainly something to recommend it.

In the closely allied genus *Flacomtea* three species may be instanced as furnishing edible fruits, as *F. Ramontchi*, a small tree common both in the wild and cultivated state throughout India, and found also in the Eastern Archipelago and Madagascar. The fruit is

about the size and shape of a Plum, and of a dark violet colour; the flesh has a sharp but sweet taste. As there is a certain amount of astringency in all these fruits it is necessary that they should be thoroughly ripe before being eaten.

Two well-known fruits belonging to the genus *Averrhoa* are the Blimbing and Carambola, the first furnished by *A. Bilimbi* and the second by *A. Carambola*. Both are small trees belonging to the Oxalideæ section of the natural order Geraniaceæ, and are cultivated in India for the sake of the fruits. Though closely allied species the fruits differ considerably in appearance, that of the Blimbing being cylindrical, almost like a small Cucumber, while the

tree of the order Sapotaceæ. It is a native of, and much cultivated in, South America and the West Indies, where the fruits ripen from October to January, during which season they are very abundant, and are much esteemed by all classes. It is usual to gather the fruits in a half-ripe state and ripen them in the house, as much to preserve them from the attacks of bats as to ensure their perfect ripening, for until they are absolutely ripe they are unfit to eat. That the fruits can be satisfactorily brought to this country by the cold chamber system was partially proved at the time of the Colonial and Indian Exhibition in 1886, but the experiment went to prove the necessity of a knowledge of the nature of the fruits

experimented upon, for in the case of all Sapotaceous fruits, as well as with those of some other natural orders, it is necessary that they should be dead ripe before eating. The Medlar is an example of this, as is also the Persimmon (*Diospyros virginiana*) and the Kaki (*D. Kaki*).

In the Sapotaceæ one of the characters of the order is the presence of a milky elastic juice in all parts of the plants—the true *Gutta Percha* is an example—so that in a green or semi-ripe state the juice readily coagulates with the warmth of the mouth and causes the lips to stick together, an experience to which many purchasers of the unripe fruits were subjected at the Exhibition in 1886, while those who were fortunate enough to obtain their fruits fully ripe pronounced them delicious.

Of other edible fruits belonging to this family the best known are the Star Apple (*Chrysophyllum Cainito*) and the Marmalade Plum or Mamma Sapote (*Lucuma mammosa*). Both are the produce of West Indian trees, and those who have tested them in the countries of their growth pronounce them of excellent quality, and likely to prove a useful fruit if it could be properly placed on the English market.

In the order Apocynaceæ we should scarcely expect to find fruits of an edible nature when we remember that a large proportion of the plants contain a milky juice which, upon being coagulated, forms a large part of the best-known African, Bornean, and Pernambuco rubbers of commerce, but even the fruits of some of the trees furnishing those rubbers are

edible when fully ripe. One of the best of the Apocynaceous fruits, however, with which we are acquainted is the Natal Plum or Amatungulu (*Carissa grandiflora*). They vary in size from that of a large Olive to an ordinary Plum, which they somewhat resemble, of a reddish colour at first, changing as they ripen to a dark violet. They have an extremely agreeable sub-acid taste, and from them the people of Natal make an excellent preserve. These fruits as well as the preserve have been frequently shown at the several international exhibitions, and have attracted some attention, but they

DIANTHUS GIGANTEUS IN HERBACEOUS GROUND AT KEW.

(Sometimes as much as 4 feet high.)

Carambola is winged or ribbed longitudinally. In a young and green state both fruits are very acid, but in ripening some of this is lost. The Blimbing is said to make an excellent fruit for tarts, and a cooling refreshing drink is also made from it. The Carambola, which ripens in December and January, is eaten both raw and cooked, but when stewed in syrup and flavoured with a little Cinnamon the fruits are said to make an excellent dish, and they also make good jellies.

The Naseberry or Sapodilla Plum is the product of *Achras Sapota*, a lofty hard-wooded

are still unknown in British markets. All the fruits yet mentioned here are, with the exception of the Custard Apple, quite unknown to English trade, but there are two which, though occasionally seen here, are not so well known as they should be, namely, the Mango (*Mangifera indica*) and the Guava (*Psidium Guayava*). To sound the praises of the Mango would be to repeat an oft-told tale. Though everybody has not had an opportunity of tasting Mangoes in their fresh state, almost everybody has heard or read of their value in tropical countries, and to what an extent they are cultivated and used and the variety of applications to which they are put. In this country they are, perhaps, best known as an ingredient in the valuable pickle known as Mango chutney. The Guava, again, seldom appears at our tables in any other form than that of Guava cheese or, perhaps, the fruits preserved in syrup. Both of these fruits, if not capable of being cultivated successfully in this country, might, we think, be imported from the West Indies in a fresh state. Space will not allow us to extend our list to any further length, but to show that there is more material upon which to work we will simply enumerate the following, all of which have more or less repute in their native countries, and some are not unfavourably known in this country.

Rambutan (*Nephelium lappaceum*) has a sweetish acid taste, like that of Lemon juice and sugar, and is said to have a wonderful power in allaying thirst. Kaki (*Diospyros Kaki*).—Flavour somewhat like Apricot, with a slight suspicion of the Medlar; ripens in English greenhouses. Wood Apple (*Feronia elephantum*).—The pulp makes excellent jelly, resembling in flavour that of the Black Currant. Bael Fruit (*Egle Marmelos*).—The pulp when ripe is sweet, aromatic and cooling, wholesome and nutritious. Langsat or Ducu (*Lansium domesticum*).—It is of a sweetish acid taste, and is eaten both raw and cooked. Litchi (*Nephelium Litchi*).—The pulp has a delicate acid flavour, most refreshing when fresh, but of poor quality in the dried state as seen in English shops. Loquat or Japan Medlar (*Eriobotrya japonica*).—It has somewhat the flavour of an Apple; sometimes ripens its fruits in this country. Cocoa Plum (*Chrysobalanus Icaco*).—Has a sweet taste, with a slight astringency, not much in favour in a raw state, but makes an excellent candied fruit. Otaheite Apple (*Spondias dulcis*).—The pulp or flesh has an Apple-like smell, and in some varieties a flavour approaching that of the Pine. *Spondias Mangifera* and *S. purpurea* also yield edible fruits. Cape Gooseberry (*Physalis peruviana*).—This has already attracted some attention for cultivation in this country. The cooling and refreshing nature of the fruit strongly recommend it for extended culture.

THE TREE LUPIN (SNOW QUEEN VARIETY).

I AM sending you a photograph of a very beautiful shrub, which has been quite a sight in my garden this summer. It is a *Lupinus arboreus* Snow Queen, seed of which I procured three years ago. The plant flowered the second year from seed, opening its flowers the beginning of June and remaining in beauty right up to the end of the month. The flowers are pure white, but die off a soft rose. My bush this year was smothered in racemes of bloom, and produced, especially in the evening, a most lovely effect. The flowers have a delicate fragrance, and I can strongly recommend this Lupin for the hardy flower border. As a regular reader of THE GARDEN I thought this plant might be of some interest to you.

Bodegraven, Holland.

T. G. DE GRAAFF.

ROUND ABOUT A GARDEN.

AUGUST IDLENESS.

AUGUST always seems the holiday time of a garden. You have done your best or worst for the season, and can saunter about and enjoy the fruit of your gardener's labours—unless you are your own gardener, in which case even August is no time for sauntering much. Nothing, perhaps, conduces more to an intimate acquaintance with all your flowers than having to water them daily; but it accords better with the spirit of the season if you can leave the watering to others and view the general effect of the many-coloured flower-beds from shady points of vantage. A mid-August garden never looks better than thus viewed through vistas of greenery, for one has few temptations to go stooping about, as in spring, admiring floral gems a few inches above the soil.

THE BLAZE OF LATE SUMMER.

And Nature lends herself easily in the later summer to this distant wholesale worship, for now she flings up tall blooms which blaze in battalions, and strikes chords of colour which ring clear a hundred yards away. She uses the brush of a scene-painter, and splashes orange and scarlet and purple so lavishly that every cottage garden now looks like one giant nosegay, such as the villagers like to make up for departing visitors to "carry back to town." No matter how aesthetic your tastes may be, you cannot keep this August blaze out of your garden. It catches fire from every page of the florists' catalogues, and you are lucky if your gardener has not somewhere stoked up for you one of those *Geranium-Calceolaria-Lobelia* conflagrations which almost make you perspire to look at.

A JUDGMENT OF PARIS.

It is not only in the flowers that Nature uses her brightest colours for summer's final set-piece of splendour. British entomology

knows no more gorgeous trio of butterflies than the Red Admiral, Peacock, and Tortoiseshell, which now flicker and sail along the flower-beds, alighting here and there as if for the conscious pleasure of submitting their brand-new glories to your view. It would be a hard Judgment of Paris to deliver, had you to decide which of these three is the most beautiful—the Red Admiral, all velvet black, scarlet and white; the Peacock, of crimson damask, with starry eyes of many dainty hues; or the Tortoiseshell, tawny and orange and black, with delicate edging of blue. I think that your decision would always depend upon which you happened to be looking upon at the moment. That would seem unrivalled in beauty.

THE MULTIPLIED WASP.

But entomology covers other insects than butterflies, and a garden includes many samples, of which those that are unwelcome always seem to multiply the most. Only a little while ago we seemed to have no wasps—and undoubtedly they suffered very severely during the last two summers of cold winds and rainstorms—but now they are swarming again. For the wasp multiplies on the "snowball" system, which, as applied to popular subscriptions, means that each subscriber should get six more subscribers, and each of these six more and so on, until in theory the whole world would soon be filled with subscribers only. So with the wasp. In the spring there may be only one wasp remaining from last year, but she is a fertile female, and by hard work she builds a small set of cells which she fills with children. These add more cells and fill them with children, and their children and grandchildren go on doing the same, until in theory the whole world ought to be filled with those wasps. Sometimes when you look into a neglected greenhouse where the Grapes are ripening, or stand under a Willow where the ground is sticky with honeydew, there seem to be more wasps than are pleasant in the world already, but in Nature the manifest and

THE TREE LUPIN (*LUPINUS ARBOREUS* SNOW QUEEN) IN A DUTCH GARDEN.

inevitable corollary to rapid multiplication is wholesale annihilation, and the first chilly day of autumn seals the fate of 90 per cent. of the wasps, and of the remaining ten if one survives until next spring to carry on the race it will be a very lucky wasp. Perhaps this ought to soften our feelings towards the wasps in the days of their multitudinous audacity, but it is hard to feel friendly towards an insect which steals your sweets and threatens to sting you when you accidentally catch him in the act.

THE ROBINS' RETURN.

Luckily, not all the multiplying visitors to your garden now are insects. As the reaping of the harvest clears the land the birds are driven to find food and shelter elsewhere, and the shrubberies of country gardens offer welcome oases to them in the midst of a new-made wilderness. So day by day more robins find their way into the garden and announce their claim to a corner of it with a song. As most of them are young birds of the year the song is usually brief and quavery, but it will grow stronger as the autumn passes, and there is always a welcome ring in the robin's notes. In the dusk of a late summer evening they may seem to remind us rather sadly of the early winter afternoons. But it is the pleasant side of winter that the robin recalls — the cheery, hospitable side, the pluck that faces hardship and the hope of happier time to come.

OTHER WELCOME VISITORS.

With the robins come the tits, and it is nice to know that some of them are the same tits that were with us last winter, because they go straight to the place where the food used to be hung up for them. Some, indeed, both great tits and blue tits, nested on the premises, and only led their fledged young afield a little while ago, but others have hardly seen the garden since they ceased to be daily pensioners in March. Equally welcome with the tits, though their stay will be shorter, are the family parties of black-capped bullfinches and goldfinches and linnets, which frequent secluded corners and amuse one by the half-hour with their pretty antics among the seed-pods and the weeds. A little later bullfinches will be a catastrophe rather than a charm in the fruit garden, but now they are doing no harm whatever, and you can whole-heartedly admire the brilliant carmine of the stout father as he teaches his ruddy-breasted youngsters how to pick the seeds out of a long plantain head. Even a covey of partridges, which come wandering anxiously down the path in single file, need not be scared over the shrubbery. The cornfield where they have lived all their lives as yet has been shaved bare, and they really do not know where they are going to live

now. To-morrow, perhaps, they will discover the shelter of a Turnip field, and if, when most of them have fallen in the terrible day of the great partridge drive in October, the remnant remember the quiet garden where they found sanctuary at harvest, they will be welcome again. Partridges are not things to cultivate in a garden to any great extent, but occasional hospitality to much-worried birds is another matter.

E. K. R.

THE ROSE GARDEN.

SEASONABLE NOTES.

THE PROMISE FOR AUTUMN.

THE value of deep cultivation is again abundantly evident this season. New beds of Tea and Hybrid Tea Roses planted in March are now sending up those fine shoots from the base that provide us with the rich and abundant blossoming next month. Everything points to a splendid autumnal display this year. Then is the time for the planter to make notes of sorts best for

heat could be given so much the better. The cuttings should be sprinkled several times a day if bright, and the glass shaded with sheets of paper or whitewash. A sunny position is best for the frames or glasses. By putting the cuttings in pots they are more readily removed to a greenhouse or cold pit, where they may be kept undisturbed until spring, if not convenient to pot off before. All rooted cuttings of this description prefer a gentle bottom-heat when potted off, and they should be kept growing in a gentle warmth. When they have become well rooted they can then be potted on, or if in spring planted out, shielding them against the baneful spring frosts.

BUDDING

is now in full swing. If stocks are full of sap there should be perfect success. It is not worth time and trouble to bud weakly, poorly-rooted stocks. I would advise all who desire thoroughly healthy plants and good flowers to see that the Briar stocks when planted possess some fibrous roots. Manetti stocks, seedling Briars, and Briar cuttings are budded upon the stems beneath the growths and as near the root as possible. In the case of the seedling Briar these are budded upon the actual root. Old Roses not now admired may be rebudded with modern sorts, provided there is some current

year's wood near their base. The old wood may be cut away at once. I have frequently made some fine plants in this way. It is best to cut such plants right down to the ground in spring, and thin out the new shoots to five or six, and bud on to these as near the ground as possible. Care is necessary the next season to rub off all new shoots as they appear, excepting the inserted buds.

LAYERING

may also be done now. Any Roses, ramblers, Tea Roses, in fact any sorts, will root from layers put down after the style of the Carnation, only rather deeper. Provide plenty of grit round about the tongue of the layer, and keep them well watered after layering. If the growths are long, tie them to a cane to prevent wobbling. The layers will usually be ready for transplanting in ten months.

P.

TREES AND SHRUBS.

THE CEDARS ON MOUNT LEBANON.

ON two mighty ranges in the Old World and in the New, Nature has set up a temple unbuilt by hands to compel the admiration and excite the wonder of those creatures of a day, mankind. In the Sequoia groves of California there stand trees so old that they may well have cast their leaves and shed their seed on the night of the Nativity. On Mount Lebanon the survivors of the groves which escaped King Solomon's four-score thousand hewers still stretch their gigantic arms and scatter their cones for the children of the West to bear away and propagate, that they may have before their eyes the offspring of the oldest trees of

THE CHILDREY CEDAR, PLANTED ABOUT 1641.

that season of the year, and it may be taken for granted that what are good in September will also be good for June and July. There will be perhaps a dearth of Hybrid Perpetuals of brilliant colours, but we shall soon be independent of these when we have more of such beautiful Hybrid Teas as Liberty and Etoile de France. I have found peat moss litter, after it has been well used in the stable, makes excellent mulch for Rose-beds. It keeps the moisture in the soil, and is at the same time a gentle stimulant. If the soil is well hoed before the application of the manure, such hoeing should suffice for some weeks. No one who has the interest of the plants at heart would think of treading upon the soil more than is absolutely necessary.

CUTTINGS

may be inserted at once under bell-glasses or hand-lights. Select wood that has just flowered. We usually have two eyes to each cutting and retain the foliage, excepting the end leaflet. Dibble the cuttings around the sides of a 5-inch pot well crocked and filled with sandy soil. Dip each pot into a bucket of water after cuttings are inserted and place under the hand-lights. If a little bottom-

which history has spoken. "Athene's Olive, or Dodona's Oaks" have not lived so long in story. It is nearly thirty centuries since King David said, "I in a house of Cedar, but the Ark of God dwelleth within curtains." Solomon, who knew every plant, "from the Cedar that is in Lebanon to the Hyssop that groweth on the wall," was only not wise in this, that he cut the Cedars, but did not, so far as history tells, ever plant where he had reaped. Still the Cedars flourished, the mightiest of all the trees, and the most inspiring to human imagination. Ezekiel must have seen them, with their roots spreading towards the snow torrents on the mountain-sides, for he says of the Cedar, "Thus was he fair in his greatness, in the length of his branches, for the waters made him great." And their growth was then the same as now, with flat and spreading heads. "His top," says the prophet, "is among the thick boughs." To the days of St. Augustine the Cedar was the type of pride and strength. "Cedar of Lebanon, whom God hath not yet broken," is his apostrophe to "overweening greatness tottering to its fall."

That the thought of the Cedar should have impressed beyond measure the imagination of the Christian West is not surprising. It was a tree which no European had seen, yet to which their one Holy Book made constant allusions. Though the Cedar flourished then, and survives yet on the Atlas Mountains and on a few ranges in Asia Minor, these were never visited, and scarcely known. But the tradition passed on from generation to generation that high on Lebanon there still grew these almost sacred trees, there, and nowhere else, as the world then thought, and continued to arouse men's curiosity and stimulate their interest. It does not appear that during the Crusades any European penetrated to the groves. The Lebanon lay in the enemy's country, and, further, was in possession of the Assassins, with their mysterious chief, the Old Man of the Mountains. Thus guarded by remote distance, and for a time by the presence of the murderous fanatics near the base of the mountains, the Cedars stood for centuries unvisited, and drank up the snow-waters with their roots, uninjured by the axe, or by the fires of wandering travellers, whose careless brands have more than once since consumed the groves of Hermon. Meantime, they still remained the most renowned natural monuments in the world. "The Arabs of all sects entertained a traditional veneration for these trees. They attributed to them not only a vegetative power which enabled them to live eternally, but also an intelligence, which caused them to show signs of wisdom and foresight similar to those of wisdom and instinct in man. They believed them to understand the changes of the seasons; that they stirred their

vast branches as if they were limbs, and could spread out or contract their boughs, inclining them towards heaven or towards earth, according as the snow prepared to fall or melt."

Perhaps the earliest account of a visit to the Cedar grove is that by Belon, who climbed the Lebanon in 1550 A.D. It will be interesting to

compare what he saw with the photograph he e shown of the surviving Cedars to-day.

"At a considerable height up the mountain the traveller arrives at the monastery of the Virgin Mary, which is situated in a valley. Thence proceeding four miles further up the mountain, he will arrive at the Cedars, the Maronites acting as

CEDARS ON MOUNT LEBANON.

guides. The Cedars stand in a valley and not on the top of the mountain, and they are said to number twenty-eight, though it is difficult to count them, they being only distant from one another a few paces. These the Archbishop of Damascus endeavoured to prove were those which Solomon planted with his own hands, in the quincunx manner in which they now stand. No other tree grows in the valley in which they are situated, and it is generally so covered with snow as to be only accessible in summer."

These gigantic Cedars, some of which are shown in the beautiful illustration of Solomon's Cedars here given, are fortunately not the only survivors. In one grove there were in 1832 nearly 500 younger trees. In 1836 it was noted that while the smallest of the ancient trees measured 36 feet 9 inches in circumference, there were forty younger ones measuring from 10 feet to 12 feet beneath the snows of Hermon.

The records of British forestry give the date at which the Cedar of Lebanon was introduced into England as the middle of the seventeenth century. If this is correct, the great Cedar of Childrey Rectory, near Wantage, in Berkshire, has strong claims to be one of the first three planted in England subsequent to 1641. The story is an interesting one. The rectory, a very ancient one, which drew such a large share of the proceeds of the three manors of Freebornes, Maltravers, and Rampaynes in that parish, that they each conceded about a third of their land to the rector in lieu of his tithe, became the possession of Corpus College at Oxford, the last of the Corpus Rectors being the Rev. C. J. Cornish, who now holds it. In the later years of the reign of Charles I. Corpus College granted it to the first Oriental Scholar of the day, Dr. Pocock, who, according to an unbroken tradition, planted this Cedar from a cone which he had brought with him from Lebanon. Two other Cedars, now at Highclere, are said to have been raised from cones brought by him at the same time. Turning to Pocock's life in "The Dictionary of National Biography," where his planting this Cedar is mentioned, we find that there is every evidence to support the belief. He became an Orientalist when almost a boy, and at Oxford found in the Bodleian missing manuscripts of four gospels, and transcribed them into Syriac and Hebrew characters, adding, for the benefit of the less learned, a "popular" translation in Greek. Then he went out as chaplain to the Turkey Company at Aleppo in 1629, when he studied Syriac on the spot and also Ethiopian and Samaritan. On a subsequent visit to the East he purchased a number of Oriental manuscripts (now in the Bodleian), with such skill and discernment that Dr. Pusey remarked that the old Royalist Scholar had never once been taken in by a fraud or mistaken in his purchases. Archbishop Laud made him the first Professor of Arabic at Oxford. Then, in the evil days of the Royalists, Pocock went again to the Orient, and became chaplain to the Embassy at Constantinople. In 1641 he returned, and was appointed to Childrey in 1642. He probably brought the cones back in 1641, and, allowing a year to raise the seed in, that would give a life of 261 years to the Childrey Cedar. It is still in vigorous growth, and increases rapidly in size.

At the present time it measures 25 feet round at 5 feet from the ground, and the lateral spread of its branches is 40 yards, giving roughly an area covered of 1,600 square yards. Every year it shoots add 14 inches to the end of its lower branches, and last autumn the ground below was covered with the debris of its cones. The soil in which it stands is extremely rich, and under it are springs, so that it may truly be said of this tree that "the waters made him great." Perhaps the most extraordinary fact is that it has renewed and repaired a loss of certainly one-fourth of its principal branches in seventeen years. One night, when the present writer was in the house, a very late and very wet fall of snow descended. Wet snow is very heavy, and it overloaded the branches. All through the night the depressing sound was heard of huge Cedar boughs snapping with a crash like fog signals. Next morning the tree looked a perfect wreck. Eleven great boughs and many

smaller ones were smashed off, huge white splinters stuck out jaggedly everywhere, and tons of timber lay below. Part of a large paddock was fenced in with posts made from the smaller boughs, and the rest was sawn up for timber.

Yet in the succeeding years the growth of other branches—mainly the smaller ones which had no chance to develop before—was such that, except on one side, the damage is not very obvious. The tree has never been struck by lightning, and, contrary to general belief, all kinds of flowers grow beneath its branches. On the side from which the view is taken are beds of wild Sweet Violets right up to the trunk. Forget-me-nots, wild yellow Anemones, Oxlips, and Daffodils flower in the grass beneath the enormous lateral branches. Standing in the very centre of ancient gardens and lawns, it reminds one of the tree in Nebuchadnezzar's dream, when "the fowls of heaven dwell in the boughs thereof." At different times and seasons whole families of different kinds of birds simply live in this immense tree, which is a kind of city to them.

Its ancient and unbroken associations with Oxford and the Church are likely to endure. Planted by the old Corpus Scholar, who held Archbishop Laud's Arabic Professorship, duly described in contemporary biography by Dr. Fowler, the genial and learned head of Corpus College, cared for, and its boughs supported by the present Corpus Rector, it has passed, on the alienation of the advowson of the Rectory by the College, into the hands of the Rev. R. J. Walker, himself the son of a Scholar and Fellow of Corpus, the well-known Master of St. Paul's School.

CORRESPONDENCE.

(The Editor is not responsible for the opinions expressed by correspondents.)

POTATO RINGLEADER.

[TO THE EDITOR OF "THE GARDEN."]

SIR,—I was very pleased to read such a good account of this Potato in THE GARDEN from Mr. Wythes and Mr. Molyneux. I have grown it extensively as a second early and mid-season variety, but not for forcing, as I still think that Sutton's May Queen will take a lot of beating both for forcing early and for an earliest outdoor sort, being also very short in the haulm. The finest mid-season Potato with me is Reliance. Never have I had such returns from a Potato before as I am now lifting. It was good last season, but excellent this. I have had as many as twenty-six tubers from a single root all fit for table; when cooked it is first-rate. It turns out very clean with shallow eyes. Of course it may not do well in all soils, but here it is superb, and no one could wish for a finer Potato.

Rdg Gardens, Corwen.

J. HIGGINS.

GALEGA HARTLANDI BICOLOR GRANDIFLORA.

[TO THE EDITOR OF "THE GARDEN."]

SIR,—I notice with much pleasure that some of your readers want to know the history of this plant, which you illustrated in THE GARDEN of December 26, 1903. To its further history I can add but little, only to mention that it is Furze-scented, most floriferous, and quite distinct from any known form. That it originated some ten years since at Ard Cairn goes without saying, that Mr. F. W. Burbidge was the first to call my attention to it some three years since, and that it appears in March with silver variegated foliage, which it keeps well into the month of May, then in June it sends forth in quantity blue and white bicolor blooms, the colour of the Wistaria. It is planted here as well as at Kew Gardens side by side with Galega patula, sent me by Mr. Watson. G. patula is quite a botanical species of no great value in comparison, as it very soon goes off to seed, while my plant never seeds, but continues flowering until late autumn. I have not tried it in

poor soil as yet, but plants potted up are of great value in the conservatory and for table decoration, in combination with Sweet Peas and the bloom of Rhus Cotinus is very effective.

Ard Cairn, Cork. W. BAYLOR HARTLAND.

YUCCAS.

[TO THE EDITOR OF "THE GARDEN."]

SIR,—Referring to Mr. D. B. Crade's notes on the flowering of Yuccas at Finsbury Park after so wet a season as last year, I may mention that here there are a large quantity of Yuccas which flower very freely, but this year I notice they are freer and the spikes are much finer, especially those in the wettest quarter; in fact, last summer and winter they were often under water, but they are in a very sunny and sheltered position, which I believe adds much to their freedom, as some I notice here in a more exposed part seldom flower.

Ruxley, Esher.

J. HILL.

CARPENTERIA CALIFORNICA.

[TO THE EDITOR OF "THE GARDEN."]

SIR,—I am inclined to think that Carpentaria californica is harder than is generally supposed. I have a good-sized bush which has stood for six years in an open border facing west, with a wall standing about 6 feet behind it. The soil is light and dry (chalk), about 300 feet above sea level, and Hertfordshire is a cold county. The shrub flowers profusely every year.

Focholes, Hitchin.

T.

[TO THE EDITOR OF "THE GARDEN."]

SIR,—Here and at Hemsted Carpentaria californica has done well both on a wall and in beds, and has been out for the last three years. An old Oak here has much fungus growing round the base. Is it desirable to remove it, or is it a sign and not a cause of mischief?

Cranbrook.

MEDWAY.

[We should like the opinion of other readers who have been troubled with fungi in this way.—ED.]

WHITE SWEET SULTAN THE BRIDE.

[TO THE EDITOR OF "THE GARDEN."]

SIR,—On page 52 "R. D." writes in praise of this, and I can endorse all he says in its favour, having seen it growing in Messrs Jarman's nursery at Chard a few weeks ago. Nothing could have been fresher and purer than it was in the open nursery without the least shelter in the hot weather. The bed was a large one, the plants most vigorous, and literally covered with their blooms. I am quite of the opinion that it will be much sought after for floral decoration. Everyone values the yellow Sweet Sultan, but this fine new kind will be even more valuable. It occurred to me, as I looked at this mass of colour beside Chrysanthemum segetum of the brightest yellow, how much colour we may have in the garden in early summer from these beautiful things, that can be raised from seed at a very small cost.

J. CROOK.

EARLY APPLES.

[TO THE EDITOR OF "THE GARDEN."]

SIR,—As an early dessert fruit, ripening towards the end of July or early in August, none can vie with the variety Mr. Gladstone for so early in the season. On the Paradise stock it is a sure cropper, but should not be too closely pruned, as the tree bears on rather long spur growths similar to Lady Sudeley, another excellent dessert variety coming into use from the third week in August. The only fault with this is that the fruits are rather too large for dessert, but the flavour is very good, and the appearance most showy, quite crimson on the sunny side. Irish Peach is another excellent variety for August; the fruit is of suitable dessert size, and has a delicious aromatic flavour. Like the two above mentioned, the fruits are never better than when picked from the tree; they neither keep long nor retain their flavour. Slight pruning only is requisite to get good crops. Devonshire

Quarrenden is an old well-known variety, so well spoken of last year by Mr. Owen Thomas, and as a rule it bears well in most seasons. The fruits are flat, bright red in colour, and of rich flavour; it doubtless does better on warm soils than when planted on heavy land. It is fit for table during the latter part of August, and retains its flavour for a week or two after being gathered. Beauty of Bath is a very pretty Apple, and deserves more extended culture on account of its brisk flavour and free bearing when established. White Transparent, a fairly new Apple of much merit with a primrose skin, bears very freely, and is highly recommended for planting near the sea. There are one or two other early Apples, but the foregoing can be relied on for earliness as well as for flavour and free cropping. To keep sound fruit it is necessary to protect the trees from birds.

Biston, Devon.

JAMES MAYNE.

THE FRUIT GARDEN.

THE MEDLAR.

FEW trees are more picturesque than the Medlar, but it is valuable also for its fruits, which are highly esteemed for dessert when in proper condition. It is also delicious when made into jelly, cheese, or as a sauce for game. The trees, budded on the Whitethorn, are very hardy, and will grow anywhere. The branches require a fair amount of thinning, and a mulching of rich manure on the surface of the ground when the fruits are formed will repay the grower. Mention should also be made of the beauty of the Medlar tree when in flower. There are but three recognised varieties.

Dutch or Monstrous.—This has very large foliage and flowers, and produces the finest fruit. The tree has a weeping habit, and is not out of place on a lawn; it may be made to form an arbour. The fruits are gathered in October and left in a cool fruit room until Christmas to ripen; they are then much esteemed.

The Royal.—The fruits of this are not so large as those of the Dutch; the tree has smaller leaves, but as a rule bears better crops than the former.

Nottingham.—This has quite small, brisk, well-flavoured fruits, and they are very freely produced; the tree is of upright growth, and both branches and foliage are thin.

NOTES ON OUTDOOR NECTARINES.

For some reason or other the Nectarine seems to be grown less than any other stone fruit. Some say it does not swell like the Peach, and others that it is dry and flavourless. Such cannot have tasted finely-grown fruits of the best varieties or they would assuredly say there was no fruit better. Its name is derived from nectar, the drink of the gods, and its lusciousness and honeyed flavour well justify it. The dictionary describes it as a nectarine variety of Peach with a smooth fruit. It is said to be a sport from a Peach, and there are well-authenticated cases of both smooth and downy fruits on the same branch, while Peach trees have been raised from Nectarine stones, and *vice versa*. The Nectarine is not quite so hardy as the Peach, and requires more sun to bring it to perfection, for whereas late September, or even early October, Peaches are often a success outdoors in the South of England, it is of little use growing Nectarines under the same conditions which ripen later than the first or second week in September. As it requires so much sun to perfect it, it is not advisable to plant it on any but a south wall, except with the very early sorts, which may be planted on a south-west, or even on a south-east, wall. The soil best suited to the Nectarine is a good deep loam well drained, and if it is calcareous so much the better. In planting it is a good plan to dig a hole 3 feet deep and 5 feet or 6 feet wide, and put a barrowload of mortar rubbish at the bottom, this serving both as drainage and as food for the trees for years to come. The preparation of borders often advocated

is both costly and unnecessary on any fairly favourable soil, unless exhibition fruits are wanted. This is speaking from the amateur's point of view. Some basic slag should be mixed with the soil when filling up the hole, especially with the soil at the bottom, Nectarines needing a great deal of solid matter for the stoning of the fruit. Early November is the best time to plant, and a good thickness of strawy manure should be put over the roots for the winter and removed in March to let the sun warm the soil, as the growth of Nectarines begins early.

The pruning and disbudding of Nectarines—both operations equally important—require a good deal of care and attention. Soon after the fruit is set in the spring all ill-placed shoots, and many others where they are too thick, should be rubbed off, but not all at once, as it gives the tree a check, which may result in unhealthiness, through congestion of sap. As a general rule, on fully-grown trees all the young shoots on a previous year's shoot may be rubbed off, except the one at the extremity to draw up the sap to the fruit and the one at the base. The terminal shoot may be pinched at about the fifth leaf and the basal shoot at 12 inches or 15 inches, or earlier if room is limited. The old shoot is cut away at the final pruning in the autumn just above the basal shoot, which is nailed in its place.

As the summer advances, say, about midsummer, all the young shoots should be tied in so as not to shelter the fruit, and also, and even more important, to give the young wood the benefit of the radiation of the heat from the wall to ripen it. When blossom fails to set or fruits fall off at the stoning period it is generally because of the imperfectly ripened condition of the wood. Until the tree has attained its full size some modification of the above system of pruning is necessary, the extension or terminal shoots (sometimes two from the same shoot) being allowed to grow their full length unless they are too gross, when they may be pinched anywhere between 1 foot and 2 feet. If laterals appear on the current season's growth they should be pinched at one leaf and the secondary laterals similarly treated, the whole of the laterals being cut back close to the stem at the autumn pruning, where the buds at their base have probably developed into fruit-buds as the result of the pinching. Beware of cutting back strong-growing shoots in the summer, as they will probably either gum or die back. They should be pinched before they get too strong.

Thinning the fruit is of the utmost importance. As soon as it is set all badly placed fruit should be rubbed off, and when it gets as large as a Pea it should be further thinned, leaving only one, and that the biggest, on the weak and fairly strong shoots, and two on the very strong shoots. It is very bad policy to leave too many fruits, as many

FRUITING SHOOTS OF THE MEDLAR.

of them will only fall when they should be beginning to ripen or before, and none will attain any size. People speak of leaving it to Nature, but Nature's object is to produce seeds, and ours is to produce luscious fruit. Another disadvantage is that a very heavy crop of indifferent fruit one year may be at the expense of the next year's crop, through the exhaustion of the tree. It is better to have a moderate crop of fine Nectarines every year than a heavy crop of small fruits one year and none the next. Some prefer to leave the final thinning till after the stoning period, fearing more may drop then; but if the tree is healthy, thinning is done early, and the tree is well fed, there is little fear of this.

As soon as possible after the fruit is picked the tree should be pruned and nailed up for the winter, except in the case of the very early Nectarines, as the last week in August is soon enough for a final pruning. Some advise the complete unnauling of the trees every autumn, and the destruction of all old shreds. Where shreds are used this is doubtless an excellent plan, and it does not mean so much extra work as it appears to do. A better plan is to tie the branches to the nails with raffia, thereby affording less harbourage for insect pests, at the same time increasing the facility of releasing the branches from the walls. Early pruning has two advantages. None of the energy of the tree is wasted in maturing useless wood, and the young wood, by being nailed in early, and having plenty of sun and air by reason of the removal of all surplus wood and foliage, has a better chance of ripening. The proper ripening of the young wood

is one of the principal things to be looked to in Nectarine culture, hence the insistence upon it, failure of the blossom to set and the fruit to stone, as pointed out above, generally being the consequence of insufficient ripening of the wood. The young shoots keep on growing till so late in the season, and make so much leafage, that they need a sunnier clime to ripen them properly. Especially is this the case if young trees, before they have borne much, are given animal manure, when the growth is very sappy, even at the end of the summer, and is then subject to gumming, and rarely produces any fruit.

ALGER PETTS.

GARDENING OF THE WEEK.

INDOOR GARDEN.

CALADIUMS.

MANY of these are now beginning to show signs of desiring to go to rest, and therefore will not require quite so much attention. Those varieties that were started early will naturally have obtained their full development, and with these gradually reduce the supply of water to the roots, and place them in an airy position until the whole of their leaves have died away. Plants that were started into growth later will for a time keep their colouring, and to the roots of these give a dose or two of liquid manure.

Caladium argyrites and *C. erubescens*, when given proper attention, will continue to form crowns and to cast up new leaves until the end of the season, consequently the supply of water to their roots need not be reduced until quite the end of the growing season, viz., October.

A mistake too frequently made in preserving the bulbs of the two last-named varieties through the winter is, first, in resting or drying off the foliage too quickly; and, secondly, in placing, during the winter, the bulbs in a temperature that is much too cold.

POINSETTIAS.

These have in a general way been receiving very good attention, and those that were propagated early, if not already done, are quite ready to be placed in their flowering pots. Very large pots are unnecessary. Six, and in very few instances are 7-inch pots required.

A cool airy temperature, with the plants elevated well up to the glass, is necessary, and give shade from strong sunshine for a few days after repotting, as well as syringing to keep their surroundings moist. In a week or two's time a dose or two of liquid soot and manure water will help to build up the strength of the plants as well as support large bracts. Old cut-back plants may be given 8-inch and 9-inch pots, and with the compost for these mix a liberal amount of dried cow manure. For dwarf plants continue to propagate, the beginning of September being the latest period at which cuttings can be inserted to produce plants that during the present season can be expected to do any good.

ALLAMANDAS

that have flowered early would ripen their growth better if they were placed in a structure that is cool and well aired and sunny. No stimulants, liquid or solid, should be given to their roots, and the supply of water generally should be greatly reduced. Plants that have made a later growth and are now in flower may be given stimulants to help in the proper development of the flowers, as well as to strengthen and improve the condition of the plants generally.

GESNERA HYBRIDA.

These are excellent plants for flowering during the dull winter months, as not only are their varied-coloured flowers effective and pretty, but their leaves also are very pleasing. If not already accomplished, these should be given their final shift into flowering pots, the compost best suited being fibrous peat, with two-thirds loam, a small proportion of dried cow manure, and coarse silver sand. At all times care in applying water to their

roots is important; but in a moist, moderately warm atmosphere they will thrive luxuriantly.

J. P. LEADBETTER.

The Gardens, Tranby Croft, Hull.

KITCHEN GARDEN.

POTATOES.

THE weather has now become more showery, and it is unlikely that another long spell of dry weather will again set in. In several gardens I have noticed Potato haulms with a suspicious appearance, showing that the disease only requires suitable weather for its full development. Midseason varieties such as *Snowdrop*, *Windsor Castle*, and many other sorts ought to be lifted at once, especially where the tops show signs of ripening or where disease is prevalent. Choose a good day for lifting, and allow the crop to remain on the ground for a few hours to dry. Medium-sized tubers should be picked out for seed, always keeping more for this purpose than may be actually required to provide against loss by disease. Those for seed may be spread out in the open to green or placed in a dry, cool shed. Those for immediate consumption should be placed in a dark room or covered with soil in the open. Clear the ground of the haulm, weeds, &c., immediately, and if diseased burn them. If the vacant ground is not required for another crop this year it should be levelled and made as tidy as possible.

GLOBE ARTICHOKE.

This crop is now nearly over. All flower-stems should be cut down to the ground. If young heads are still showing they also should be removed unless they are still in request for the kitchen. This will do much to strengthen the plants. Now is a suitable time to apply a dressing of some reliable chemical manure, or what is perhaps better, a rich top-dressing of good farmyard manure. This is the season for making another plantation. Where young growths are coming up from the parent plants they should be lifted, and if set out on well-prepared land they will establish themselves before the winter begins. If the garden is cold and damp the young growths should be potted and given the protection of a frame during the winter months.

LEEKS.

Those planted out in specially prepared trenches and intended for competition will require special attention. Earthing up should be done frequently, a little at a time, and a liberal amount of stimulants must be given. Leeks for the main supply planted out in late July have now begun to grow. The hoe may be worked between the rows to fill in the holes made by the dibber. If the land is rich, no chemical manures need be given unless extra large roots are required.

CABBAGE.

The last sowing should now be made on a warm border. These may be used for planting out in plots for spring use, or may be transplanted into nurse-beds for spring planting. Winter Cabbages are now growing rapidly, and if in exposed positions should be well earthed up to prevent damage by wind. Blanks may still be filled up. If good strong plants are available and lifted carefully with a trowel they will experience little check.

Hopton House Gardens, Thomas Hay.
South Queensferry, N.B.

FRUIT GARDEN.

PEACHES AND NECTARINES.

THESE are generally considered our most tender and uncertain hardy fruits. This year the trees are carrying heavy crops of fruit, which promise to be above the average in size. *Alexander*, *Waterloo*, and other early varieties growing on south walls, which have now been cleared of fruits, have produced fine specimens of high colour and good flavour. These trees must be syringed with an insecticide if necessary to clear them of any insects, and freely syringed every afternoon along with later trees which are swelling their fruit. The growths on later trees are clean and healthy; trees carrying heavy crops should be well mulched and freely watered with liquid manure. Stimulants must be withheld from other trees only carrying

light crops or making too much wood, but at the same time they must have plenty of clear water. Tie in the shoots as required and keep them close to the wall, give them plenty of room for full development of their leaves, 6 inches being none to much to allow between the shoots. Keep the laterals closely pinched, and pinch out the points of any very strong shoots to keep the trees well balanced. Keep a sharp look out for earwigs, woodlice, or other insects pests, and endeavour to hold them in check by some of the many methods employed for reducing them. Remove or put aside any leaves which shade the fruits, which must be protected from birds and squirrels with netting; the latter are most troublesome here. Take notes of any trees which are not fruiting well or making too much growth, to be attended to later by being root-pruned. Any young trees which have not yet fruited should have any weak shoots removed and strong growths stopped to secure an even flow of sap over the whole tree.

APRICOTS.

As soon as the trees are cleared of fruit give them a thorough cleansing with the garden hose to rid them of insects. Do not allow the trees to suffer for want of water. Keep the laterals in check, and remove any strong growths not required. It is better to remove them at this season than to prune the trees severely in winter. Pay attention to young trees and encourage moderate growth by keeping the roots in check by root-pruning early in October if necessary.

PLUMS.

A second growth will have been made on trees which were stopped early. This must now be pinched back. Where the trees were well mulched and watered in much finer fruits may be expected for dessert. Protect the fruits of the finest varieties with hexagon netting or other material to keep off birds and wasps, or the best fruits will be spoilt before they are ripe.

STRAWBERRIES.

Any Strawberries that still require planting should receive attention as soon as the ground can be got ready for them. Early planting, which means finer fruit, well repays the little extra labour bestowed upon the plants at this season. Strawberries require a good depth of fairly heavy soil, freely manured for the preceding crop. A good crop to follow is early Potatoes, as these require the ground to be well cultivated during the summer, and very little preparation is necessary. In early planting the roots become well established and the crowns well ripened before the frosts.

Impney Gardens, Droitwich. F. JORDAN.

FLOWER GARDEN.

ROSE CUTTINGS.

In many instances Roses grown on their own roots are largely superseding those budded on the *Manetti* and other stocks. When advocating the own-root method of culture in preference to the older budded system, it is usual to bewail the comparative slowness of growth of such plants during the first two years, but this fault can with equal truth be found with budded plants.

Cuttings of many Hybrid Perpetuals of other strong-growing Roses root freely if inserted in the open ground in the autumn. But to be successful with Teas and any delicate varieties it is necessary to strike the cuttings under cover. When possible the cutting should be taken with a heel of old wood—a shoot from which a flower has previously been cut makes a capital cutting. The heel should be trimmed and the lower leaves removed; if the foliage is at all luxuriant it is advisable to cut off a few of the remaining leaves, usually the centre lobe of the leaf is sufficient. The best results are obtained when rather deep pots are used, so that the cutting may be inserted a good proportion of its length. The soil used should be of a sandy nature, and it is essential that the cutting be firmly inserted, and that it rests on its base. Give a good watering, and after the pots have drained place them on a gentle bottom-heat, admitting air for a short time daily, and wiping all moisture from the glass. After having taken the cuttings,

many growers prune the plants which have flowered to three or four buds, and a crop of late flowers is frequently the result.

ROUTINE WORK.

This consists of the daily round of cleaning and tidying. Weeds and dead flowers must be frequently removed. Although grass does not grow nearly so fast as during the spring and early summer, mowing must be done fairly frequently to keep the lawns trim. While the weather keeps hot and dry the knives must be set higher than usual or the lawns will burn quickly. As the cooler and moister weather sets in the knives should be gradually lowered again. Turf which was laid late in the spring has cracked badly in places. The crevices should be filled up with fine soil and sown with grass seed.

With the exception of *Calceolarias* and *Gazanias* the bulk of the bedding cuttings should be inserted during the present month, for early struck cuttings pass through the winter with few losses. Cuttings of *Pelargoniums* must be taken as opportunity occurs, but there are plenty on such plants as *Pansies*, *Pentstemons*, and *Antirrhinums*. For standard light-flowered *Heliotropes* I prefer to pot into 3-inch pots sufficient plants from the earliest struck batch. These kept growing through the winter, and potted on when necessary, are less trouble than old plants, and give equal if not better results, for when planted out into the beds they invariably grow away much faster than old plants.

A. C. BARTLETT.

Pencarrow Gardens, Bodmin.

ORCHIDS.

SOBRALIAS.

In a degree these may be termed unpopular on account of their long, thin growths and the short time the individual flower lasts, yet when a well-cultivated plant is seen in flower it never fails to command admiration, and if the hybridist can reduce the length of growth—and I have every hope that such will be the case in the near future—then the chief objection to these lovely Orchids will be removed. Although the individual flower only lasts a few days, the quantity produced by a strong reed makes the flowering season of a *Sobralia* a long one. In most cases the season is past and the second batch of young reeds are well advanced, enabling potting or dividing being done now in a compost of two parts fibrous loam, the other part made up of peat, leaf-soil, and sphagnum in equal quantities, mixed together with a liberal sprinkling of small crocks and sand. The pots should be filled one-third with clean crocks, using the largest possible, over which place some lumps of turfy loam. Pot rather firmly, keeping the compost below the rim of the pot and the crown of the plant on a level with the compost.

In the case of large specimens that are beginning to show signs of exhaustion, and further pot room cannot be given, divide before deterioration is too pronounced. The greatest care is necessary in this work. A certain number of roots must be sacrificed, but with care the outer ones may be saved. All damaged roots should be cut off above the broken point. The divided sections may then be remade into a specimen or potted up in smaller pots at the grower's discretion. The latter course is preferable, the best specimens being those obtained by potting on young vigorous plants. Those plants that are growing freely, and are as yet not of such size that further pot room cannot be given, should be given a shift, not disturbing the ball of the plant beyond liberating a few of the outside roots to enable them to quickly enter the new material. Never allow the reeds to become crowded as the new growths develop. The ones that have produced flowers must be removed gradually; then no check is given. If the situation afforded them is not to their liking, beyond making indifferent growth, thrips will be found very troublesome. A moist corner in the intermediate house is the most suitable, pure air and abundance of atmospheric moisture being essential. Overhead spraying is helpful on bright days during the greater part of the year. Newly-potted and especially divided plants require very careful watering till the roots have well

started again, and during the dull, short days of winter they must be allowed to become dry before more water is given. When grown in the intermediate house temperature at other seasons, strong established plants will take copious supplies.

CATTLEYA BOWRINGIANA.

This grand species may now be potted, using a compost of fibrous peat, two parts, the same of sphagnum, and one part of leaf-soil, mixed with some small crocks and coarse sand. The drainage given should be ample; make it up of a few crocks, over which place some rhizomes. On account of the deep-rooting nature of the plants pots are preferable to pans. They are well suited when given a position with the long-bulbed *Cattleyas*. It will now be necessary to constantly watch that water does not accumulate in the bracts on the sides of the young growths, so overhead spraying on this species should now be discontinued.

BOOKS.

Smith's Chrysanthemum Manual.
This is a handy little cultural treatise recently

SCOLOPENDRIUM VULGARE CRISPUM.

(Fronds 3 feet long.)

published by Mr. Elmer D. Smith, formerly the secretary of the Chrysanthemum Society of America, and is the result of a long experience with the flower. It is a neatly-got-up work in paper wrappers, with several illustrations in black and white, but, of course, the literary matter is more particularly intended for growers in the States. It is published by Nathan Smith and Son, Adrian, Michigan, U.S.A. Mr. Smith divides his work into fifteen chapters, and deals with every phase of Chrysanthemum culture likely to interest American growers. Thus we find chapters on the following subjects, viz.: History, stock plants, propagation, specimen plants, miscellaneous plants, packing plants, exhibition blooms, commercial flowers, insects, diseases, seedlings, sports, preparing exhibits, exhibitions, types, &c.

Bulletin de la Societe Francaise d'Horticulture de Londres.—Mr. George Schneider, the much-respected president of this society, may well feel proud that he has been able to see the fifteenth annual issue of the Bulletin of the French Horticultural Society of London. A

long and prosperous career has attended the society, and this largely the result of our old and valued friend's exertions in the interest of his young fellow-countrymen, who come to England to learn our language, and in most cases our business methods. The membership list grows apace, and happily in proportion the financial position also improves, a fact that cannot be said of every horticultural society we know of. It is commonly said by many of our Continental friends that the English are essentially a practical people, but it is evident that the officials of the French Horticultural Society, if not English, have at any rate learnt to be practical in the management of their society, and the results, as set forth in this year's bulletin, prove it to the highest degree. We may point out, as it is not too widely known, that besides finding situations for young French gardeners in England, the society is also open to find places on the Continent for young English gardeners, several of whom have been placed abroad. The bulletin is in the same form as usual, an excellent portrait of the late M. Godefroy-Lebeuf forming the frontispiece, with a short biographical notice from the pen of Mr. Schneider. Reports of the monthly meetings and the text of the papers read there are, as usual, given in the body of this always interesting publication, which we hope may long continue to make its annual appearance. We notice in the lists of members several important additions, horticulturists of note on both sides of the Channel being continually added in large numbers.

THE FERN GARDEN.

A FINE HART'S-TONGUE.

THE accompanying illustration represents a splendid specimen of one of the frilled or crispum varieties of this protean species, and gives a capital idea of its value as a decorative plant. Curiously enough, this plant and a row of others not shown, belonging to both the cristate and frilled sections, are all growing in the poorest possible soil, consisting mainly of coarse gravel. This is due to the fact that the cold fernery in which they are growing was built out from the dwelling-house over a narrow bed and a gravel path, which were left undisturbed, except that a row of large red tiles were bedded into the gravel to form a better path. Some time afterwards, having some odd divisions of the Hart's-tongues, these were dibbled into the said gravel just under the edge of the staging which was erected over the bed, and to our surprise they immediately commenced to make strong growth, and at the present time are all very much finer and robust specimens than any we can attain by careful pot culture. A curious fact is also that, despite their robust growth, they have little root-hold—so little that the specimen illustrated fell over on to the tiles when watered overhead, when it was seen that it was only sustained by a mat-like mass of brown aerial hairy roots spread over the surface and between the stones of the gravel, these evidently sufficing owing to the damp aerial conditions of a glass house. From this it may be deduced that the more such roots can be fostered by an open, lumpy compost the better. Further to test this point we installed an equal number of choice Hart's-tongue seedlings in two pans—one filled with a spadeful of gravel just as swept up from the garden paths, and the other with the best compost we could make of the ordinary kind. The result, however, is that while the seedlings in the gravel have done very well, those in the richer compost have done somewhat better, which we attribute to the shallowness of the pan and consequent large superficies of soil, which favoured aeration better than smaller, deeper pots can do, and thus permitted the plants to benefit by richer soil in this case. The fronds of the specimen depicted are over a yard long, and the frilling, as will be seen, is beautifully developed. It is clear, therefore, that the Hart's-tongue varieties are

peculiarly adapted for rockwork in cold conservatories, and in view of their great diversity both of size and form, ranging from a few inches up to a yard and more, and their perfect hardiness and evergreen nature, we cannot too strongly advise their introduction into such positions. There are at least a score of different crispums finely frilled and even with fimbriated lacy edges, plus in some cases beautiful tassels as well, so that a collection restricted to this section alone would well pay for the accommodation afforded.

CHAS. T. DRURY, F.L.S., V.M.H.

SOCIETIES.

NEWPORT AND COUNTY HORTICULTURAL SOCIETY.

THIS society was favoured with a fine day on the 4th inst. to hold its annual show, the place being King's High Field, Newport. Larger shows have been seen at Newport, though it was a good average one, the various classes being usually well filled; the exhibits were generally very good. The trade also did much towards making the show the success that it was, by filling a large space with choice subjects.

PLANTS.

For six ornamental foliage plants the first prize went to Mr. Duff, gardener to Mrs. Williams, Brynglas, Newport, who staged large plants of *Kentia fosteriana*, *Phoenix rupicola*, and *Sabal blackburniana*; Mr. Carpenter, gardener to J. Buckley, Esq., Llanelly, was a near second. For six stove and greenhouse plants much the best were shown by Mr. Lockyer, gardener to J. C. Hambury, Esq., Pontypool Park, who, amongst other things, staged a magnificent plant of *Ixora Duffii* (which was awarded a silver medal offered for the best plant in this class); Mr. Harris, gardener to G. F. Colbourne, Esq., was placed second. *Caladiums* were splendidly staged, Mr. Lockyer being placed first with six large fresh specimens; Mr. Powell, gardener to Colonel Wallace, Newport, second. Mr. W. J. Jones, gardener to R. P. Williams, Esq., led with six zonal *Geraniums*, and staged nicely-flowered, medium-sized plants. *Gloxinias* made a creditable class, Mr. Pegler having the best.

GROUPS.

Several classes were devoted to these, and being arranged close together they made one of the most imposing features of the show. The chief class, which was for a group in a space of 11 feet by 11 feet, brought two exhibits of almost equal merit, Mr. Carpenter, who is an old exhibitor in this district, however, secured the leading position, while Mr. Wood, gardener to H. Oakley, Esq., was the other exhibitor. Each of these exhibitors arranged graceful, effective groups, and employed suitable plants for the purpose. A group in a space of 50 square feet tempted four exhibitors, Mr. Powell, gardener to Colonel Wallace, being given the leading award, closely followed by Mr. Harris, gardener to G. F. Colbourne, Esq. For a similar group in 25 square feet, Mr. Jones, gardener to R. P. Williams, Esq., was first, and Mr. Wiggins second.

A class for a group of tuberous *Begonias* in 25 square feet was provided, and four good groups were arranged. The leading one was arranged by Mr. Mitchell, gardener to W. J. Orders, Esq.; Mr. Pegler, gardener to M. Morday, Esq., being placed second.

ROSES

were well but not largely shown, the first prize in the chief class (twenty-four varieties) was taken by Mr. S. Treseder, The Nurseries, Cardiff, his leading blooms being *Marchioness of Londonderry*, *Captain Hayward*, *Alfred Colomb*, *Gustave Piganeau*, *Charles Lefebvre*, Dr. Andry, Mrs. J. Laing, Marie Rodocanachi, and *Ulrich Brunner*; Messrs. Jaman and Sons, The Nurseries, Chard, Somerset, were a good second. Mr. S. Treseder was again placed first in a class for twelve Teas, and staged good blooms; Mr. W. Treseder, Cardiff, was a good second.

CARNATIONS.

For twelve blooms Mr. W. Treseder was first with large good blooms, slightly past their best; Messrs. Lupin and Sons were second. A collection of cut flowers of herbaceous plants, Lilies, &c., in a space of 12 feet by 3 feet was arranged by Mr. W. Treseder, who staged a choice selection, and was the only exhibitor. Mr. Bathurst, Iron Acton, had the best twelve glasses of Sweet Peas, staging leading varieties, as did also His Honour Judge Williams, and Messrs. Jaman and Sons, who were respectively placed second and third. A class for Sweet Peas arranged in a space of 9 feet by 3 feet was well filled by fine exhibits. Mr. Bathurst was again first, and Mr. Jones, Stow Hill, Newport, second.

DINNER TABLE DECORATIONS.

These filled a tent and attracted much notice, as they worthily deserved to do; a class for a round table laid for eight persons attracted seven exhibitors, of which Mrs. Brook Gratta had the best, and Mrs. Hollingdale the second. Tables of 4 feet by 3 feet also attracted the same number, and of these Mrs. Woodcock was placed first and Miss Dawson second. The exhibits in the above classes were really creditable displays, and the leading one greatly so.

FRUIT AND VEGETABLES

were in many instances well shown. The collection of the latter, for which Messrs. Sutton and Sons, Reading; Messrs. Wheeler and Son, Gloucester; Messrs. Carter and Co., High Holborn, London; Messrs. Garraway and Co., Bristol; Messrs. Clibran and Sons, Altrincham; and Mr. C. H. Thomas, Newport, offered special prizes were in most cases well contested.

There were several exhibits not for competition. Messrs. Lupin and Sons, Newton Abbot, had a fine display of *Carnations* and other cut flowers, for which they were awarded a gold medal. Silver medals were awarded to the King's Acre Nursery Company, Hereford, for a large exhibit of Roses; and to Messrs. Dennis and Co., the Floral Hall, Newport, for bouquets, vases of cut flowers, wreaths, baskets of fruit, &c. Messrs. Jaman and Co., staged Sweet Peas, Roses, *Cactus Dahlias*, herbaceous plants, *Begonias*, &c.; Messrs. Clibran and Sons, a large collection of herbaceous and other cut flowers; and Mr. E. H. Jones, Newport, *Carnations*, *Begonias*, *Crotons*, *Palms*, &c., while Messrs. Garraway and Co., Clifton, Bristol, had a good group of miscellaneous stove, greenhouse, Fern, and other decorative plants.

LLANELLY HORTICULTURAL SOCIETY.

THIS society recently held its annual show in the Market Pavilion, which affords ample space for gatherings of the kind, and on the occasion a very effective display was made, though it was said good as the show was better have been held at Llanelly. If this has been the case it certainly reflects great credit upon the officials and exhibitors, for the surroundings of Llanelly do not strike one as being, to say the least, favourable to horticulture. The society is probably endowed with ample pecuniary means; be this as it may, a good show was held, and everything connected with it appeared to pass off in a most satisfactory manner. Mr. Carpenter, gardener to W. J. Buckley, Esq., Pen-yfar—a well-known South Wales exhibitor—was one of the chief prize winners throughout. Mr. Barnes, gardener to E. Trubshaw, Esq., Acllybrau, was also a most successful exhibitor; also Mr. Lucas, gardener to C. W. M. Lewes, Esq., Stradey, Llanelly, Mr. J. Williams, Mr. George, and Messrs. J. and E. Jones.

There was only one class for groups, viz., in 100 square feet, and two capital arrangements were made, the best, a light, bright, graceful one, was set up by Mr. Barnes. Mr. Carpenter, who was lately placed first at Newport and second at Cardiff, had on this occasion to take the second place. He had, however, an effective and well-arranged group.

Cut flowers were extensively exhibited, many and very varied classes being provided. Sweet Peas, as is now commonly the case, made an imposing effect. The winning exhibitor in the leading class, viz., twelve glasses distinct varieties was Mr. J. Cleaves, who was closely followed by Mr. Wilkins. *Cactus Dahlias* made another excellent class, Mr. W. Treseder, Cardiff, who was first for twelve sorts, staged a fine set of well-finished fresh blooms. Mr. Treseder was also first with show Dahlias.

TRADE CLASS.

For the best trade exhibit to consist of plants, cut flowers, fruit, and vegetables, or the whole combined, a silver cup, valued at £5 5s., was offered as a first, and the Royal Horticultural Society's silver-gilt Flora medal as a second prize. Two very good collections were arranged, the leading one by Mr. W. Treseder, who had an excellent collection of herbaceous cut flowers, *Cactus Dahlias*, *Carnations*, zonal *Geraniums*, *Crotons*, *Palms*, *Ferns*, &c., together with some dishes of vegetables and fruit. Messrs. Parsons and Co. of Swansea, who were the other exhibitors, staged a fine group of *Gloxinias* in pots, backed by *Gladioli* in great variety, *Palms*, and *Ferns*.

Table decorations were very pleasing, Miss T. Evans, Llanganec Park, was first.

Fruit was generally fairly well staged, Mr. Hill (gardener to J. Mayberry, Esq.), Mr. Lucas, Mr. Barnes, Mr. Carpenter (the only exhibitor of Pine-apples), Mr. Runnalls, Mr. Wilkins, Mr. J. C. E. Jones, Mrs. Speck, and Mr. T. Williams being the principal prize takers.

THE BRITISH PTERIDOLOGICAL SOCIETY.

THE usual annual meeting of this society was held at Bowness-on-Windermere, on Monday, the 1st inst., when, owing to the unavoidable absence of the president (Dr. F. W. Stansfield of Reading), Mr. Charles T. Drury, F.L.S., V.M.H., one of the vice-presidents, took the chair. Both the secretary's and treasurer's reports demonstrated the success of the association financially and numerically, and as an item of the formal business of the meeting Mr. W. H. Phillips of Belfast was elected president for the coming year, Dr. Stansfield's professional duties having induced him to resign. Mr. Phillips, ranking as he does as one of the pioneers of the cult and the finder of a number of the choicest varieties, is undoubtedly peculiarly qualified for the position.

Mr. Drury, though unprepared for a formal address, emphasised the particular points which render the British Fern cult of special interest. In no other branch of horticulture is it possible to accumulate and exhibit splendid collections of distinct and beautiful varieties wholly and entirely independent of exotic or foreign introductions. For some reason British air seems to inspire Nature with novel ideas in the Fern direction, so that we are constantly being enriched with the results. He furthermore pointed out that, thanks to the careful records kept for the last half century and more, a mass of information has accumulated which is being recognised as of great value in connexion with the vexed question of variation and its laws. Obviously it is not dependent upon culture, as many thought, since all the marked types originate wild. The recent results of Professor Farmer's research, and embracing the discovery of an analogy between the forms of the cells in cancer and that of abnormal reproductive cells in Ferns, were also touched upon as additional evidence that the study of Ferns in their varietal forms could lead to results of immense value apart from the mere acquisition of more and more beautiful ones. Mr. Drury then read a paper on the British Polypodies, which will eventually appear in the society's report. A number of fronds and plants were exhibited for name, and among the latter was a beautiful new variety of the Hard Fern (*Blechnum spicant*) found in the Black Mountains, Ireland,

by Mr. W. Porter. This has a heavy flat foliose crest, divided into three on the lines of the Prince of Wales's feathers, and was consequently named *B. s. tricapitatum* Porter, and given a certificate of merit. Mr. Alexander Cowan exhibited fronds of a fastigate form of *L. dilatata* found in Scotland, another of Nature's novelties, and quite distinct from any known variety; *L. d. fastigiata* was the name given thereto. The society then resolved to meet at the same place and time in 1906, and with a hearty vote of thanks to the chairman the function concluded.

HASTINGS HORTICULTURAL SOCIETY.

AUGUST 10.

AFTER two years of financial failure the above society has succeeded in holding a successful show, having this year amalgamated with the Amusements Association. The show was considerably better than those of several previous years, three large tents being well filled, that portion set apart for cut blooms being by far the best, Mr. Alfred Gadd (gardener to P. A. Eagles, Esq., Meophams Bank, Hollington), Mr. James Duke (gardener to Mrs. Stoue, Castleham, Hollington), Mr. E. Seymour (gardener to J. H. Upson, Esq., Hollington Park, St. Leonards), Mr. G. Grigg (gardener to the Earl of Ashburnham, Ashburnham Place), and Mr. W. Peters (gardener to Miss Penrhyn, Holmhurst, Baldslow) were the chief prize winners.

The *Dahlia* classes were scantily filled, but what there were were good. Messrs. James Stredwick and Son, Silverhill Park, St. Leonards, were first for twelve bunches of *Cactus*, six in a bunch, showing chiefly new unnamed varieties, notably white, and a new one named *Radium*, of very beautiful colouring, and two striking pink flowers. Mr. W. Peters had the best twelve bunches of *Pompons*, six in a bunch. Messrs. W. Apps and Son showed a fine lot of hardy perennial and bulbous flowers in twelve bunches, followed by another fine collection from Mr. W. Peters.

Sweet Peas in twelve bunches of twenty-five spikes were a feature of the show, Mrs. Brewer, The Oast, Beckley, taking the lead with a beautifully clean and tasteful lot of bunches.

As is usually the case at Hastings the contest for the table decoration prizes was very keen, and this year Mrs. Jenner, Beaufort Lodge, carried off the first prize.

Fruit was not well shown, but creditable Grapes were on view. Mr. G. Grigg and Mr. J. Gore were the principal winners. One of the best exhibits in the show was that of Mr. J. Gore, a collection of ten dishes of fruit, his Grapes, both black and white, being very good.

Probably the most severely contested class in the show was that for collection of Potatoes, six varieties of nine each, to be correctly named, first prize a silver medal and 10s. This brought up sixty dishes, the greater part being splendid examples. The winner was Mr. A. J. Kemp (gardener to A. J. Barry, Esq., Castfield Place); second, Mr. G. C. Lyon, Alexandra Park; third, Mr. W. Peters.

Another silver medal, offered by Messrs. J. Stredwick and Son for six bunches of *Cactus Dahlias*, three in a bunch, was won by Mr. F. Grinstead, Beaufort Park, Battle, who had, amongst others, the new variety *F. M. Stredwick*.

Messrs. Arthur Charlton and Son, Summerville Nursery, Tunbridge Wells, put up a large exhibit of herbaceous flowers.

CARDIFF GARDENERS' ASSOCIATION.

THE eighth annual outing took place on Monday, the 8th inst., when over sixty members left Cardiff at 5.40 a.m. in special saloon carriages for Reading to pay a visit to Messrs. Sutton and Sons, the Royal Seed Establishment. The party was met at Reading Station by Mr. H. G. Cox, who escorted the members to the Royal entrance, where they were met by Mr. M. F. H. S. Sutton. The chairman (Mr. T. Clarke) and hon. secretary (Mr. John Julian) signed the visitors' book. Mr. Sutton then gave a brief and welcome address to the party, who afterwards proceeded to view the various branches of the gigantic warehouses. Great interest was manifested by the methods of seed-testing and recording results, also seed-cleaning and storing. The vast suite of offices were inspected, where correspondence is executed dealing with business throughout all parts of the world. The methods adopted are simplified to the minutest detail. Proceeding by special trams the trial grounds were next inspected, together with the various greenhouses. Batches of *Gloxinias*, *Begonias*, and *Tomatoes* deserve special mention. *Tomatoes* were cropping extraordinarily well. Many other things of considerable interest were noted.

At 12.30 Mr. A. W. Sutton entertained the party to luncheon in the beautiful conservatory which stands in the grounds. Mr. T. Clarke proposed the health of "The Firm" of Messrs. Sutton and Sons, and in a few well-chosen words thanked Mr. Sutton for the hospitality extended to the members of the Cardiff Gardeners' Association. Mr. Sutton replied, and in his short and valuable address gave a few interesting incidents as to how the firm had risen. Mr. John Julian next proposed the health of "The Assistants" (Messrs. Deane, Cox, Macdonald, Bennett, and Plumer), who, he said, had done all they could to show everything of interest in the various departments. Messrs. Deane and Cox responded.

A move was then made for the river, where a steam launch was in readiness to convey the party down stream to Park Place, Henley-on-Thames (the residence of Mrs. Noble). Arriving there, Mr. Powell, the head gardener, took them over the place. The beautiful specimens of Cedars were greatly admired, as also were many other fine trees surrounding the residence. The scenery from this spot is charming.

Re-embarking for the return trip to Reading, the party repaired to the St. George and Dragon Hotel, Henley, for refreshments. The return train left at 9.5 p.m. Just before reaching Devizes an accident occurred; happily, beyond a severe shaking no one was hurt, and after an hour's delay the train proceeded, reaching Cardiff at 2.30 a.m. The arrangements were carried out in a most satisfactory manner by the hon. secretary.

SHREWSBURY FLORAL FETE.

THE thirtieth great annual floral fête of the Shropshire Horticultural Society was held in the Quarry Grounds, Shrewsbury, on Wednesday and Thursday last. On the opening day heavy rain fell unceasingly until the afternoon, and a thunderstorm broke over the town in the morning. The rainfall was so heavy that it was almost necessary to have the protection of an umbrella in some of the large tents, surely sufficient to damp the ardour of the most enthusiastic flower lover. However, Shrewsbury Floral Fête is a red-letter day, not only in the picturesque old town itself, but to thousands of dwellers in the thickly-populated neighbourhood, and sunshine or rain seems not appreciably to affect the attendance. Visitors in the morning were comparatively few, but in the afternoon the tents were thronged. As we write the weather improves, and it is safe to predict an enthusiastic and numerous "gate." No one pretends that the thousands of excursionists come to Shrewsbury Fête solely to see the flowers, for the numerous other attractions in the Quarry Grounds are ample evidence to the contrary. Nevertheless, there are few who do not make the round of the tents, and it is safe to say that at no other provincial show is there so much to be seen. One Shrewsbury show is very much like another, as all such great displays must necessarily be. There is always an attraction in seeing the best of plants, flowers, and fruit that brains and labour can produce, however, and long may this grand exhibition receive the patronage it deserves. To turn for a moment to some special features of the Fête. The hardy flowers made a brilliant show; sweet Peas were a host in themselves; Dahlias and Roses were not so good as usual; the groups and specimen plants were much the same as they always are; Carnations and Begonias were splendid; the black Grapes were much better than the white; the Peaches and Nectarines were beautifully coloured; the bouquets and floral displays were a credit to the designers, and the non-competitive exhibits were one of the features of the show. The white Grapes were weak all through the great champion class, though there were some magnificent bunches of black varieties. Mr. W. Shingler has now twice won the fifty guinea challenge cup, and may he soon become its possessor.

The decorated dessert tables seem to gain rather than lose by the exclusion of Orchids. These are often indiscriminately used with other flowers, and with bad effect. To venture upon a few criticisms we would say that it seems absurd to give prizes for decoration in a class so small as that for nine dishes of fruit. There is absolutely no scope for decoration at all; the first prize decoration consisted of two small glasses filled with sprays of *Oncidium* and some *Smilax*. It is a great pity that the naming of varieties of fruits is not enforced. A visitor sees a Melon, a dish of Peaches or Nectarines that obtains first prize, and he naturally wants to know which one it is, and it is disappointing to find no name attached. It is wearisome to see the same formally-trained specimen plants winning the same prizes year after year, and we would suggest that exhibitors be encouraged to grow and show them in a more natural manner after the style of the plants of *Ixora Duffii* and *Allamanda Williamsi* in the first prize collection of Mr. T. Lambert of Oswestry. These were the two most beautiful specimen plants in the show to our mind, and we feel sure that to encourage the culture of such would be well worth while. The plant of *Ixora Duffii*, with its large heads of rich orange-red flowers disposed loosely, was admired by everyone. To pioneer a large exhibition such as this to a successful conclusion requires tact, energy, and resource, and although we are repeating what we have stated before, we do not hesitate to say that the honorary secretaries, Messrs. Adnitt and Naunton, deserve the best thanks of the flower-loving public for their untiring labours in connexion with the Shrewsbury Floral Fête.

PLANTS.

Fifteen stove or greenhouse plants: First, Messrs. J. Cypher, Cheltenham, *Statice intermedia* and *Dipladenia regina* being very fine. Mr. W. Vause, Leamington, was second with very large *Crotons*, *Bougainvilleas*, &c.

Six stove or greenhouse plants: First, Messrs. Cypher, with *Erica austriana* and *Ixora Williamsi* very good; second, Mr. W. Vause, Leamington; third, Mr. B. Cronwell, gardener to T. Sutton Timmis, Esq., Allerton.

Group of miscellaneous plants, 300 square feet: First, Messrs. Cypher and Son, with a charming display, foliage and flowering plants pleasingly blended. The white Lilies and white *Phalenopsis* and *Odontoglossums* were in striking contrast to the brightly-coloured *Crotons*, &c.; second, G. H. Kendrick, Esq., Edgbaston, with a group in which foliage plants were rather too numerous; third, Mr. W. Vause, Leamington.

Group of ornamental foliage plants, Palms, Ferns, &c., 300 square feet: Mr. Cypher, Cheltenham, was first with a display in which *Crotons* were largely used, and their splendid colouring undoubtedly largely helped to Mr. Cypher's success. They were well grown and boldly grouped. *Aralias*, *Strobilanthes*, *Alcasias*, *Anthuriums*, *Bamboos*, and Palms, too, were tastefully interspersed. Mr. J. V. Macdonald, gardener to G. H. Kendrick, Esq., Edgbaston, was second. A splendid Palm towered high in the centre, and from a groundwork of *Crotons*, *Aralias*, *Abutilons*, Ferns, &c., splendid plants of *Acalypha macaefesna* stood out. Mr. G. Hancock, West Bromwich, was third.

Thirty stove or greenhouse plants: Mr. T. Lambert, Oswestry, was first with a really very pretty group. The plants were not stiffly trained, and therefore much more effective. *Allamanda Williamsi* and *Ixora Duffii* were very fine, the latter particularly so; Mr. Cypher was second with well-bloomed plants also; third, T. Sutton Timmis, Esq., Cleveley, Allerton. *Lapageria rosea superba* was very beautiful, trained in pillar form. Mr. Cypher showed the best stove or greenhouse plant in *Ixora Williamsi*.

For a group of tuberous Begonias in pots Mr. F. Davis, Woolashill, Pershore, won the first prize with some splendid plants, chiefly double varieties; second, Messrs. T. S. Ware and Son, Limited, Feltham. There were numerous other

classes for pot plants, e.g., for *Gloxinias*, *Coleus*, *Fuchsias*, Ferns, &c. The classes for groups and pot plants, open to residents in Salop only, brought some good exhibits.

PRIZE FOR NEW PLANTS.

Messrs. William Bull and Sons, King's Road, Chelsea, offered a handsome silver cup—of which we give a reduced illustration—value 10 guineas, and a money prize for the best six new plants sent out by them. The successful exhibitor was Mr. James Vert, gardener to Lord Howard de Walden, Saffron Walden, who showed the following: *Ceropegia Woodii*, *Ficus radicans variegata*, *Anemia rotundifolia*, *Heliconia illustris*, *Dracena Victoria*, and *Davallia lucida*.

FRUIT.

There were four competitors in the class for a dessert table decorated with plants in small pots, foliage, and cut flowers, Mr. Goodacre, Elvaston Castle Gardens, being first with 121 points. Full points were obtained for Apple Ribston Pippin, and other good dishes were Pears Williams Bon Chrétien and Souvenir du Congrès, Grape Madresfield Court, and Pine-apple Nectarine. The decoration was very effective, *Schizanthus* and *Francoa* being chiefly used. Mr. G. Mullins, Eastnor Castle Gardens, Ledbury, was second with 116 points. No maximum points were obtained, though nine out of ten were given for general arrangement. *Francoa* and a rose-red *Potentilla* were chiefly used. Melons, Pears, Nectarines, Peaches, and Figs were very good. Mr. Dawes, Temple Newsam Gardens, was third with 95 points. Mr. T. Jones, gardener to Mrs. Need, Malvern, won the fourth prize with 91 points.

In the champion Grape class, for twelve bunches of Grapes in four or more distinct varieties, the first prize was a silver

SILVER CUP PRESENTED BY MESSRS. WILLIAM BULL AND SONS FOR SIX NEW PLANTS AT THE SHREWSBURY FLORAL FETE.

(Won by Mr. James Vert, gardener to Lord Howard de Walden.)

cup value 50 guineas, which must be won three times to become the property of the winner. First, Mr. W. Shingler, gardener to Lord Hastings, Melton Constable, with 115½ points out of a possible 121. He obtained full points for Muscat of Alexandria twice, Gros Maroc twice, and Madresfield Court, all of which were very good bunches. The award of full points to the two bunches of Muscat of Alexandria caused some little surprise, as one bunch distinctly lacked colour, and the other was hardly of perfect form. Most of the white Grapes lacked colour. Mr. Goodacre was second with 109½ points, obtaining full points for none. This exhibit obtained second prize for decoration. Messrs. D. and W. Buchanan, Kippenby-Stirling, were third with 106 points; they did not obtain maximum points for any bunch. Mr. G. Mullins, Eastnor Castle Gardens, was fourth and first for decoration, using small *Crotons* and *Eulalias* in pots, *Francoa*, *Lychnis*, and *Gypsophila* in glasses, and Asparagus on the table. The third prize for decoration was won by Mr. E. Dawes, Temple Newsam Gardens, who was placed fifth for Grapes.

Sixteen dishes of fruit (separate prizes for decoration): Mr. J. H. Goodacre, Elvaston Castle Gardens, was first for fruit and second for decoration. Apple Gascoigne's Scarlet, Nectarine Lord Napier, and Grape Madresfield Court were excellent. Mr. G. Mullins, Eastnor Castle Gardens, Ledbury, was second, winning the third prize for decoration.

Nectarine Stanwick Elruze, Grape Gros Maroc, and Pear Triomphe de Vienne were very good dishes. Mr. F. Jordan, Impney Hall Gardens, was third for fruit and first for decoration. He used cut *Odontoglossums*, *Cattleya*, *Francoa*, *Montbretias*, &c., and pot plants of *Croton* and *Chironia ixifera*.

Collection of twelve dishes of fruit (separate prizes for decoration): Mr. J. Dawes, gardener to Lord Biddulph, Ledbury, won the first prize with an excellent lot of fruit. Peach Sea Eagle was a splendid dish. The first prize for decoration was also awarded to this exhibit. *Francoa*, a single-flowered zonal *Pelargonium*, and *Gypsophila* were used. Mr. J. Jones, gardener to Mrs. Need, Malvern, was second for fruit and also for decoration. The white Grapes were poor in both exhibits. There were no other competitors.

Collection of nine dishes of fruit (separate prizes given for decoration): First, Mr. C. Roberts, gardener to Mrs. Swan, Halston Hall. The first prize for decoration was also awarded to this exhibit. Peach Alexandra Noblesse was very fine. The decoration consisted of sprays of a small-flowered *Oncidium*. The second prize was won by Mr. Charles Wilkes, gardener to C. F. K. Mainwaring, Esq., Ellesmere; second prize for decoration also. Third for fruit and for decoration, Mr. J. Langley, gardener to the Rev. T. M. Bulkeley, Tedsmore Hall.

GRAPES.

Mr. T. Lambert, Oswestry, had the best four bunches of Grapes, two black and two white, with very good Mrs. Pince and Muscat of Alexandria; Mr. C. Wilks, gardener to C. F. K. Mainwaring, Esq., was second, and Lord Trevor (gardener, Mr. W. Dawes) third.

Mr. Goodacre, Elvaston Castle Gardens, showed the best two bunches of Black Hamburg; Mr. A. Ruddock, gardener to E. A. Young, Esq., Bangor, was second, and Mr. Wilson, gardener to J. Brinton, Esq., Moor Hall, Stourport, third.

The best single bunch of Black Hamburg was shown by Mr. A. Ruddock, gardener to E. A. Young, Esq.; Mr. W. Dawes, gardener to Lord Trevor, being second; and Mr. G. Mullins, gardener to Granville Farquhar, Esq., Eastnor Castle, third.

Messrs. D. and W. Buchanan, Stirling, were first for two bunches of Black Muscats, showing Madresfield Court well coloured; Mr. Goodacre was second, and Mr. A. Ruddock third.

For two bunches of Madresfield Court, Mr. T. Lambert, Oswestry, was first; Mr. W. Shingler second, and Mr. Goodacre third.

Mr. J. Dawes, Ledbury, had the best two bunches of Alicante; Mr. C. Richardson, gardener to J. Bayley, Esq., Llanfairfechan, being second.

For two bunches of any other black Grape, Mr. Wilkins, gardener to C. F. K. Mainwaring, Esq., was first with Gros Maroc; second, Mr. Shingler with the same variety; third, Mr. Goodacre.

For two bunches of White Muscat, Mr. Goodacre was first; Mr. C. Richardson, Llanfairfechan, second, and Mr. J. Dawes, Ledbury, third.

Mr. Goodacre also had the best single bunch of White Muscat; Mr. F. Jordan, Impney Hall Gardens, being second, and Mr. C. Richardson third.

For two bunches of any other white Grape, Mr. J. Brown, gardener to J. Ivake, Esq., Market Rasen, was first with Mrs. Pearson; second, Mr. J. Mills, gardener to Captain Heywood Lonsdale; third, Mr. Lawley, gardener to Mrs. R. Darby, Adeote Hall.

Mr. R. Grindrod, gardener to Major Clive, Hereford, had the best dish of Apricots, showing very good Early Red; Mr. J. Dawes, gardener to Lord Biddulph, Ledbury, was second; and Mr. Humphrey, gardener to the Earl of Chesterfield, third.

Mr. J. Durnell, West Felton Gardens, Oswestry, had the best flavoured green flesh Melon (not named); Mr. C. Ritchings, Guernsey, being second; and Mr. B. Ashton, gardener to the Earl of Lathom, third.

Mr. E. Clowes, gardener to E. C. Pelle, Esq., Shrewsbury, was first for the best flavoured scarlet flesh Melon (no name); second, Mr. W. A. Webster, Paul's Moss Gardens, Whitchurch, with Blenheim Orange; third, Mr. J. Stalker, Madeley.

The best white flesh Melon (not named) was shown by Mr. J. Barson, gardener to the Earl of Sandwich, Huntingdon; second, Mr. R. Grindrod; third, Mr. W. Phillips, Leighton House Gardens.

Mr. W. Dawes, gardener to Lord Trevor, showed the best two bunches of Black Hamburg in the class open to Salop only. There were similar classes for two bunches of Madresfield Court: First, Mr. Mills, gardener to Captain Heywood Lonsdale. Two bunches of black Grapes: First, Mr. T. Lambert, Oswestry. Two bunches of White Muscats: First, Mr. James Mills, gardener to Captain Heywood Lonsdale. Two bunches of white Grapes: First, Mr. W. Dawes, gardener to Lord Trevor.

Mr. Goodacre showed the best yellow Plums (Jefferson), the best purple Plums (Kirke's), and the best Gage Plums (Transparent Gage). Mr. A. Ruddock sent the best dish of Cherries.

Mr. T. Barson won the first prize for a dish of Nectarines with beautiful fruits; second, Mr. Goodacre; third, Mr. W. A. Webster, Whitchurch. Mr. B. Ashton sent the best dish of Peaches (Royal George); second, Mr. J. Dawes, Ledbury; third, Mr. R. Grindrod, Hereford.

CUT FLOWERS.

Collection of Cactus or decorative Dahlias: First, Mr. W. Treseder, Cardiff, with, needless to say, beautiful flowers attractively arranged; Mr. S. Mortimer, Farnham, was second; Messrs. Keynes, Williams and Co., Salisbury, third. This class made a charming display. Among the new seedlings were Mrs. J. S. Brunton (yellow Cactus) and Blush Queen (deep rose Cactus, with white centre).

Mr. W. Treseder, Cardiff, was also first for a collection of Dahlias, any varieties, with a bold display of show and Cactus sorts; Messrs. M. Campbell and Son, High Blantyre, were second with a less striking display; Messrs. Keynes, Williams and Co., Salisbury, were third.

Mr. Maurice Prichard, Christchurch, Hants, was first in the class for a collection of hardy perennials, making a splendid show of good things. Gladioli, Tritomas, Gaillardias, Lilies, Phloxes, Montbretias, &c., were very fine. Second, Messrs. Harkness and Son, Bedale, Yorks, the bunches of flowers too compactly set up; third, Messrs. Cocker and Sons, Aberdeen.

For a collection of cut Carnations and Picotees, with their own foliage and buds, not dressed, Mr. W. A. Watts, Bronwylla, St. Asaph, won the first prize with a very beautiful display. Four of his varieties obtained awards of merit, and are mentioned elsewhere. Mr. A. E. Dutton, Bexley Heath, London, was a good second, having his blooms very attractively arranged. For a similar collection (trade excluded) Mr. W. B. Vernon, Oswestry, was first.

For twelve vases of Carnations and Picotees Mr. A. R. Brown, Handsworth, Birmingham, was first, and for twelve bunches of cut flowers, stove and greenhouse, the first prize was won by Mr. Cromwell, gardener to E. Sutton Funnis, Esq., Allerton.

SWEET PEAS

For the best exhibit of eighteen distinct varieties of Eckford's Sweet Peas (prizes by Mr. Eckford) Mr. T. Jones, Ruabon, was first with a lovely lot, Dorothy Eckford, Black Knight, and Mrs. W. Wright being especially fine; Mr. T. Duncan, Duns, N.B., was second.

For twelve distinct varieties (prizes by Mr. Robert Sydenham) W. H. Banks, Esq., Kingston (gardener, Mr. Barnfield), was first, Lord Rosebery and Dorothy Eckford being unusually fine; Mr. T. Duncan, Duns, was second with lovely Miss Willmott, Dorothy Eckford, and Countess Spencer; third, Mr. T. Jones, Ruabon.

For six vases of Sweet Peas (prizes by Messrs. Jones and Son, Shrewsbury) Mr. C. Peplow, Binton Heath, was first.

Mr. W. H. Banks won the first prize in the open class for twelve distinct varieties of Sweet Peas with a beautiful lot; Mr. C. Peplow being second.

FLORAL DECORATIONS.

For bouquets, Messrs. Jenkinson and Son, Newcastle, Staffs, were first with very beautiful arrangements of Odontoglossums, Oncidiums, and Lælias; second, Mr. F. Gault, Kilmacolin; third, Messrs. Felton and Sons, London.

For one bride's bouquet, Messrs. Jenkinson were again first; the other winners were Mr. W. J. Garner, Altrincham, and Mr. Gault.

For a bouquet of flowers, Messrs. Jenkinson again were first; second, Mr. W. J. Garner; third, Messrs. Felton.

For a shower bouquet of Dahlias, Messrs. Felton won with a bright scarlet, Mr. W. J. Garner second. Messrs. Pope and Sons were first for a bouquet of flowers.

For a floral cross Messrs. Felton won with a charming arrangement; Messrs. Pope and Sons and Mr. W. Treseder, Cardiff, were the other prize-winners.

For a floral harp, Mr. W. Treseder was first, Messrs. Pope second, and Messrs. Felton won the remaining award.

Basket of flowers: First, Mr. O. Robinson, Aberly Edge, with a brilliant display, Lælias and Odontoglossums being relieved by highly-coloured Croton foliage; Mr. M. E. Jones was second, and Messrs. Felton third.

Hand-basket of cut flowers: First, Messrs. Felton; second, Mrs. M. E. Jones.

Floral wreath: First, Messrs. Felton; second, Mr. W. Treseder.

Stand of cut flowers: First, Messrs. Felton.

VEGETABLES.

Collection of nine distinct kinds (prizes presented by Messrs. Sutton and Sons): The premier award was set up by Mr. E. Beckett, gardener to the Right Hon. Lord Aldenham, and contained some fine produce, including Ailsa Craig Onion, New Red Intermediate Carrot, Sutton's Perfection Tomato, Sutton's Solid White Celery, Best of All Runner Beans, Sutton's Prize-taking Leek; second Mr. B. Ashton, gardener to the Right Hon. the Earl of Lathom, with a good lot; third, Mr. W. Leith, gardener to Colonel O. R. Middleton.

Nine distinct kinds (prizes presented by Messrs. R. Smith and Co.): Mr. E. Beckett again was first; Mr. B. Ashton was second with fine King Edward VII. Potatoes, &c.; third, Mr. R. A. Horspool.

For nine distinct kinds Mr. E. Beckett again led with good Ailsa Craig Onion, Carter's Standard Bearer Celery, Autumn Giant Cauliflower, Duke of York Tomato, &c.; Mr. B. Ashton again a second, having fine Elephant Peas, &c.

For eight distinct kinds (prizes given by Mr. Edward Murrell): Mr. R. C. Townsend, gardener to J. E. Akroyd, Esq., Chalfont Park, Bucks, was first, having good Potatoes, Onions, Runner Beans; second, Mr. E. Jones, gardener to the Misses Howell, Rhieuport; third, Mr. E. Walker, gardener to Sir W. Honyman, Bart., Whitchurch.

For six kinds (prizes by Mr. E. Murrell): Mr. J. Abbot, gardener to Mrs. Guire, Hadnall, had the leading lot; second, Mrs. Tinsley, Whittington; third, Mr. J. Clowes, gardener to G. F. Ward, Esq., Hadnall Hall, all unnamed.

Six distinct kinds (prizes by Messrs. Webb and Sons): Mr. B. Ashton held the coveted position with grand Potato New Empire, Onion Ailsa Craig, Carrot New Prize-winner, Cauliflower Webb's Autumn Giant, and Pea New Masterpiece; second, Mr. W. L. Bastin, gardener to Sir A. Henderson, M.P., Farlington; third, Mr. W. Pope, gardener to the Earl of Carnarvon, Highclere Castle. Eight entries.

Collection of vegetables, twelve kinds: Mr. E. Beckett was again successful, staging finely throughout; second, Mr. L. Bastin; third, Mr. R. A. Horspool.

Collection of nine kinds: Mr. J. Mills, gardener to Colonel Heywood Lonsdale, Sharnington, Mr. T. Birch, gardener to Colonel C. W. Herbert, Osleton Hall, and Mr. John Delauney were first, second, and third respectively.

Three dishes Potatoes: Mr. B. Ashton led with splendid examples of Sutton's Ideal, Sutton's Reading Russet, and General Buller; second, Mr. E. Cumberland; third, Mr. W. Pope, out of eleven entries.

Six Tomatoes: First, Mr. J. Weston; second, Mr. J. Jones, gardener to Mrs. F. Need.

Mr. Robert Sydenham, Tenby Street, Birmingham, offered numerous prizes for vegetables, and Messrs. Hewitt and Co., Birmingham, Messrs. John King and Sons, Reading, Mr. John Wilson, Hereford, and Messrs. Pritchard and Sons, Shrewsbury, also offered prizes.

NON-COMPETITIVE EXHIBITS.

Messrs. James Veitch and Sons, Limited, Chelsea, exhibited a group of miscellaneous plants, that included Nepenthes, Crotonus, Ferns, Abacassias, Bracaea Doucetti, Ivoras, Caladiums, &c., all well grown and boldly grouped. A small group of Orchids in the centre added a bright touch of colour. Messrs. Veitch also showed *Buddieia variabilis* veitchiana, not grown, and bearing racemes of flowers 15 inches to 18 inches long.

Messrs. Hobbies, Limited, Dereham, made a delightful display with Dahlias and Roses.

Mr. Angus, Penicuik, showed *Chrysanthemum maximum* King Edward, C. Robinson, and Carnations.

Messrs. Jarman and Co., Chard, had a very bright display of cut Roses, Pelargoniums, Dahlias, Sweet Peas, and hardy flowers.

Messrs. Reamshotton and Co., Alderborough Nurseries, Geashill, King's County, exhibited their beautiful Anemones in many shades of colour. King of Scarlets and Salmon King were two of the finest varieties.

Mr. George Prince, Longworth, Berks, exhibited a stand of garden Roses, comprising many lovely bunches, as well as some fine blooms of Frau Karl Druschki.

Mr. A. J. Bruce, Charlton-cum-Bardy, showed an interesting collection of Sarcocolla, Durlingtonias, Pinguiculas, &c.

Mr. John Forbes, Hawick, showed some very fine Pentstemons, Phloxes, and miscellaneous hardy flowers, as well as cut blooms of Carnations and Dahlias.

The Pansies from Messrs. Dobie and Co., Rothesay, made a delightful show, especially those shown in bunches.

Messrs. Peed and Sons, West Norwood, exhibited a large bank of Gloxinias in many beautiful shades of colour.

The Sweet Peas from Messrs. Jones and Sons, Shrewsbury, as well as their Dahlias and Carnations, were very bright and much admired. Messrs. Jones also showed a variety of floral designs.

The large group from Messrs. Webb and Sons, Worsley, contained Gloxinias, Sweet Peas, Holyhocks, Gladioli, and other hardy flowers in excellent variety.

Mr. Edwin Murrell, Shrewsbury, had some very good Roses, both in pots and bunches. Single blooms of Frau Karl Druschki and Soleil d'Or (hybrid Austrian Briar) were very attractive.

Messrs. Felton and Sons, Hanover Square, W., exhibited a group that contained Lilies, Crotonus, small Cacti, Lilies of the Valley, &c.

Mr. Bonskell, Market Bosworth, showed hardy flowers extensively and in great variety. Phloxes were finely shown by Messrs. Green and Sons, Olton, Birmingham.

The King's Acre Nursery Co., Hereford, exhibited fruit trees in pots and a collection of Apples, as well as hardy flowers in variety.

From Baker's, Wolverhampton, Dahlias were well and extensively shown, as also were Pelargoniums, Roses, and hardy flowers in great variety, making a splendid display altogether.

Messrs. Dicksons, Limited, Chester, had some splendid *Lilium auratum* in their group of hardy flowers, as well as some fine Gladioli. They also showed a collection of really well grown stove plants.

The zonal Pelargoniums from Mr. Albert Myers, Shrewsbury, made a most attractive display, and the Cacti in small pots from Mr. Richard Anker, Addison Nursery, Kensington, were interesting.

Messrs. Thomas B. Dobbs and Co., Wolverhampton, exhibited rustic work, decorated with various plants.

Messrs. Isaac House and Son, Westbury-on-Trym, exhibited a splendid display of Phloxes, Pentstemons, Tritomas, and other hardy flowers.

Messrs. T. S. Ware, Limited, Feltham, showed a bright display of tuberous Begonia plants in pots, the flowers large and of good colouring.

Messrs. B. R. Davis, Yeovil, showed fine cut blooms of tuberous Begonias in many lovely shades of colour.

Messrs. Laing and Nether Kelso, showed a most attractive group of Carnations in many beautiful sorts.

Messrs. R. Smith and Co., Worcester, had a brilliant bank of hardy flowers, as Lilies, Tritomas, and Phloxes, backed by Palms and Bamboos.

Messrs. Hewitt and Co., Solihull, showed Carnations and other hardy flowers.

Mr. L. E. Russell, Richmond, Surrey, exhibited a group of exceedingly well-grown and finely-coloured stove plants.

Messrs. Pritchard and Son, Shrewsbury, showed table decorations and Ferns.

Mr. J. H. White, Worcester, exhibited a splendid lot of hardy flowers in great variety.

Messrs. Clibran, Altrincham, exhibited a brilliant group of their gold medal strain of Celosias.

Mr. W. L. Pattison, Shrewsbury, showed Violas and Pansies extensively, and Mr. J. E. Knight, Wolverhampton, arranged a small group of Chrysanthemums.

Mr. John Derbyshire, Ashley Road, Hale, Altrincham, exhibited a large collection of Sweet Peas, and Mr. G. Fitzherbert, Wrexham, sent flowers of tuberous Begonia seedlings.

Mr. Henry Eckford showed a delightful lot of Sweet Peas, among which Scarlet Gem was noticeable. Mr. Harold B. Golden, Moberley, also showed Sweet Peas.

Mr. Vincent Slade, Tamton, exhibited some very fine zonal Pelargoniums.

Messrs. W. and J. Brown, Stamford, showed Roses and Carnations, and Mr. G. Penwill, Totnes, sent his new Raspberry Penwill's Champion.

Mr. Joseph Lambert, Southport, showed Carnations, and Mr. Robert Bolton, Warton, Carnforth, Sweet Peas.

AWARDS.

Large gold medals were awarded to Messrs. Jas. Veitch and Sons, Limited, Chelsea; Dicksons, Limited, Chester; Baker's,

Wolverhampton; Jarman and Co., Chard; Hobbies, Limited, Dereham, and Jones and Sons, Shrewsbury.

Small gold medals to Messrs. J. H. White and Son, Worcester; George Prince, Longworth, Berks; Clibran, Altrincham; Isaac House, Westbury-on-Trym; and Albert Myers.

Awards of merit were given to *Carnations Etan* (Derbyshire); *Mrs. Keadley*, bluish; *Pied Piper*, yellow, marked with crimson; *The Master*, bright red; and *Cheryl*, apricot, marked with scarlet (all from Mr. W. A. Watts). *Cactus Dahlias Mrs. Branton*, yellow, and *Blush Queen*, deep rose, with light centre (Mortimer). *Centauria The Bride* (Jarman).

[We shall give the other medal awards next week.]

NATIONAL CARNATION AND PICOTEE SOCIETY.

NORTHERN DIVISION.

The annual exhibition was held on the 13th inst. in the show house of the Manchester Botanical Society at Old Trafford in beautiful weather. The exhibition was fully up to the average as to quality, and there was a slight increase in the number of exhibits. The arrangements were, as usual, ably carried out by Mr. William Prescott, the courteous secretary and treasurer.

For twelve Carnations, bizarres and flakes, white grounds, dissimilar, Mr. T. Lord, Todmorden, staged the premier stand; second, Mr. C. F. Badenberg, Marple.

Six bizarres or flakes, white grounds, Mr. C. E. Rossiter, Birmingham, led with good blooms; second, Mr. J. Brocklehurst.

For twelve Picotees, white grounds, dissimilar, Mr. T. Lord had the leading award with excellent flowers; second, Mr. J. Edwards.

For six Picotees, white grounds, dissimilar, Mr. W. H. Goodfellow, Walsall, was first.

For twelve selfs, not more than two of any one variety, Mr. A. R. Brown had the winning lot with Chancer, Bomba, Gloriosa, Sappho, Penbow, Cadet, Edna Lyall, Teddy Galton, Milton, Jenny Gough, and Wordsworth; second, Mr. T. Lord.

For six selfs, not more than two flowers of any one variety, Mr. F. W. Goodfellow led out of eleven exhibits.

For twelve yellow or fancy ground Carnations or Picotees Mr. G. W. Goodfellow was first, followed by Mr. A. R. Brown.

For six fancy or yellow ground Carnations or Picotees Mr. J. Brocklehurst held the place of honour; second, Mr. W. Hancock.

For the best scarlet bizarre Mr. T. Lord won with Robert Houlgrave; second and third, Mr. J. Edwards with Robert Lord and Robert Houlgrave; fourth, Mr. Badenberg; fifth, Mr. Brocklehurst.

For the crimson bizarre: First, Mr. T. Lord with Master Fred; second, Mr. E. Kenyon with seedling; third, Mr. A. R. Brown with Agamemnon; fourth, Mr. J. Edwards with J. D. Hextall; fifth, Mr. T. Lord with the same variety. Pink and purple bizarre, the winners were:

First and second, Mr. T. Lord; third, Mr. Rossiter; fourth, Mr. J. Edwards, all with Sarah Payne; fifth, Mr. Rossiter with W. Skirving. Scarlet flake: Mr. T. Lord first with Guardsman; second, Mr. J. Edwards with Sportsman; third, Mr. S. Lord with John Wormald; fourth, Mr. J. Edwards with Sportsman; fifth, Mr. J. Brocklehurst. Rose flake:

First, Mr. J. Edwards with Reliance; second, Mr. E. Sale with Mrs. T. Lord; third, Mr. Rossiter with Mrs. T. Lord; fourth, Mr. J. Brocklehurst with Dolly Varden; fifth, Mr. A. R. Brown with Mrs. T. Lord. Purple flake: First, Mr. T. Lord with Gordon Lewis; second and third, Mr. Rossiter, same variety; fourth, Mr. T. Lord with George Melville; fifth, Mr. T. Bolton with Gordon Lewis.

Picotees, single blooms, best heavy-edged red: First, Mr. T. Lord with W. E. Dickson; second, Mr. J. Edwards with Brunette; third, Mr. E. Kenyon with Dr. Epps; fourth, Mr. Rossiter with Brunette; fifth, Mr. Plant. Light edged red: First, Mr. J. W. Goodfellow with Mr. Gorton; second, Mr. T. Lord with Thomas William; third, Mr. F. A. Goodfellow with Mrs. Gorton; fourth, Mr. C. J. Thurston, same variety; fifth, Mr. Rossiter with Thomas William.

Heavy-edged purple: First, Mr. T. Lord; second, Mr. Rossiter; third, Mr. C. H. Thurston; fourth, Mr. T. Lord; fifth, Mr. C. H. Thurston, all with Amy Robart. Light-edged purple: First, Mr. F. A. Goodfellow with Pride of Leyton; second, Mr. J. Edwards; third and fourth, Mr. E. Kenyon with Summerhill; fifth, Mr. T. Lord with Harry Kenyon.

Heavy-edged rose-scarlet or salmon: First, Mr. T. Lord with W. H. Johnson; second, Mr. A. R. Brown, same variety; third, Mr. J. Edwards with Lady Louise; fourth, Mr. E. Kenyon with Mrs. Sharp; fifth, Mr. G. Thornley with Mrs. Bewick. Light-edged rose-scarlet or salmon: First, Mr. C. F. Thurston with Lucy; second, Mr. A. R. Brown, same variety; third and fourth, Mr. J. Edwards with Favourite; fifth, Mr. A. R. Brown.

The best Carnation in the whole exhibition came from Mr. T. Lord, who had Master Fred, a finely-coloured crimson bizarre.

The best Picotee in the whole exhibition was from Mr. E. C. Rossiter, who showed a refined bloom of Thomas William, a light-edged red.

CHEPSTOW HORTICULTURAL SHOW.

THIS society held its sixth annual show in connexion with an agricultural society's show in the beautiful Piercefield Park, Chepstow, which was kindly lent by Mr. H. Clay. Most of the classes for fruit, vegetables, and plants were well filled with very good produce. Peaches, Grapes, collections of vegetables, and collections of Potatoes being particularly noteworthy. The best collection of fruit came from Mr. Adamson, gardener to W. Pegler, Esq., The Mount, Chepstow.

Mr. Cooper, gardener to Sir W. Marling, Sidbury Court, Chepstow, was a good second.

Mr. Baker, gardener to Dr. Copper, Mount Ballan, near Chepstow, who was placed first, had large, finely shaped and coloured bunches of black Grapes; Mr. C. S. Hughes, gardener to the Misses King, Buscobel House, was second.

[AUGUST 27, 1904.]

SHREWSBURY FLORAL FÊTE

THE "TEMPLE SHOW" OF THE NORTH.

WHAT may not inaptly be termed the Temple Show of the provinces—the Shrewsbury Floral Fête, as the annual exhibition of the Shropshire Horticultural Society is called—was held last week in the delightful Quarry Grounds, and notwithstanding the almost incessant downpour on the opening day was largely attended. So popular an institution has this fête become that its success is practically assured before the gates are opened, hundreds of tickets being sold some days in advance. It is a proud boast that a town with less than 30,000 inhabitants should have built up a flower show and fête which has no rival in this country, and which draws visitors from all quarters. For nearly thirty years past this society has held its floral fête, and apart from the advantages the townspeople have derived from the annual incursion of so many thousands of people, the show has served another most commendable purpose. The income of the society from the twenty-nine shows which have been held amounts to the large sum of £84,004. The profits have not been exceptional because of the great expenses connected with the fêtes, but in twenty-nine years the society has spent a sum of £7,000 in public improvements—chiefly in beautifying the Quarry—donations to charitable institutions, &c., and still has a handsome reserve fund. At a cost of £1,086 the society has further removed the reproach that Shrewsbury had no memorial of her greatest son, Charles Darwin, by providing the statue which now adorns the front of the school at which he was educated, now converted into a public library, a conversion that was assisted by the society by donations amounting to £405. Considerable sums have also been spent in improving the banks of the Severn, in giving open air spaces as recreation grounds, and in laying out the Abbey Gardens, a work which cost £300. Surely this is a noble record for a horticultural society.

It is interesting to notice that at the first show the total value of the prizes offered was £96, whereas at the show held last week the cash prizes in the horticultural section alone amounted to £1,100, excluding the fifty guinea silver challenge cup for Grapes, silver cups, gold and silver medals, &c. Such unexampled progress in the history of a provincial horti-

cultural society reflects the greatest credit upon the organisers and managers, of whom, in addition to the influential committee, we may mention Sir Walter Smythe, Bart., who is president for the year, and who has made himself much more than the nominal head of the society, and the honorary secretaries, Messrs. Adnitt and Naunton, of whom it is said that neither has been absent from the floral fête once during the last thirty years, a proud record of splendid work.

The exhibits last week were striking evidence of the variety and good quality of the horticultural products of our country and of the skill of our gardeners. It would be impossible in any country to see finer fruits and vegetables, plants, and flowers, and a few hours spent in the tents must have convinced everyone but the most hopeless pessimist of the sound teaching of those who advocate "Back to the Land." It may seem puerile to criticise details among such a wealth of good material and evidence of the best management; but as the success of the whole depends upon the right building up of details, we may venture, in a kindly spirit, to emphasise one or two points that we drew attention to last week. Quite a minor matter is that of offering prizes in such a small class as that for nine dishes of fruit, where there is absolutely no scope. Rather a more important item is that many of the first prize dishes of fruits were unnamed. Now if a visitor wishes to know the name of anything at all, the finest varieties of fruits or flowers would naturally be the first to arouse his curiosity. And it could hardly be otherwise than disappointing to find them unnamed. We think those responsible would do well to make the naming of the varieties of fruit and flowers, in the competitive classes, compulsory.

No one can deny that the exhibition of the same stiffly trained specimen plants year after year is wearisome. We feel sure that if a class were instituted for naturally-grown specimen plants it would prove much more pleasing from a pictorial point of view, and would be studied with interest and pleasure by the passers by, and this we are afraid can hardly be truthfully said of the present day trained specimens. Again, why should not growers be encouraged to exhibit other plants in these classes. This again would give variety and an added interest to them, and relieve their almost painful monotony. With these few suggestions we close our appreciation of this great horticultural event.

NATIVE WILD FLOWERS FOR THE ROCK GARDEN.

THE following excellent notes, by the late Rev. C. Wolley-Dod, will be read with interest and profit:

Those who think that the only proper place for wild flowers is a wild garden or a natural bank should remember how many town houses and suburban villas have owners who love wild flowers, but have no space to devote to wilderness. And there are many towns, such as Matlock and Great Malvern, where the rockeries with which the gardens abound are not made the most of, being smothered with white Arabis and Mossy Saxifrage and two or three common Sedums, to the exclusion of gayer flowers quite as easily grown. In recommending a few native flowers for such places I do not mean flowers called native only by courtesy, or those which are so rare or so generally cultivated as to be better known as garden than as wild plants, but flowers which may either be found anywhere, or which are locally abundant in many parts of the kingdom, even though they may look best on their native banks where they have to fight their way amongst grass and coarser plants. They look very well when they revel luxuriantly in a space cleared for them, and their flower-heads have only to struggle with one another for the most conspicuous place to display their beauty. When I speak of rockeries I do not mean heaps of rocks or stones placed to fill up dark and shady corners where nothing will grow but Ferns, but the facings of sunny banks or piles of large stones with soil inside raised in the most open part of the garden. Rock plants, as a rule, delight in full exposure to sun and air, though there are some exceptions.

The first plant I mention is the common Bird's-foot Trefoil (*Lotus corniculatus*), which is easily cut to any size, and makes such a mass of gold colour through June and July as few plants can rival. Then there are the biennial *Geranium lucidum* (the Shining Crane's-bill) suited for any shady corner, or for the angles and sides of rough steps. Its bright glossy foliage is invaluable in winter, and the scarlet tint of its old leaves in spring has a good effect. It may easily be established, and transplanted or weeded out. Then there is the common wild Thyme, for which a gravelly spot should be selected, and, as the plant flowers all over, it may easily be cut to its proper limits. The white variety has flowers as pure as snow, and should not be omitted, as it contrasts well with the yellow of the Trefoil. The Trailing St. John's Wort (*Hypericum humifusum*) is common in most parts of the kingdom. It flowers late, but its elegant light green leaves and close habit make it a very good rock plant. Being truly herbaceous, it does not encroach.

The Bluebell (*Campanula rotundifolia*) is superior to many of the alpine Campanulas. It requires care in getting up. If you mark a

large plant on a stony bank to be got up in autumn, you will probably find that it has a tap root 1 foot long, thicker than a large Radish, and with many branches from the end. These must not be broken, but you must imitate on your rockery the natural conditions. In this way large plants of many years' growth may be successfully moved. Several varieties of colour may be found, especially pure white and light lavender. The Wood Sorrel (*Oxalis acetosella*) will probably come up of itself on your rockery, but if not, sunless crevices, where little else will grow, may be assigned to it. The Horse-shoe Vetch (*Hippocrepis comosa*) is abundant on chalk downs in the south of England, and on limestone rocks elsewhere. It is a first-rate rockery plant. The Sea Bladder Campion (*Silene maritima*) is one of the most beautiful of wild flowers, as it grows in the fissures of its native rocks at Llandudno. I am very successful with it on my limestone rockery, where it is far more ornamental than the double form so common in nurseries. The Mountain Cudweed (*Gnaphalium dioicum*) abounds on the top of the Llandudno mountain, and on many other downs in the west of England. Planted on the exposed top of a rockery it is always neat, but prettiest when in bud in May. At that time a patch containing three or four colours always reminds me of the coloured pictures of Aaron's breastplate. The Common Dropwort (*Spiraea Filipendula*) is better known in gardens in its double form, but the bright pink of the buds is more conspicuous in the single flower-heads. Though the stalks are rather tall, the foliage is neat and close-growing, and the plant never does so well as on a sunny rockery. All the plants I have mentioned are easily obtained and easily grown, but most of them expect and deserve a good place. I could add many more, but should certainly exhaust the patience of your readers sooner than the list of plants.

PRESERVATION OF WILD FLOWERS.

THE lecture on Tuesday afternoon last at the meeting of the Royal Horticultural Society was on a subject which should arouse interest in the hearts of all who love their country. Professor Boulger, in an exhaustive and interesting lecture, pointed out clearly and reasonably the results that the present destruction of the flora will lead to—a flowerless England, brought about not by the thoughtlessness of the child who plucks flowers only to throw them away, but of the tourist, the objectionable botanist who removes rare species wholesale, and the men who dig up roots in hedgerows and on private estates for the sake of gain. The United States of America and many other countries were striving to protect their wild flowers, but except in Devonshire little has been accomplished here, and the destruction goes merrily on until the time will come when threatenings and punishments are unavailing—the flowers of England will be no more. This is not an hysterical utterance, but the plain truth. Many articles have recently appeared in THE GARDEN on this question, and we hope, now that the Royal Horticultural Society has in a sense recognised a grave and growing evil, definite steps will be taken to secure effective legislation. The law of trespass is a strange one, and we hope to again refer to this subject and to publish Professor Boulger's lecture when it appears in the Journal of the Society. At the moment of going to press we can do no more than briefly refer to it.

NOTES OF THE WEEK.

FORTHCOMING EVENTS.

August 31.—Reading Show; Bath Floral Fête.
September 1.—The Cottagers' Show at Great Warley, held in Miss Willmott's grounds.
September 2.—National Dahlia Society at Crystal Palace (two days).
September 6.—Royal Horticultural Society's Committees.
September 7.—Hull Horticultural Association (two days).
September 14.—Royal Caledonian Horticultural Society's Show, Edinburgh (two days).
September 20.—Royal Horticultural Society's Committees; National Rose Society's Autumn Show.
October 5.—National Chrysanthemum Society's Show at Crystal Palace (two days).
October 12.—Royal Botanic Society.
October 25.—Croydon Chrysanthemum Society's Show (two days).
November 1.—Bournemouth Chrysanthemum Show (two days); Brighton Chrysanthemum Show (two days).

Rose show at the Crystal Palace.

The directors of the Crystal Palace write that it is their intention to hold a Rose show there next year.

Huntly flower show.

His Grace the Duke of Richmond and Gordon opened the annual show of the Strathbogie Horticultural Society at Huntly on the 17th inst., the chair being occupied by Provost Arnott. His Grace gave an interesting address, in the course of which he warmly advocated the improved cultivation of cottage gardens, and commended the objects of the society, which, he said, was established in 1846, only a year after his birth. The show was quite equal to the average of former years, and all the classes included produce of high quality. The most successful competitors among the gardeners were Mr. A. Philip, Mr. J. Cattanaich, and Mr. P. Duncan. The leading prize winners in the amateurs' classes were: Pot plants, Mr. Alex. Dufton; cut flowers, Mr. J. Petrie; fruit and vegetables, Mr. J. Mitchell.

Bedding Begonia Count Zeppelin.

I cannot agree with the favourable opinion expressed by your correspondent A. Osborn, on page 120 of your last issue, as to the merits and beauties of this Begonia, as, after a series of trials extending over three years, I have come to the conclusion that it is utterly worthless, and intend to throw it away. My reason for forming this opinion is that in my garden, at all events, it drops nine out of every ten of its male or double flowers in a bud state unopened, leaving only the comparatively small and thin single female flowers to expand, which, though their colour is bright, form a very poor and inadequate show for bedding purposes. I can in no way account for this singular failure, but only state the fact as proved by my own experience for the past three years.—W. E. GUMBLETON.

International fruit show at Düsseldorf.

The directors of the International Horticultural Exhibition, which is being held this year at Düsseldorf, have now issued their programme and schedule for the International Fruit Exhibition, which will be held from October 8 to 16 next, in conjunction with the congress of the German Pomological Union, and in addition to these two important events a German show of market fruit and nursery garden goods. The last day of entry is September 15. No dealers are allowed to compete, no charge is made for entry or for space, and the exhibition authorities pay the cost of carriage of goods to Düsseldorf. As was to be expected, the schedule is at once large and comprehensive, and is divided into 147 classes, over 100 of which are reserved for the thirteen sections into which the international exhibition is divided. Collective exhibits are invited from countries, estates, associations, and unions. There will be instructive educational exhibits, including specimens of the best early and late fruits from different parts, arranged according to the local

dates of ripening, classes in which size and beauty or recent introduction will be determining factors in the awards. Fourteen classes each will be reserved for named varieties of Apples and Pears. Besides Apples, Pears, Nuts, and stone fruits there promises to be a great show of wine and dessert Grapes. Fruit in pots and table decorations have also special sections devoted to them. Makers of boxes, baskets, and other packing methods have seven classes for their wares, and the exhibits of pictures, models, photographs, books, periodicals, and plans, all relating to pomology, should prove of great interest to the public, as well as those for whose special benefit they will be gathered together. Schedules and forms of application may be had on application to Freiherr A. von Solemacher, Burg Narned, near Andernach-on-Rhine.

Introduction of the Cherry.

Whence have we Cherries? This well-known fruit formerly grew wild near Cerasus in Pontus.—Who first brought them to Rome? Lucullus, a Roman general.—Who first planted them in Ireland? Sir Walter Raleigh on his estate at Youghal.—And when were they planted in England? In Henry VIII.'s time about Sittingbourne in Kent. In this staccato fashion knowledge was impressed upon my memory in my youth, and these questions and answers were recalled to my mind by the note on "Cherries" in last week's GARDEN. Now Cherries must have been planted in England before Henry VIII.'s reign, as is proved by the following quotation from John Lydgate's poem, "The London Lackpenny," written in 1429:

"Then unto London I did me hie,
Of all the land it beareth the prize;
'Hot peascoddes,' one began to cry;
'Strawberries ripe!' and 'Cherries in the rise!'"

The expression "in the rise" means on the bough, therefore freshly gathered, not imported. Probably the Romans first brought Cherries into England. On looking up the life of Lucullus in the "Dictionary of Greek and Roman Biography," after a short account of his wars it mentions the fact of his bringing Cherries to Rome, and the following references to Pliny are given: "Plin. H. N., VIII. 52, IX. 54, XIV. 14, XV. 25." The Roman figures evidently refer to the books of the elder Pliny's "Historia Naturalis," of which, unfortunately, I have no copy, but as Book XV. is on the "Olive, Fig, Apple, and other luscious fruits," it is extremely likely that the passage in Pliny required by your correspondent is to be found therein.—W. SPURLING.

Lilium sulphureum in a small garden.

When first introduced into this country the Himalayan Liliums were treated as cool greenhouse plants, as they succeeded indifferently out of doors. However, L. Henryi has since proved to be quite hardy, and to flower as freely outside as inside. Judging from the way L. sulphureum is flowering in a little front garden at Richmond it will do quite as well. Five years ago Mr. Corrin, the proud grower of the Liliums, planted a few bulbs, seven of which grew. No special treatment was accorded them beyond mixing a little lime rubble, sand, and fowl manure with the ordinary garden soil. The first three years only growth was made, and Mr. Corrin felt disposed to pull them out, but fortunately left them for another year, when two or three flowered. This year (the fifth) all are flowering, six of the bulbs carrying three flowers each and the seventh one. The plants are about 5 feet 9 inches in height. Growing within a couple of yards of the road a few flowers were stolen last year, and to prevent them being seen the Privet hedge has been allowed to grow up, quite hiding them from passers by. The ground at the base is quite thick with young plants grown from last year's bulbs.—A. O.

Acacia baileyana.—This Acacia deserves all that is said in its favour on page 95, for it is in every way a desirable species, but one that needs a fairly large structure for its development. In the Temperate house at Kew it forms one of the most attractive members of the genus. At present it is seldom met with, but is, I see, included by Messrs. Hugh Low and Co. in their plant catalogue.—T.

***Ipomœa rubro-cœrulea* outdoors.** On the wall garden at Gunnersbury House this is now one of the prettiest features. The flowers, which are of a peculiarly pleasing shade of blue, are produced in great profusion on the long, trailing growths. We certainly have very few things of the same pleasing shade of colour, and for covering any trellis work or old tree stumps in summer it is most effective. The seeds sown in pots early in the spring will make good plants for putting out as soon as the weather permits, and they soon begin to flower, keeping up a succession until late autumn.—H.

***Amaryllis Belladonna maxima*.**—In the gardens at Gunnersbury House this is now in full beauty. Planted in front of some frames, where it has been for the past four years, it seems very happy. The strong flowering stems carry good heads of the beautiful soft pink flowers, which are of large size, and produced in great profusion. It appears that this *Amaryllis* only succeeds well in rather a dry position. It is found very serviceable for cut bloom, and if the stems are gathered when the first bloom is open all the others will open in water, and they last for a considerable time.—H.

***Statice Suworowi*.**—This is one of the best plants we have for bedding. I have seen it in private gardens, where it has been very effective. It grows freely and produces its tall branching spikes of pink flowers in great profusion. I have before me some spikes of bloom which were cut about a month ago, and though dried the flowers retain the pretty shade of mauve-pink, and at a distance appear as if freshly cut. This *Statice* may be raised from seed, which, if sown in January, will flower the same year, or if sown in autumn and grown on in a cool house the plants will be stronger and produce larger spikes of bloom. There are several other *Statice*s which are now seen in the market. Of these *Statice Gmelini* is one of the best, the flowers being of a clear blue. There is a white variety of this, which is also grown extensively. I find the blue and white are much used by florists; they work in well for sprays and bouquets, and keep for a long time without water, which is a great advantage.—H.

Value of the Loganberry.—I was pleased to note the excellent illustration on page 111 and read the remarks on the value of the above fruit. There will be more interest taken in it when its value becomes better known, and THE GARDEN has for years advocated its culture. It will thrive where the Raspberry fails. It not only grows well, but is a splendid cropper. Years ago many persons planted the American Blackberries when they were sent to this country. They generally grew well, but fruited sparsely. The Loganberry is a great cropper; I have grown it for at least half a dozen years, and my original plants are still the best—so good, indeed, that each autumn we have been obliged to give more room. Last year some of the young growths were over 15 feet in length. For tarts or preserving it is an ideal fruit, larger than the Raspberry, but like it in shape, and of a darker colour. Our best fruits are obtained from north walls. The young growths are laid in each summer their full length, the old fruiting wood being removed when the crop is cleared.—G. WYTHES.

New Peach Peregrine.—On several occasions I have had an opportunity of seeing this new fruit, and it is, in my opinion, a splendid acquisition, fruiting freely without much forcing. It was recently shown before the fruit committee of the Royal Horticultural Society, and, of course, like many other new fruits, it may have been too ripe or under ripe the first time shown; there is always a difficulty in presenting fruits at the right moment. The same week I saw some splendid trees in fruit of this variety at the annual show of the Bishop's Stortford Society, and I was much impressed by its cropping qualities, size, appearance, and splendid flavour. I feel sure this new Peach is too good to be lost sight of. I know we have no lack of good midseason Peaches, but there are none too many that will stand hard forcing. The new Peach Peregrine appears to be a robust grower and sets very freely. I have no

idea of its parentage, but this will soon be known when the trees are distributed. Messrs. Rivers, who have raised so many choice fruits, would not have selected it had it not been an improvement and worth placing in the list of Peaches raised at Sawbridgeworth.—G. WYTHES.

Sweet Peas in bowls.—Sweet Peas are used in many ways for indoor decorations, but seldom are they represented in such pleasing form as they were at the August meeting of the National Amateur Gardeners' Association. On this occasion a competition was arranged for the lady members, and a bowl was filled with Sweet Peas and their own foliage. The successful bowls were charmingly arranged, and crowding was avoided. Flowers of the variety Miss Willmott, of a colour that some describe as orange salmon, were in the leading exhibit. In most of the other exhibits flowers of pink and rosy blush shades predominated, and all looked very pretty. In two or three cases the bowls were placed on raised stands, and the latter covered with white silk cloths. By these means the colours of the Sweet Peas were more pronounced and the general effect considerably enhanced. This is a class that might with advantage be added to the list of competitions in many of the leading societies' exhibitions.

Cottage and allotment gardening (1904).—The examiners' report of the Royal Horticultural Society is as follows: "Whilst regarding with satisfaction the considerable number of papers submitted to them of comparative excellence, there is yet reason to express regret that a large portion of them were, in respect of practical knowledge in allotment and cottage gardening, somewhat crude. Questions relating to the composition of soils and of manures were in most cases answered with ease, but still generally from a 'bookish' rather than from a practical aspect. Candidates in this examination should seek to make themselves familiar with the actual operations needful in any really well-managed garden or allotment during the cultural season, and seek also for defects, if any be furnished, and point out how they may be remedied. Such practice would be of great service when sitting down to answer questions relating to practical gardening. Many candidates had indifferent knowledge as to what constitutes hardy perennials, and less as to the most suitable kinds for garden cultivation, and specially of those suitable for furnishing flowers for cutting. Knowledge with respect to annuals, both tender and hardy, was imperfect. The proper cropping of garden or allotment in winter seemed not to have been fully understood. Still, on the whole the papers have shown better results than were originally anticipated. Some answers were written on both sides of the paper. That practice should always be avoided."

Herbaceous Phloxes in 1904.—In the course of a discussion the other evening at the monthly meeting of the National Amateur Gardeners' Association the chairman spoke at some length regarding his experiences with these charming late summer-flowering plants this season. He led off the discussion by speaking of the beauty of the perennial Phloxes, mentioning, in the course of his remarks, the difficulties growers on dry soils were experiencing. The warm weather this summer had told against the plants, the open position in which they were planted leaving them exposed to the sun from early morning until sunset. In consequence, notwithstanding a good mulching, the plants were shrivelled and the display was most unsatisfactory. Last year they did exceptionally well, owing to the cooler and moister air at that time. He recommended a division of the plants annually, or propagation by cuttings in spring. Growths on old plants should be carefully thinned out and heavy mulchings with good manure and copious applications of water given in the evening of hot days. Attention was called to the charming variety in which the perennial Phloxes can now be obtained, and the chairman suggested the acquisition of a representative collection by those who felt disposed to give this subject their special care. A member whose garden is within four miles of

Charing Cross emphasised the beauty of the Phloxes already referred to, but he could not recommend them for London or suburban gardens. He did not succeed with them in his garden. Another member differed from the previous speaker in this matter, and thought the perennial Phloxes were one of the best subjects for London gardens. He asked where would you see them better grown than they were in Finsbury Park?—C.

***Musa Holstii* (K. Sch. n. sp.).**—Mr. C. Sprenger has received some seeds of this new species from German East Africa. They are like those of *Musa Ensete*, but smaller. The growth is in the way of that named species, but the leaves are not so long, being broader, glossy green, and of a dark brown colour, the edge almost black. They are also more solid than those of the other species. It is a very distinct kind, and stands well in the open at Naples all the year round.

***Musa imperialis* (Spr. n. sp.).**—This new species comes from the mountains of Kamerum, where it is common. It is held in reverence by the natives, who can never be prevailed upon to destroy it when new land is brought under cultivation. It is also planted around the houses. The leaves appear in the spring from the root-stock as in *Musa religiosa*; they are stiff, erect, dull green, glaucous, and with a white border. The growth is enormous, even in a half-shady place.—WILLIAM MULLER, *Vomero, Naples*.

***Chrysanthemum Goacher's Crimson*.**—For some years past early-flowering *Chrysanthemum Harvest Home* was regarded with considerable favour for its beautiful crimson colour. Previous to its introduction there was nothing of the same colour that flowered so early in the season, and it was heartily welcomed as the beginning of better things. Goacher's *Crimson*, however, is much better in every way. It has flowers of a brighter shade of crimson than the newer one, and its bright golden yellow reverse gives it an additional charm. There is a fault, however, in the shape of the flowers, the majority being malformed on one side. The habit of the older sort also leaves much to be desired. In the case of Goacher's *Crimson* we have a plant of strong growth; the shoots are sturdy, short-jointed, and seldom attain a height of more than about 2½ feet. The flowers are of good size, beautiful form, and remain fresh for a long time. The crimson colour in this instance is deeper and richer than in *Harvest Home*, and the reverse of the broader petals is a shade of golden bronze. Flowering has already begun, and if the spent blossoms are removed the display should be carried well into October. Before the present flowering season has concluded there is good reason for believing many of the older sorts will be completely outclassed.—D. B. CRANE.

THE FLOWER GARDEN.

SWEET WILLIAMS.

IN order to have a good show of Sweet Williams sow seed early and get out the plants now in beds about a foot apart. Thus the stems will next year be so close together that they will sustain each other and make a fine, but varied mass of colour. Too often it is advised that seed be sown during the summer. That is a mistake as far as all hardy biennials are concerned. The month of April is the best time to sow all such things, and if the seedlings are being planted out into their flowering places at the time some would advise that the seed be sown, then fine plants and large heads of bloom are ensured. Sweet Williams specially, if put out late, seldom throw up more than one or two stems, but strong plants will throw up seven or eight stems and carry huge trusses, and if they are of a fine strain, few border plants can excel in beauty a well-flowered Sweet William during July. No special culture is needed for these plants, as they do admirably in any ordinary garden soil, but of course, like all other things, preferring that which is occasionally dug and manured to border soil which is starved by being eaten up

with tree, shrub, or plant roots. Ordinarily these biennials are, with Wallflowers, Stocks, Canterbury Bells, &c., planted out singly into borders. Far better is it to plant in trebles to make a good clump, and, better still, in masses or beds.

One special charm in the Sweet William is that in any varied, as well as fine, strain there are so many diverse markings and colours that the flowers are all the more interesting and enjoyable when they can have close scrutiny. Out of hundreds of plants no two, perhaps, will produce flowers quite alike, at least such is my experience, although some selections seem to favour the ringed forms only, the northern strains being peculiarly of that class, very fine indeed and handsome, but wanting in variety. I am not sure whether in selecting these ringed strains too much has not been sacrificed to secure almost uniformity of marking and smoothness of edge in the pips. The serrated edge is no objectionable feature in these flowers, especially when allied to good size and rich colours. The serrated edge marks the Auricula-eyed especially. These have white eyes, rich coloured grounds, with generally very narrow lacinated edges. As a rule, the pips are not so large as are those of the ringed strains, but the colouring is so beautiful that it is

various markings found in mottled flowers. That they are very beautiful, as well as interesting, must be taken for granted by those who have not seen them. No doubt in time these varied markings will increase wonderfully. These forms add very much to the interest of any strain, as so many diverse colours make a bed of flowers so much the more beautiful. Sweet Williams have two special enemies—grubs when newly planted, should the weather be dry, and fungus in the late autumn, should too much moisture prevail. In the former case the grubs should be sought for when plants collapse and be destroyed. In the latter case it is well to put out the plants in fresh soil the following year. A.

A WILD AND BOG GARDEN.

I SEND you herewith three photographs of my bog garden, which were taken by Mr. F. Bonney on the 4th ult. No. 1 shows a fine group of the Californian giant Saxifrage (*Saxifraga peltata*), which this year is some 5 feet high, growing by the side of a narrow stream with its roots right in the water. At the back are Ferns of various kinds, including the *Osmundas* and the *Ostrich Feather*

till almost midwinter there is a continual change of scene, colour, and effect.

Wolseley, Stafford.

C. M. WOLSELEY.

[We reproduce one of the photographs kindly sent by Sir Charles Wolseley, but our correspondent's notes of the others show the plants that may be used with beautiful effects in such positions.—ED.]

CHRYSANTHEMUMS.

SEASONABLE NOTES.

SELDOME have these looked more promising than at the present time, and providing we get a fair amount of sunshine during the next three weeks or so very fine flowers should be seen in autumn. Plants which are expressly grown for large exhibition flowers will now have practically completed their growth, and all the buds should be secured if possible by the 10th of next month. Though every pains may have been taken to time the showing of these, both as regards striking the cuttings and stopping the plants at various dates, this certainly cannot always be assured, as much depends on the seasons, but in nearly all cases it is safe to assume that if the taking or securing the bud be done through August these may, with a reasonable amount of care and forethought, be seen at their best during the end of October and beginning of November, especially all the large Japanese, as large massive flowers of many varieties take a considerable time to unfold their florets.

FEEDING.

Though this should by no means be withheld take the greatest care in applying the various manures, especially after the bud is first selected, otherwise the flowers will be coarse and lack refinement. It is most unwise at this time to strip the plant of every particle of growth, but leave a reasonable amount of side shoots for at least a week or ten days. Should the weather be hot and dry frequent syringings of clean tepid water should be given during the day, the last application being about 4 p.m. See that every growth is made thoroughly secure by staking and tying in case gales prevail, which we generally experience at this time of year.

INSECT PESTS.

Where earwigs abound vigorous measures must be taken to catch them, the most simple and efficient way of trapping them that I am acquainted with being to cut Broad Bean stalks into lengths of about 6 inches. Tie these to the stakes with small string about 2 feet in length and lodge the trap near the top of the plants. These should be examined every morning and blown out into a vessel of warm water. In addition to this, go through and examine the plants with a lamp after dark, when the pests may generally be caught feeding, as it takes them but a short time to spoil the tender bud. The insect commonly known as the jumper is also a great enemy to the Chrysanthemum, and this year appears to be prevalent. It also pierces both the buds and the young tender tops. These are somewhat difficult to catch, but they must be sought for and destroyed. The points should also be syringed once or twice a week to ensure freeing them of thrips. These tiny insects, which can hardly be observed with the naked eye, have a strong liking for some varieties, and before they can be observed will do much mischief, so much so that the blooms will be useless.

RETARDING THE BLOOMS.

Much may be done in this respect, particularly if taken in hand at an early stage, and it is useless to leave them to the mercy of the weather

IN THE WILD GARDEN AT WOLSELEY, STAFFORDSHIRE.

unwise to strive to eliminate it. Without doubt size of pip in the Sweet William commands material attention. There is a boldness and character about these fine trusses with pips as big as Polyanthus flowers, also very flat and rounded, that even rich colours cannot counteract. Generally the greatest size is found in light flowers, though never in pure whites, and again less so in deep red and crimson selfs.

This latter form is one which much needs developing, as whilst we have superb colours and beautiful quality in the dark selfs, there is room for increase of pip. Fine as Sweet Williams were a few years ago, the advance made in the quality and size of pip in these dark hues is remarkable. Some of the most striking flowers are to be found in those which are mottled, speckled, or flaked. These show wonderful diversity and beauty, but seem to some extent to be governed in their colouring by weather, as cold wet weather will in some cases produce self flowers, whilst warmth will bring out the mottled or marked colours. That variation, however, applies more to the mottled flowers of the Auricula-eyed strain than to those of the bolder ringed strain. It is impossible to describe the

Ferns (*Struthiopteris pennsylvanica* and *S. germanica*), which have grown to a height of 6½ feet. Beyond these are plants of the noble-foliaged *Gunneras*, with some Foxgloves beyond.

No. 2 shows the effect of a bold group of Foxgloves, chiefly white, from the north side. In the foreground are Irises growing by a wet ditch, and beyond these a splendid group of *Primula japonica*. These have quite naturalised themselves here, and seed all over the place, even on to the cinder paths. To the left is a bold group of *Funkias* with Ferns at the back, and on the right a group of the noble *Spirea gigantea*.

No. 3 shows the same picture from the south side. In the foreground are Asters, Michaelmas Daisies, Phloxes, and other plants. The bog garden was originally an old disused pool, which had been neglected for very many years, and was full of Nettles and other weeds until it was taken in hand some ten years ago and planted with various bog-loving shrubs and plants and innumerable bulbs, such as Daffodils, Crocuses, Snowdrops, Grape Hyacinths, and Bluebells. The Ferns, Irises, *Primula japonica*, *Funkias*, and *Spireas* simply luxuriate in it, and from very early spring

when the buds begin to crack. Though no injury may be apparent for some time to come, sooner or later decay will set in, even after the flower has partly developed. This applies, of course, to large blooms. A rough shelter should be made in a north position which can easily be accomplished with any spare frame-lights. The more air these can be given the better, and overcrowding strictly avoided. Give one or two thorough dustings of black sulphur to prevent mildew spreading. No syringing will be required and much less water at the roots. When in doubt of any particular variety being too late these should at once be placed under glass in quite a cool late house. At least a good ten days may be gained by so doing, and many of the varieties, especially so the later flowering of the incurved section, are much benefited by such treatment.

TRAINED SPECIMEN PLANTS.

These will require abundance of water, both clear and liquid manure, as they are generally grown in the smallest size pot possible, and to maintain a large quantity of healthy foliage and perfect their flowers they need much attention and assistance. As I have frequently pointed out, a reasonable amount of perfectly-developed blooms which show their true character are preferable to huge ungainly plants with little or no quality. Over-training, too, is equally bad, and should not be encouraged, either for exhibition or home use, though it is necessary to tie out and train the shoots in the early part of the year. These should afterwards be allowed to grow away freely and assume as natural an appearance as possible. The growths should be temporarily protected, but the final staking should not be done for some time. Endeavour to arrange the plants in as open but sheltered position as possible till the end of the present month, when steps should be taken to place them under glass and complete the dis-budding. Arrange the plants near the glass and admit abundance of air both day and night. Give the plants as much room as possible between each.

POMPONS AND POMPON ANEMONES.

These, when grown in bush form, should have each shoot neatly but securely tied to one centre stake. These will also require liberal feeding and a reasonable amount of disbudding. At the same time it is well to bear in mind that this can easily be overdone, and when this is the case it robs the plant of much of its beauty. A sufficient thinning, therefore, should only be done to enable each bud to develop perfectly.

SINGLE SORTS, LATE FLOWERING.

In fact, all sections grown for decoration, will require much the same treatment. One important rule to observe is that now and while the plants remain in the open as much room as possible should be given, so that abundance of air can reach them. Sulphur should be dusted well on the under side of the foliage and Tobacco dust frequently used on the points.

SUMMER FLOWERING VARIETIES.

These charming varieties, which are being more grown every year for the flower borders and cutting, are now beginning to make a fine display, especially where a border is devoted entirely to them with the colours and heights suitably arranged. The best way of supporting them is to use several stakes to a plant and tie out the shoots so as to enable the flowers to expand better, and by so doing a finer display is obtained. Dust the points with Tobacco powder directly the first traces of insect life are noticed. Give good soakings of clear and liquid manure water in dry weather, and keep the surface soil stirred with the Dutch hoe.

The early-flowering varieties have given a fresh joy to the autumn garden, as the more recent sorts show a greater range of colours than those of a few years ago, when washy pinks and whites prevailed. The golden orange, clear yellow, dark crimsons, and clear whites are very effective in border or shrubbery.

E. BECKETT.

Aldenhurst House Gardens, Elstree.

THE CARNATION IN THE GARDEN.

IF the Rose holds the first place in the garden, the Carnation surely must come next in importance, though the Lily may surpass it in grace, and the Carnation has this merit—that in gardens near towns or in smoky districts it will thrive quite as happily as in pure air, while the Rose demands both shelter and pure air. In the country, however, it must be confessed that hares and rabbits work havoc among Carnations, and make it impossible to grow them in many gardens unless carefully wired in from all attacks of their enemies.

For this reason, and for others which I shall specify, I want to suggest that the Continental plan of growing Carnations in boxes or pots on balconies, house-tops, or any such place of vantage is worth considering. In Spain Carnations are grown almost entirely in this way and the flowers hang down naturally, so that the guard petals are then able to fulfil their function and shelter the centre of the flower from sun and rain, thereby causing the centre to fill up, perfectly protected meanwhile from the elements. I fancy that some of our exhibitors would find the quality of their blooms enhanced were they allowed to hang down in this way, and no one who has visited Spain in late spring will deny the beauty of this mode of growth.

Carnations are found growing wild on crags and on ruined walls, so it is evident they do not prefer a low or flat situation, though at first they may make very strong growth in such a position when the soil is rich, but winter rains and autumn dews will cause these vigorous and sappy shoots to canker and rot off at the base by another spring, disappointing the gardener who looked for success in the summer.

The real difficulty in Carnation growing is the short duration of the plants. What is uglier than a nurseryman's bed of rooted layers planted in rows in a stiff bed, each with its flower-stem stiffly tied up and the buds probably severely disbudded, and this more or less must be true of all freshly planted Carnations. The object, then, of picturesque Carnation growing is to keep your old plants in health for two or three years, when a luxuriant mass of growth and flower is produced. When this is achieved the beauty of the Carnation is quite undeniable. It is certain that a Carnation plant will last longer in health when its collar is screened from damp by stones or any such protection as is afforded by steeply sloping ground. Extremes of heat are quite as injurious as winter cold, for the Carnation prefers an equable climate that is neither hot nor cold, such as is found over the greater part of our islands.

So then, if the Carnation is to last long in the garden you love, plant it on banks with plenty of big stones about to screen the collars of the plants from moisture and cold, rendering the temperature equable. Let the aspect be east or west rather than south, and let the wind blow freely over it, for no plant enjoys wind more than the Carnation. Most gardens have a wind-blown corner. Why not plant your Carnations there, and shelter the clumps with stones? When you can, let the flowers and foliage hang down naturally, and you will achieve in the second summer a tangled mass of flower and foliage quite unlike the conventional Carnation bed, and infinitely more enduring. The so-called Tree Carnation is the most useful for autumn flower-beds, as the handsome but more formal and summer-flowering florist's Carnation does not continue

more than a month or five weeks in flower and, moreover, does not strike so readily from cuttings as the Tree varieties do.

By the sea and on sloping banks the spicy Cloves endure for years, and need only an occasional layering, so when there is the opportunity of making a dry wall with plenty of earth behind, moist and yet well drained, there is the place for a long-lived display of Carnations, which will give the amateur several years of pleasure before it needs thorough renewal or overhauling.

No one regrets more than I do the impossibility of the culture of Malmaison Carnations in the open garden. So fragrant, so beautiful, so large and handsome, it seems quite a mistake that they will not exist save under very special conditions. Will the gardener of the future provide us with a race of hardy Malmaisons? If so, I think he will gain a good reward both in thanks and in gold. Carnations are particularly acceptable in the old-fashioned kitchen garden herbaceous border. Their beauty is not suited to the formal garden, and when planted formally should only be used for cut bloom and for propagation, two things that are indispensable in the modern garden. Moderate disbudding I would always allow. Some varieties, indeed, require it; the flower-buds are so congested that all cannot expand freely. It is, however, a matter of individual taste, and should be left an open question.

How best to determine what Carnations shall be grown is another matter that needs judgment. The varieties that grow well on the strong and cold soils of the northern portion of England do not like the hot and light soils of the south, while some of the yellows and soft reds and pinks do much better in the lighter soils. The old and fragrant Clove is apt to die out in the south in hot seasons, while in the north a wet year—like last summer—causes heavy losses the following winter. There are a few extra enduring named varieties I will mention, such as the well-known Raby Pink that is still well to the fore after more than three score years wear and tear, but its flower is small as well as fringed deeply, a fault in some folks' opinion, though not in mine. Of whites I still put Trojan as the most reliable of border Carnations, fine in every way save its lack of scent. Of pure scarlets there is a greater choice; indeed, this colour is always of hardier growth than any other that I know, and it is a matter of opinion whether the very smooth-edged varieties are as effective as the rougher-edged sorts. Of deep crimsons I have found Mephisto the most enduring and hardy, and of pure yellows there is nothing to touch Miss Audrey Campbell, as far as I know. Of rose reds no variety is more enduring and handsome than Belladonna. Of orange shades Midas is still finest, and of lighter buffs Mrs. Reynolds Hole is yet worthy a place, though not good on strong soils.

The Picotees, especially the modern ones raised by Mr. Martin Smith, are extra vigorous and hardy, but after a few years they are apt to lose vigour when grown in the open border, while those grown in pots retain their health to a far greater degree, which proves that much water in winter is death, more or less lingering to the Carnation.

The Tree or perpetual Carnation is not enough used for summer use in my judgment. It is far more answerable for bedding, and can equally be propagated for summer and autumn flowering as for winter culture under glass.

With an edging of Phlox Drummondii pegged down outside the Carnations an uncommonly bright display can be achieved, and the long

THE ROCK GARDEN AT LILFORD HALL.

sprays of autumn bloom are lasting for cut flower purposes. Perhaps someone has already tried some of the strong-growing American varieties in this way. The Carnation is always so welcome as withstanding rain when half open that it must prove very useful in stormy autumn weather until winter is upon us, and the hardy Chrysanthemum is ready to supply the demand for cut flowers.

E. H. WOODALL.

THE ROSE GARDEN.

PROPAGATING ROSES.

AT this season, when so much can be done in propagating Roses, the following notes taken from "Roses for English Gardens" may be useful:

There are several other ways of propagating Roses, but the one most frequently employed and the most satisfactory is by budding.

Dwarf Stocks.—Many people imagine that all the dwarf or bush Roses they see in gardens are growing on their own roots, whereas in ninety-nine cases out of a hundred the roots of the plants are those of some Brier stock. The three stocks most in favour at the present time are the Brier-cutting, seedling Brier, and the Manetti.

The only difference between the Brier-cutting and seedling Brier is that the former is obtained by making cuttings of the ordinary hedgerow Brier, while the latter is the result of sowing the seed of that Brier. They are both excellent stocks, and there are scarcely any Roses which will not unite with and grow well on either of them. The roots of the Brier-cutting are thrown out more horizontally than those of the seedling Brier, and are therefore more accessible to light and air and to any liquid or other surface nourishment that may be given them. On the other hand the downward tendency of the numerous roots of the seedling Brier enables the Roses budded on it to withstand drought better, and it is if anything the more permanent stock of the two. The Manetti stock answers

well in some parts of the country, such as the northern districts of England, and on certain soils, but cannot be so generally recommended as the other two stocks that have been mentioned. In most cases the roots of the Manetti, which is a foreign Brier, gradually decay, and the Rose budded on it, after a time, either dies outright or is kept alive by the roots thrown out round the collar of the plant by the Rose itself. It has another great defect in that the foliage of the Manetti is not easily distinguishable from that of many cultivated Roses, so that the suckers from this stock often pass unnoticed. Indeed one seldom goes into any ordinary garden without meeting with these suckers. In many cases the Rose has entirely disappeared, and the shoots of the stock alone remain.

It is not necessary to explain the method of raising any of these dwarf stocks, as all three can be obtained early in the autumn at a cheap rate from any Rose nurseryman. As soon as they arrive they should be planted 1 foot apart and 3 feet between the rows. For the convenience of budding they should be planted only about 4 inches deep, and afterwards earthed up like potatoes as far as the main stem extends.

Standard Stocks.—The only stock used for standards, half-standards, and dwarf standards is the hedgerow Brier. These may be purchased during November from a nursery, or any local labourer used to such work will obtain as many as required from the wild Briars in the district. These stocks should be trimmed of any side shoots, cut to the length wanted, and planted 2 feet apart and 4 feet between the rows. The root should be cut away to within, say, 2 inches of the stem and not be left like a hockey-stick. The best stocks are those of the second year's growth.

Budding Standard Stocks.—Budding is one of those things which cannot readily be learnt from printed instructions, but which any proficient in the art will be able to teach the beginner in a few lessons, and which a little practice afterwards will soon render quite easy to him. A few hints may, however, be useful when the mechanical process has been mastered. For instance, in budding standard stocks a single rather long slit is preferable to the somewhat shorter T-shaped one usually employed, as the transverse cut weakens the shoot of the Brier

and often causes it to snap off in high winds where it has been made. It is also a good plan to give the roots of the stocks a good drenching with water before they are budded, as it will cause the bark to come away from the wood more readily than it otherwise would have done. Budding can be done at any time during the summer; the early part of July is usually the best period of the year to begin, as the majority of the shoots are then in that half-ripened condition which is so desirable—that is to say, neither too sappy nor on the other hand too old and dry. The shoots of the Rose from which the buds are taken should be in the same half-ripened condition, and the buds themselves only moderately plump and consequently quite dormant. If the bark does not come away readily from any shoot when the handle of the budding knife is inserted, it is useless to try and bud on it. When the prickles on either the shoot of the Brier to be budded or on the shoot of the Rose from which the bud is to be taken come off easily and there are at the same time fresh green leaves at the end of that shoot, it is certain to be in the best condition possible for budding. The Hybrid Perpetuals and Hybrid Teas will be found easier to bud than the Teas. The buds should be tied in moderately firmly but not too tightly. In a fortnight's time they may be tied afresh, this time more loosely. After budding, none of the budded shoots of the Brier should be touched with the knife until November, when the longest and most vigorous may be shortened about one-third of their length.

Budding Dwarf Stocks.—The stocks should be kept well earthed up until budding time, when the surrounding soil should be removed with a small hand fork from a few of the Briars as they are wanted. The main stem should then be cleaned with a rag and the slit made in it for the insertion of the bud. The T-shaped slit, previously objected to in the case of standard stocks, may here be made, and a single bud (or if preferred two buds close together) be inserted in it. The buds should be inserted quite low down in the stem near the roots and not in the upper part of it. The instructions given when treating of budding standard stocks as regards watering, the time of year, the selecting of the buds, and also as to tying and retying them after insertion, apply equally to those dwarf stocks.

Raising Rose Plants from Cuttings.—Now that excellent Rose plants can be obtained ready made, as it were, from the nurseries at such reasonable prices, it seems hardly worth while trying to raise them from cuttings, besides which, budding is a much more certain and quicker method of increasing a stock of Roses. To ensure the greatest measure of success the following directions may be followed with confidence, as they are the outcome of the experience of one of the most skilful raisers of own-root Roses that we have ever had. A Cucumber or other cold frame should be placed on hard ground and filled with a mixture of loam, sand, and leaf-mould in nearly equal proportions to the depth of 6 inches. This compost should be made very firm and afterwards well watered. In a few days it will be ready to receive the cuttings. The best time to commence operations is towards the end of September. The cuttings should be taken from shoots which have borne the first crop of Roses of the year, as they will then be in the half-ripened condition required. They should not be cut from the plant but stripped off with a slight heel. The cuttings should be about 4 inches in length and thus prepared. All the leaves should be cut off except the two lower leaflets of the two upper leaves. They must be dibbled in and made very firm at the base or they will not strike. The cuttings should be inserted 6 inches apart and 3 inches deep, leaving the remaining inch with its leaflets to peep out above the compost. After the cuttings have been planted they should for a time

be kept close, admitting a little air to prevent the leaflets damping off. In severe weather the frame must be covered with sufficient matting or other material to keep out frost, or the cuttings will be lifted by its action on the compost and so prevented from rooting. Early in May in the following year they should be taken up with a ball and potted, kept close for a time in a frame, and then gradually exposed to the air and sunshine. In August they will be ready to plant out. The Roses which best answer to this treatment are the stronger growing varieties, for the moderate growers, if they succeed at all, take a long time before they make good plants.

Rose cuttings may be struck in the open ground under a north wall or other shady spot, planting them in sandy soil as above advised; but owing to the disturbing influence of frost and other causes the percentage of successes will not be nearly so great as when they are afforded the protection of frames.

Grafting.—This method of propagation is scarcely ever employed by amateurs, and it is therefore unnecessary to describe it here. It is used by nurserymen, principally for raising pot Roses and as a rapid way of increasing the stock of any new or rare variety.

COMPANION TO CRIMSON RAMBLER.

HERE I find the Himalayan Briar *Brunonis* comes out exactly at the same time as *Crimson Rambler*. The two plants run about 20 feet up the north side of my house and over the window of a bow. This year the white was the finest, as the *Rambler* was rather blighted, but last year they both did equally well at the same time. It is not an ideal place for a *Crimson Rambler*, but both in the open would make a fine picture.

Reigate.

J. R. D.

NOTABLE GARDENS.

LILFORD HALL.

LILFORD HALL, near Oundle in Northamptonshire, the seat of Lord Lilford, is a beautiful old mansion, surrounded by an extensive park, and containing within its domains exceptionally charming grounds laid

out in both the regular and irregular styles. Having been built of a very hard limestone, Lilford Hall is so well preserved that few would suspect its antiquity.

It was rebuilt during the reign of James II., when that King's Attorney-General, Sir Thomas Powys (great-grandfather of the first Lord Lilford), acquired this extensive property, which he partly remodelled. But many of the noble trees in the large park evidently existed long before that period, and now impart to the landscape that dignified appearance of ancient grandeur which is sought in vain in parks of more recent construction. A few weeks ago I was permitted to take some photographs of the house and grounds, and three of these are here reproduced. The first picture shows the house seen from a distance. The spacious mansion is built in the Renaissance-Tudor style, with handsome gables and massive oriels, which in the photograph, however, are mostly hidden by the greenery of the trees and shrubs in front. The whole south front is covered by a magnificent *Wistaria* (probably the finest specimen in this country), whose wealth of blossoms intermixed here and there with climbing *Roses* produces a charming effect. From the broad

terrace, bounded by pierced parapets, exquisite views are obtained of the large park with its noble trees, its picturesque vistas, and its broad expanse of green sward traversed by the River Nene, and enlivened by grazing herds of Afghan cattle and splendid deer. Adjoining the terrace is the formal garden. This is laid out on a large scale, in keeping with the style and character of the house. It has elaborate flower-beds and gentle slopes, and is encompassed by a low wall of pierced stone balustrading, by the side of which a line of Irish Yews—as seen in the illustration—completes the design. Among the flower-beds within this enclosure a great number are planted with that exquisite dwarf *Rose Hermosa*, which, though difficult to grow in some places, luxuriates at Lilford Hall. From the iron gates seen in the first picture a broad grass walk leads to other portions of the grounds, comprising extensive pleasure grounds, a children's garden, a *Rose* garden, a very large walled garden, and a rock garden.

The present Lord Lilford's father was acknowledged to be the greatest British authority on ornithology. No wonder, then, that the grounds of Lilford Hall abound in rare birds of all descriptions. Cranes from distant countries inhabit the shores of lakes and ponds filled with rare ducks, geese, and waterfowl from all corners of the globe. Song birds of all kinds are everywhere, and even talking ravens with an almost unearthly bass voice greet the visitor.

The huge walled garden, though chiefly devoted to fruits and vegetables, has its ornamental features nevertheless. Many of its borders are filled with flowers. *Eremurus* robustus, with flower-stems 9 feet high, was in full bloom at the time of my visit; but perhaps the greatest feature of this walled garden is the green walk, a long, straight grass walk with a broad herbaceous border backed by espalier fruit trees on either side. The herbaceous plants include Tree *Pæonies* and other choice flowers arranged with a view to successive effect. In another part of this garden are well-kept Yew hedges of enormous

proportions, forming a most fitting background to the *Roses* and other brilliant flowers displayed in front of them.

THE ROCK GARDEN AT LILFORD HALL.

About five years ago another feature was added to the grounds in the shape of a rock garden, in the formation and embellishment of which Lady Lilford took a special interest, inspired, no doubt, by recollections of the splendid assortment of mountain plants grown in profusion in the beautiful grounds of her Devonshire home.

The rock garden is reached by a long walk winding through a pleasant part of the grounds, where choice shrubs and especially *Lilacs* and *Hawthorns* abound; but the nearest approach to it is from the formal garden by means of the broad grass path shown in the first illustration. As a first introduction single rocks and small rocky beds crop up from the grass here and there, some of them protruding from the sward itself, while others rise from carpets of such dwarf plants as *Thymes*, alpine *Veronicas*, mossy *Saxifragas*, and other things. Presently larger beds of low rocks are reached, devoted chiefly to the smallest and choicest rock plants. The latter include such little gems as *Pentstemon Halli* and *Erigeron trifidus* from Colorado, *Petrocallis pyrenaica*, *Androsace lanuginosa*, *Dianthus neglectus*, *Saxifraga squarrosa*, and many others. On approaching still nearer, the picture shown in the second illustration comes into view and the Lily pond is reached. Looking at the luxuriant growth covering the greater portion of the banks of this pond, no one would suspect that the foundation of this scene is really an ugly cemented basin with all its artificial appearance carefully hidden from view. In constructing rock gardens I avoid cement as much as possible, but in this case it was impossible to do without it. It will be seen from the illustration (No. 2) that neither stones nor plants form a complete fringe around the pond, but that the margin is interrupted here and there by grassy banks, which in some places dip down into the water, and in others are studded with irregular groups

LILFORD HALL (THE SEAT OF LORD LILFORD) AND THE FORMAL GARDEN, AS SEEN FROM THE PARK.

of Irises and other moisture-loving plants. The plant with grass-like foliage in the foreground of the picture is *Libertia formosa*, which, with its handsome white flowers, is very effective. Immediately to the left of this is a large batch of *Primula rosea*. This is planted in such a way that its roots can reach the water. It had finished blooming when I took the photograph, but the flower-stems are still visible, and indicate by their unusual length how thoroughly the plants feel at home. *Iris Kämpferi*, planted with its crowns well out of the water, but with its roots within reach of the liquid, has done equally well, while *Iris sibirica* and other species enjoy positions a little higher up where the water of the pond does not touch their roots. Among other plants in the illustration are *Hemerocallis*, *Spiraea astilboidea*, *Astilbe rivularis*, *Spiraea Aruncus*, *S. palmata*, and others too numerous to mention. In the background are *Yuccas*, *Ferns*, and Japanese Maples, while garlands of *Clematis* spread over a prominent rock, and Tree *Lupins* half drooping send showers of flowers hanging over the tallest mass of rocks, at the foot of which a shady nook has been specially prepared for *Cypripediums* and other hardy Orchids. A double waterfall, of which a portion only is seen in the picture, feeds the Lily pond, where the best and newest of choice Water Lilies show by their luxuriant growth and abundance of flowers how much they feel at home. At the back of the rock garden seen in the illustration on page 138 is an old Fern wall, built with large stones in imitation of rock. This was constructed some years ago by the present Lord Lilford's uncle. In several places this has been left intact, and was blended with the new work done recently. Access to the flowers in and around the pond is facilitated by stepping-stones, which in one of the pictures may be observed right across the pond. A still better view of this stepping-stone bridge is afforded by the third illustration, showing a closer view from another point. The figure in this picture is that of Lord Lilford's head gardener, Mr. Wilson, who, since the construction of this rock garden, has not only made himself thoroughly familiar with the names of the many hundreds of varieties of rock plants used, but takes also the keenest interest in studying them. By careful attention he has made the rock garden a complete success.

Elmside Ecce.

F. W. MEYER.

TREES AND SHRUBS.

HYDRANGEA HORTENSIA VAR. LINDLEYI.

HYDRANGEA HORTENSIA and the majority of its varieties cannot be said to be good outdoor shrubs about London, as they are usually cut to the ground during winter and flowers are therefore absent. The variety under notice, however, is much hardier than most of them, and a fair quantity of flowers usually appear, while occasionally we are rewarded by an extra fine display, as is the case this year. The wood of this variety is more wiry and firmer than that of most of the others, while the inflorescences are from axillary instead of terminal buds, so that in the event of immature points being injured by frost, the lower flowering buds are left unharmed. In addition to the wood being different from that of the type, the leaves are also distinct, being much smaller and less fleshy. As a rule a number of

shoots. The flower stalks and calyx are very hairy, reminding one somewhat of those of *R. hispida*, but the hairs are shorter and softer than in that plant. Seeds ripen in this country, and good-sized trees can soon be obtained from them. At Kew this species is now, the first week in August, just coming into flower, and by the end of the month it will be a fine sight.

HYPERICUM HOOKERIANUM.

At this season of the year the different St. John's Worts assert themselves, for most of them are now in bloom. The genus *Hypericum* is an extensive one, and representatives occur in most of the temperate regions, several being natives of Great Britain. The species under notice, which, by the way, is often known as *H. oblongifolium*, is one of the finest of the genus, though it has the drawback of not being perfectly hardy in severe winters, but the last few have not subjected it to any great strain in this respect, consequently it is in many districts an object of great beauty just now. It forms a rather upright shrub, with reddish branches

clothed with glossy, dark green leaves, while the flowers, which are in clusters at the points of the shoots, are of a rich golden yellow colour, and fully 3 inches across. This *Hypericum* is a native of the Himalayas, and was introduced into cultivation by Messrs. Veitch, through their collector Thomas Lobb, about fifty years ago. An exceptionally severe winter usually plays considerable havoc with it. As there are about 150 species of *Hypericum*, and the flowers of all are of some shade of yellow, it is evident that in most places a rigid selection is necessary. Of the remainder the following, limited to the shrubby kinds, are all of especial merit: *H. aureum*, North America; *H. calycinum* (Rose of

Sharon), Levant; *H. elatum*, North America; *H. moserianum*, garden hybrid; *H. patulum*, Japan; and *H. prolificum*, North America. T.

OUR EARLIEST LEBANON CEDARS.

THE history of the Lebanon Cedar since it has been an object of culture in this country is probably more interesting than that of any other ornamental tree of exotic origin. During the comparatively brief period that has elapsed since it was first planted in Europe it has been intimately connected with the history of modern gardening. No tree has had so much attention bestowed upon it, none has been nurtured with such fostering care, and no tree has imparted such a distinctive character to the garden landscape as the Cedar of Lebanon. Its stateliness of growth, absolutely different from that of any other tree, was at once recognised by the tree planters of a few generations ago. To our tree-loving forefathers we are indebted for the noble tree growth that is now so important a feature in many of our finest gardens, and to their forethought

STEPPING-STONES ACROSS LILY POOL IN LORD LILFORD'S ROCK GARDEN.

inflorescences are borne from each stem, the individual heads being from 3 inches to 4 inches across, and composed of eight or more sterile flowers and numerous fertile ones. The latter blossoms are small and blue, the former white when they first open changing with age to red. In spring it should be pruned, cutting out weak shoots and the points of the branches just above the stoutest buds. As it blooms during July and August it is worth looking after, as flowering shrubs are then scarce.

ROBINIA NEO-MEXICANA.

THIS is from the Southern United States, and is one of the lesser-known Robinias, and also one of the most ornamental. It is of rapid growth, and makes a good sized tree, with long, semi-pendulous branches. The leaves are 9 inches to 1 foot long, and are made up of a dozen or more pairs of leaflets of oval shape. The flowers are deep pink in colour, and are borne in dense racemes from terminal buds and also from axillary buds near the ends of the

some 200 years ago are we also indebted for our magnificent Cedars. But where are the Cedars that planters nowadays mean to bequeath to generations yet to come? One may travel throughout the length and breadth of these islands and meet with but very few young specimens of the Cedar of Lebanon that will take the place of the venerable examples that must at no distant date fall victims to the ravages of time. Where are we to look for successors to the Cedars at Warwick Castle, Goodwood, Pains Hill, Gunnersbury, Linton, Gattton, and a few other places? True, at Warwick there are some half-grown Cedars that will in time occupy the place of the grand trees whose ponderous boughs overhang the Avon; but in nine places out of ten where old Cedars exist there are none to be seen to take their place. In all probability the numerous old Cedars that are now to be found in English gardens are the outcome of a short-lived fashion, such as that which obtains nowadays of planting all kinds of coniferous trees, whether suited to the climate or locality or not. No doubt it was the correct thing about a century ago to have at least one or two Cedars of Lebanon about the house, and it so happened that the subject taken in hand was just the tree whose merits rendered it worthy of being handed down to posterity. Would that we could hope that even a tithe of the trees which fashion bids us plant at the present time would develop into such noble growth as the Lebanon Cedar. If this tree had been planted in the same proportion as the Wellingtonia, we might in truth congratulate ourselves on the provision we have made for our heirs in the matter of ornamental planting. It would be folly to hope that the Wellingtonia will ever make an ornamental tree in the sense that the Lebanon Cedar is, for while in its youth it is as formal as it can well be, it is, travellers tell us, absolutely ugly in its old age. The near relations of the Lebanon Cedar from the Atlas and Himalayan Mountains, however, are receiving their due meed of attention from tree planters, particularly the Deodar, on account of the gracefulness of its adolescent stage. The Atlantic or Atlas Cedar, the African representative of the Lebanon species, is no doubt the more valuable of the two, and far more suitable for our climate generally than the Deodar, which is a tree for particular localities only. There are numerous examples about the country of the Deodar having been planted in ill-judged positions, the consequence being an array of miserable starvelings.

According to the "Hortus Kewensis," compiled by Aiton, the date of the first planted Cedar is 1683, though this must be incorrect, inasmuch as there are records of a tree which was planted at Bretby Park, in Yorkshire, in 1676. That the Lebanon Cedar was not planted or even known in this country previous to that date may be inferred from the fact that no mention is made of it by Evelyn in his "Sylva," which appeared about the year 1664. Aiton's account was no doubt founded upon the celebrated trees in the Apothecaries' Garden at Chelsea, planted in 1683, and which were supposed to have been the first planted in the country, and probably in Europe. Though Evelyn does not mention it in his "Sylva," he is, according to Loudon, supposed to be the introducer of it into Europe. In tracing out the modern or garden history of the Lebanon Cedar, Loudon has compiled

in his "Arboretum" a long account concerning the earliest planted trees, which embodies many interesting little incidents in connection therewith. He says that there were Cedar trees at Enfield and Hendon which were said to have been planted by Queen Elizabeth, but there seems to be no authentic memoranda in corroboration of this assertion. There can be no doubt that the Cedar in the Chelsea Botanic Garden was among the earliest, if not the first planted, specimen. It has been, however, cut down. Contemporary with the Chelsea planted Cedars are those, no doubt, at Syon, Gunnersbury, Kew, and Chiswick, all of which still exist. There were also some famous trees years ago at Whitton, then the residence of the Duke of Argyll—the tree-monger, as he was then called—who appears to have also planted the first Cedars in Scotland at Hoptoun House, but the date of this planting seems to

have been several years later than the trees planted about London.

One of the principal reasons, no doubt, why this Cedar is not more generally planted nowadays may be attributed to the fact that it has the

back branches may be trained. It should not be very closely pruned. That the chief factor in the free production of flowers is plenty of sunshine in the late summer and autumn is seen by their abundance this spring. Its comparative scarcity in gardens is due probably to the slowness with which it has been propagated, the only methods successfully adopted, up to within the last few years at any rate, being layering and division. Some years ago, however, it fruited and produced seeds at Touraine in France, so from this source young plants may possibly be obtained in future. The species flowered for the first time at Messrs. Standish and Noble's nursery at Bagshot in May, 1854.

AMORPHA CANESCENS.

THIS is an interesting leguminous shrub rarely seen in gardens, though it has been known for nearly a century. It is a native of the United States, being found in Louisiana on the banks of the Missouri and Mississippi. In stature it is low, being from 2 feet to 3 feet only in height. The leaves are greyish through being covered with a soft, whitish down, and are 3 inches to 4 inches long, composed of twenty-five or more tiny leaflets.

It blooms in July and August, the flowers being small and purple, with golden anthers, and in large, terminal panicles. It succeeds in loamy soil, and requires to be pruned fairly hard each spring, the principal shoots being well shortened and very weak ones removed. For a small bed or for a group in the shrubbery it is interesting, especially to those fond of uncommon things. W. D.

ORCHIDS.

TWO NEW CYMBIDIUMS.

MESSRS. SANDER AND SONS of St. Albans send an interesting note which they have just received from their collector Mr. Micholitz, respecting the habitat and conditions under which he found *C. Sanderæ* and another unnamed in their native home. This note shows under what very different aspects two apparently similar plants exist and flourish in a wild state. Mr. Micholitz says: "*Cymbidium Sanderæ* always grows on trees, frequently together, with a large *Polypodium*, where its roots seem to revel in the Fern roots and

decayed leaves deposited in these Fern stumps. A true epiphyte, growing in sparse numbers, making enormous quantities of roots in the spongy masses of the Fern clumps, which are full of deposited leaves and other debris, excrement of birds, and small animals. The red-flowered kind, however, which is provisionally called No. 1, grows under quite different conditions and surroundings. It may almost be termed terrestrial, for I found it on steep banks in ravines among thick grass and growing chiefly in a stiff, clayey-like soil, but never on trees. This fine *Cymbidium* has long spikes of open, rosy red flowers. Some very long spikes were on the plants, which must have been grand, but I was a little too late in reaching Lyang to see many plants in bloom. We were delayed many times on the road, and the flowering season was over on our reaching the mountains. I think you will find that these new *Cymbidiums* will do well, and flourish in or under similar conditions to *Cymbidium eburneum*, which must be grown warmer than *Cymbidium lowianum*. The latter is a cold plant, and probably will do well with as little heat as any known Orchid. It is certainly as cool a grower as *Cypripedium insigne*, if not colder. The latter will stand strong heat, but I do not think *Cymbidium lowianum* ever

THE PEARL BUSH.

(EXOCHORDA

GRANDIFLORA.)

reputation of being a slow grower, and consequently years elapse before the tree assumes its true character. It need hardly be said that a tree possessing such a reputation at the present day stands but a poor chance of being plentifully planted. That the Cedar is not, however, an exceptionally slow grower there is abundant evidence. W.

EXOCHORDA GRANDIFLORA.

INTRODUCED by Robert Fortune from Northern China over forty years ago, this shrub has not yet become at all well known; yet it is not only very pretty, but quite distinct. It is nearly allied to the Spiræas, and has, indeed, been known under that name. In the open it is a rather spreading, rounded bush 6 feet to 8 feet high, and bears in April and May a profusion of pure snow-white flowers. The leaves are 1 inch to 2 inches long, obovate, and quite glabrous. The flowers occur in short, erect racemes, each of them 1 inch across, the five petals being of elliptical outline. Although it succeeds very well in the open, the best results are obtained by growing it against a wall, to which

needs a tropical heat. It is possible that the beautiful red one (No. 1) will do with a more decided rest than *C. Sanderae*, because at times those ravines must be nearly as dry as the sun-scorched plains, where the sand was so hot that it blistered the feet, but at night heavy dews would envelop the plants in the ravines for several hours, otherwise they would perish. *C. Sanderae* would not be nearly so severely punished by drought, because the roots nestle in the spongy Fern roots and debris, with more or less shade by day and heavy dews at night, hence it would receive some moisture all the year."

The *Cymbidium Sanderae* exhibited at the Drill Hall, where it was awarded a first-class certificate, was one of a small consignment which had commenced to develop an inflorescence in the case during the journey home. Being well cared for, the single spike produced four blossoms, giving abundant evidence of its beauty and distinctness. It is well figured in the *Gardeners' Chronicle* of May 28, 1904, as a variety of *C. Parishii*, to which it bears some resemblance. Messrs. Sander's plant, however, is far finer than the rare and exceedingly beautiful *C. Parishii*, more brilliantly coloured, and altogether a more handsome plant. The petals of *C. Sanderae* are different in shape and size to *C. Parishii*, and the labellum in *Sanderae* is very much larger and finer. Messrs. Sander say: "We have only had one plant in flower yet, so we can only speak from what we have seen, but we believe that *Cymbidium Sanderae* is quite distinct from all other *Cymbidiums*."

WORK FOR THE WEEK.

CYPRIPEDIUMS.

THESE should now be thoroughly overhauled, as insects may be lurking deep down in the young growths, and the injury is not noticed till the new leaves lengthen. If thrips are seen dip the entire batch in a mixture of quassia. We fumigate periodically, and by that means this pest is seldom troublesome, but if the small yellow thrips obtain a firm hold dipping in quassia water is needful in addition to fumigating.

Some plants will now require potting, such as *C. lawrenceanum*, *C. callosum*, and others that flower late in the season, and many hybrids that have been obtained by crossing those that flower early in the year with the autumn-flowering sorts. A good compost for *Cypripediums* is made up of two parts good peat and one part each of sphagnum and leaf-soil. Those hybrids in which *C. insigne*, *C. spicerianum*, *C. niveum*, and the like are one of the parents prefer less peat and the addition of a little good loam. In each case small crocks should be added when mixing to keep the whole in a porous condition. The drainage should be ample and made up of crocks and rhizomes. In determining the quantity of drainage, the quantity of live roots each individual plant has must be also considered. Plants that have few roots should be in pots quite half-full, and others could be treated in proportion, always bearing in mind that when growing freely water will be required in abundance. If it cannot get away quickly the soil soon becomes sour.

When repotting is done give the plant sufficient room for two seasons, and the back growths should be severed. New growth will then come from the back part as well as from the front. If there is no room for the new back growths to develop, both with the main plant and the back growth division is best.

It will also be found needful to tie away some of the old foliage to allow the new growths an uninterrupted course. This is often required, especially when the back growths have been severed and the new ones are starting. The newly-potted plants will only require one good watering. Then the compost will keep sufficiently humid for some time with the overhead sprayings, which must be well followed up so long as bright, hot weather lasts. Many *Cypripediums* will now be well rooted and making vigorous growth, among them the popular varieties of *C. insigne*, which are now very numerous. Give these water freely, and on bright days overhead syringings. Keep them

well shaded on bright days. The growths can be checked from becoming soft or drawn by allowing a free circulation of air among them, and so long as the nights remain warm keep the top ventilators well open. I consider the night air very beneficial to the cool-growing *Cypripediums*. A side of a house may be looking very well, but a thorough inspection from time to time is quite necessary, and that is only done by handling each plant.

CARPENTERIA CALIFORNICA IN THE NORTH OF SCOTLAND.

[TO THE EDITOR OF "THE GARDEN."]

SIR,—Referring to your note on *Carpenteria californica* (the 6th inst.), it is certainly hardly near the sea on the west coast of Scotland. I have only one bush, which has been planted long enough to prove its hardiness, viz., twelve years. It flowers regularly in July, and is now 7 feet high and 5 feet through. It is against the house, but not trained, and facing south, being sheltered from the westerly gales by a wing of the house, and from east winds (which are very trying here in the spring) by a *Choisya ternata* 12 feet high and 9 feet through. Of course, this west coast of Inverness-shire has a comparatively mild climate, and very many Mexican, Californian, Chili, and New Zealand shrubs flourish here, but certainly during two winters at least since planting the *Carpenteria* it has stood 30° of cold without being cut, and in 1894-5 there was severe frost for two months.

LATE STRAWBERRIES—THE VARIETY ST. ANTOINE DE PADOUE.

[TO THE EDITOR OF "THE GARDEN."]

SIR,—Having read the paragraph in your paper recently by Mr. G. Wythes respecting late Strawberries, I thought it might interest the readers of THE GARDEN if I gave a short account of St. Antoine de Padoue Hybrid (St. Joseph × Royal Sovereign). I have forced it for the last two years with Royal Sovereign. To my thinking it is a very valuable Strawberry for that purpose. The fruit is of fair size and also good in colour and flavour. I started it with Royal Sovereign in the middle of January, and began to gather fruit the third week in March. Royal Sovereign is about a week later in ripening. The fruit is not equal to this in size, but one of the extraordinary things about it is that when gathering the first berries a second crop is coming on, quite as good as the first; in fact, it is a perpetual fruiter from the first gathering until removing the plants out of the house about the end of April. This year I have utilised the plants for out of doors after forcing. The plants were removed into a cold frame to harden off for a fortnight and then planted out in the open. The plants lost a portion of the old leaves, but at once began to grow away and became quite bushy in June. They at once began to show flower, the result of which was that on the 15th inst. I gathered one of the finest dishes of fruit that anyone could wish to see, so fine that my employer, Mr. Thomas Statter, sent for me in the evening after dinner to ask me what Strawberry it was I had sent in for dessert. He thought he had never eaten a Strawberry of so fine a quality, and Mrs. Statter expressed her regret that the dish of fruit had not been photographed. The most striking feature was the richness of the flavour and the size of the fruit.

I think if Mr. Wythes would try this sort and treat it as I have done this year, he would find a Strawberry equal to anything that could possibly be raised for August. This has certainly been a

favourable season for my experiment. I do not think that last year it would have been so successful.

R. JOHNSON.

Stand Hall Gardens, Whitefield, near Manchester.

[TO THE EDITOR OF "THE GARDEN."]

SIR,—When Strawberries are in demand from August onwards this variety is a valuable addition to this section, namely, alpinas and their hybrids. It was raised from the alpine variety St. Joseph and Royal Sovereign, thus giving much larger and better flavoured fruits than St. Joseph, besides being quite as perpetual. In growth it is almost as strong as Royal Sovereign but sturdier; the fruit is of capital size and flavour, with trusses of bloom and bud throwing up for succession. This variety does well planted out, but from my experience here it may be grown in pots, placing them in frames or any other protection while fruiting. The flowers should be kept pinched off until the end of June or even later, and so a stronger plant is formed and the fruiting time is deferred. It should be grown as an early variety for spring. Layer the plants at different seasons for spring or autumn fruiting. Here the plants are layered from the old fruiting pots, when layers are weak or short on the border plants.

"NOVEL" POTATO CULTURE.

[TO THE EDITOR OF "THE GARDEN."]

SIR,—I was not a little surprised to see a notice headed "Novel Potato Production" in your issue of the 16th ult. It has evoked some comments in the gardening press, and an abridged notice appeared in some of the daily and weekly newspapers, several of which were sent to me. Not being the author of the notice I cannot, of course, be responsible for everything it contained.

I may say we do not make any claim to be the original discoverers of this mode of culture, for some evidence of the capability of the Potato in this direction must have occurred to many. I think, however, Park Place may be credited with its development and of reducing it to a system. I described about two years ago in detail our method of culture in the *Gardeners' Magazine*. It has now become part of our routine work at Park Place, Henley-on-Thames, and three or four dishes a week of new Potatoes of good size and quality are gathered (not dug) from September to Christmas, and two or three dishes per week from Christmas to March.

The culture is being still further developed by Mr. Powell, my successor in the gardens. I may safely say it has provided a most useful and much-appreciated addition to our winter vegetable supply. The chalk caverns at Park Place help us very much, and few places are better adapted for this system of Potato culture.

GEORGE STANTON.

CISTUS LADANIFERUS.

[TO THE EDITOR OF "THE GARDEN."]

SIR,—I notice that "W." in an article on "The Rock Roses" (page 90), speaks of this species and its variety *maculatus* as if they were fairly easily procurable, and gives the size of the flowers as nearly 2 inches across. I believe the white-flowered type to be unprocurable, and the variety *maculatus* to be most difficult to obtain. As I mentioned in a note on the latter (page 20), I had then just measured a blossom that was slightly over 5 inches across. In Vol. LVIII. (page 251) Mr. Archer-Hind wrote: "It is nearly impossible to meet with the true *Cistus ladaniferus* (*maculatus*), *C. cyrius* I may say being almost universally sent out instead. Not to enter into minute distinctions, it is sufficient for identification to point out that not only has *C. ladaniferus* a very much larger and handsomer flower and much larger crimson splashes in the centre of the flower, but, whereas *C. cyrius* has three or four flowers on each peduncle, *C. ladaniferus* has only one. I am of course speaking of *C. ladaniferus maculatus*, the pure, unspotted white I have never been able to

procure." Messrs. Barr bear this out in their catalogue, in which they quote "*Cistus cypricus*, *C. ladaniferus* of gardens." Having vainly endeavoured to obtain a plant of the white type, which a few years ago I saw in hundreds at the side of the railway between Algeciras and Ronda in Spain, the bushes being then in full flower, I welcomed a note on page 280, Vol. LVIII., which stated that seed of this had been sent by the writer to Mr. T. Smith of Newry. I wrote to him to enquire if he had raised any plants, but was informed that the seed had failed to germinate. This year in the list of plants to be distributed by the Royal Horticultural Society the name of *C. ladaniferus* occurred, and I applied for and obtained a tiny plant, which I am growing on, but whether it will prove to be the true white type I have my doubts. S. W. FITZHERBERT.

ROSE WILLIAM ALLEN RICHARDSON.

THE accompanying illustration is from a photograph taken at Earldoms, Ridgeway, Enfield, the residence of Mr. Courtenay J. Page. As will be seen, the plant is in the rudest health. I was pleased to note the success which Mr. Page attained at the recent National Rose show, for he was second in the well-contested class of twelve blooms, there being no less than nineteen competitors. It is pleasant to find the decorative Roses grown by exhibitors, for they have a charm to the majority of individuals which the true exhibition Rose is bereft of. I think many exhibitors could blend the two together in a way that would remove the reproach now often hurled at exhibitors that they only care for Roses of an exhibition standard. Even with the beautiful garden Roses, such as *Gustave Regis*, &c., their beauty is much enhanced when some cultural skill is afforded in order to bring their blossom to the finest perfection. One would scarcely recognise some varieties when well grown to the same Rose indifferently produced. RAMBLER.

GARDENING OF THE WEEK.

INDOOR GARDEN.

THE PLANT STOVE.

PROVISION must be made to accommodate during the winter such plants as *Euphorbias*, *Poinsettias*, *Gardenias*, *Begonias*, *Scutellarias*, *Thyrsacanthus*, and others. A good deal of space for the purpose can be rendered available by removing from the roof the shoots of specimen *Allamandas*, *Clerodendrons*, *Stephanotis*, and similar plants that have flowered during the summer. After cutting away altogether a portion of the weak superfluous growth, attach the rest loosely to the trellis, and afterwards remove them and store them close together in the coolest end of the structure. Withhold gradually the supply of water to their roots, and the growth will in time harden and mature, a condition of much importance to success in flowering another year. It will be necessary also to free all plants from insect pests and to wash well the woodwork and glass, as well as lime-wash the walls. Bulbous plants, such as *Caladiums*, *Gloxinias*, and *Achimenes*, may be removed to a dry, cool position, in which their growth will gradually die away, and the supply of water to the roots should be greatly reduced.

THE GREENHOUSE,

in which a great number of *Azaleas* and other hard-wooded plants have to be wintered, must be got ready to receive these plants, as it will be advisable to house them as early as convenient in September. Zonal *Pelargoniums* and tuberous *Begonias* that have done flowering should be placed in any position where they can be given shelter from wet, but are fully exposed to the air. Have in readiness the shelves or stages on which *Cyclamens*, *Primulas*, *Mignonette*, &c., are to be placed near to the glass. Syringe less frequently around *Ericas*, *Epacris*, and other hard-wooded plants, but fresh air in abundance should be admitted.

THE PALM HOUSE.

The atmosphere here, which has until now been kept abundantly moist, should now be drier, and the Palms will harden the growth they have made during the summer and be better prepared for use indoors during the winter months. An occasional dose of weak liquid manure, to which a little soot has been added, will sustain those plants that have their roots situated in small pots in a healthy condition and impart a dark green colour to the foliage.

THE FERNERY.

Before removing the shade from the glass endeavour to harden somewhat the growth of the Ferns by reducing the supply of water to their roots as well as the moisture previously occasioned by syringing their surroundings.

Tranby Croft, Hull.

J. P. LEADBETTER.

FLOWER GARDEN.

AUTUMN AND WINTER BULBS.

To ensure success with many of these beautiful flowers it is necessary to insist on early delivery of

beyond its quickness, which is often a doubtful advantage. I much prefer to use a small spade, and, after removing the turf where the bulbs are to be planted, make square holes and remove the old soil, replacing it with new. After planting, the turf may be broken up and replanted. The selection of bulbs will depend largely on the requirements of the place and the tastes of the owners. Whether for planting in the garden proper or in grassy slopes there are many beautiful families to choose from, such as *Anemones*, *Chionodoxas*, *Colchicums*, *Crocuses*, *Eranthis hyemalis*, *Snowdrops*, *Leucojums*, and *Sternbergias*. This last-named is deserving of more extended culture. Occasionally one hears that *Sternbergias* are impatient of removal, and do not flower for several years after planting. But if the planting is done at the proper season, and the bulbs are placed quite near the surface of the soil, there need be little fear of failure.

English and Spanish Irises are also suitable for planting in the natural leaf-soil on the verge of woods. Given shelter from rough winds and

ROSE WILLIAM ALLEN RICHARDSON AT ENFIELD.

any fresh bulbs that may be ordered. Some nurserymen require considerable stirring up, and prefer to delay the delivery, so as to be able to despatch the whole of the bulbs ordered at the same time. Of course, there is no need for any hurry with *Tulips*, *Hyacinths*, &c., but as the principle of "first come first served" is fairly observed in the greater number of seed establishments, the gardener, if he wants the first quality bulbs and roots, should order them as early as possible. As the bulbs to be planted during the present month will in all probability occupy the same spot for some time, it is wise to make preparations by digging the soil to a fair depth, and after adding some decayed manure, well working the top spit to ensure a fine tilth. Heavy soils will give much better results if a good proportion of leaf-soil and coarse sand is added.

For planting in grass land and on banks the use of the crowbar for making the holes is sometimes recommended, but unless the soil is unusually friable this method has little to recommend it

exposure to what sun there is, at their period of flowering these quickly increase in size.

A. C. BARTLETT.

Pencarrow Gardens, Bodmin.

FRUIT GARDEN.

RASPBERRIES.

If the old fruiting canes have not been cut away this should now be done, to give the young ones more light and air to become properly matured. Tie in the strong young canes loosely to the wires or stakes to prevent their being damaged by strong winds, and remove or pull up weak shoots not required for planting that will not fruit next season. Autumn fruiting Raspberries should be protected with netting and trained thinly so as to give the fruits full exposure to the sun. Mulching and occasional waterings with weak liquid manure will be beneficial to them in dry weather and help to prolong the supply.

OUTDOOR VINES.

These are looking remarkably well this season. If the laterals have been allowed to extend a bit they must now be closely pinched and the growths trained thinly or good results cannot be expected. A mulch with good manure and copious waterings will be of great assistance to them, especially to those growing in light soils.

FIGS.

Figs growing on outside walls are making firm and short-jointed wood, a great difference in comparison to the growths made last season, which were gross and sappy. Do not allow the trees to become crowded with shoots or the wood cannot mature. Feed liberally trees that are carrying heavy crops of fruit, at the same time be careful of excessive moisture or the fruits will crack badly. Protect the fruits with hexagon netting from wasps and flies in general. This is the season of the year to visit some good nursery if it is intended to plant any quantity of fruit trees during the coming autumn and winter. New varieties may be seen and compared in fruit and growth with old and reliable ones. Notes should be taken now of trees that are crowded with branches and have them removed if possible, or marked to be removed later when the fruits are gathered. The crowding of branches is more noticeable at this season than at the winter pruning when the trees are clear of foliage. Good fruit cannot be expected in the centre of trees crowded with wood where sun and light are excluded, these only bear at the outside or end of the shoots. Go over Apple and Pear trees and pinch in all secondary growths.

Protect all the finest fruits from the birds with netting where possible. Round pieces of cardboard about the size of a five shilling piece with a hole in the centre just large enough for the stalk, and a slanting cut from the outside fixed upon Pears is an excellent protection from tits and other birds. Young trees of the above carrying heavy crops should be supported to prevent damage by high winds. Jars of beer and sugar hung on the walls and other places help to reduce the number of wasps and flies. Go over the trees of Plums daily and gather all ripe fruits, as they are quickly destroyed. Examine the ties of spring-grafted trees and remove them if cutting into the bark, and replace with fresh ones where necessary. Where budding of Pears, Apples, &c., is carried out, if not already done, this should be attended to at once, as, since the recent heavy rains, they are now in good condition for working.

Impney Gardens, Droitwich.

F. JORDAN.

KITCHEN GARDEN.

MUSHROOMS.

Now that the weather is cooler, beds in the open will soon cease to bear and cannot be depended on to produce sufficient quantities for a much longer period. About this date preparation should be made for a return to the Mushroom house proper. The collecting of manure should be done as speedily as possible and thrown into a heap, which must be turned over several times to allow some of the ammonia to escape. Mushroom manure should not be allowed to become dry and mouldy, but should be made up when in a fresh condition. After the temperature falls to 95° the bed should be spawned and covered over with rather heavy loamy soil and smoothed on the surface. The chief thing in the culture of Mushrooms is to see that the manure is gathered from stables where many drugs are not being used, and that the bed is made very firm before spawning. See that the structure is free from mice and other vermin. Keep a temperature of 60° and the house in a moist condition. The spawn should be procured in small lots, so as to ensure its being fresh and in the right condition. Mushrooms should appear in from six to seven weeks from the time of spawning the bed.

SEAKALE.

The foliage of this winter vegetable is now beginning to ripen. Remove decaying leaves, and pick off the seed-vessels unless seed is to be saved. Where later plantations are still growing they may

be given some stimulant to ensure good crowns for forcing for the winter months.

RHUBARB.

This is now in the best condition for preserving. The rank growth of this plant is over, and the stalks are now small and of a rich colour. Remove all decaying leaves and cut down flower-stems. Before the plants have lost all their leaves some of the best should be marked for lifting later for forcing.

ONIONS.

Spring-sown Onions are now showing signs of ripening. The heads may be laid over. Lift the crop where growth has been completed, choosing a dry day for the operation. These should be tied into bundles and hung in the sun to dry and ripen, or, if this is not convenient, they may be spread thinly on boards and thoroughly dried before storing. Autumn-planted Onions are still quite green and growing freely, and may be left for some time yet. When ripe they should be lifted without delay, and if the wet weather should continue they should be placed under cover in an open shed or cold frame to dry before storing. It is necessary to handle them carefully, as if much bruised they do not keep so well. Onions should be stored in a dry, airy room, should be inspected frequently, and all diseased roots removed.

THE FRUIT GARDEN.

POINTS ABOUT THE PLUM CROP.

IN April, when Plum trees in gardens, orchards, and plantations were sheets of bloom, a general heavy crop was anticipated, and even at that stage some people began to talk pessimistically of the extremes of a famine one year and a glut the next. As matters have turned out, however, there is not an abundant supply of Plums as a whole, though they appear to be distributed somewhat unevenly. Everywhere the early promise was good, but the vigour of the blight plague seemed to be worse in some districts than in others, with the result that trees are heavily laden in some gardens and localities, while in others there is little fruit to speak of.

Though Plums are grown more or less in every private establishment in the country, it may be observed that from a commercial point of view Plum culture is largely confined to certain defined areas. East Kent, for instance, is a great Plum district, and in that splendid fruit-growing country, which stretches away from ancient Sandwich to quaint old Canterbury, a large quantity of fruit is produced. Here the Mogul, the common Plum of Kent, may be seen at home, and a very useful variety it is when all things are considered. The round purple fruits are well adapted for culinary and preserving, and the tree, which is a compact grower and heavy cropper, is so well adapted to the soil and locality that it needs little attention. In years gone by this was the standard variety of the district, but since the introduction of such excellent Plums as Rivers' Early Prolific, The Czar, and Monarch, the latter have superseded the local Plum to a certain extent. Still the native variety has its own place, and proves its usefulness in seasons of comparative scarcity, because if any Plum bears this one does, and when the markets are not over-burdened the fruit commands a good price. It is when Plums are very plentiful generally that the preponderance of the native variety is felt, and I have known seasons when tons of fruit have rotted on the ground because the crop did not pay to pick.

Passing from the south to the west everyone is acquainted, through experience or repute, with that famous fruit-growing district round Evesham in Worcestershire. Here Plums are a great feature of the fruit industry, and here again there is a native variety—the well-known Pershore—which is common to the district. The Pershore is a good, useful, and, taking one season with another, a profitable Plum; but in years of plenty the prolific

Pershore bears so heavily that the fruit cannot always be disposed of at a profit. A recent journey through this locality revealed the fact that the Plum crop is a good one, and bearing in mind the dearth of last year, satisfactory prices should be maintained. The trees are mostly half standards grown on the plantation system, with the ground beneath cropped with bush fruit and kept under cultivation. The shape and form of many of the trees are by no means perfect, but these shortcomings can be overlooked when every branch is roped with fruit. Besides those mentioned, there are other districts in the country which have peculiar natural adaptabilities for stone fruit, and these should be guides in the development of the industry. To plant fruit anywhere with the idea of growing rich from the proceeds is foolish; but the thing is to develop the industry to the highest excellence in those localities which Nature has adapted for the purpose.

Wherever Plums are grown for sale or home consumption the name of Early Prolific is a household word. Why is this? Admitting that the variety is a good cropper and free grower, it must also be remembered that the fruits are small, and it takes a good many to fill a basket, while the quality is no better than that of many other varieties, so the cause of the popularity of Early Prolific does not exist in the above recommendations. The secret rests in the fact that the Plum in question is early and is ready for the market before the majority of high-class varieties are ripe. Gluts of Plums do not affect the sale of very early sorts, because they can be disposed of before the rush comes on, and when they introduced the variety in question some years ago Messrs. Rivers and Sons doubtless earned the thanks of the Plum-growing fraternity in general. But we

WANT MORE GOOD EARLY PLUMS,

and this fact is proved by the demand there is for Early Prolific. In its season the latter holds the monopoly, but when it is over most of the first-class as well as the common mid-season varieties, come in together, and if crops are generally heavy we have the regrettable gluts of fruit which are bad for producers and of no great benefit to consumers. Suppose we had a Plum of the Victoria type which ripened its fruit in conjunction with the Early Prolific, what an acquisition it would be! I have pointed out that varieties of local origin and medium quality are valuable in seasons when fruit is scarce; but in years of plenty they are doubtless responsible for gluts and low prices, because, when high-class varieties bear heavily, the trees of local sorts are laden to breaking point, and the superabundance of the latter brings down the market value of the former.

Speaking of late culinary Plums, Monarch is, of course, the best variety introduced in recent years, but the demand for late Plums does not appear to be so great as for very early fruit. It may be well to extend the season of production somewhat by the cultivation of late varieties, but the Plums produced in August and early September largely supply the demand for preserving and other purposes, so that there is no great call for stone fruit afterwards, except in the way of Damsons. Taking these points into consideration it is doubtless amongst the very early section of varieties that there is room for fresh introductions, and a really good Plum which would be ready for picking early in August would be welcomed by private and market growers alike.

No mention of Plums at this season would be complete without reference to the aphid plague, which has been such a source of trouble throughout the summer. Trees on walls, in gardens, plantations, and orchards have suffered to a greater or lesser degree, and the condition of the growth is worse where no attention is paid to washing or summer pinching than in cases where these matters receive attention. Blight, in the language of the fruit grower, is a comprehensive term, applicable to each and every member of the aphid family, but its meaning seems to become more serious every year. It is useless to look upon blight as a calamity brought about by the easterly wind or some other cause, and to take no further notice of it.

THE BANANA IN AN ENGLISH HOTHOUSE.

This is how the Hop growers of old used to treat the attacks of aphid which now and then ruined the crop, but all is different now, and every Hop grower realises the absolute necessity of washing if he expects to see anything back for his outlay and labour. As yet things are not quite so bad as this amongst the crops of stone fruits, but the tendency is in the same direction, and every year gardeners and fruit growers become less independent of the appliance maker and insecticide merchant.

G. H. H.

THE BANANA.

BANANAS are largely consumed by the inhabitants of tropical countries, being excellent food. They are also now a popular article of food in temperate countries, large quantities of them being imported all the year round from the West Indies and the Canary Islands for consumption in the British Islands. They are cheap, conveniently portable, and so wholesome that they will soon rival, if they do not surpass, the Orange and even the Apple for general use among all classes.

The imported Banana, from the fact that it has to be cut before it is ripe, and for other reasons, is necessarily inferior in quality to fruit that has been allowed to mature on the plant. Consequently high-class Bananas can only be obtained in this country from home-grown plants. A good Banana is one of the most enjoyable of fruits. At Kew and in a few other large gardens in England where they can be conveniently cultivated they are grown to perfection. There are numerous varieties, varying in size from 9 inches in length by 3 inches in diameter to dainty little thin-skinned fruits no bigger than a man's thumb. They are either angular or smooth and regular, their colour is either yellow or russet red, and their flesh resembles that of a ripe apricot in colour and mellowness or

may be had from plants grown in large pots or tubs. The root-system of a Musa is large, and therefore a liberal allowance of root-space is necessary. They like a strong loamy soil and liberal supplies of manure. All the forms of *M. sapientum* require a tropical temperature; the Chinese Banana may be grown in an intermediate temperature, but it is at its best only in a house where the winter temperature does not fall below 60° and in summer not lower than 70°. If a border can be afforded for Musas it should be at least 3 feet deep, and contain 2 feet of rich soil on 1 foot of drainage. The soil should be renewed for every fresh plantation. Musas enjoy plenty of sunshine and a liberal supply of water at all times.

THE INDOOR GARDEN.

GLOXINIAS AND THEIR CULTURE.

WHILE the better sorts of Gloxinias were at one time propagated almost exclusively by the leaves, the principle of selection is now so generally carried out, and the seed saved only from the very best, that the better plan is to procure a packet of seed from some good collection and raise a batch of young plants in this way. The seed, which is very minute, should be sown during the month of February in a well-drained pot or pan, filled to within half an inch of the top with good open soil, such as a mixture of two parts well-decayed leaf-mould to one each of loam and silver sand. On this the seed may be sprinkled thinly, and if a pane of glass is laid over the top it will need no further covering. If the pan is then placed in a spot free from draughts and away from the hot-

water pipes, it will need little, if any, more water till the young plants make their appearance, when the glass must be at once removed. The seed will require to be kept where the thermometer does not get lower than from 60° to 65° at any time. After the young plants appear above ground they make rapid progress, and will soon require to be pricked off into other pans, using much the same soil as before. From the time germination takes place the seedlings must be kept near the glass and in as light a position as possible; otherwise should the young plants become drawn and weak during their earlier stages, it is quite useless to expect satisfactory results from them afterwards. In pricking off the young plants should be placed about 1 inch apart, and directly they show signs of crowding it will be necessary to pot them off into small pots. The same kind of soil as that previously used will do well for the first potting, which should be into pots about 2 inches in diameter. They can afterwards be shifted into 3-inch pots, which will be large enough for most of them the first season, and in which fine plants can be grown. Gloxinias do not require to be heavily shaded at any time; still, shading is very necessary during the summer. The soil for the final potting should be of a more lasting nature, say, equal parts of loam, leaf-mould, well-decayed manure, and sand, with a sprinkling of crushed bones. Then, as the pots get full of roots, an occasional dose of liquid manure or some artificial stimulant will be of service. By midsummer the plants will be strong and sturdy, and will do well in a structure rather closer and warmer than an ordinary greenhouse. A light dousing with the syringe during very hot weather is of service till the plants come into flower, and at all times their surroundings should be kept moist, otherwise thrips may be troublesome. When these pests put in an appearance fumigation must be resorted to. When the flowering season is over the plants will gradually go to rest, the first indication of this being the leaves turning yellow, and from this time the supply of water should be gradually diminished. When the foliage dies down altogether the soil should be allowed to get almost dry (not parched up), as if too wet the plants do not get the requisite amount of rest, and start prematurely into growth, while if the soil is kept in a baked-up state the tubers are sometimes attacked by a kind of dry rot, which will cause numbers of them to perish. The tubers should be wintered in a structure where the temperature ranges from a minimum of 50° to a maximum of 65°, while at the same time if too warm they become greatly weakened thereby. They may be wintered in the pots in which they have been grown or where it is necessary to economise space as far as possible, they may be turned out and laid in boxes of sand or very sandy soil of a light nature; fine sandy peat will do well. Although Cocoanut fibre is sometimes used, it absorbs too much moisture from the tuber, which, unless the fibre is frequently moistened, is liable to become shrivelled; while if the fibre is kept too moist it is apt to cause the bulbs to decay. After the tubers have passed the winter in a state of rest they will require repotting and starting into growth. To do this they must be shaken completely clear of the soil and potted into small pots, say, from 2½ inches to 4 inches in diameter, according to the size of the tuber. As the pots get full of roots the plants must be shifted into their flowering pots, the same plan being followed as that recommended for seedlings, except that most of them will now require pots 6 inches in diameter for their full development. Where a succession is required a very good plan is to start the tubers in two or three batches, with an interval of a fortnight or so between each, as the flowering season will then be spread over a longer period. Again, the seedlings will, as a rule, flower later than the old bulbs, so that the season will be still further extended. For autumn and early winter flowering the latest seedlings should be selected, and to ensure success they will then require a very light position in a structure that does not fall below 60°. The potting of Gloxinias in all stages should be done with a light rather

than a heavy hand, as if the soil is pressed down too firmly the plants do not make satisfactory progress. In wintering the tubers, should the soil become very dry, it is better to sprinkle the surface slightly than to allow it to become parched up. H.

TYDEAS.

IN common with many gesneraceous plants, the name by which these are grown in gardens differs altogether from that recognised by the botanical authorities, for to them they are *Isolomas*, but in gardens and nurseries they remain as of old. By varying the method of cultivation they may be induced to flower at different periods of the year, but if simply potted in the spring and grown on in a warm greenhouse they are at their best during the latter part of the summer, and not only furnish a bright bit of colour after the *Gloxinias* are past, but in many instances attract particular attention by reason of the quaint marking of the flowers. They need an open soil containing a liberal amount of vegetable matter, such as equal parts of loam and leaf-mould, with a good dash of sand. The treatment usually given to *Gloxinias* will suit them well. As with these just named subjects, *Tydeas* can be readily raised from seed, but at the same time there are some well-marked varieties that are indispensable to any collection. A few of the best are herewith given: *Marius*, tube vermilion, edged deep purple, striped dark red; *Niger*, carmine, spotted maroon; *President Faure*, gold, spotted vermilion; *Princesse Clementine*, rosy yellow, spotted purple; *Robert le Diable*, carmine vermilion, spotted maroon; *Scorpion*, bright yellow, spotted brown; *Souvenir d'Alexandre Dumas*, pale rose, netted and spotted crimson; *Trophée*, rosy yellow and vermilion, marbled purple; *Belzebuth*, crimson, spotted black; and *Gigantea*, golden yellow, striped vermilion.

H. P.

THE KITCHEN GARDEN.

THE CUSTARD MARROW.

IT is the small Marrows, not much larger than a cricket ball, that are the most readily cooked and have the best flavour. Although large fruits and large varieties seem most desired, I would advise a trial of the Custard varieties in place of the big coarse ones so much grown. These grown in quantity and cut daily will give materials for the cook that are unobtainable in the market. Many object to cutting Marrows in a young state, thinking it wasteful, but this is not the case, as if the cutting is done regularly the plants yield enormously, more so than when a smaller number of fruits are left to form seed. The culture is very simple. The Custard varieties can be planted much closer together, and, though mostly bush forms, these require similar culture to the ordinary sorts. I do not think the plants like masses of manure. Ours do much better on the flat with a little food at the start, but what they do like is ample moisture at the roots, an open position, and waterings overhead late in the day. Grown thus dozens of fruit may be cut daily, and this may be done till the plants are cut down by frost. Red spider and green fly are their enemies, but this only attacks them when the plants are dry. We sow three seeds in $4\frac{1}{2}$ inch pots in April and plant out late in May, giving ample moisture at the start, and the hardier the seedlings are raised the better.

The Custard Marrow, though the growth is sturdy, does not grow so gross as others, but, at the same time, if supplies of liquid manure can be given in July or later so much the better. Our first fruits are cut in about six weeks from the time of planting, and in quantity from July till October. The plant is very productive, and there are some good sorts to select from.

I have referred to the bush forms, and of these there are distinct sorts, but they vary mostly in the shape of their fruits, and in writing of the bush I do not intend to class them with the Green Bush Marrow, which is not unlike the ordinary trailing

variety. Some Custard forms are nearly round, others long and ribbed, but the true varieties are small, shapely, and very prolific. Recently we have grown a trailing Custard variety called the Improved Custard, which is a great advance on the bush Custard; it produces a great quantity of fruit, but requires more room, and in this respect resembles more the larger trailing Marrow. The fruits of this variety when cut if about three days old—that is, from the time they begin to swell—are delicious. The older Custards do well if planted 3 feet or 4 feet apart and in an open, sunny position. Seed should not be saved from bearing plants. G. W. S.

NOTES FROM SCOTLAND.

THIS is the season for flower shows, and these appear to increase in Scotland annually, although each year some fall into pecuniary difficulties and suspend operations. It is surprising, indeed, that there is sufficient support for all the existing ones, and in many cases a combination of some neighbouring parish societies could be carried out with advantage to all concerned. Another point which might well be considered is the possibility of so arranging the dates that there could be no interference with each other's chances of gate money. I know two local shows held within two days of each other, and the places are only five miles apart. In consequence, both shows lose money, whereas if the meetings had been held a week or a fortnight apart both would have gained considerably. Up to the present the Scottish shows have this season had excellent exhibits, and in many things a great advance must be noted. Most of the smaller shows have sports or other attractions to help to attract the multitude. One of the most successful and most valuable of such shows is that held at

HADDO HOUSE,

the seat of the Earl of Aberdeen. It is well known that the Countess of Aberdeen is keenly interested in country industries in general, and in horticulture in particular, and every encouragement is given by Lord and Lady Aberdeen to the Haddo House Society. The annual show, which was held on the 10th inst., was most successful, the large number of classes being well filled, much excellent produce being exhibited. The horticultural department was a really fine one, the various exhibits being divided into two classes, one open to those occupying more than ten acres and the other to those occupying less than that area. Lady Aberdeen gives a number of special prizes, which are well competed for. The prize list is a long one, and one can only indicate a few of the winners of the special prizes. Lady Aberdeen's prize for window boxes was won by Mr. H. Smythe, Keithfield Lodge, and her ladyship's prize for a basket of fruit was secured by Mr. H. R. Conns, Ellon. Mr. L. Gavin, jun., Drumwhindle, won Lady Aberdeen's prize for a collection of Grasses, that for the best collection of leaves of trees and shrubs being awarded to Miss Mary Gavin, who was also the winner of Lady Marjorie Sinclair's prize for the best drawing of a wild flower.

SOCIETIES' EXCURSIONS.

The annual excursion of the Scottish Horticultural Association to Dalkeith Palace on the 6th inst. was highly successful, although the heavy rain was disturbing. Under such conditions the outdoor departments could not be properly seen, but enough was witnessed to cause the members to appreciate the excellent work done by Mr. Whytock in his onerous charge. The glass houses were, as usual, full of lessons to gardeners, and general gratification was expressed by those privileged to be present at the quality of the plants and fruits in that department. Dalkeith Gardens can always be looked to as supplying good cultivation, and Mr. Whytock succeeds in maintaining the high reputation this great establishment has held for so long. Fully 100 members and their friends took part in the excursion, and Mr. J. W. M'Hattie, the president, entertained the company to tea.

On the same day a number of the members of the Dundee and Broughty Ferry Horticultural Associations had a joint excursion to Brechin Castle Gardens, where they were welcomed by Mr. M'Dowall, gardener to the Earl of Dalhousie. An interesting afternoon was spent in the gardens and grounds of Brechin Castle, and general appreciation was expressed at the results of the methods adopted by Mr. M'Dowall, who kindly gave much information regarding the practice followed. Before leaving, on the call of Mr. D. Storrie, the Earl of Dalhousie was thanked for so kindly giving permission to visit the gardens, and, on the call of Mr. Slater, Mr. M'Dowall was also thanked for his kindness.

RAILWAY STATION GARDENS.

Passengers by the short sea route to Ireland, *via* Stranraer and Larne, will have observed the attractive way in which several of the stations are decorated with flowers. This is greatly due to the action of the Portpatrick and Wigtownshire Railway joint committee in offering prizes for these. The prizes for the year have just been awarded, the Newton Stewart Station coming out first. Parton follows closely, and other stations for which prizes are given are: New Galloway, Creetown, Crossmichael, Millisle, and Palmure. The award of the first prize to Newton Stewart will be endorsed by those who have seen the tasteful way it is decorated and the good cultivation given to the plants.

THE EDITOR'S TABLE.

WE invite our readers to send us anything of special beauty and interest for our table, as by this means many rare and interesting plants become more widely known. We hope, too, that a short cultural note will accompany the flower so as to make a notice of it more instructive to those who may wish to grow it. We welcome anything from the garden, whether fruit, tree, shrub, Orchid, or hardy flower, and they should be addressed to The Editor, 3, Southampton Street, Strand, London.

A BEAUTIFUL NEW IVY-LEAVED GERANIUM.

Princess of Wales is the name of a new Ivy-leaved Geranium which is being sent out by Mr. J. Fisher of Lewisham. It is a seedling from the beautiful variety *Mme. Crousse*, and has a flower of a peculiarly delicate mauve colour, and it is excellent for the open garden owing to its short-jointed growth. Its colouring should certainly make the flower popular.

TULBAGHIA VIOLACEA.

This comes from Mr. Fitzherbert, who kindly sends many interesting flowers from Kingswear in South Devon. It is one of those pretty Cape plants which are only happy in warm climates, such as the south of England, Ireland, and favourable places farther north. The heliotrope and pink flowers have a quiet charm, and the colour is clear and distinct.

ZEPHYRANTHES ANDERSONI.

This is one of the most interesting of the family, though without the beauty of *Z. carinata*. The flower is an orange-red shade on the outside of the segments, but within a clear rich yellow.

MICROMERIA GRECA.

This is of no account for its flowers, but the smell emitted from the leaves when bruised is almost as pungent as *sal volatile*, and sometimes strong enough to bring tears to the eyes. It might be called the vegetable smelling salts.

CASSIA MARILANDICA.

We are reminded of this bright yellow-flowered shrub by a shoot from Messrs. Thomas Ware,

Limited, Feltham, Middlesex, who also send *Sidalcea Rosy Gem*, a form with rose-purple flowers, and *Pentstemon spectabilis*, a strong coarse grower, with salmon-pink flowers of a pretty clear shade. Of the *Cassia* Messrs. Ware write: "The plants which are now flowering with us were raised from seed sown three years ago. It dies down with us in winter."

BULES FROM LOWDHAM.

The bulb season is at hand, and by this we mean the time to plant, and the less delay there is for most things after September the better. Messrs. J. R. Pearson and Sons, Lowdham Nurseries, Notts, send bulbs of the Emperor Daffodil and of the double Tulip *La Candeur*. The bulbs are excellent, and we are glad to learn from this firm that all bulbs are "very good this season, far better than was the case last year."

HOYA BELLA SEEDLINGS.

I send what appears to be a curiosity in the *Hoya* family for your inspection—four separate seedlings from bella, all of which seem to lean towards Paxtoni. I sent pieces to the Royal Horticultural Society's scientific committee, and received an answer thanking me for the specimens, "but no one had any experience of the plants." We have had *H. bella* in the place for a generation, and have never heard of a seed pod. Was Paxtoni the last?—JOHN FISHER.

It has been conclusively proved that *Hoya Paxtoni* is but a form of *Hoya bella*; indeed, in the "Kew Hand List" *H. Paxtoni* is referred to as synonymous with *H. bella*, and is not even kept as a variety of it. Taking the two extreme forms they are certainly distinct, but we have often met with plants quite intermediate in character. Whether they were seedlings or not we cannot, however, say. Seminal variation prevails to a greater or lesser extent in most genera, but it is very probable that the plants will in time more nearly approach their seed parent. We believe that *H. Paxtoni* was introduced subsequently to *H. bella*.

ARRANGING FLOWERS AND FRUIT.

NOTHING is more frequent in our homes, and more especially in our gardens, than to see good things either misused or merely got together without any attempt to classify or to reconcile or to harmonise. It is the fashion now to collect; nine people out of ten among well-to-do folk who have the pleasant task before them of furnishing the home that they are to live in for many years—perhaps for life—will take pleasure in visiting old furniture shops and buying a quantity of articles that take their fancy. Just now there are keen collectors of old English furniture, of French of the time of Louis Quatorze, of eighteenth century English. All are about equally in fashion. The larger number of buyers have but little knowledge of styles; they buy all three kinds, and bring them home in triumph, and complete the appointments of their houses with a good sprinkling of Oriental things of two or three different nationalities and of several epochs.

So it is that a moderate London drawing-room will have, perhaps, a preponderance of inlaid furniture with brass mountings and spindly legs, supposed to be French, and in the same room there will be an old English Oak linen chest, with very coarse carving, that may have come out of a Sussex farmhouse, and an Oak dresser from a cottage kitchen, whose top shows that it was made for a room about 6 feet 9 inches high. And all this incoherent jumble of articles is brought together into one room, and there left to fight it out as best it may.

It is the rule rather than the exception that arrangements of flowers in rooms are made in good taste. It is generally understood that the old tightly-bunched mixed bouquets of fifty years ago are things of the past. In country houses the mistress or her daughters arrange the table flowers with simple good taste, using one kind of flower at a time, or some pretty mixture of not more than two or three kinds of blossom and foliage. They also choose their flowers so as to suit the colouring of the walls, and soon get to know the kinds and colours of the blooms that seem most happily to accord with the various places where it is desirable to have the bouquets. They find that the room insists on having certain things in certain places. One place may ask for white flowers with rather bright green foliage, and one finds that it is gratified by being given Solomon's Seal, or tall white Tulips, or great branches of white Lilac; and later, white Roses in large sprays of arching, or sheaves of upspringing, blossom. Another place may demand those of an orange colour, and receives the great orange Lilies or *Alströmarias*, or orange Day Lily or African Marigold. Another again wants crimson, and has Tulips—the tall May-flowering sorts—and, later, the old garden Peonies, red, rose, and pink, and then Rhododendrons, and so on throughout the year.

It is safest certainly to begin with the simplest arrangements of some one thing, such as a jar of Daffodils, taking care to place them so that the flowers show themselves at their best and stand up as a handsome sheaf; enough but not crowded; with a few of their own leaves, and in such a jar as will hold them easily and comfortably, with plenty of water, and all their stalks reaching to the bottom. Flowers take kindly to careful arranging; they seem to understand what is required of them, so that however well and carefully they may have been placed in their jar, they will be found next day to have accommodated themselves so well to their position that they are even better than before.

Many of those who are accustomed to pick flowers for indoor use will have noticed a curious thing—how often it happens that the flowers seem to arrange themselves in the hand, and can scarcely be bettered afterwards. This is especially the case with bunches of Roses. It may be that unconsciously each Rose as it is cut and transferred to the left hand is put there with some idea of balance. Roses are heavy things; moreover, the prickliness of the stem makes their after arrangement a matter of some discomfort in the actual placing in the jar, the prickles catching in the stems of those already placed and tending to disarrange them.

Much more should be done in the way of well-disposed groups of fruit on our dinner-tables. In the late summer, when there are Melons, Grapes, Pears, Figs, Peaches, and Plums, it is desirable to arrange some of these on a large dish of silver, brass, pewter, or china. Fruit so arranged becomes a delightful picture, even more pleasant to look at in the middle of a dinner-table than a bowl of flowers. The amount of fruit that would fill four ordinary dessert dishes seems to increase in volume when so arranged; it gains greatly in beauty, and gives off a delightful scent. If anything brighter than ordinary Vine leaves are wanted to complete the dressing, those of Virginia Creeper are excellent. Vine leaves should be chosen rather small and pale in colour; as the season advances some may be found out of doors on some of the Sweetwater Grapes that are charmingly streaked and

mottled with golden yellow; and coloured Blackberry leaves—so Vine-like in form—may be found in hedge and thicket.

SOCIETIES.

ROYAL HORTICULTURAL SOCIETY.

THE meeting to the Royal Horticultural Hall on Tuesday last was not large—it is not the month for a big display—but many of the exhibits were of much interest. Professor Boulger gave an excellent lecture on "Preservation of Wild Flowers," and was listened to by a good audience considering the season; Mr. A. Dean in the chair.

FLORAL COMMITTEE.

Present: Mr. W. Marshall (chairman), Messrs. H. B. May, R. Dean, James Hudson, John Green, G. Reuther, E. T. Cook, Charles E. Dixon, Charles Jeffries, Charles Bick, J. W. Barr, Charles E. Pearson, W. P. Thomson, E. H. Jenkins, C. E. Shea, George Gordon, R. W. Wallace, and Amos Perry.

Mr. M. Prichard, Christchurch, Hants, in a fresh and good group of hardy cut flowers had prominent batches of *Montbretias* and *Gladioli*, the latter mainly of the *Childsii* and *Lemoinei* sections. Some of these were extremely effective. *Columbia*, for example, scarlet and crimson flakes; *Baron J. Hulot*, purple; *Eclipse*, white and crimson-purple, quite a hooded flower; and *Princess* was in grand form. Other good things were *Campanula hybrida Isabel*, very fine violet-blue; *Scabiosa caucasica alba*, *Clethra alnifolia*, *Helianthus multiflorus Soleil d'Or*, &c. *Campanula hybrida White Star*, a white seedling from *C. carpatica* *Riverslea*, *Anemone japonica elegantissima*, and *Hemerocallis Dr. Regel* were among other good things in this group. Silver Flora medal.

Mr. H. B. May, Edmonton, had excellent Ferns, such as *Nephrolepis Plurica*, *Adiantum farleyense*, *Pteris Childsii*, &c., in company with *Bouvardia*, *Lobelia cardinalis fulgens*, and a pretty group of *Veronica*s of the shrubby *Andersoni* section.

Messrs. James Veitch had a small group of *Daedalacanthus parvus*, with *Begonia Washington*, *Senecio Clivorum*, *Lilium Browni* (very fine) and its variety *L. B. Colchesteri*. *L. sutchense* is a dwarf, narrow-leaved form after *L. tigrinum*. A tall plant of *Buddleia variabilis*, 10 feet to 12 feet high, is called *Wilsonii*; it is, perhaps, more deeply coloured than the variety *veitchiana*, and a good plant withal.

Mr. Amos Perry, Winchmore Hill, had a full table of hardy plants with *Water Lilies*, &c. *Phloxes*, *Aconites*, and *Rudbeckias* were prominent. *Cedronella cana* is an unusual exhibit with reddish tubular flowers. *Helenium fulva* was good and well marked. *Gemm. Heldeirichii* *superba*, *Helianthus mollis*, and *Liatris pycnostachya* were prominent things, and not less so *Tritoma grandiflora*, with a score or more of its showy spikes. (*Euthera missouriensis*, *Asclepias tuberosa*, *Delphinium chasmerianum album*, *Phlox Coquelet* in a fine mass, *Lilium Henryi*, and many beautiful forms of *Lychius haageana* were other notable things. Silver Banksian medal.

Messrs. J. Peed and Sons, West Norwood, S.E., had a choice group of *Gloxinias* in flower, arranged with *Carex* and *Maidenhair Ferns*, and *Palms* as a background. The plants gave evidence of good cultivation, and were freely flowered. A great array of cut blooms, also of *Gloxinias*, were set upon boards, and formed quite a display of these valuable flowers. *Achimenes* in pots in several distinct kinds were shown. Silver Banksian medal.

Mr. Charles Turner, Slough, staged a small collection of *Hibiscus*, of which *Alba luteo plena*, *Blue Celeste*, *Monstrosa* (white and crimson), and *Leopoldi pleno* were the best. *Tamarix hispida aestivalis*, *Clerodendron Bungei*, and climbing *Rose Belle Vichyssoire* (a blush *Polyantha* kind) were also exhibited.

Messrs. T. S. Ware, Feltham, had a fine stand of *Cactus Dahlias*, very well arranged. *Amos Perry*, brilliant scarlet; *Effective*, yellow and fawn; *Loagala*, orange scarlet; *F. M. Stredwick*, white; *Mrs. H. B. Brousson*, orange fawn; *J. H. Jackson*, maroon; *Lauretta*, red and pale orange, were all prominent and good. *Traits of Smilax*, *Asparagus*, *Ferns*, and *Eulalias* assisted in the decorations, the exhibit constituting a very pleasing feature. Silver Banksian medal.

Some *Lobelias* in pots were shown by Mr. G. Kent, Norbury Park Gardens, Dorking. *L. oculata*, dark blue, white eye, is a seedling from Newport's Model.

Border Carnations were shown by Messrs. W. A. Proctor and Son, Chesterfield, and two spikes of *Gladiolus* from W. A. Bull, Esq., Ramsgate.

Messrs. Barr and Sons, Covent Garden, in addition to several cabinets of Daffodil blooms modelled in wax, in which quite a representative gathering was arranged, had many good and showy hardy flowers in season, *Gladioli* in beautiful array, *Crimin Powellii*, *Lilies* of the *speciosum* and *tigrinum* sections, *Senecio pulcher*, *Podophyllum Emodi*, *Sagittaria variabilis* fl. pl., *Cannas*, *Kuiphoza Pfizeri* (very fine), *Tropaeolum speciosum*, and others. *Water Lilies* were also in many good kinds. Silver Banksian medal.

Messrs. J. Laing and Sons, Forest Hill, staged a capital lot of *Begonias* in pots of an obviously good strain. The group included named sorts such as *Viscount Grimston*, *crimson*; *Sir C. Tennant*, *salmon*; *Lady White*; *Lady Ashburton*, *golden yellow*; *Grand Duchess of Hesse*, *white*, and others. Many of the unnamed kinds were also fine, and both single and double varieties were represented in plenty. Silver Banksian medal.

Messrs. Felton and Sons, 9, Hanover Square, W., had a large exhibit of *Chrysanthemum maximum* King Edward. The flower-head is very large.

Vases of Carnations and pots of early-flowering *Chrysanthemums*, as *Horace Martie*, *yellow*; *Ralph Curtis*, *white*; *Mme. M. Masse*, and *Bronze Masse* were also from the same firm. The plants were all well-grown and flowered.

A large table filled with *Begonia* blossoms on boards came from Mr. A. L. Gwillim, New Eltham, Kent. The varieties

were not named, and were represented in shades of rose and salmon, crimson and scarlet, orange, deep and light crimson, golden, white, and intense scarlet. Some of the sugar-flowered kinds were monsters, the white and salmon scarlet shades especially so. It was indeed a great display. Silver-Bankian medal.

A stand of Cactus Dahlias from Mr. S. Mortimer, Farnham, Surrey, contained some excellent novelties, e.g., *Vivid*, a most brilliant flower; Mrs. M. A. Mortimer, a syriac-like, Edith, crimson-maroon; Mrs. J. S. Brunton, rich yellow, &c. Blush Queen was excellent. (See awards.)

AWARDS

Dikla's Peach Queen (Cactus).—A remarkably pretty flower of a rosy peach hue with creamy yellow centre. As shown it is one of the most effective we have met with, and it is equally good in the garden will become a valuable sort. From Mr. S. Mortimer, Farnham, Surrey. Award of merit.

Tunbridge Begonia.—One of these elegant and beautiful flowering shrubs that cannot be too well known. The leaves are of a somewhat glaucous hue, the numerous small blossoms of a syriac arranged on the freely branching spikes. From Mr. Charles Turner, Slough. Award of merit.

A botanical certificate was awarded to *Gladiolus grandiflorus*.—From the Rain Forest, Victoria Falls of the Zambezi River, South Africa. The following interesting information was given: "These bulbs, which are believed to be closely allied to *Gladiolus primulinus*, grow in the spray of the falls. The petals act as an umbrella for protecting the pistil and stamens from the spray. They have been named Maid of the Mist.—Townsend. The growth is 3½ feet high, the inflorescence wiry and somewhat elegant, and bearing four to six of the light golden yellow flowers. The outer sepals are recurved, the inner uppermost one arched over and covering the organs of the flower. The lower petal is much shorter than the rest, and recurved in such a way as to meet the under side of the tube. It is in any case a most interesting plant. From Mr. Francis Fox, Ayn Bank, Wimbledon.

ORCHID COMMITTEE.

Present: Mr. Harry J. Veitch (chairman), Messrs. J. O'Brien, H. A. Tracey, H. Little, F. Wellesley, G. F. Moore, W. Boxall, J. Douglas, M. Gleeson, W. Cobb, A. Hislop, J. G. Fowler, F. W. Bond, J. Charlesworth, De B. Crawshaw, and F. J. Thorne.

There was not much before this committee, and no awards were made for novelties, but among those submitted was *Cypripedium bellia* (exillarium) *levigatum*, a very pretty variety, which lost an award by one vote. From Mr. F. Wells, Westfield, Dorking.

From Captain G. L. Holford, Westonsbirt, Tetbury, Gloucester, came *Cattleya germania superba* (C. granulosa schobeldii × hardyana), a fine variety with purple-mauve sepals and petals, and a large spreading lip of deep purple, prettily imbricated; also *Cypripedium Milo Westonsbirt* var. (insigne Chantini × *canthium superbum*), a beautifully marked variety.

From Mr. R. J. Measures, Cambridge Lodge, Camberwell, came *Masdevallia* × *Veitchi* fragrans, small flowers, amber with a purple gloss, an interesting variety.

From Mr. C. J. Ingram, Elstead House, Godalming, Lello-Cattleya Admiral Togo (schillerianum × Turneri), soft mauve sepals and petals, with a purple veined lip. A distinct form.

From Mr. H. S. Goodson, Fairlawn, Putney (gardener, Mr. G. E. Day), a group of Orchids, which included *Cattleya Harrisonii* var. H. F. Goodson, a fine variety, the petals and sepals deep mauve, regularly spotted with crimson, and a well marked lip; *Lello-Cattleya Harry Goodson* (parentage not known), dark bronzy brown sepals and petals, and a rich purple lip, evidently with *Lelia tenebrosa* blood in it; *Cypripedium canthium superbum*, a fine dark variety; *Curtisi splendens*, and several other good kinds, also *Lello-Cattleya*, *Oncidium*, and others. Silver Bankian medal.

FRUIT COMMITTEE.

Present: Mr. J. Cheal (in the chair), Messrs. W. Bates, S. Mortimer, A. Dean, L. Castle, G. Lyne, W. Poupard, J. Jaques, G. Norman, and F. Q. Lane.

Apples were the chief feature before this committee. Messrs. G. Bunyard and Co. of Maidstone staged fifty varieties, all of excellent quality and well matured, only early autumn varieties being included. Among the most noteworthy were *Bleio Bor-dawka*, a medium-sized kitchen Apple of good appearance (was submitted for a certificate but failed to get it); *Peter the Great*, *Early Victoria*, *Wiltshire Fillbasket*, *White Transparent* (very fine), *Golden Spire*, *Red Hawthornden*, *James Welsh*, and *Lord Grosvenor*. Of dessert varieties *Beauty of Bath* was fine, also *Ben's Red*, *Irish Peach*, *James Grieve*, *St. Edmund's Pippin* (an early russet), and *Worcestershire Pearmain* (a very fine exhibit indeed). Silver Knightian medal.

Messrs. Cannell and Sons made a bright exhibit, having about fifteen sorts in pots, the plants all being well cropped with fruit, and included such sorts as *Lady Sudeley*, *A. Inon Pippin*, *Banman's Red Reinette*, *King of the Pippins*, *Cellini*, *Early Victoria*, *Winter Peach*, *Stirling Castle*, *Pott's Seedling*, and other good sorts. Among those shown in dishes were *Beauty of Bath* (in splendid condition), *Red Astrachan*, *Mr. Gladstone*, *Red Quarrenden*, *Lady Sudeley*, *Duchess of Oldenburgh*, *The Queen*, *Grand Sultan*, *Sugar Loaf Pippin*, *Golden Sphere*, and others, a well displayed and attractive exhibit. Silver Knightian medal.

Mr. H. Spooner of Isleworth also made an excellent display of Apples, though the fruits were not quite so well matured as in the other collections, and included several not seen in the other exhibits, *Okera*, *Benoni*, *Golden-nough's Nonsuch*, *Early Julien*, *Williams Favourite*, *Eckinville Seedling*, *Kerry Pippin*, *Grenadier*, and other good sorts. Silver Bankian medal.

Mr. W. A. Cook, gardener to Colonel Simpson, Shirley House, Croydon, showed some fine bunches of *Grape Buckland Sweetwater* from vines planted in 1867, also a good Tomato named *Shirley Favourite*. The fruits were of perfect

shape and very firm, but of a pale red or pink colour, and some good fruit of *Peach Sea Eagle*.

Mr. J. Crook, The Gardens, Forde Abbey, Chard, showed fine examples of *Apricot Moore Park*, and was awarded a cultural commendation.

Mr. W. Roupell, Roupell Park, had well-ripened fruit of *Apple Lady Sadeley* grown within five miles of Charing Cross and was given a cultural commendation.

Mr. J. B. Cawill, High Street, Sidmouth, showed *Raspberry Diamond*, a very fine variety, some of the largest we have seen this season.

Mr. G. Penwill of Totnes, Devon, showed his *Raspberry Penwill's Champion*, which gained an award at the Holland House show.

Mr. G. Kent, Norbury Park Gardens, Dorking, showed *Melons Kent's Al* and *Norbury Hero*, both scarlet flesh, well netted, and of good flavour; and from

Mr. Whinstanley, gardener to Sir Pryse-Pryse, Bart., came *Melon The Baronet*, a pale flesh, but very good flavour.

From Mr. W. Deal, Brooklands, Kelvedon, *Scarlet Runner Bean Brooklands* scarlet was shown in bunches, representing a very fine crop; also *Potato Excelsior*, a fine early round variety.

Some fine examples of the *Mirabelle* or *Cherry-Plums* came from the Royal Horticultural Society's gardens at Wisley.

Rubus sorbifolius (the strawberry-raspberry), from Mr. Charles Turner of Slough, were attractive to look at, but, we believe, deceptive, as the flavour is poor. It is, however, sufficiently attractive as a climber.

EASTBOURNE FLOWER SHOW.

The flower show held in the beautiful grounds at Compton Place on the 15th inst. was a great success. The gardens were open to visitors, and perhaps proved a greater attraction than the flower show itself, though this was exceptionally good. Mr. May, gardener to the Duke of Devonshire, made a splendid display, putting up a large miscellaneous group of plants that included some fine specimens of *Campanula pyramidalis* (white and blue).

Among the competitive exhibits were some very good groups. Mr. G. T. Scott of Eastbourne taking first prize. Mr. W. E. Hollands of Tunbridge Wells also made a very fine display. Mr. Durrant Young of Eastbourne put up a good group in the background; a bright display was made with *Tuberous Begonias*, *Tuberose*, and *Liliums*. For Ferns Mr. Scott was again first with a well-arranged group. There were some very fine specimen Ferns from J. Warren, Esq., Hand Cross Park, Sussex, *Davallia polyantha*, *D. Mooreana*, and *Marattia alata* being specially good. Other foliage plants and large specimen flowering plants were equally good from the same exhibitor. Mr. Alfred Gadd, gardener to P. A. Egles, Esq., St. Leonards, also exhibited well in the above classes. *Tuberous Begonias* in double varieties were very good from Mr. F. W. Thomas, Wannock, Polegate. *Zonal Pelargoniums* were well shown, also *Gloxinias*. Hardy flowers were quite a feature. Messrs. G. Bunyard and Co. of Maidstone staged a large group, in which the *Tritomas* were very fine.

Messrs. A. Charlton and Son of Tunbridge Wells also had hardy flowers and a good collection of Cactus Dahlias. Cactus Dahlias were very fine from Messrs. Stridwick and Son of St. Leonards, also from Mr. F. W. Seal of Sevenoaks, and Messrs. J. Cheal and Sons, Crawley. The last two named also had *Pompons* and singles in good form. Good Roses came from Mr. Will Taylor of Hampton and Mr. W. J. Woodland of Uckfield.

There was a good display of fruit. In a collection from Mr. J. Gore of Polegate, Sussex, *Maddresfield Court Grapes* were very fine. Among *Melons*, from over a dozen exhibitors, the first prize was gained with *Frogmore Scarlet*, which is a fine variety. In *Nectarines* *Pine-apple* took first, and in *Peaches* *Diamond*. Apples were well shown in dessert varieties, *Irish Peach*, *Lady Sadeley*, and *Red Astrachan* were the sorts taking first prize for three dishes.

Potatoes were largely shown, the best round being *White Globe*, and the best *Kidney Up to Date*.

Table decorations were another good feature, some very pretty arrangements being displayed.

FELLING FLOWER SHOW.

On the 15th and 16th inst. the twenty-fifth annual exhibition of the Felling Floral and Horticultural Society was held at Felling. The entries were as numerous as in previous years, and the exhibits of the highest quality. The list of special prizes in the open class were as follows: Tradesmen's Silver Challenge Cup, Hizzinbottom Challenge Bowl, and Members' Silver Challenge Bowl. The exhibits of Messrs. Harkness and Sons of Bedale in the open class were remarkable, they having won the Hizzinbottom Challenge Bowl for twenty-four cut Roses, defeating Mr. R. Gardner of Whickham the holder. Equally magnificent were the table decorations exhibited by Mr. James Summers of Sunderland, for which he was again awarded the Members' Silver Challenge Bowl for the third successive year. Mr. Thomas Battensby of Baydon was awarded the Tradesmen's Silver Challenge Bowl for eighteen Dahlias, twelve dissimilar, he defeating Messrs. Harkness and Sons of Bedale, the holders. Other principal prize-takers were Mr. F. Edmundson, nurseryman and florist, Newcastle; Mr. John Arkless, Gateshead; Mr. J. Ellison, Shankhouse; Mr. R. Gardner, Whickham; Mr. A. Winter, Corbridge, &c.

KIRKCUDBRIGHT.

The annual show, which was held in the Town Hall, Kirkcudbright, on the 13th inst., was one of the best yet held by the society, and had the weather been more favourable the results would have been highly satisfactory. The Grapes in the open section were of exceptional excellence, the first prize going to Mr. James Duff, gardener to Colonel Gordon of Threave, the second to Mr. W. Thompson, Cally Gardens, who, however, led in all the classes for Grapes confined to gardeners. In the pot plant classes the competition was

good, and three fine tables were arranged in the class for a table of plants 4 feet in diameter, the first prize deservedly going to Mr. W. M. Guffog, gardener to the Countess of Selkirk, Balmoe, Mr. Duff being second, and Mr. Thompson third. Cut flowers were good, the leading prize winners being Mr. Duff, Mr. G. Benson (Borzu), Mr. M. Guffog, and Mr. Walker, gardener to Misses Blackburn, Park House. The fruit classes were unusually good, Mr. Duff, Mr. Thompson, and Mr. B. Rutherford, gardener at Glenlair, being the leading winners. Vegetables were fine, the autumn sown Onions from Mr. M. Guffog being universally commented upon for their excellence.

TAUNTON DEANE HORTICULTURAL SHOW.

THERE is vitality in a society that for the space of thirty-seven years has held a large flower show annually. The show was held in Vivary Park, a municipal open space at the top of the town, on the 11th inst., and here some nine tents were placed. The Taunton show brings together one of the finest displays of specimen plants seen in the country. The committee had to regret the temporary loss of the fine plants hitherto shown from the gardens of Wilfrid Marshall, Esq., the late president, who died a short time since. Not only were the specimen plants numerous and good, but cut flowers, fruit, and vegetables, together with elaborate table decorations, were up to the usual high standard.

SPECIMEN PLANTS.

With twelve plants in flower Messrs. Cypher and Son were placed first with some of the best specimens staged by them at Taunton during the past twenty-five years; Mr. Vause was second; W. Brock, Esq., Exeter (gardener, Mr. Rowland), third. With six specimens Messrs. Cypher were first and Mr. Vause second. Some excellent specimen *Begonias* were shown by Miss Neale, Taunton (gardener, Mr. W. Hayward). There were *Fuchsias* also, very fine *Cockscombs*, and several classes for single specimen stove and greenhouse plants. The best plant in bloom recently introduced was a pale-coloured *Lixia*; the best foliage plant *Croton turnfordensis*, both from Messrs. Cypher and Son. The best group of plants arranged for effect was from Mr. Vause.

In the amateurs' division the principal exhibitors of plants were Mr. W. Brock and Colonel Sandford, Nynehead Court (gardener, Mr. S. Kidley). Mr. Brock had the best group, and Colonel Sandford was second. In the open division foliage plants were finely shown in eights, also Ferns, by Messrs. Cypher, Vause, and W. Brock. In the amateurs' division Ferns, *Coleus*, and *Caladiums* were produced, all highly creditable.

CUT FLOWERS.

These included Roses. Mr. G. Prince, Longworth, took the first prize for thirty-six and eighteen blooms, and also for eighteen Teas, Messrs. J. Jefferies and Son, Cirencester, taking the second prize. Mr. W. Treseder had the best twelve blooms of show Dahlias, staging good blooms, but Messrs. J. Gray and Son, who were second in the previous class, came in first with twelve good fancy Dahlias. They were also first with six bunches of single varieties and with nine bunches of *Pompons*. Mr. W. Treseder coming first with six bunches of charming Cactus Dahlias. *Zonal Pelargoniums*, *Phloxes*, types of *Asters*, *Gladioli*, *Phlox Drummondii*, *Hollyhocks*, *Begonias*, and *Carnations* were well shown, the latter especially, Messrs. Herbert and Brown of Birmingham staging finely finished flowers, which formed excellent object-lessons. Stove and greenhouse cut flowers and hardy herbaceous and bulbous plants were in good character, and Sweet Peas were shown in two classes, some special prizes offered by Mr. R. Sydenham bringing a large competition. In the amateurs' and gardeners' division cut flowers were shown in twenty classes, and of general good character.

FRUIT.

In a schedule of prizes of 176 classes it is obvious that only certain leading features can be touched upon; and of the fruit it may be said there was a very good display indeed. The best eight dishes were from J. W. Fleming, Esq. (gardener, Mr. Mitchell), who had excellent Grapes, Peaches, Nectarines, *Apricots*, Figs, &c.; *Lady Ashburton* (gardener, Mr. J. Hall) was second. With four dishes *Lady Ashburton* was a good first, and Colonel Sandford second. Mr. Fleming was first with two bunches of *Black Hamburgh Grapes*; Mrs. Brooks, Yeovil, was second. With two bunches of any other black Mr. H. H. Shepherd, Ilminster, was first with *Madresfield Court*, Mr. Fleming coming second with *Gros Maroc*. The latter had the best two bunches of *White Muscats*; Mr. J. S. Donne, Castle Carey, was second. Mr. R. G. Somerville was first with two bunches of any other white, showing finely-developed *Buckland Sweetwater*.

In the open class vegetables were very fine, and the special prizes offered by Messrs. Sutton and Sons, Carter and Co., E. J. Butt and Co., and Jarman and Co. brought good competitions. The cottagers' productions, which were included in twenty-one classes, made a show in themselves, as they filled a large tent.

Very interesting exhibits were made by Messrs. Kelway and Son, who were awarded six certificates of merit to very fine new varieties; Messrs. J. House and Son, Westbury-on-Trym, who had *Phloxes* in great variety and *Delphiniums*; Messrs. R. Veitch and Son, Exeter, who had a large and varied collection of plants, prominent among which was the large yellow *Lonicera Hildebrandtii*; Mr. Prichard, Christchurch, who had cut flowers and plants; Child and Herbert, Acock's Green, who had *Carnations* and *Pionettes* in variety; Blackmore and Langdon, Twerton, who had fine *Begonias*; W. Treseder, Cardiff, who had Cactus Dahlias; P. Slade, Taunton, showing Roses in pots, *Zonal Pelargoniums*, &c.; W. B. Smale, Torquay, who had Cactus Dahlias, *Begonias*, *Phloxes*, &c.; Topley and Son, who had Cactus Dahlias, *Carnations*, &c.; J. H. White, Worcester, who had a collection of hardy flowers; W. L. Pattinson, who had *Violas*; while Mr. G. Prince staged a charming collection of Roses. As is usual, there was a large attendance, the taking being equal to those of previous years.

THE GARDEN

No. 1711.—VOL. LXVI.

SEPTEMBER 3, 1904.

ROSES — PAST, PRESENT, AND FUTURE.

BY THE LATE DEAN HOLE.

"I came to the place of my youth, and I said,
'The friends of my youth, where are they?'
And echo answered, 'Where are they!'"

I HAVE come back for a while to the place in which I have lived my life, all but a decade in the Deanery at Rochester, and I go into my garden, where, once upon a time, 5,000 Rose plants grew, and I say to the 500 which represent them now, "The Roses of my youth, where are they?" Alas! as when in a Sunday School no responsive hand is held up to indicate information, so now there is no sign, no sound.

Where are the Roses of my childhood? Even the wild Roses which beautified the hedges of our high roads, and embowered our rural lanes, have in many districts almost disappeared, hacked to death by the billhook, or grubbed up altogether to make way for iron rails, or for that abomination of desolation, the prick-wire fence. In the garden, where are the great bushes of the Moss Rose, exquisite in the bud, but somewhat prickly and sticky to our tiny and grimy fingers? Where are the flowers which proclaimed that the Wars of the Roses were over, and that the colours of York and Lancaster were blended in peace? Where is Rose Celeste, sweet and blushing as miss in her teens, which we children loved most of all? Where are the Burnet, the Portland, the Pimpernel, the Pompon Roses? Where is the Damask, Rose du Roi, in crimson velvet robes? Where are the Provence Roses—the Cabbage, sweetest of all? Where are all the admirable Roses painted in Redouté's charming book? Where are the Roses of which Mrs. Gore wrote some sixty years ago? She gives us the names of nearly 400 "species allowed by botanists," and of more than 1,500 varieties: where are they—the Emperors and Empresses, the Kings and Queens, the Princesses, the Archbishops and Archdukes? Where is the Rose de quatre saisons, better known to the working gardener, who, like Mr. Lillyvick, has no opinion of the French language, as "Quarter Sessions?" The Assemblage des Beautés is dispersed: the Bella Donnas have retired from the stage. Gloria Mundi and Merveille de l'Univers are faded and gone!

"I feel like one who treads alone some banquet hall deserted,
Whose guests are fled, whose Roses dead, and all but he departed."

Here and there in ancient gardens, in shrubby borders, and in neglected nooks a few of the old Roses may still be found, and specimens are sent to me from time to time with a request that I will "name this child." Some of the latter I am able to identify from personal acquaintance or from their portraits in my possession; but they arrive, as a rule, in an advanced stage of decomposition, and I can only designate them as pot-pourri. One of

my correspondents accepted this reply as the correct appellation for the Rose, and I had intense gratification, on a subsequent visit to his garden, in reading that he had named his *bella incognita* in large black letters on a white ground, "Rose, Pot-pourri!"

The more numerous survivors of those which bloomed when

"In the days of my childhood 'twas like a sweet dream
To sit in the Roses and hear the birds sing.

are the Ayrshire, the Banksian, the Scotch, the Austrian Briar, and, true to its title, the Semper Virens. Among the latter, conspicuously, Felicité-Perpetuelle (who will tell us when and why it was abbreviated to Perpetue!) reminds us of the delights, pure and infinite, which gladden the rosarian's heart.

Passing on to manhood, through the years in which the cricket-bat and the football, the new gun, the pony, the cob, the hunter, enticed us in our hours of recreation from the garden to the wicket and the goal, to the woods and to the stubbles (there were stubbles in those days nearly up to the knee, and there were men who preferred to find and follow their game rather than have it driven to them), to the time when more than fifty years ago, that love of flowers innate in us all came back to be with me always, again, I ask—the Roses, which changed my apathy into enthusiasm and made the desert smile, where are they? The Gallicas, robust in growth, resplendent in colour, but more remarkable for size than symmetry: Boule de Nanteuil, D'Aguesseau, Kean, Ohl, Shakespeare, where are they? *Rien ne me surpasse* has been jeered to death.

Where are the Hybrid Chinas, the Hybrid Bourbons, which once absorbed our admirations (the defect is never in the flower, but in our impotent appreciations)? where are Brennus and Chénédolé, Charles Lawson, Coupe d'Hébé, Paul Perras, and Paul Ricaut? Blairii No. 2 (Blair, a gardener, raised two seedling Roses, of which No. 1 was worthless) still remains one of the most fascinating flowers in our gardens, on wall or trellis, although I have heard the exhibitor denounce it as "not having staying powers," but nearly

"All its lovely companions
Are faded and gone."

The Hybrid Perpetuals—was it imaginable that Abel Grand and Alphonse Damaizin, the Baronesses Prevost and Rothschild, Caroline de Sansales, Comtesse de Chabillant, Jacques Lafitte, Jules Margottin, Mesdames Lacharme, Laffay, Rivers, and Vidot, Paul Verdier, and William Jesse could ever be superseded? Was not the Duchess of Sutherland as pre-eminent for her beauty among the Roses then as the living Duchess amongst the ladies now? We gave 10s. 6d. for Géant des Batailles, and we saw him mortally wounded by General Jacqueminot, and the aphides came down like birds of prey upon the slain, and the mildew made him a shroud.

Général Jacqueminot we regarded as invincible until Charles Lefebvre, achieving a more glorious reputation, became our commander-in-chief; and so by a gradual development of beauty we have been constrained to admit, ever cherishing with tender affection our memories of the past, the superiority of the Roses which are with us now.

"Never, sure, since high in Paradise
By the four rivers the first Roses blew,"

have they been so numerous or so exquisite—never such a diversity and perfection of colour and of form. Who could weep for the Bourbon Queen in the magnificent presence of Her Majesty? But what a consternation of woe would come if half a million of our English homes were denuded of Gloire de Dijon! What a paralysis and softening of the brain, what sighing and sobbing would ensue if the fond rosarian were separated for ever from his Anna Olivier, his Augustine Guinoisseau, his Beauty of Waltham, his Caroline Testout, his Catherine Mermet, his Eugénie Verdier, his Margaret Dickson, his Marie Baumann, his Marie van Houtte, his Thérèse Lévet, his Suzanne Marie Rodocanachi! Imagine his desolation and despair, bereaved of his Enchantress, his Sylph, his Little Pet, and his Bride.

The bountiful and beautiful addition of new Roses which has come to us, and the cry is "Still they come," in these latter days, has been most welcome to the fastidious exhibitor who desires to have both size and symmetry, with every petal in its place. There was a time when the nurseryman who desired to show seventy-two and the amateur forty-eight varieties were perturbed in spirit, when, like sad young Lovel, they sought wildly, but could not find the object of their affections, when they were constrained to include Roses which had outlived, had not yet attained, or never would attain, perfection, and were sorely tempted to insert a duplicate, which by any other name would smell as sweet. It has been my painful duty more than once, when acting in a judicial capacity, to disqualify a collection on account of this vain repetition; and I recall an occasion, when in a box containing "twenty-four distinct varieties" I counted five Charles Lefebvres. It is a Rose which *decies repetita placuit*, but not under false pretences, and there is now an ample abundance for the selection of those who grow Roses largely, an *embarras de richesses* rather than a dearth. I have seen an exhibitor, when cutting for a show, with two specimens of La France in either hand, and one between his teeth.

And it may be noted here, that this accumulation of material has been accompanied by a more artistic arrangement, so that we no longer see a Rose of moderate dimensions dwarfed by its gigantic neighbour, or the results of that colour blindness which has no perception of contrasts or combinations.

(To be continued.)

NOTES OF THE WEEK.

FORTHCOMING EVENTS.

September 6.—Royal Horticultural Society's Committee.

September 7.—Hull Horticultural Association (two days).

September 14.—Royal Caledonian Horticultural Society's Show, Edinburgh (two days).

September 20.—Royal Horticultural Society's Committee; National Rose Society's Autumn Show.

October 5.—National Chrysanthemum Society's Show at Crystal Palace (two days).

October 12.—Royal Botanic Society.

October 25.—Croydon Chrysanthemum Society's Show (two days).

November 1.—Bournemouth Chrysanthemum Show (two days); Brighton Chrysanthemum Show (two days).

November 2.—National Chrysanthemum Society's Show at Crystal Palace (three days); Southampton Royal Horticultural Society's Show (two days); Highgate Chrysanthemum Show (three days); Lowestoft Chrysanthemum Show (two days); Portsmouth Chrysanthemum Show (three days).

Royal Horticultural Society.—The next fruit and flower show of the society will be held on Tuesday next, in the society's hall, Vincent Square, Westminster, 1 to 5 p.m. On this occasion the National Dahlia Society's Committee will meet for the purpose of awarding certificates to new seedling Dahlias, entries of which must be made to the Hon. Secretary, National Dahlia Society, Royal Horticultural Hall, Vincent Square, S.W. A lecture on "Gourds" (illustrated by lantern slides) will be given by Mr. J. W. Odell, at three o'clock, and exhibits from growers will be welcome. At a general meeting on Tuesday, the 9th ult., twenty-six new Fellows were elected, amongst them being Lady Mackenzie of Coul, the Hon. Mrs. Verner, and the Hon. Mrs. Wynne, making a total of 1,159 since the beginning of the year. The Royal Horticultural Society will hold (in conjunction with the National Rose Society) an exhibition of autumn Roses on Tuesday, the 20th inst., in the Royal Horticultural Hall, Vincent Square, S.W. Intending exhibitors can obtain a copy of the prize schedule on application to the Secretary, Royal Horticultural Society's Office, Vincent Square, Westminster, and are requested to note that entries for prizes cannot be accepted after Thursday, the 15th inst. Prizes are confined to Fellows of the Royal Horticultural Society and members of the National Rose Society. The council has been approached and requested to erect lockers in the basement of the hall in order that exhibitors may rent the same for leaving in them various articles required from time to time for their exhibits, and so avoiding the trouble of carrying them backwards and forwards. The council is quite willing to do this if a sufficient number of exhibitors will signify their wish for such a convenience, and also give some idea of the size of the locker they would require.—W. WILKS, Secretary.

Horticulture as a recreation.—Horticulture is not only the happiest of all our recreations, "the greatest refreshment to the spirit of man," it is not only the most accessible in some phase or other of all our enjoyments, for it is given to all classes, rich and poor, to the widow plantsman as well as to the owner of a crystal palace; but it is, of all our delights, that which retains the longest its manifold power to please. Age cannot wither it, nor custom stale its infinite variety. When there is no longer the physical activity for sports and games, not even for that beneficial lawn tennis, which rouses the energies and checks the rotundities of our middle age, when the voice of the singer, and the touch of the musician, and the keen sight of the painter fail; then the love of a garden lives on in the human heart, and some of its easier employments may be done by the feeble hand.—The late DEAN OF ROCHESTER.

The fruit industry of Great Britain.—The Departmental Committee appointed by Lord Onslow to enquire into and report upon the fruit industry of Great Britain made a

tour through some of the principal fruit districts of England from the 22nd to the 26th ult. On the 22nd ult. a visit was paid to the National Fruit and Cider Institute, situated at Long Ashton, Somerset. On the 23rd the committee visited the fruit plantations on the Toddington Estate in Gloucestershire, and on the 24th those of the Evesham district. On the 25th a visit was paid to the Duke of Bedford's experimental fruit farm, situated at Ridgmont, Bedfordshire, and on the 26th to the Sussex County Council fruit station, situated at Uckfield. The committee visited the Swanley district of Kent earlier in the year. The following members were present: Mr. A. S. T. Griffith-Boscawen, M.P. (chairman), Lieut.-Colonel C. W. Long, M.P., Mr. C. W. Radcliffe-Cooke, Dr. W. Somerville, Mr. P. Spencer-Pickering, M.A., F.R.S., Mr. E. Vinson, and Mr. Ernest Garnsey (secretary).

Eremurus Bungei at Colchester. The clump of *Eremurus Bungei* here shown was

EREMURUS BUNGEI AT COLCHESTER.

so pretty in full flower that I had it photographed, and I think it shows exceptionally well how vigorous and free *E. Bungei* is when grown in a warm position. The original root, planted three years ago, was a single crowned one. The first season's growth, as usual after removal, was nothing remarkable; the second season's gave three fine spikes; this season there were seven, all fully grown, and very lovely they were. There is, to my mind, a greater refinement in the flowers of *E. Bungei* than in any other, and it is seen in the slender stems as well as in the more closely set spikes of deep lemon flowers rising from a tuft of narrow leaves. It is also very lasting in flower, and a spike will remain a fortnight in good condition.—R. W. WALLACE, Colchester.

The autumn Rose show.—The beautiful Horticultural Hall in Vincent Square will be a fitting place to hold the first autumn show of the National Rose Society, and every lover of our

national flower must wish the society every success. The splendid light available will show up the varied tints to perfection, and it is to be hoped all who are able to will show what can be done in the way of an autumnal display. As trade exhibitors depend largely upon the advertisement which such an exhibition must bring them if well attended by the public, it is to be hoped the authorities will do all in their power to make the exhibition known. A show of autumn Roses should be of more value to the would-be planter who is desirous of planting autumnal-blooming Roses than the summer display, for he may there learn what would be best for massing, especially if exhibitors would display their flowers in a natural manner. The bunching up system in vogue is extremely misleading, as no one can see what sort of spray the individual sorts yield. May I suggest that at the forthcoming exhibition all members may assist to make it a real success, not only by exhibiting, but also in mentioning the show among their friends.—P.

A note from Bournemouth.—"Beautiful Bournemouth" is the title, and a well-deserved one, that the citizens of Bournemouth give to their thriving Pine-surrounded town. For very pretty and interesting it is, though not grand and awe-inspiring like the scenery of the Yorkshire coast, which, with its black, towering cliffs, forms as great a contrast as it is possible to imagine to the pretty sandy cliffs, with here and there clumps of purple Heather and golden Gorse that one sees along the coast at Bournemouth. Heather and Gorse and Pine trees, with peaty pools and beds of silver sand, one sees stretching for miles round about Bournemouth. Floral curiosities, too, one finds on these heaths: Dodder, a pretty parasite that lives on the Heather and Gorse; also Sundew, the pretty little carnivorous plant that grows in damp depressions on the common. And everywhere the Pine trees, with Rhododendrons, Escallonias, and the coniferous trees of all sorts, give Bournemouth its name of "The Evergreen Valley of the South." With its warm climate and damp, peaty soil flowers grow in most of the gardens like weeds. Scabions, Begonias, and Zinnias, these three especially, seem to flourish here. The flowers grow as large as the pictures in a seed catalogue, and the colours are as bright. Such things as Tritomas, Gladioli, and the delicate Montbretias thrive exceedingly, also Lavender. On one mass of Lavender there must have been at least a score of white butterflies hovering over and settling on the fragrant flowers. At a certain boarding-house the low balcony is festooned with bright Nasturtiums, with hanging pots of Petunias and other annuals interspersed. The Fuchsias grow wild when let alone, and at Swanage, a little distance off, they grow into huge bushes. The Veronica, too, shows its pretty flowers freely, and grows to a good size. The round beds in the Public Gardens are very gay. In the deep pools in the bottom of Branksome Chine and in the reservoir white Water Lilies grow. Alas! a beautiful common, overlooking Poole Harbour and Branksea Island, is to be sold for building purposes. It is already marked out into hundreds of plots with the dreaded little white posts that precede bricks and mortar.—A. SMALLPEICE.

Royal Horticultural Society of Perthshire.—While the recent show of the Royal Horticultural Society of Perthshire was one of the largest and finest held since the inauguration of the society in 1806, it is to be regretted that the attendance was much smaller than last year. The total drawings for the three days only amounted to £69 11s. 3d., against £125 14s. 9d. last year. Various causes are assigned for this falling off, and a considerable feeling prevails that it will be necessary to provide additional attractions to induce the general public to come to the show. It cannot well be said that the society failed in giving the public an attractive programme, as, in addition to the magnificent show, the Beekeepers' Association held its annual exhibition in conjunction with that of the Horticultural Society. Probably one of the causes of the decline in the attendance was due to the Highland and Agricultural Society having held its show in Perth in July, when over £5,000 was the sum taken.

Begonia Argus.—A small group of this bedding Begonia is conspicuous in the front of the herbaceous border at Kew. It is a tuberous variety, and the bright double scarlet flowers are quite $3\frac{1}{2}$ inches across; they are borne well above the foliage on stiff, erect stalks. It is of vigorous growth, dwarf, and for a Begonia the flowers last on the plant a long time. It is one of Messrs. Blackmore and Langdon's introductions.—A. O.

Horticultural lecturers in the south of Scotland.—At the dinner to the judges at the successful Dalbeattie flower show, held on the 13th inst., some remarks were made by one of the number, Mr. James Blacklock, gardener to Sir M. J. McTaggart Stewart, Bart., M.P., Southwick, regarding the desirability of horticultural lectures in the county. Mr. Blacklock suggested that the various horticultural societies in the county should approach the County Council and urge the appointment of a horticultural lecturer. He threw out the suggestion that the lecturer might lecture on winter evenings, or that he might visit the various flower shows and give a demonstration and some instruction in the course of the afternoon. Mr. Blacklock said that a good deal had been done in the way of lectures for agriculturists, but nothing for those interested in horticulture. The suggestion was well received by those present.

Gladiolus princeps.—This hybrid Gladiolus is the result of a cross between *G. cruentus* and *G. Childsii*. It is certainly one of the best ever raised. The colour is crimson-scarlet with a small white irregular band on each of the three lower segments. The individual flowers are fully 6 inches across. It is very vigorous in growth. When the first flowers open the spike is short, but develops as the flowers open upwards. A single spike often has eighteen or twenty flowers, and with side shoots lasts for quite a month. The spikes when cut last in water a long time, the flowers continuing to open as on the plant. It is exceptionally easy to increase, a great number of little corms or bulbils being formed round the large ones. A bed on the Range Terrace at Kew is at the present time a blaze of colour.—A. OSBORN.

Late Peas.—Two of the finest late Peas shown at Shrewsbury on the 17th ult., where Peas are always remarkably fine, were Gladstone and Captain Cuttle. With these firm, well-filled pods, each containing ten or eleven Peas, and of the best possible form for shelling, we seem to have reached a standard of excellence that will be hard to beat. Edwin Beckett, Alderman, and Prizewinner were also fine, and Autocrat, though not so long in pod, was also largely shown. It was evident that in the West of England, and especially in Wales, the season has been an excellent one for Peas. Generally, for ordinary consumption, very large or long pods are not essential, but it is evident that when tested for quantity by shelling, the long pods, which give ten or eleven Peas, must have precedence over those which give only eight or nine Peas.—A. D.

Single Dahlias from seed.—Whilst we all know how easily single Dahlias can be raised from seed, and that is a matter of much importance to many who cannot store or care during the winter for root tubers, yet so many who love these pretty garden flowers have been loth to grow them, because the plants generally grow so tall and gross. When at Messrs. Sutton and Sons' seed farm, Reading, recently, amidst the wonderful wealth of beautiful seed-raised flowers there, I could but pause to admire their dwarf, compact strain of single Dahlias. Many hundreds of plants, ranging from 24 inches to 30 inches in height, were covered with flowers in so many colours, and of the best form. The plants evidently needed only a moderate amount of staking and tying. For furnishing flowers of a light and graceful character for vase or table decoration nothing could well be more pleasing. Really so profusely do the plants bloom that it is a case of cut and come again every day.—A. D.

St. Mary's Isle garden competition.—In accordance with her usual generous custom the Countess of Selkirk has again given

prizes for the best kept cottage gardens and the best creepers or climbers on cottages on the estate of St. Mary's Isle, Kirkcudbright. The judges were Mr. R. Service, of Messrs. James Service and Sons, nurserymen, Dumfries, and Mr. W. McGuffog, gardener to the Countess of Selkirk, Balmoe. They have now issued a detailed award in which they express gratification at the improvement presented by the gardens since last year. The prize winners were—Section I.: First, Mrs. Lafferty, Old Stables, Cannee; second, Mrs. Jamieson, Mill of Senwick; third, Mrs. Graham, Auchendower; fourth, Mrs. Kelly, Burnfoot; fifth, Mrs. Kirk, Sandside. Home district: First, Jessie Caldwell, Dromore; second, J. McBurnie, Little Balmoe; third, John Boyle, Crailness; fourth, Mr. Shields, Balmoe Stables; fifth, Mr. Beattie, Balmoe Stables. Creepers: First, Mrs. Dorrance, Mute Brae; second, Mr. Taylor, Sandside; third, Mr. Graham, Low Newton.

The children's classes at Aberdeen show.—A large amount of interest has been taken in the new classes for pressed flowers and leaves open to children at the recent show of the Aberdeen Royal Horticultural Society. Prizes were offered for garden flowers, for wild flowers, and for leaves, all pressed and mounted on cardboard. Professor Traill, who kindly judged the exhibits, referred at the dinner in appreciative terms to the success which had attended the new classes, and to the benefit to the children which would accrue from taking part in such competitions. Several of the exhibits were worthy of special notice, and the youthful prize winners are to be congratulated on the excellence of their exhibits. In the class for the best collection of outdoor leaves, pressed and mounted on cards 18 inches by 30 inches, the first prize was won by Lizzie Pirie, Ashvale Place; that for garden flowers similarly prepared by Agnes Sangster, Skene Street; and that for wild flowers by Hector Duncan, Sunnyside Road.

THE FLOWER GARDEN.

THE HERBACEOUS PHLOX.

UNDER this heading I intend dealing with the group of late-flowering varieties known as *P. decussata*. The varieties have increased wonderfully of late, as many new forms come from the Continent, others are home raised. How numerous the varieties have become is shown from the fact that a well-known Scotch florist catalogues as many as 250 varieties, and it may be presumed that all are kept in stock. The late-flowering Phloxes fill a large gap among hardy plants; they come into bloom towards the end of July, and they continue in flower for the space of five months. Their brilliancy of tint seen in the carmine-coloured varieties makes them of great value for the decoration of the border, and they are as much at home and as effective in the cottage garden as in that of the ducal palace.

The herbaceous Phlox has been greatly improved during the past ten years, the improvement is seen in increased size of the pip, in the brightness of colour seen in the modern raised varieties, and also in the habit of growth; the varieties of some years ago, which grew to a height of 4 feet and 5 feet, have given place to those of much dwarfer growth, some of them only 1 foot in height. The development of sizes and substance in the pip is remarkable, some have been measured fully 2 inches in diameter, the range of colour has been broadened, there are many self-coloured varieties, and also many showing charming combinations of colours.

At the recent exhibition of the Taunton Deane Horticultural Society a very fine and varied collection of hardy flowers was staged by Messrs. Isaac House and Sons, nurserymen, Westbury-on-Trym, Bristol, and among them

quite an unique collection of herbaceous Phloxes, which included several recent novelties. Unfortunately, the crowded state of the tent in which the Phloxes were staged prevented me from taking notes so fully as I desired, but Mr. House kindly sent me a box of blooms of the finer varieties, and the fine development they exhibited pointed to the fact, not only that the soil near Bristol is suited to the growth of the Phlox, but also that the plants are well cultivated. These Phloxes I divided into groups of different colours, in order to make any reference to them as intelligible as possible.

The collection contained five white flowered varieties, the purest white I thought to be seen in Viola, but Sylphide and Flocon de Neige were of the finest form, though all are good whites; the last named is of very dwarf growth, not more than 1 foot in height, and all three throw fine trusses of blooms. The other two whites are Albatre and Laurence.

Blush or delicate lilac shades are found in James Farquhar, white centre, the margin tinted with lilac-pink, the pip large and of fine form. Henry Murger is a very fine variety, blush with large rosy purple centre, large well formed pip, one of the best. Jean Gerbeaux, blush with large bright rosy crimson centre, is also very fine, the pip large and well-formed. Conspicua is delicate pink with a circular rosy crimson eye, also of fine form.

Pink and salmon shades are found in Mrs. Oliver, soft salmon pink with white starry centre and slight pencillings of purple, very pleasing and attractive. La Siecle pale pinkish rose with white centre marked with purple, fine solid pip. Comete, pink flushed with delicate rose, large white starry centre, and slight purple line, large well formed pip. Mrs. James Farquhar, bright salmon-pink with white centre and slight lines of purple, fine form and very pleasing. Treador, blush pink flushed with carmine, especially on the younger flowers, compact purple eye, well formed pip.

Some of the most showy and striking of the herbaceous Phloxes are to be found among the carmine and scarlet varieties, and they are always brilliant in the border. Of the seven varieties sent, and which may be classed under this heading, I thought Coquelicot the brightest, being of a warm carmine-scarlet, with purple eye, but it appears to lack substance of floret.

Etna is scarcely so vivid in its colouring; it is of a rich orange carmine, and has large and stout finely formed pips, extra fine. Roger Marx is of a deep salmon carmine with a purple eye, well formed pip. Tom Welsh, bright carmine with purple eye, a little deeper in tint than the foregoing, pip medium sized and fine shape. John Fraser, a little paler than the foregoing but distinct, large well formed pip with purple centre. Jocelyn, one of the largest, pips of fine substance, colour pale carmine with compact purple eye. Miss Pemberton, carmine flushed with salmon, large purple centre, fine stout pip and bold truss.

Lilac shades are found in Crepuscle, soft lilac with large rosy purple centre, bold pip and fine truss, distinct. Javanaise, large white centre margined with pale lilac, with a much deeper tint on the reverse, small dark eye, finely formed pip, very pretty and pleasing. Pharaon, large white starry centre round a dark eye, and margin of bright lilac, fine bold pip and truss.

Purple and violet shades are found in Cœur de Lion, very large pale crimson-maroon centre, margined with rosy lilac flushed with purple, fine bold well formed pip and truss. Walter Wright, bright rosy purple with dark centre.

Sesostria, a magnificent Phlox, deep bright purple flushed with rose, slight dark crimson centre, pip large, stout and finely formed, extra fine. Le Mahdi, bright violet flushed with purple, slight dark centre, also a fine and striking variety.

Few plants answer more generously to liberal treatment than the Phlox, and they are generally seen at their best when the weather is moist. Some of the more brilliant carmine shades are apt to become bleached by hot sunshine, and should therefore be shaded when required for exhibition. Such varieties might with advantage be planted on the north or east side of a row of trees so as to have the advantage of their shade. In such a position they should be well looked after in the matter of mulching and watering, as the roots of the trees might be found drawing goodness from the soil. Phloxes may be propagated by cuttings taken from the old clumps in February or March. They are slow in rooting, and should be kept close and moist for a fortnight or more, shading being carefully attended to. As soon as the young plants are sufficiently rooted and hardened off they may be planted out in well prepared soil, and with due attention many may be expected to flower in the autumn, and they generally produce fine spikes.

For exhibition purposes two year old plants give the best results. Clumps should not be allowed to produce more than three spikes. When they are required for showing they should be carefully tied to stakes of suitable length before the first pips expand. Before packing the spikes for a flower show they should be placed in water as soon as cut, and allowed to stand for two or three hours.

R. DEAN.

BEAUTIFUL ANNUAL FLOWERS.

I SHOULD like to supplement the descriptive list of hardy annuals by Mr. R. Dean in THE GARDEN for the 13th ult., both for autumn and spring

sowing. We grow a large variety of hardy annuals in the gardens here, and always find an article in THE GARDEN on the above very interesting. We grow most of the kinds, but not all the varieties mentioned in Mr. R. Dean's list. The *Brachycome iberidifolia* and *Schizanthus* are unsatisfactory with us if treated as hardy annuals, but by sowing in pans or boxes inside and planted out they make a good display.

Autumn sowing.—I think for spring flowering the *Leptosiphon* hybrids are amongst the prettiest, coming into bloom as they do with the spring bulbs with flowers of various shades. The plants grow only 3 inches high and like a sunny situation, and for either a sunny or shady situation *Ionopsidium acaule* is very useful. *Lasthenia californica* is very effective with its deep golden flowers, and flowering at the same time we have *Oxyura* (or *Layia*) *chrysanthemoides*, with yellow and white flowers, and *Platystemon californica* with lemon-coloured flowers. All three kinds grow about 1 foot high and seed themselves on the borders. They come up year after year, so that we have no trouble in keeping them. A very effective spring flower is *Erysimum perofskianum*, with bright orange flowers; it grows about 18 inches high. When this is sown in spring it will, after flowering, break out at the foot of the flower-stalk, and flower again the following spring and then die. *Nigella damascena* fl. pl. (Love-in-a-Mist), with blue flowers bidden in its feathery bracts, is useful. Another blue flower is the Woodruff (*Asperula setosa azurea*). It grows about 9 inches high and finds favour with many. For flowers of a bright red colour we have *Collomia coccinea*, which one does not often see in catalogues. We have grown it here for several years. Then we have *Coreopsis* of the tinctoria race; this, if sown early in the autumn, will flower the whole of the summer, and the flowers are very useful for cutting.

Spring sowing.—A very showy flower is *Chrysanthemum Morning Star*, with soft yellow or primrose-coloured petals and yellow centre. *Cosmos Golden Queen* is useful for cutting for decorative purposes. The flowers are a rich golden yellow, freely produced, and the plants grow about 2 feet high; they begin to flower early in summer and continue in bloom until autumn. Seeds of the above two kinds

appear to remain dormant in the soil all the winter, coming up freely in spring. *Linaria bipartita*, with purple flowers, and *Linaria reticulata aurea*, with scarlet and gold flowers, make very pretty annuals. These will sometimes stand the winter if sown in the autumn. *Phacelia campanularia* and *C. viscida*, generally known as *Eutoca viscida*, with bright blue flowers, should be grown by all lovers of hardy annuals. *Sphenogyne speciosa* is a showy annual with yellow Marguerite-like flowers. It likes sunshine. *Layia elegans* has flowers similar to the spring-flowering *Limnanthus*, and then we have *Delphinium Blue Butterfly*, which, I believe, is described as a hardy annual, but we find it more satisfactory if sown inside and then planted out.

Benslow, Hitchin.

A. W.

CARNATIONS IN THE FLOWER GARDEN.

It is unfortunate that many still cherish the idea that Carnations are not sufficiently hardy to withstand our English winters. The consequence is gardeners still neglect them, and are quite unaware of what Carnations are capable of and the important part they should take in the adornment of the flower garden. It has been said, "What is a garden without a Rose," and we might say, without a Carnations, too, for it comes next in importance. There are many flower gardens without either, not merely small gardens, but standard English gardens.

Now that there are visible on all sides signs of the commencement of a change in our mode of flower gardening which tends towards natural beauty instead of harsh formality, and variety instead of monotony, it would be well that the cause of the neglected Carnations should be pleaded, and a revival in their favour is much to be desired. Although we are told they are not neglected, many gardens tell an opposite tale, for Carnations have in many places never found a home, and are looked for, but in vain, unless it be some very poor seedlings, or a few remnants of former days stuck in some out-of-the-way border.

Carnations are perfectly hardy plants, and there is abundant evidence obtainable to prove this assertion. On the other hand, if Carnations are coddled, they are weakened in constitution and not able to withstand the rigours even of our often mild winters. In most cases the English system of growing Carnations has been that of coddling, and it has been thought little short of madness to plant Carnations out and leave them in the open air all the winter. Although some growers do go so far as to plant them out in spring, others grow them on into large pots and display them in full flower in glass houses or under canvas tents, and we are told it is not possible to obtain good Carnations blooms in the open.

When grown under such conditions it is impossible to judge of the merits of Carnations for outdoor English flower gardening, nor can it be expected that those who grow them as described are in a position to speak upon the matter with authority or from experience. Moreover, it is perfectly obvious that young stock propagated from plants grown in this manner, where soft shoots are made in too high a temperature, is the very worst wherewith to try experiments or to prove the possibility of Carnations living in the open ground throughout the winter.

In striking contrast to this system of culture, we have seen a collection of Carnations, numbering 2,000 plants, that were layered in the open air last summer from plants put out the previous spring. The layers were planted in the flower-beds last September and October, and all passed safely through the winter, not one perishing from cold; in fact, the plants themselves asserted their claims to hardiness, for during the first three months

CLEMATIS RECTA.

of this year some of the plants were thrown out by the upheaval of the soil caused by the expansion of water when frozen, and they might be seen lying upon the surface of the ground, not perishing, but, under the uncongenial influence of a bitter wind, putting forth white fleshy roots in search of moisture. Due attention being given, and the plants replanted when the milder weather came, they grew away, and there is now no visible difference between those that were disturbed and those that were not. Experience proves also that Carnations planted in autumn are far superior to those planted in spring, provided, of course, that in the former case the plants are sturdy and hardily grown. The autumn-planted ones make a good root-growth before winter sets in. During the winter they remain dormant, but directly the temperature begins to rise they grow away and soon spread out into handsome, healthy tufts, when, even without flowers, they are an ornament to the flower garden. With plants put out in spring it is often just the opposite. They may be strong and healthy tufts that have been kept in a frame all the winter, but perhaps immediately after they are planted, a chilling, drying wind sets in before they have obtained root-hold, and the growth is weak and sickly, consequently producing inferior flowers, which lead some to say good Carnations cannot be grown in the open, whereas it is the system and not the plant that is at fault.

There are some soils better suited for Carnations than others, for we have seen the old Clove die off in winter by scores, but such cases are exceptional. The collection previously alluded to was not grown in the most favourable soil; far otherwise, for the soil is a cold and very heavy loam, which cakes and cracks with the alternations of wet and dry weather.

Quite recently, when passing a cottage garden in West Sussex, we saw some large plants that must have been several years old, for some had grown into veritable bushes 3 feet high, and others spread out into great tufts like the Pinks. Carnations vary in this respect, for while some kinds require to be layered and replanted every year, others do not, and in some soils a kind will grow more tufted. They seem to do better in places near the sea coast, being possibly benefited by a degree or two of more warmth. However, without a doubt, there are plenty of soils capable of growing good Carnations when once they are planted.

The culture of Carnations is so simple, and they give so little trouble, while there is so much of interest and beauty in them, that we feel confident if this fallacy of tenderness can be for ever exploded, Carnation growing will so greatly extend that undreamt of results will be achieved. We have ample evidence what can be done in the way of Rose growing. Why not then with Carnations?

A.

THE CLEMATISES.

CLEMATISES, together with their numerous botanical and garden varieties, form an interesting and justly popular group of shrubs and herbs, many of which are very ornamental and of exceptional merit in the garden. Upwards of 100 species and botanical varieties have been introduced, and quite half of these are suitable for planting out of doors in most parts of the country, and it is quite probable that this number will be greatly increased in the near future as new ones are constantly being introduced. In addition to this number there are a great many garden varieties which are all showy and popular.

The genus, in addition to being a large one, is very widely distributed, the United States, Asia, Europe, New Zealand, Australia, and Africa all having few or many representatives. In many parts of England *C. Vitalba*, better known as "Old Man's Beard," is found in quantity, and is usually very effective, clambering over high hedges and low trees.

As a rule species and botanical varieties are not often found in gardens, for, although many of them are very pretty, their beauty is surpassed by the several distinct types of garden varieties which have been raised by the horticulturist. In gardens the various groups are classed as follows: Florida, patens, lanuginosa, Jackman, and Viticella. To these may be added for convenience: Other shrubby species, Coccinea hybrids, herbaceous species, and tender species.

USES OF CLEMATIS.

As many are of trailing or climbing habit and, moreover, of rapid growth, they are excellent for planting against the walls of houses or pergolas, summer-houses, arbours, and similar structures. There are, however, many other purposes to which they may be put and for which they are not so largely used. One

CLEMATIS ON POLE.

way is to plant in large beds, giving a group of irregular-shaped Oak branches for a support. On these branches the long pendant shoots arrange themselves quite naturally. Then for covering rough or unsightly-looking fences the stronger growers are first-rate, for in a very short time an extensive space can be clothed with verdure. For planting to climb over old tree stumps and large roots they are also to be commended, while they succeed admirably when placed at the foot of some old bush and allowed to ramble about and intermingle with the branches. Some prefer companion plants with Clematis, and very fine effects are sometimes seen of a mixture of purple or white-flowered Clematis and green-leaved Ivy, and in the autumn the same coloured blossoms with the orange and scarlet tinted leaves of

Vitis inconstans (*Ampelopsis Veitchii*). The indoor species, more particularly those that can be cultivated in cool structures, are useful for draping pillars and rafters, while for the conservatory in spring forced plants of many of the garden varieties are not to be despised, for they are very showy and last in good condition for a considerable time. For this forcing they can be grown in 5-inch or 6-inch pots carrying from six to twelve or more flowers, or they may be worked up into large specimens occupying 12-inch or 14-inch pots, the branches being supported on wire balloons.

CULTIVATION.

Previous to planting it is necessary to see that the ground is well drained and worked to a depth of 2 feet, adding rich loam to the soil if it is at all poor. The best soil for Clematises consists of rich loam, neither very heavy nor very light, containing a fair quantity of chalk or lime. When preparing ground it is advisable to avoid using green manure, and, if manure at all is used, it should be kept at a good distance from the roots. If lime is not found in the soil lime or old mortar rubbish should be mixed in when trenching the ground. The best time to plant is October, November, or March, though those which are in pots may be put out at almost any time. Old specimens which it is thought desirable to transplant should be moved in October. As soon as planted stakes should be provided and the branches be securely fastened up. As the growing season comes round they should be looked round fortnightly and secured and trained in the required direction. A mulching of well-rotted manure should be given annually with a light dressing of lime every two or three years. An occasional watering with weak liquid manure is beneficial during spring and summer, while in dry weather water must be given as required.

PRUNING.

This requires a good deal of care, and should be done either during late autumn or early spring, the latter being the best time. The work should be given to an intelligent man, for the following year's display of flowers may be easily lost through bad pruning. The patens and Florida groups, which flower in May and June, require simply the removal of dead wood. The Jackmani and Viticella groups, on the other hand, which produce their flowers from the current year's wood, must be hard pruned, and are, in fact, better if cut back to within five or six eyes of the old wood, that is after they have attained a fair size. The harder this section is pruned the better the growth and more numerous the flowers. The lanuginosa group should be pruned fairly hard, but not quite so much as the foregoing. Many of the species require little or no pruning. *C. montana* is helped by being cut back as soon as the flowers are over. *C. alpina* must on no account be cut back until after it has flowered, and then very little pruning is necessary. The herbaceous set simply require the old heads removed to make room for the young shoots.

PROPAGATION.

There are several means at disposal, namely, seeds, cuttings, or grafts. Seeds may be sown indoors in pots of sandy soil in autumn or early spring, and as soon as large enough to handle the seedlings should be potted up singly into 3 inch pots, planting them in nursery quarters as soon as large enough. This is the best method of increasing species. Cuttings may be used in the case of many garden varieties and some species. The best are obtained from young wood just as it is becoming firm

towards the end of June or beginning of July. They should be placed in pots of sandy soil and put into a close and warm propagating case. Grafting is often practised in dealing with garden varieties, and also with *C. indivisa*. Pieces of root 3 inches to 4 inches long are obtained from one of the strong growers, usually *C. Vitalba*, and on these short pieces of either old ripened wood or young soft wood from forced plants are worked, the operation taking place indoors in early spring. As the grafting proceeds the pieces of root are potted into small pots and plunged in a warm and close case, in which place they remain until the union of stock and scion takes place and young roots are pushing vigorously. Saleable plants can be quickly obtained from grafts, but some growers are now more in favour of cuttings, stating that plants on their own roots are not so liable to be attacked by disease. Several forms of grafting are employed, side and wedge being the most common.

It grows to about the same height as the foregoing, flowers profusely, and is at its best during May and early June.

W. DALLIMORE.

(To be continued.)

THE AURICULA— SEPTEMBER.

DURING this month give all the air possible, and expose on all favourable occasions to the heavy dews at night. The plants grow fast and make handsome growth, for it is their second spring. Everything possible must be done to secure good, sturdy, healthy growth, to enable the plants to pass safely through the long winter. Many will now throw a flower stem, the buds of which should be gently rubbed off, when the stalk is clear of the foliage. Autumn blooms are never in good character, and may prevent the plant from

sporting, but the culture is easier, since absolutely no artificial heat is required. To obtain the spores is easy enough if the would-be raiser has access to a collection of good forms, and can thus obtain a few fronds when they are fertile. In this case he, of course, acquires a knowledge of the varieties he starts with, which is a great advantage. If, however, this is not practicable, his next best plan is to purchase a packet of mixed spores from one of the few nurserymen who make a speciality of British Ferns, in which case his harvest will probably be far more diversified, though his subsequent naming of the resulting collection may require the aid of a specialist. In the first case, however, he is fairly sure to find greater variety than the fronds sown from would justify, since in every collection the spores of all the kinds become scattered upon the adjacent fronds of other sorts, so that a pure sowing of a particular variety is almost an impossibility, as these stray spores naturally germinate with the specially sown ones. Where acquired fronds are in question, these should be gathered so soon as the spore heaps, which appear in dots and lines in different ways upon the backs of fronds of different species, are brown or bright yellow, or in the Royal Fern of a dull green. The fronds should then be laid separately, backs downwards, upon sheets of glazed paper, upon which, in a few hours, the spores will be shed profusely, sometimes actually so as to resemble a tinted picture of the frond itself.

Their number is simply enormous, adult plants producing many millions. The deposits can be collected by merely folding the paper once and tapping it until the spores fall into the fold in a long heap. As no amateur desires a crop of a million or so, and each of these spores requires at least one-eighth of an inch of soil surface for its primary development, it is clear that a very tiny pinch is sufficient for an ordinary pot or pan, and when we say that we have raised 800 Hart's-tongues from a sowing in a 2-inch pot it is obvious that such a pot is big enough for ordinary cases. We may, therefore, now consider how to sow them on these lines. Our plan is to take a 9-inch square pan and fill it with fresh Cocoanut fibre, into which we lightly pack as many such small pots as it will hold. These pots we then fill with a mixture of loam, leaf-mould, and coarse silver sand, two, two, and one part in proportion, topping them with a little crumbled loam. These being installed, we take a kettle of boiling water, and, placing a small piece of paper on each pot to prevent washing up, we pour this water on to the paper until it runs out at the bottom of the pan scalding hot, which means repeated pourings, as the soil cools the water greatly, and the object of the

scalding is to kill all worms, germs, and insects' eggs, which might eventually do damage. The fibre itself should, therefore, be similarly saturated. We then place a sheet of glass over the whole, and set it away until quite cold. To sow the spores we remove the paper and scatter them as thinly and evenly as possible over the surface of the soil. In doing this we take out each pot and treat it separately, as otherwise the spores are so light that some would be sure to reach the other pots and upset the register which should be kept. This register we keep by putting a small wooden label bearing a number, this number representing a name entered in a book for recording purposes. The sowing being finished the glass should be replaced and the pan placed in a shady (but not dark), cool place. At this time of year in a week or two we shall note a greenish tint spreading on the soil, showing the spores have germinated, and in a week or two more the surface will be covered with tiny green growths the size of herring scales, and not unlike them in shape, each spore having produced a heart-shaped primary frond or prothallus. A period of apparent rest then ensues, during which, however, the equivalent of male and female flowers are produced on the under sides of these scales in

CLEMATIS MONTANA OVER A ROUGH WALL.

Below is given a brief description of the various types, together with a select list of species and varieties.

PATENS AND FLORIDA GROUPS.

These two groups may be readily placed together, for they require similar treatment and are in many respects much alike.

C. patens, which was described by Lindley as *C. cœrulea*, is found in China and Japan, and, according to London, was introduced to our gardens in 1836. It grows to a height of 12 feet or so, and forms a large tangled mass. It is a profuse bloomer, and opens its flowers in May, June, and July. The flowers are fairly large, 4 inches or more across, with six or eight bluish sepals, which are quite separate from each other.

C. florida is also a Japanese plant, but is a much older introduction, 1776 being given as the year in which it was introduced. It differs from the foregoing by having slightly smaller flowers, white in colour, with the sepals close together and slightly overlapping each other.

doing its best in spring. Too much attention cannot be given to watering and cleanliness. As the large summer foliage dies it must be carefully removed; in fact, decayed leaves at all times should be removed, but not till they are quite yellow. Continue to keep a sharp look-out for a small green caterpillar and also green fly. It is attention to these apparently trifling matters that enable some growers to so much outdistance others.

W. SMITH.

THE FERN GARDEN.

FERN SPORES.

AMID all the many branches of the horticultural cult, undoubtedly one of the most interesting, and one most within the reach of the amateur with little space at command, is that of raising Ferns from spores. If, indeed, the spores be sown of some of the finest varieties of our native Ferns, the interest is not only greater by reason of diversity in the offspring, due to secondary

the form of microscopic protuberances, and by the under action of these we shall presently see tiny fronds peeping up in all directions. Should, despite all precautions, a very crowded crop result, larger pots or pans can now be filled and sterilised as before, and into these little patches of the scales and young plants can be pricked an inch apart, giving both them and the balance left sufficient elbow room. The rest is easy, as it is only necessary to prick out and pot on until the adult specimen stage is reached, when, as all the species likely to be raised thus are perfectly hardy, they can be installed in shady rockeries out of doors or pots in cold conservatories according to taste and space at disposal. One thing is quite certain, and that is that one who has carried such an operation through on proper lines, that is, with spores of choice forms, would never again give even garden room to the common wild Ferns they have arisen from, but so far surpass in beauty and variety, and all this can be done for an initial outlay of 1s. or 1s. 6d., the cost of the spores, the result of which may be a garden full of gems.

CHAS. T. DRURY, F.L.S., V.M.H.

TREES AND SHRUBS.

VARIEGATED TREES IN GARDEN SCENERY.

NO one, I think, would question the value of variegated or golden-leaved trees when intelligently employed in producing pleasing effects in garden and park landscapes or any scenery of artificial creation. Their power of relieving the monotonous greenery that prevails among trees throughout the summer is recognised by all, and therefore the chief object in planting variegated deciduous trees should be to render garden and park scenery more interesting and cheerful. If you ask a landscape painter why he prefers to paint an autumn or winter landscape to that of summer or spring, he will probably tell you that in summer the monotonous greens that prevail everywhere in natural scenery among trees are without character and not very suitable for painting. In spring, when less critical people are charmed by the bursting bud and unfolding leaf suggestive of new life and vigour, the painter will say that Nature's colouring is crude, and to him a spring scene is insipid. He waits till autumn, when the greens break into a multitude of rich and mellow tints—here a Sycamore a mountain of cloudy gold, there a Thorn, Cherry, or Cornel radiant in scarlet, red, and purple, while between these extremes the whole gamut of subtle tints is displayed and brought out in strong relief against the verdure of the trees that do not change their leaf colour at the fall. Such is the scene that the painter delights in, and in a mild way, with the rich material we now have, we can produce throughout the summer the striking effects that charm the artistic soul in the season of decay. The effect of planting trees and shrubs with strongly pronounced foliage tints may be good or bad, according to the way these strong colours are grouped and distributed in garden scenery. Generally the result is bad, either because the variegation is too abundant, producing a spotty effect, or because the trees have been grouped in a careless way in respect of colour. Rather, I should say, too much care is taken to produce striking contrast, for how often do we see a Purple Beech grouped with a Silver Maple in order to get a contrast. Contrast it certainly is, but one that is too harsh to be pleasing—the one quite neutralises the effect of the other. Golden Elder and Purple Hazel is another favourite mixture, but how seldom is the effect produced pleasing. This injudicious grouping of colour, however, is far less objectionable than the commoner error of dotting the whole place at regular intervals with white and yellow patches, which is far too prevalent in small suburban gardens, and in not a few large ones, planted in accordance with the nurserymen's recipe. I venture to assert that nine out of every ten gardens about London planted within the last twenty years by

nurserymen exhibit the glaring fault of too many variegated and golden trees, and too few of those that are really beautiful either in flower, leaf, or growth. One can tolerate a nurseryman's specimen border, however commonplace and tasteless the arrangement may be. He has trees to sell, and he naturally aims at displaying them to the best advantage; but when he attempts to plant a private garden the case is different, though it is seldom thought to be. I could point to several prominent large gardens about London that reflect the nursery specimen border, some where a sallowness is cast over the place by the superfluity of the beautiful, but much abused Golden Yew; others having the effect of a laundry ground from the abundance of Silver Maples, and not a few where ornamental conifers—those destroyers of beautiful gardens when used in excess—have been planted at regulation intervals of a few feet, just as a nursery border is set out with young trees that are constantly transplanted.

Were I to enumerate all the variegated and golden trees and shrubs that are now to be seen in the nurseries, I should have to make out a very long list, but I hold that there is but a comparatively small number of kinds that are of real value to the landscape gardener. The nurserymen are always eager to seize upon a sport of variegation, but not equally wise in discriminating that which is really ornamental. The result of this is that we have numbers of so-called variegated and golden trees and shrubs that are anything but ornamental, always wearing a sickly look. A list of choice deciduous kinds should include the variegated Sycamore and the variety Leopoldi, the variegated Negundo (*Acer Negundo variegatum*), Worley's Maple, with pale bronze-yellow foliage; Golden Catalpa, Golden Sweet Chestnut, variegated Dogwood (*Cornus alba variegata*), Späth's Siberian Dogwood (*C. sibirica Späthii*), Golden Ash (*Fraxinus excelsior aurea*), Golden Oval-leaved Privet (*Ligustrum ovalifolium aureum*), Golden Mock Orange (*Philadelphus coronarius aureus*), Golden Canadian Poplar (*Populus canadensis aurea*), Golden Oak (*Quercus Robur concordia*), variegated Turkey Oak (*Q. Cerris variegata*), Golden Acacia (*Robinia Pseudacacia aurea*), Golden Elder, Golden Spiræa (*S. opulifolia aurea*), Golden Snowberry (*Symphoricarpos racemosus variegatus*), Golden Elm (*Ulmus Dampieri aurea*), Silver Elms (*U. campestris variegata* and *U. glabra variegata*), and Golden Weigela (*W. Looymansii aurea*). Among purple-leaved trees and shrubs there are numerous beautiful kinds. Besides the Purple or Copper Beech, the Purple Sycamore, and Purple Birch, there is the newer Purple Cherry Plum, so effective if properly placed, and among shrubs there are the Purple Barberry, quite indispensable to a picturesque shrubbery, and the Purple Hazel. What charming effects one can produce with these in combination with the beautiful *Eleagnus*, *Shepherdias*, silvery *Poplars*, and the like, not to mention the delicate greens and dark greens which abound now among ornamental trees, evergreen and deciduous.

The plants are from a nursery list under the names by which they are known best, and I think it includes all the finest of the common kinds, and they afford abundant material for planting for ornamental effect. How to distribute and group this colour cannot be told in writing. The experienced eye of a tasteful planter, and that alone, will be the guide. He will aim at producing distinct and decided effects in relation to the surroundings; he will avoid dotting the plants about in a haphazard way; he will blend his greens, golds, silvers, and purples in such a way that one colour will not destroy the effect of the other; and he will aim at a scene on a small scale imitative of that which Nature does in autumn when strong and rich tints of varied shade prevail in every wood.

SOME OF THE SHRUBBY HYPERICUMS.

THE Hypericum family is a very extensive one, and includes hardy annuals and biennials and hardy herbaceous and shrubby perennials. The hardy

shrubs of the genus number about twenty species altogether, of which only about half a dozen are what may be termed really good garden plants, the remainder being chiefly of botanical interest, or in general appearance so much like other species that it is not worth while to plant them in the garden. All the *Hypericums* are easily grown in warm, sandy soils, and should have full exposure to the sun to ensure their thorough ripening, as some of them are somewhat tender, and suffer from frost if the wood is not thoroughly ripened. On cold, heavy lands some of them are not satisfactory, neither in growth nor quality of bloom, while frost often plays havoc with them. A light soil is best for them, as they rarely, if ever, suffer from drought, and dry, sunny weather seems to increase both the quality and quantity of their flowers. Propagation is effected by seeds, by cuttings taken in summer and rooted under glass, or by division of the roots in early spring. To increase by the latter method—which, by the way, is the easiest—old clumps should be pulled to pieces, each portion that has a few roots attached being sufficient to form a fair-sized plant in one season. This is best done in March or April, especially with the tenderer ones, when all danger of continuous frost is past. The following *Hypericums* can be recommended as a good selection, and, flowering as they do from the middle of June until well on into September, are worthy of a place in every garden.

H. androsæmum (the Tutsan).—This is a native of Europe, including Great Britain, and forms an evergreen shrub about 3 feet high, consisting of numerous reddish-coloured stems springing from a woody rootstock. The leaves are about 3 inches long, and of oval shape. In a young state they are strongly tinted with red. The flowers are borne in terminal corymbs, and open through June and July. Each bloom is rather less than an inch across, of a pale golden yellow colour, and are produced in such quantity as to make up for their lack of size. They are followed by round shining red berries, ultimately turning black as they ripen. They are full of seed, which germinates readily almost anywhere. *H. androsæmum* grows almost as well in damp shady places as in the open, and it is rather surprising that it is not more generally planted, as it is well worthy of a place in the garden or shrubbery.

H. calycinum (Rose of Sharon or St. John's Wort). This is a dwarf evergreen shrub about a foot high, spreading readily in all directions by means of underground stems, which make it one of the best subjects we have for clothing dry banks where practically nothing else will grow. During June and July they are covered with the terminal, solitary, bright yellow flowers, which are amongst the largest of the family. They are from 3 inches to 4 inches across, and filled in the centre with a conspicuous mass of slender stamens, topped with red anthers. A bed of this is much improved by being cut down to the ground about every third or fourth year. This should be done in the early spring, and, with a light top-dressing of good soil at the same time, the plants will greatly increase in vigour. It is a native of Eastern Europe.

H. hookerianum (*H. oblongifolium*).—This is a native of the Himalayan region, and is an upright shrub 4 feet or so in height, with dark green shining leaves and bright golden yellow flowers. Unfortunately, it is rather tender, and, though the roots may escape without injury, yet if the stems are cut down by frost the plants take two years or more to fully recover themselves, as this species is not such an annual bloomer as the other *Hypericums*, but requires a woody, matured growth before it will flower freely. It is, however, worthy of a trial in every garden, as when in full bloom it is one of the gems of the genus.

H. moserianum.—This is a hybrid between *H. calycinum* and *H. patulum*, and raised by M. Moser. It is one of the best of the genus. The flowers appear from the end of June until September, and are borne in terminal clusters of from three to seven. They are 2 inches or more in diameter, of a deep yellow colour, and have conspicuous red anthers. The leaves are 2 inches long, bright green above, and glaucous beneath. The plant grows from 1 foot to 2 feet high, and, though it partakes to a certain extent of the tender nature

of *H. patulum*, yet, though cut to the ground in the winter, it will throw up fresh stems in the following spring, and flower profusely in season. There is a variegated form of this (*H. m. var. tricolor*) which is very pretty, but is not hardy enough for outdoors, though it makes a useful plant in pots for conservatory decoration.

H. patulum.—This is a native of India and Southern China, and is a shrub 3 feet high and as much in diameter when fully developed. It is rarely, however, seen more than about half this size, as it is rather tender and gets cut down by frost, though not often killed outright. The stems are slender and twiggy, and are clothed with leaves 1 inch to 2 inches in length. The flowers open during July and August, and are about an inch across, borne in terminal clusters of three to seven. They are of a deep golden yellow colour.

H. prolificum.—This is a native of North America, and, though not so showy as some of the above, yet it is worthy of a place in the shrubbery for its freedom of flowering and growth. It is a shrubby bush about 2 feet in height, with slender stems bearing terminal clusters of yellow flowers about 1 inch across. The leaves are 1 inch to 2 inches in length, and of a deep shining green. This plant is often known as *H. kalmianum*, another North American species, from which, however, it differs in its larger size in all its parts, *H. kalmianum* only growing about a foot high, and bearing paler coloured flowers.

Bagshot, Surrey.

J. CLARK.

ROUND ABOUT A GARDEN.

A FLOWER OF AUTUMN.

NO flower of the garden is more especially appropriate to its season than the Torch Lily, or Red-hot Poker of familiar garden lore, which flames in the perennial border now. Its magnificent brilliance of scarlet and yellow seems the very essence of the autumn tints, which, stealing in crimson upon the Virginian creeper, and splashing with bright orange clusters of berries, the deep green of the Rowan tree have already lighted up the first glories of the sunset of the year. All this the Torch Lily brings to mind with the first flaming spike which it holds aloft, brightening and lengthening from day to day, and then as gradually burning itself away. And as the type of autumn it is the more complete, because there is no flower which even at the height of its splendour more plainly shows its seamy side, in the scores of dead and withering flowers which hang below its brightest ring of colour, just as the autumn-tinted foliage is nearest to decay where it glows the most.

THERE ARE POKERS AND POKERS.

As a name for popular use, Red-hot Poker will, no doubt, survive for ages. It recommends

itself so strongly to the sense of humour of childhood that the plant remains ever after one of the select few whose names are never forgotten; yet if you look at it you will see at once that the name is inappropriate, because the brightest part of the spike, which would be the hottest part of the poker, is always below and not at the end. But the real objection to the name is that it is *too* colloquial, and bestows the name of one familiar object upon another without qualification, so that one could not

DEATH TRAPS FOR INSECTS.

To return, however, to the Torch Lily—*Tritoma* or *Kniphofia*, Red-hot Poker or Flame Flower—one of its excellent characteristics is the trap which it occasionally provides for wasps and earwigs. Each of these insects seems to be so exactly fitted by the tube of the blossoms that often, when it has crawled in, exit becomes impossible. This occurs most frequently in damp and chilly weather, when the luckless insects appear to have

remained inside long enough for the flower to shrink upon them; and it is only by the tightness of some of the withered blooms afterwards that you can recognise those which contain dead prisoners. Although the slaughter of wasps and earwigs by this means is not extensive enough to recommend the Torch Lily as an exterminator of noxious insects, yet it is interesting, because the plant seems to gain no sort of advantage from it. Like the common Furze, which, growing on some wind-swept corner, is often generously decorated with the corpses of moths and butterflies that have spiked themselves upon its spines, the Torch Lily seems to be merely an accidental danger in the path of the

incautious insect. Yet the Teasel, whose joined leaves make cups for rain water, in which many small insects are constantly drowned, probably reaps advantage from their decaying juices, and clearly suggests how the Pitcher Plants gradually elaborated their death-traps. So it is quite possible that ages hence even the Torch Lily may become an accomplished carnivore.

E. K. R.

TERRICK ELLESBOROUGH, TRING.

OLD AND MODERN NAMES.

Many of our old names for familiar flowers—such as Bachelor's Buttons, for instance—are open to the same objections; while others, like Love-lies-bleeding, are too fanciful and elaborate for easy use. Others, again, carry in their derivation the coarseness of metaphor, which was accounted no blemish in ruder ages; while yet others are in different localities given to different kinds of plants. Some which, like Heart's-ease, although a little lackadaisical in sentiment, deserve to live, have nevertheless gone gradually out of fashion, leaving us instead a confusion of modern titles—for not many of us, off hand, would like to define the meaning of *Violas*, bedding *Pansies*, fancy *Pansies*, show *Pansies*, and *Tufted Pansies*, all children of the Heart's-ease. There are, of course, many delightful old flower names, such as *Speedwell*, for *Veronica*, which should never be allowed to fall into disuse; but we sadly need some authoritative committee to take the whole question of the English names of flowers in hand, and to draw up a list of those which should be used in future.

A WATER, ROSE, AND JAPANESE GARDEN.

TERRICK, ELLESBOROUGH.

IN the garden of the Comte Mauny de Talvande at Terrick, near Ellesborough, Tring, the three chief features of interest are the water garden, Rose garden, and Japanese garden, and these are additionally interesting from the fact that they were only made last year. They serve to show what good results can be obtained in a short time. The immediate surroundings of the picturesque Queen Anne residence, which is shown in one of the accompanying illustrations, needed careful and special treatment. A formal entrance court, with Bay trees, *Hydrangeas*, &c., in tubs, is in keeping with the somewhat bare and austere north front, while the southern side, smothered in creepers which festoon the windows and make the walls a mass of pleasant greenery, looks upon a garden which is also formally designed,

but contains beds and borders filled with bright-hued flowers; the paths are paved and the boundaries are defined by hedges of Yew. Immediately beyond is the water garden, of which we are able to give an illustration also. Although, of course, it is yet somewhat bare, considering that it was planted so recently as last year, the results are most gratifying. Flag Irises, Irises English, and Irises Japanese fringe the banks, and their quaintly-beautiful flowers hang gracefully over the water, and, being reflected there, gain an added beauty. Nymphaeas luxuriate in the shallow pond, whose surface is studded with their glistening cups, as they gratefully expand in the warm rays of the sun. Sedum spurium makes a carpet of red on the stony bank, and keeps company with Rock Roses, some of the Gentians, Saxifrages, Pinks, and other plants that delight in a warm, sunny position. Close by the water, with their roots practically immersed, are yellow and red Mimuluses, Pinguicula, Ranunculus, Butomus, and other moisture-loving plants. A bed of Rhododendrons and Azaleas hides the sunken water garden from view as one approaches from the house, and in admiring the Lilies that luxuriate in the semi-shade of those plants and the peaty soil, in which they thrive best, the near presence of the water garden is not even suspected until its smiling, flower-studded surface lies before one. In fact, Terrick is, and will be still more so as time goes on, a garden of surprises. And what more delightful feature can a garden possess than this? Surely the creation of surprises should be one of the aims of the garden maker.

On the other side of the water garden are some splendid beds of Rose Mrs. John Laing, a favourite at Terrick; another hedge, and then the Rose garden proper, which contains hundreds of plants of Mrs. John Laing, Caroline Testout, and many more of the best Hybrid Teas and Hybrid Perpetuals. Of climbing Roses, of which there are many at Terrick, Comte Mauny de Talvande thinks highly of Reine Marie Henriette, Queen Alexandra, Waltham Rambler, Blush Rambler, and W. A. Richardson. The standard Roses are excellent, as, indeed, are all the Roses here. They have made a splendid growth, and give promise of making a wonderful display when well established. The long grass path leading to the kitchen and fruit garden is fringed by borders of herbaceous perennials, among which the Delphiniums, Madonna Lilies, and Orange Lilies are conspicuous, while the Sweet Peas, in distinct colours, are planted separately, and

add a welcome tone of colour among the monotonous greenery of fruit trees and vegetables.

The Japanese garden has been made in a shallow dell beneath forest trees on the north side of the house. It is of too recent formation for the planter's design to have fully developed. The characteristic features are still dormant, waiting for the hand of time to mould them into form. There are groups of Bamboos, of Plantain Lilies, of Japanese Lilliums, as well as pathways of stepping-stones and garden ornaments, inseparably associated with a Japanese garden. Comte Mauny de Talvande is about to form another Rose garden, a work in which he takes keen delight, the gardens at Terrick having been made from his designs and planted to his suggestions. There are other points of interest at Terrick, but in the possession of those we have mentioned lies its chief attraction.

THE ROSE GARDEN.

ROSES IN POTS.

WHEN the cold, frosty nights of October and November set in well-developed Roses are esteemed, and even more so in the early spring months. Amateurs and others who make a speciality of

Roses always have their plants before them, and whenever there is a press of garden work demand-

flowers in passable condition. Everything has required water, and at such times the plants which have been turned out of doors for the summer are apt to suffer from mere lack of time to give them the attention they daily need.

To do Roses well in pots some care is necessary in repotting them, and the potting material should be of the best quality. They are also impatient of stagnant water at the roots; therefore free drainage must be provided for them, and the plants must also be stood in a position out of doors where worms cannot find ingress by the holes in the bottom of the flower-pots. Before commencing to repot, see that the leaves are quite free from insect pests and mildew. They are very liable to be attacked by mildew, and it is very destructive indeed, quite spoiling the leaves and effectually checking their growth. I find the best way to get rid of it is to lay the plants on their sides and thoroughly syringe them with soft soapy water, in which has been dissolved about 3oz. of sulphur to each gallon of water. This not only destroys the mildew, but also the aphid tribe and red spider. I have only once had to deal with the orange fungus. It appeared on some pot Roses I had in from the nursery, and, not having seen this pest before, I was alarmed and felt much inclined to burn the whole lot of plants and stand the loss of them. Second thoughts are often best, and it was so in this instance, for I carefully cut out every bit of disease, and as the plants were not large I dipped them in the soft soap and sulphur mixture, and, as a positive fact, that was the first and last I ever had of the orange fungus amongst the Roses.

After dipping or syringing the plants, let them lie on their sides for an hour or two to drain off the water, for if it drains down the stems and into

the flower-pots the roots are injured. It will be seen in a day or two whether the leaves and stems are quite free from their insect and parasitical enemies, and, if they are, give a thorough syringing with rain water, and when the leaves are dry set about repotting them. I use a mixture of good fibrous yellow loam, to which has been added a fourth part of leaf-mould, as much decayed stable manure, and an 8-inch potful of crushed bones to each barrowload of loam; a little coarse sand may also be added. The old spent soil should be forked out from amongst the roots to a considerable extent with a pointed stick, or, what is better, a pointed iron kept for this purpose. Some tough fibre is

THE WATER GARDEN AT TERRICK (MADE LAST YEAR).

ing attention other things may suffer, but the Roses never. My own experience with general gardening has been that gardeners are apt to allow their pot Roses to be neglected during the summer months. Mildew, green fly, and red spider get upon the leaves, and the time required to keep them clean is not easy to be found. In a season such as we have passed through in the south of England, and in gardens where no additional hands have been found to do the work, gardeners have been at their wits' end to keep their plants and

always placed over the drainage to prevent the finer particles from mixing with it. The potting material is worked well in amongst the roots, and packed in rather firmly with a wooden rammer. See also that the plants are moderately moist at the roots before repotting them, and do not give any water for at least a day after repotting. In dull, drizzly, cold weather water may not be needed, for it is an error to give newly-potted plants much water until the roots have taken well hold of the new potting soil. The Roses may be

left out in the open garden until the beginning of October, with the exception of the Tea-scented kinds, which would do better if they were placed under glass after repotting; moreover, they also prefer lighter potting soil than the Hybrid Perpetual and other hardier Roses. A little light fibrous peat added to the compost as above would greatly improve it for the Teas.

It is pretty well known that the Teas are by far the best for autumn blooming, and plenty of Roses can be gathered from a bed of them out of doors until damp and cold nights prevent the blossoms from opening, and it is after this time that the pot Roses come in useful for autumn and early winter blooming. We have a house, light and airy, constructed for flowering Tree Carnations, zonal Pelargoniums, Bouvardias, &c., and the treatment these require in October, November, and December exactly suits the requirements of the Roses if they have been prepared by resting at the right time after the summer or spring flowering was over. The plants should be allowed to become comparatively dry at the roots and be rested, as they would be in some districts in the south of Europe, where these Tea Roses form a large industry for the production of cut blooms in the winter. In the Riviera scarcely any rain falls from the beginning of May until September. Roses lose their leaves owing to drought and heat, and the long days of summer are their period of rest. In August or early in September they are pruned, and Roses thus treated will flower in the Riviera from late in October until the middle of January. We can imitate very nearly the conditions of the south of Europe with our Tea Roses in pots, for they are far better for our purpose than the Hybrid Perpetuals. Although both are grown in the south of Europe, they are not equally well adapted for greenhouse culture here. The plants should be kept comparatively dry after flowering, and if it rains keep the rain from them. Prune them in August, and when they have well started they may be placed in the house where they are to flower. This house is heated with 4 inch hot-water pipes in the usual way; and besides this a flow and return 1-inch pipe have been fixed to the roof, one of them about 1 foot from the bottom of the rafters, and the other 9 inches higher up. These small pipes are of much value in drying up condensed water, and also for preventing frost from gathering on the glass at the bottom of the rafters. J.

GARDENING OF THE WEEK.

FLOWER GARDEN.

PLANTING AND TRANSPLANTING LILIES.

IF it is found necessary to move any established clumps of Lilies, this is best done as soon as the leaves and stems have ripened, getting everything in readiness beforehand, so that the bulbs are not exposed to the drying influences of the air longer than is absolutely necessary. Liliuns thrive best in a partially shaded position, or at least in a bed or border which receives direct sunshine for only a few hours daily. Nearly all of them require peat in varying proportions. When planting it is not wise to dig in any manure; the first aim of the cultivator should be to get the plants established. With some kinds this may take several years. This done any feeding that may be necessary can be given either in the form of a top-dressing of decayed manure or liquid manure water when the flower-spikes are well above the soil. Some North American kinds require more peat and moisture than most of the others. Where it is hardy the noble *L. giganteum* should be grown. This is also a moisture-loving plant, and requires thorough drainage and plenty of decaying vegetable matter and leaves to root into. Such kinds as *L. auratum*, *Humboldtii*, *bulbiferum*, *tigrinum*, *Martagon*, and their varieties are most at home in a stronger soil with a good proportion of rich loam. For a light soil *L. candidum* and the more delicate *longiflorum speciosum* and their varieties are to be recommended. Unless they are quite hardy it is not

wise to plant many of the newer and more expensive varieties, but an occasional bulb may be planted to settle the question of bardiness, and if they thrive such plants are of great interest. If upon their receipt any bulbs are bruised or shrivelled they should be laid in moist soil until they have become plump, when, after all dead scales have been removed, they may be planted. As most Lilies send out roots from the stem just above the bulbs they should be planted fairly deep: 4 inches to 8 inches, according to size, will usually be found a suitable depth. Some protection from frost will be necessary, and, above all, they must be in a position sheltered from all rough winds.

A. C. BARTLETT.

Pencarrow Gardens, Bodmin.

INDOOR GARDEN.

BULBS TO BE POTTED.

THE bulbs to be potted will depend very much upon individual requirement, but in any case to keep up a succession of bloom during the winter and early spring months it will be necessary to pot up at once such kinds as will afford an early display; for the purpose Paper-white Narcissus, double Roman Narcissus, double Daffodil (*Telamonius plenus*), Roman Hyacinths, Crocuses, Snowdrops, Scillas, and Early Duc Van Thol Tulips. The bulbs will succeed equally well in a compost of loam, leaf-mould, and sand, and should, if the soil be in proper condition for use, be potted moderately firm. Sand or cocoa-nut fibre is the best material in which to plunge the pots until they become filled with roots. Afterwards, and just as the bulbs have shown growth from the centre, remove them from the plunge-bed to a cold frame, where they should for a week or so remain previous to being taken into the forcing-house.

WINTER-FLOWERING PELARGONIUMS.

The continued wet weather has caused the soil in the pots to become saturated, a condition that should not exist for long, or the plants will soon lose a great portion of their leaves, and there will be little prospect of their doing any good afterwards. With the shortening days and declining degree of heat there is naturally less evaporation of moisture; consequently to keep the plants healthy and in good flowering condition remove them at once to the shelter from heavy rains, where they can have abundance of air and light to mature their growth.

J. P. LEADBETTER.

The Gardens, Tranby Croft, Hull.

FRUIT GARDEN.

MELONS.

THE outside linings of the pit or frame must be frequently renewed to keep up the necessary heat to thoroughly mature the fruits. The plants will require very little, if any, water at this season when approaching ripeness. Where a good depth of material is used none will be required. The fruits should be kept well raised and fully exposed to have the benefit of sun and light, and be occasionally turned so as to secure even size and good finish. Thin out the laterals and keep the foliage thin and evenly distributed over the whole frame. Later Melons grown in houses will now need more careful treatment, as the sun and light decrease, as regards watering and less atmospheric moisture. Give plenty of air early in the day when the weather is favourable, and syringe the plants on bright days only, damping the paths and walls being sufficient in dull and wet weather. Do not overcrop the plants at this season, two fruits being quite enough for the plants to mature. I have found it a good plan to grow the latest plants in 12-inch pots, allowing them to carry one or two fruits, according to the strength of the growth and the variety. The watering of plants grown in pots is kept more even, without any loss from canker or other causes. Should the autumn be wet and cold better flavour is obtained from plants grown in pots than from those in beds. Keep the bottom-heat steady at about 80° to 85° and a night temperature of 68°, with the usual rise during the day from sun-heat, always closing early on bright afternoons.

CUCUMBERS.

If the seeds of these are not already sown for winter and early spring fruiting, no time should be lost. A good form of Telegraph is still hard to beat. Rochford Market is a strong-growing and free-fruited variety; it keeps well, a great thing in its favour for winter work. The season of these plants being to supply fruits for a long period of dull months, every care should be taken in making the beds and to see that the drainage is in order. Moderately-sized mounds of soil should be placed in position, consisting of good fibrous loam, leaf-mould, Mushroom bed manure, with a sprinkling of wood ashes and bone-meal. Do not make the soil too light at this season, as the plants will grow stronger in more loam than is generally used during the summer months, when a quick return is necessary. Sow two seeds in each mound of soil and remove the weakest later. Plants sown direct grow stronger than when sown in 3-inch pots. Give plenty of air when the weather is favourable to secure firm, short-jointed wood that will supply fruits from Christmas onwards.

AUTUMN-FRUITING CUCUMBERS.

These should be encouraged by having weak supplies of liquid manure given them. Top-dress the plants at short intervals with rich, light soil, covering over all the roots on each occasion. See that the soil is well warmed through before being used. Keep the growths thinly trained, and do not overcrop the plants unless they are shortly to be removed. Syringe and damp the house according to the weather, and maintain a night temperature of about 68°, 75° by day, closing at 80° with sun-heat, and allow the house to run up to 90°.

Impney Gardens, Droitwich.

F. JORDAN.

KITCHEN GARDEN.

SALADINGS.

MUSTARD AND CRESS from this date must now be grown in boxes indoors. The heavy rains and lessened sunshine prevent the necessary rapid growth. A sowing should be made weekly to ensure a constant supply. See that the boxes are removed from drip, and if the seed has germinated in heat the boxes should be removed to cooler quarters. Radishes are still in request. These must now be sown in cold frames. Keep the frames shaded till the seedlings appear. Copious waterings will be required, so that the roots may be crisp. Lettuce sown about the middle of last month will now be ready for planting out. Choose a warm, sunny position, such as the bottom of a south wall. See that the plants are not put in too deeply, as at this date they are very liable to damp off. Slugs will, no doubt, be troublesome, and must be kept down. If not already sown, Lettuce for wintering in frames should be got in, and if sown at once will be the right length for transferring to frames. About the end of the month Cos varieties in the open may be tied up—not too tightly. There should be a sufficient quantity of these on the way to meet all demands till hard frosts sets in.

FRENCH BEANS.

Make another sowing of these in pots to succeed those in frames. The pots should be three parts full, with ample drainage. They may be placed in cold frames till germination takes place. The lights should be placed on the frames, as the prevailing heavy rains would destroy the seeds, or, at least, retard germination. For this sowing Veitch's Forcing Favourite is a safe variety, and is a most reliable sort at any season. Broad Beans have been a splendid crop, and if any are required for pickling they should be secured now, choosing, of course, the finest pods.

GENERAL REMARKS.

Attention will now have to be given to the early winter digging and trenching, and it is well to be in time with the collecting of manure for the different plots. Good farmyard manure should now be turned into a large heap to allow time for its thorough preparation. Garden refuse of all kinds may be mixed along with the manure, or if much trenching is to be done this may be kept separate

for placing in the bottom of the trenches. If the refuse heap is known to be full of seeds of weeds, it should on no account be brought back to the garden, but be carted off the premises. Remove the stakes and clean the ground of the early Pea plots. The stakes should be stored in a dry place if possible. Ground for the planting of Cabbage for spring use should now be got ready, land that has been cleared of Potatoes or Onions being very suitable. Except levelling, Potato land will need no future preparation. If the plot cleared of Onions is very hard it may require loosening with the fork.

Hopton House Gardens, THOMAS HAY.
South Queensferry, N.B.

ORCHIDS.

DENDROBIUMS.

MANY of the semi-deciduous section, such as *D. nobile* and its varieties *D. wardianum*, *D. crassinode*, *D. findlayianum*, and many of the now numerous hybrids, among them *D. leechianum*, *D. splendidissimum grandiflora*, *D. Juno*, *D. Wiganie*, *D. wiganianum*, *D. Ainsworthi*, *D. Curtisii*, *D. Cybele*, *D. Artemus*, *D. bnrfordense*, *D. Euterpe*, &c., are now approaching full development, and the treatment they have been receiving during the growing season will require changing. In the past we have generally taken them from the growing house and gradually hardened them till they have eventually been placed in an early vinery or Peach house or other very airy and dry structure. I find, however, we get our best results by not subjecting them to such a radical change. We do not take them now from the growing house, but we select those that have not yet finished growing and give them still a free supply of water. Those that are finished, or nearly so, are only watered when they become dry. More air is now admitted, and, generally speaking, the house is being changed gradually from a stove temperature to the intermediate Orchid house degree.

I certainly advise those that do not devote a house to Dendrobiums to take the finished plants from the growing house and stand or hang them in the intermediate structure, giving them the lightest position possible. If one can give the finished ones such a temperature, which is often impossible where large numbers are grown, they could be removed and the temperature maintained for those still growing, but my experience tells me that Dendrobies will grow well when it comes to this time of the year in a much more buoyant and cooler temperature than is needful during the spring and early summer, when the growths are young and soft.

It is essential that the change should be brought about gradually, and at no time would I advise a lower temperature than 60° at night.

A great mistake is often made in giving Dendrobiums their needful rest by withholding water to such a degree that the pseudo-bulbs shrivel. Nothing is more detrimental, and the ultimate result is flowers of inferior size and wanting in substance. Next year's growth is generally weak. Well-rooted plants will go for many days without water, yet it will be necessary for the grower to constantly observe his plants and watch for the first signs of shrivelling. If the plant is then at once thoroughly watered the plumpness of the new pseudo-bulbs will be restored in a few hours. This is likely to occur with anyone who is giving their plants an ideal rest, it being well to run as near as possible to the point that causes shrivelling without overstepping the mark. The blinds should not be lowered now till about 10 a.m. on the morning side, and those on the afternoon side should be raised about 3 p.m. to allow the morning and evening sun to help forward the ripening process.

As the season advances less shade will be required, and as the bulbs get more fully ripened less water will be required to maintain them in a plump state.

The whole secret of success in properly resting Dendrobies is to maintain the plants in a sound state, with as much sun as possible and with the least quantity of water; the roots will then keep in good health, and many more will be made to help sustain the plants through the flowering season. We find we can bring this about better by not subjecting them to such cool and airy conditions as we have done in the past.

THE KITCHEN GARDEN.

NOVEL POTATO CULTURE

I HAVE been reading your correspondent's article on production of new Potatoes from old tubers during the winter months with profound interest, and intend to try the experiment myself. Could you tell me

(1) If the earth sprinkled on the old Potatoes should cover them entirely? (2) If that earth should be perfectly dry or decidedly moist?

Cullompton.

W. TRACY.

I HAVE much pleasure in giving the following information in reply to your correspondent's two enquiries on the production of new Potatoes from old tubers: (1) If the old tubers are put in a dark place, such as our chalk caverns or a Mushroom house, they need only be partially covered with fine soil. Many people come to see them in winter, and it is interesting to see them growing. The old tubers, with their young ones, can be lifted up, examined, and replaced. It does not hurt them at all, as there is no leaf or root growth. If they are grown in a place where more or less light can reach them they should be covered, but not too deeply. We grew some in a frame very satisfactorily with a little heat, covering them with 2 inches or so of soil. In this case we had to finger them about to find the young Potatoes. If exposed to light there is a tendency, of course, to turn green. We have had the best results in total darkness, when with a taper or candle we can see exactly what to pick. (2) The earth need not be perfectly dry; it certainly should not be wet. We use the soil from under the potting bench, finely sifted, without any other preparation. We are quite satisfied with our success, and I believe there is a future before it.

GEORGE STANTON.

Park Place Gardens, Henley.

SEASONABLE NOTES ON CELERY.

THOUGH badly attacked by the Celery fly in the earlier part of the season, Celery generally is looking wonderfully well, and gives every promise of yielding first-rate returns. Much care and attention, however, must be exercised at this time of the year to ensure perfect blanching and keeping qualities, and especially so on land which is naturally of a stiff, stubborn nature. Fortunately Celery, providing plenty of farmyard manure is given to it, will thrive luxuriantly on almost any soil. Side growths and all split and deformed leaves should be removed before the work of proceeding to apply the earth. The roots should be thoroughly moistened by giving two or three drenchings of liquid manure, and it is well to bear in mind that Celery is a moisture-loving plant and can hardly be over-watered at the roots. Even though the weather may be showery there is seldom sufficient to benefit the roots. A good dressing of soot should be placed round each plant and about the growths and leaves also, and where sufficient hands are at command three pairs should always be used for the purpose—two for preparing and adding the soil, and the other for placing it securely round the plant. The work should be performed as much as possible in fine, dry weather, and one of the greatest mistakes is to add too much soil at the time, the consequence being the young growths become crippled and premature decay sets in.

Well-grown Celery requires at least four applications of soil to perfect it, and in the case of stiff, lumpy material care should be taken to pulverise this as much as possible. Six to eight weeks is necessary before it is really fit for the table, and the later in the season the longer time it will take. Keep a sharp look-out for any signs of the Celery maggot, and take means to destroy it as speedily as possible, as it often makes its appearance, as it did last year, twice during the season—spring and autumn. Soot should be constantly applied both over the foliage and on the surface of the soil, and when used in time it undoubtedly does much to ward off the attacks of the fly and slugs. As a stimulant for Celery it is unsurpassed.

That which is required for midwinter and spring supplies, and, of course, was the last put out in trenches, should receive every encouragement to induce it to make free growth. The earthing up of this should be deferred for at least another six weeks or two months. As is well known, it is harder and escapes injury from severe weather better when not too much blanched.

THE CELERY QUARTER IN LORD ALDENHAM'S GARDEN AT ELSTREE.

When required for exhibition the best and most promising sticks should be selected and brown paper bands about 6 inches in width placed round them, adding others of the same width about every seven or eight days until it is of sufficient height. Eight weeks should be allowed at this season. It will be well to examine these once or twice during the period to see that all is going well and that there are no decayed pieces in it. In dry weather give a thorough watering at the root every third day.

E. H. H.

E. BECKETT.

NURSERY GARDENS.

MESSRS. WEBB & SONS, WORDSLEY, STOURBRIDGE.

THE trial seed-grounds of Messrs. Edward Webb and Sons are on high land at Kinner, near Stourbridge, an ideal spot for the purpose: the air is pure and the soil good. The total extent of ground cultivated here by Messrs. Webb is 1,500 acres. The culture of plants for seed is a most important work, and position and environment are points that need careful consideration, so that the stock of certain varieties may be kept healthy and true. Messrs. Webb's seed business is a very extensive one; in addition to the Kinner farms some 20,000 acres of land in different parts of the country are used by them for seed-growing purposes. The Kinner farms are for the production of stock seed, and it is there that new varieties are raised by cross-fertilisation and improved forms obtained by selection. A valuable work carried out there also is the cultivation, side by side, of Messrs. Webb's varieties of vegetable, flower, and farm seeds, with varieties from many other sources.

Thus it is possible to determine the relative value of their new productions, which is a very necessary thing to do. Unless such a method is practised it is impossible to appraise new sorts of flowers or vegetables, cereals or grasses, at their true value. We may think a certain Pea or Potato to be an excellent one and well worthy of being put upon the market, and, indeed, when seen by itself no one would have any but the highest praise for it, yet when seen side by side with others of proved worth it may possibly lose considerably by comparison. Thus it is not difficult to see how important a matter it is to grow new varieties along with old. This is what Messrs. Webb and Sons do, and if the new sort does not show a marked improvement in one or another direction, in quality, size, vigour of growth, or productiveness, then it is discarded. When such rigid selection is practised the result cannot be otherwise than beneficial, for by its means poor varieties are weeded out and a high standard is maintained. The varieties of vegetables and flowers are now innumerable; careful and rigid selection becomes of increased importance every year, and it is very satisfactory to see that Messrs. Webb so thoroughly realise this and carry it out.

In connexion with the trials there are at Kinner to-day many plots of different vegetables, flowers, cereals, and grasses growing side by side, the object of Messrs. Webb being to determine the best varieties of each kind. These trials include fifty-three of Wheat, thirty-seven of Barley, eighty-four of Oats, 15 of Peas, forty-eight of Beans, forty-two of Cabbage, fifty-six of Onions, sixty-three of Cauliflower and Broccoli, thirty-nine of Carrot, forty of Swedes and Turnips, fifty-four of Mangolds, and twenty-five of Lettuce. We might mention two new strains of cereals that were pointed out to us, viz., New Barley obtained by cross-fertilisation, the result being a very stiff-strawed variety, combining the productiveness of the one parent with the fine malting quality of the other. This will be offered to the public next year under the name of the New Binder Barley, a name peculiarly suitable on account of the erect character of this new variety. The other novelty is the White Horse Oat, which has been obtained

by selection. Undoubtedly it is a good stable Oat, and, while the length and strength of straw make it valuable in one way, the heavy yield and thin skin render it equally desirable in another. Two new Wheats and two new Peas were also pointed out to us. In the vegetable trial quarters, in addition to those kinds already mentioned some eighty different sorts of Potatoes were growing, and among them were several seedlings of great promise. The finest Beetroot we saw, and one that can be strongly recommended is Satisfaction. Of new Peas we noted Mainstay (late), Senator and Kaiser (maincrop varieties), all of sterling merit. Some sixteen other seedling Peas raised at Kinner, but as yet not fully tested, and therefore unnamed, were pointed out to us.

The flower seed trial-grounds made a brilliant picture: some 150 varieties of annuals were growing there, and most of them in bloom. The Nasturtiums made ribands of red and yellow and gold; the bed of Carnations, some 100 yards long, was a delightful feature: the Hollyhocks stood sentinel over masses of Dahlias, Candytuft, Larkspurs, &c., all of which combined to make a galaxy of colouring as perhaps only annuals at their best are capable of giving. We have never seen a finer selection of Nasturtiums than Messrs. Webb have, and among the many distinct and richly-coloured varieties three were particularly fine—King of Tom Thumbs, with brilliant scarlet flowers and dark green leaves; Tom Thumb Rose, with rosy red blooms; and Cloth of Gold, bearing a profusion of very bright yellow flowers, and with light green foliage. Candytuft was represented in several pleasing shades of colour, and the masses of white and purple Clarkias served to remind one of the value of these somewhat neglected garden flowers. The Carnations were layers from seedlings, the result of seed sown in 1902, and all had been carefully selected; the plants were vigorous and the colour of the flowers very bright and attractive. Mignonette, Godetias, Poppies, Lupins, Eschscholtzias, Alyssum, &c., added further variety of form and colouring to this veritable farm of flowers, and served to bring home to one the peculiar value as colour plants of annuals in the garden. Oxurys chrysanthemoides is a pretty and uncommon annual plant with yellow, white-edged Daisy-like flowers, that deserves to have attention drawn to it.

In the glass houses for the production of the seeds of tender plants we saw many excellent varieties of Messrs. Webb's Excelsior strain of Gloxinias and tuberous Begonias that included some very pretty crested forms. Our attention was drawn to a new red Plum-shaped Tomato called Coronation, which is a very heavy cropper. The premises at Wordsley have been recently added to by the erection of new storage and drying-rooms, and there is now a commodious and extensive block of buildings. At Saltney, Cheshire, Messrs. Webb and Sons have large chemical works, seven acres in extent, for the manufacture of artificial manures for both farm and garden crops.

E. GAYE, LOWESTOFT.

If plants grown on the East Coast have any advantages over those grown amid more congenial surroundings it is that they are as hardy as plants can be, and this may truthfully be said of those grown by Mr. Gaye at his nursery a mile or so from Lowestoft. The fresh sea breezes that in winter often attain the velocity of a gale blow uninterrupted from the North Sea across the flat country characteristic of the south-eastern counties, and the plants are exposed to a good deal of their force. It is safe to say then that, if they live and thrive at this Lowestoft nursery, they are pretty sure to do so in almost any garden in the kingdom. Plants that have been "coddled" in the nursery invariably prove unsatisfactory, if they do not fail altogether, when transplanted to a somewhat exposed position where they must brave the wind, sun, and cold. It is safe to say that many plants are annually lost from this cause alone. If you would make sure of having plants that are strangers to "coddling," that have braved the elements from their earliest days, you are certain to find them in Gaye's Lowestoft nursery.

Altogether some thirty acres are under cultivation. A special feature here is the culture of hedge plants. Mr. Gaye has large stocks of Myrobalan Plum, Privet, Quick, Laurel, Beech, &c. The first-mentioned makes an excellent hedge quickly. We saw one formed of plants only three years old, planted two years ago, that is now from 4 feet to 5 feet high. The plants were put in 9 inches apart in two rows. This makes a prettier hedge than the Privet, and is apparently almost, if not quite, as quick growing and hardy. Mr. Gaye speaks highly of the Silver Poplar, which he recommends as an effective plant for exposed positions. We saw numerous and very good plants of this from 3 feet to 6 feet high. The Spruce Fir, the Lombardy, Canadian, and Balsam Poplars, Willows, Larch, and Lilacs in variety are all grown in considerable quantities. Hyacinthus (Galtonia) candidans and Montbretias made the nursery bright, the former with their bells of creamy white, the latter with their numerous racemes of orange-red flowers that are produced in such profusion in almost any position and any soil. Mr. Gaye grows plants that are of proved garden value, and for which there is a good demand, hence one sees large quarters filled with Polyanthus, Primroses, Canterbury Bells, Violets, Wallflowers, Pansies, Pinks, Carnations, Roses, and many more, all of which are popular with the million. They are indispensable in every garden. In common with everything else in the nursery they have that hardy appearance which denotes vigour of constitution, a consideration that is all-important with most purchasers of plants. Fruit trees are chiefly represented by Currants, Gooseberries, and Raspberries, although Mr. Gaye supplies other sorts, such as Apples, Pears, and Plums. That the plants sent out by Mr. Gaye give satisfaction is evidenced by the rapid growth of his nursery, which, when established eleven years ago, employed only three men, whereas now it gives work to some forty altogether. Indirectly also this serves to show how great and real has been the increased love for plants and flowers among the people of this country.

CORRESPONDENCE.

(The Editor is not responsible for the opinions expressed by correspondents.)

PLANTING EVERGREENS IN SUMMER.

(TO THE EDITOR OF "THE GARDEN.")

SIR,—I can hardly agree with "J.'s" contention in THE GARDEN of the 13th ult. that evergreens can be moved better in the middle of summer than at any other time. I grant they can be moved and live afterwards, even in the hottest summer, provided they are watered and shaded and all the rest of it, but these operations mean a lot of extra work for a very doubtful success. I wonder whether he has ever tried to move conifers in the summer: if so, I should like to know the result, as I have almost invariably found them die or set so unhealthy that they have been got rid of at once. The best time for planting evergreens is from the middle of September until the end of October, and next to that from the beginning of April to the middle or end of May, according to the rainfall and the direction of the wind. The essential conditions under which evergreens can best be moved are warmth of soil and humidity of atmosphere. The ground, being warm, induces fresh root action, and the moist air prevents evaporation, thus causing no demand upon the roots before they begin to push. Given these conditions for a fortnight there is no danger of a plant dying, as it will have become settled down in its fresh berth and be starting to make fresh roots. These conditions are found more generally in the early autumn than at any other time of the year, and therefore that is the best time for transplanting. In the spring we are liable to get a succession of cold, drying, easterly winds, accompanied by bright sunshine, which are very injurious to most vegetation, and especially to freshly-planted evergreens. If the plants to be moved are in a fit condition for transplanting, a

fortnight or so of mild, damp weather afterwards, with a suitable ground warmth, will be sufficient to ensure their living and thriving. The remarks on the preparation of plants are good, and cannot be too strongly impressed on intending planters. Any plant that is not in a permanent position must be moved periodically or it will become coarse-rooted, and either die outright or suffer badly when moved from the place it is growing in. The time that should elapse between each shift depends upon the plant itself, some things standing for three or four years without any injurious after effects, while others must be moved every year, or every other year at the outside. To cut round a plant, however, in October, and then to move it in the following July, is too soon, as the young roots have not had time to develop properly, and the

the ground is warm and the atmosphere is moist, which conditions, taking an average of years, are found more during the latter part of September and through October than at any other time of the year.

Bagshot, Surrey.

J. CLARK.

LUPINUS ARBOREUS SNOW QUEEN.

[TO THE EDITOR OF "THE GARDEN."]

SIR,—I note your correspondent in your issue of the 29th ult. thinks well of this plant, and very kindly sends you a photograph. When I contemplated placing this plant on the market I had a photograph taken of a bed—or part of it—which was over 100 yards in length: the bushes were 3 feet to 4 feet high, entirely covered with flowers.

at which these trees were first introduced into England is referred to, viz., about the middle of the seventeenth century, the following note left by my great-grandfather, Sir Wm. Wolseley, in 1802 may be of interest:—

"Feb. 9th, 1802.—The *Arabia Cedar* at Wolseley was blown down on the 21st of January, 1802, between two and three o'clock in the afternoon, a day famous in the era of Time whereon Lewis, the 16th King of France, was beheaded by his own subjects. On this day also there was an occultation of the Planet Jupiter with the Moon: from this circumstance and from the influence they have on the weather, the most violent hurricane that has been known in England since the year 1703, was such as not only to blow down this famous *Cedar*, but also tore up by the roots seven *Large Oak*

LUPINUS ARBOREUS SNOW QUEEN IN MR. LADHAMS' NURSERY.

plant suffers afterwards, these young fibres being broken or bruised, as they inevitably are during transplanting. Most trees and shrubs should be left for at least twelve months after being prepared, while a few are all the better for being left two years.

"J." in his note seems to be mixing evergreens with deciduous subjects when he speaks of the second growth in summer. I have never noticed a regular second growth on evergreens, the same that one sees on an Oak for instance, though sometimes a Holly or a Yew or Laurels will make a second growth during August or September, which, however, rarely ripens sufficiently to withstand hard frost. The great point in transplanting evergreens, as I have said before, is to do it when

It was at that time like a deep snowdrift, and the scent was wafted into the high road for half a mile. So striking was this big lot that the public came three miles to see it. We, of course, never again had such a fine show, although individual plants have been if anything finer. I had a lot of very indistinct and curious forms before selecting this one.

B. LADHAMS.

Shirley Nurseries, Southampton.

THE CEDARS OF LEBANON.

[TO THE EDITOR OF "THE GARDEN."]

SIR,—Having read in THE GARDEN of the 29th ult. the interesting article on the Cedars of Lebanon, and noticing that the generally accepted date

Trees in Wolseley Park the same day. This Cedar was of a considerable age and size, and contained even *limbs* of very large timber, and was all perfectly sound. The *butt* of the tree *was* yards and a half 12 inches in circumference, three great branches *two* yards 24 inches in circumference, several others one yard and upwards, and its *height* sixty-three feet. Such is the true statement of this stupendous tree, nothing can compensate for its Loss! ! ! The family tradition is that Sir Wm. Wolseley, who was drowned in his chariot in the mill stream at Longdon, brought the Cedar cone from Mount Lebanon, having set out from Aleppo on a journey to Jerusalem in company with eleven other English gentlemen in 1697, whose travels are described in print. The said cones Sir Wm. gathered himself

on the top of Mount Lebanon, and he had them sown in the stone walled Wolseley garden; that the common weeder in the garden, not knowing of there being anything of the sort planted there, weeded them nearly all up, but accidentally left one, and that this was the *very tree* so left that attained to such a magnificent growth.—Signed, W.M. WOLSELEY."

There are three fine Cedars now on the lawn at Wolseley, which, until quite recently, I have always believed were planted at the time referred to in the above note, which, however, disproves this theory. Two of these trees are at least 50 feet in height, the butt about 13 feet in circumference, with fine spreading branches, and do not seem to have perceptibly increased in size during nearly fifty years that I can remember them. I now presume that these were planted to replace the one blown down referred to above, which would make them about 100 years old only. If so, their growth during the first half of their existence must have been very much greater in proportion to the last half.

Wolseley, Stafford.

C. M. WOLSELEY.

THE FOAM FLOWER AND SPIRÆA LINDLEYANA.

[TO THE EDITOR OF "THE GARDEN."]

SIR,—I notice in your issue of the 6th ult. that two correspondents write about *Tiarella cordifolia* and *Spiræa lindleyana* as if they were difficult plants to grow. My experience is that they are both of the easiest cultivation. The *Tiarella* can be increased by runners or division of the root, and grows like a weed in my Buckinghamshire garden. The *Spiræa* grows both there and in my Yorkshire garden most luxuriantly; it is now at the latter place, 550 feet above the sea, covered with its plumes of white blossom. I have given offshoots to many friends, and have had the shrub here for more than twenty-five years.

Yorkshire.

"HEDGERLEY."

EVERLASTING PEA MOONLIGHT.

[TO THE EDITOR OF "THE GARDEN."]

SIR,—In reply to the note of "R. D." in THE GARDEN of the 20th ult. I am pleased to give all the information I can respecting this hybrid. I received a packet of twelve seeds of *L. splendens* (Californian Pea) from a foreign house of high repute. All germinated, nine being *L. splendens*, two *L. sylvestris platyphyllus*, of a fine form, but the usual magenta colour; the other is the white variety, to which I have given the name Moonlight. There was no apparent difference in these seeds. Presumably Moonlight is *L. s. p. albus* × *splendens*, accidentally the hybrid keeping the colour and form of the former, but, as is so often the case after introduction of fresh blood, all parts are more finely developed. I have Hobbies' variety growing beside mine, but forbear a comparison.

Gresford.

P. H. MILES.

HARDY CLIMBERS FOR ARGYLL-SHIRE.

[TO THE EDITOR OF "THE GARDEN."]

SIR,—The best of all is *Escallonia macrantha*, but all *Escallonias* do well. I have a grand *E. langleyensis*, now two years old and growing fast, on a south-east wall. Nothing grows better than white Jasmine; this and a *Cotoneaster buxifolia* are 10 feet or more high in the same time, and an *Exogonum Purga*, planted out in May, has grown at the rate of some 3 inches a day, and is flowering well. You do not mention the Brooms, but they flourish better than anything except Fuchsias. Of the Heaths, *E. arborea*, *E. lusitanica*, *E. mediterranea*, and, indeed, all this tribe do very well, though we have not yet had a hard frost to try the first-named. By far the best Rose for a wall is a yellow Banksian. I planted one at Ormsary in April, 1895, which was well over the roof when I left the place in 1901. If "X." has a garden at all sheltered from our winter gales, let him plant, next April, a few Himalayan *Rhododendrons*, and first of all let him go to Stonefield to see the beautiful

specimens there, now some forty or fifty years old. I have not found the Fire Thorn or *Wistaria* do well.

H. R. BRUNNER.

Achaglachyach, Tarbert, Loch Fyne.

DESTROYING WASP NESTS.

[TO THE EDITOR OF "THE GARDEN."]

SIR,—I should be very grateful if you or any of your readers would tell me the best way to destroy wasp nests. I am plagued with the pests.

J.

[The first and most important attack one can bring to bear on wasps is unmistakably at the nest, but in a district where fruits are widely and universally cultivated in the garden and orchard of the cottage, mansion, and farm their increase is certainly encouraged. At some local flower shows prizes are given, and very wisely too, for the largest number of queen wasps, and it would be well if private individuals could take up the matter in the same way. Where it is carried out, much less trouble is caused from their visits in late summer, or from the early Plum season until all Pears and Apples are stored. Early summer fruits, fortunately, are exempt from their interference, and there are districts and gardens where no trouble is known from wasp attacks. For destroying the nests, nothing is so quickly effective or so simple as cyanide of potassium. Needless to say, this is a deadly poison, and should be used with caution, but with ordinary care no one need have any fear. The great advantage of this is that it can be applied much more effectively during the day, and thus the old-fashioned or tedious ceremony of burning them out at night is altogether dispensed with. Very strong nests, however, require sometimes a second application of the liquid; the dead and dying insects apparently, when so numerous, stifle down the fumes or vapour, which to them is so destructive. It is useless to visit a nest, apply a dose of cyanide, and then leave it, hoping that its destruction is assured, even if all the wasps on the wing pass in and remain in the nest. To those who have watched their progress, it is well known that those in the maggot stage hatch and re-establish the nest in a surprisingly short time. To obviate this, one must visit the nest with a spade only a few hours after the solution is applied, dig it out and beat it into a paste. Sometimes, when to outward appearance all is quiet, a quantity of winged and living wasps are disturbed in the course of digging out the nest. A pot of water quickly thrown on them greatly facilitates their end. The cyanide supplied in ½-lb. or 1-lb. bottles is in lumps, which is easily dissolved in warm water, and it is better to mix only as much as can be used at once, because the loss by evaporation is such that the solution is rendered almost valueless in a day or two. It should, both in a dry and liquid state, be carefully sealed against air. Two or three lumps, according to size, suffice for a pint of water, and a tablespoonful poured well into the entrance soon commits havoc among the inmates and those passing in. Nests are most easily found when the sun shines, because wasps are then traced for some distance on the wing, and the direction of their nests can be often ascertained by noting the course taken on leaving the fruit trees. Bottles filled with sugar and beer, or honey and water, attract and destroy a quantity of wasps and the large blue-bottle flies, which, when in quantity, are almost equally as destructive. This perhaps is the only means of trapping the flies in question, and it is surprising the quantity collected in large sweet bottles when partly filled with a tempting mixture.]

PLANTS THAT NEED CAREFUL HANDLING.

THE following interesting notes by Mr. J. H. Maiden, Government Botanist, and Director of the Botanic Gardens, Sydney, were contributed to the Therapeutical Society:

Rather more than twelve months ago I had the misfortune to contract a severe attack of eczema through coming into contact with a growing plant of *Rhus radicans* (Toxicodendron) in these

gardens. Discussing the matter with the physician to whom I owed speedy recovery, I found that little was known about plants which induce this distressing complaint (of which, of course, many kinds are known to physicians).

Careful search on my part shows that the matter has probably escaped the attention of botanists. I enumerate the eczema-inducing plants known to me in botanical sequence, but the list is so scanty that no conclusion can be come to as the result of scanning this list, except that at present the genus *Rhus* has unenviable notoriety. Perhaps the publication of this list may draw attention to the subject, and we may thus obtain the data that we at present lack.

I have not referred to mere urticating or stinging plants, such as the Nettle. If we know but little as to the plants which cause irritation, we know less of the active principles concerned. If we can make a comprehensive list of well-authenticated plants, the active principles will be ascertained, I feel sure, without delay.

RUTACEÆ.

(1.) *Phebalium argenteum*, Sm.—This has been called the "Western Australian Blister Plant," and Dr. Alex. Morrison* has shown that it blisters the human skin if handled. It has also been suspected of poisoning stock, though no details of this are available. It probably owes its acridity to an essential oil, as do so many plants of the natural order to which it belongs.

MELIACEÆ.

(2.) *Dysoxylon Richii*, C. DC. (*D. alliaceum*, sem.), native name Mastanea, is found in several Polynesian islands. Dr. Funk of Apia Samoa, informs me that the wood "causes sickness," which I understand to be in the nature of skin irritation. The sap or sawdust causes a kind of eczema on the hands, also eye inflammation, and a burning feeling in the throat.

(3.) *Dysoxylon Muellieri*, Benth. "Red Bean."—This well-known furniture wood of New South Wales has been accused as follows: Some cabinet-makers report that after working at it for "four or five days they begin to suffer from a virulent form of influenza, accompanied by violent fits of vomiting and bleeding at the nose, while if they cut themselves in handling the timber blood poisoning almost inevitably ensues. Remarkably enough, the more seasoned the wood is the worse it becomes."

It appears to me that the language of exaggeration has been here employed. So far as I can glean, the wood, and particularly the sawdust, are exceedingly irritating to some people, and it has induced severe eczema and also irritation of the mucous membrane.

(To be continued.)

HYBRID MONTBRETIAS FROM BELGROVE.

MR. GUMBLETON sends from Belgrove, Queenstown, Ireland, flowers of a series of beautiful hybrid Montbretias, descriptions of which are as follows:

Montbretia hybrida M. Jacquaeu.—A charming flower, just over 1 inch across, the outside of the florets flushed with a warm brownish crimson, but within deep yellow, with the same crimson mingling with the yellow on the upper half. The buds are of the same colouring as the outer surface of the flowers.

M. h. Fantaisie.—This is not unlike M. Jacquaeu, but the flower has a greater brightness. It is about the same size, and very pretty in shape and colouring.

M. h. Messidor.—In this the flowers are conspicuously close together on the stem, not more than one-sixth of an inch separating them. The colouring is rich, the buds purplish crimson, and the back of the florets in the expanded flowers of a similar shade, which also suffuses much of the inner surface; but there is a ring of crimson spots

* Chemist and Druggist, July 8, 1899, page 63.

at the base, surrounded with deep orange. This gives great distinctness to the hybrid.

M. h. Flamboyant.—The name is suggestive, and it is, happily, not misleading. It is a brilliant flower, and deep orange both in the bud and expanded stage. One of the most delightful of the whole series.

M. h. George Davidson.—When the flower of this hybrid is wide open it is nearly 1½ inches across, and a clear and bright yellow, with an orange suffusion on the outer surface of the florets. The buds are orange, too, and the stem quite a bright green, which brings out the rich colouring of the flower. It is a most valuable hybrid.

M. h. Germania.—This is quite different. It is the most intense in colour of all, the flowers deep red.

M. h. Europa.—A beautiful hybrid. The flowers crowd together at the apex of the spike, and individually they measure about 1½ inches across, the predominant colour deep red, but this is relieved by the yellow anthers. Within the flower at the base is a little pool of pleasant colouring. At the base of each segment is a yellow patch, marked with two rectangular dabs of crimson, and the lower half of the segments shines with a bluish satiny sheen. The whole flower seems full of colour.

M. h. Gloire de Selle St. Cloud.—A handsome and striking flower. We measured the largest, and it was 2½ inches across, the colour a clear and beautiful soft yellow, with a blotch of crimson at the base. The buds and half-expanded flowers have more of an orange colouring. A garden flower of the greatest value and beauty.

M. h. Grenade (Lem.).—This is not so striking as some of the others, but it is interesting. The flowers are almost double, and this increase in the number of segments imparts a certain lumpiness which is not pretty. The colour is yellow, and bright red on the upper half of the florets, the exterior suffused with the same shade.

M. h. Globe d'Or.—We must make the same complaint about this still more double hybrid. The outer segments of the rosette-like flowers are quite half an inch across, but the inside ones are narrower. The tube is short, and the hybrid is evidently very free, but it is not one of the most effective for the garden.

M. h. Transcendant.—A bright flower, with its yellow colouring and warm reddish suffusion; the buds are dark red. It is a very handsome hybrid.

M. h. Tête Couronné.—A noble hybrid—magnificent is not too strong an expression. The flower is 2½ inches across, each floret over half an inch across, and the colouring is remarkable. The predominant shade may be described as old gold, which suffuses almost the whole flower, but just below the lower half this gives way to velvety crimson, then this old gold colouring again, which leads to a black spot at the entrance to the tube. The exterior is simply this lovely golden shade. A hybrid to make note of by all who are interested in Montbretias.

THE EDITOR'S TABLE.

WE invite our readers to send us anything of special beauty and interest for our table, as by this means many rare and interesting plants become more widely known. We hope, too, that a short cultural note will accompany the flower so as to make a notice of it more instructive to those who may wish to grow it. We welcome anything from the garden, whether fruit, tree, shrub, Orchid, or hardy flower, and they should be addressed to The Editor, 3, Southampton Street, Strand, London.

APPLE LADY SUDELEY.

I am sending for your table specimens of the early dessert Apple Lady Sudeley. For use in the middle of August I know of nothing better. It is of

excellent flavour and showy. Here in Norfolk it does remarkably well either on the Paradise or Crab stock. This variety deserves a more extended culture on account of its free-bearing qualities. One often wonders why so many of the old and, in some instances, almost worthless varieties are retained when for a very trifling cost far better results may be realised.—T. B. FIELD.

[An excellent early Apple, bright in appearance and very juicy.—En.]

FLOWERS FROM EXETER.

Messrs. R. Veitch and Sons send several interesting plants, one of which we hope to illustrate, namely, *Pentstemon Bridgesii*, a graceful plant, pink in colour, slender, the flowers lining the stems. The white *Gentiana asclepiadea alba* is interesting, the flowers pure white, but otherwise similar to those of the parent. *Erigeron ciliata* is a tall, strong growing kind, very pretty, white, with yellow centre, a charming little Daisy-like flower. *Rudbeckia hybrida superba*, a large, handsome flower, lilac-mauve in colour, a clear and charming shade; *Campanula cordifolia*, white; *Lepachys pulcherrima hybrida*, yellow; the blue-flowered *Nierembergia frutescens*; *Potentilla Fredreichsenii*, *Statice sinensis*, white; *Eryngium creticum*, deep blue, not unlike *E. planum*; and *Dianthus aridus*, a clear primrose yellow flower, very pretty with its soft colouring.

SOCIETIES.

LEITH HORTICULTURAL SOCIETY.

THE annual show of the above society was held at Hawkhill, Leith, on the 19th and 20th ult. The entries were hardly equal in number to those of last year, but, with the exception of cut flowers, were of as high quality. The stormy weather prevailing in advance of the show affected the cut flowers largely. In the horticultural department there were 1,015 entries, and in some classes the competition was very keen. The show was opened by Mr. Rufus Fleming, United States Consul, Edinburgh. In the gardeners' classes a number of the best gardeners in the district competed, and Mr. J. Alexander, Ashbrook; Mr. J. Fraser, Kilravock; Mr. J. C. Brown, Waterloo Place; Mr. P. McLauchlan, Grace-mountain; and Mr. Alex. Dyker, Seagrove House, were the most successful with pot plants. Cut flowers were well shown by Mr. W. Robertson, Pirrig House; Mr. Seath, Donihirstle; Mr. T. C. Rodgers, Mr. Dyker, Mr. Heert, Mr. Murrayfield, and others. In the classes for dark Grapes Mr. J. Fraser was first, Mr. J. Alexander taking a similar place with light Grapes. Mr. J. Alexander was first for a collection of vegetables, Mr. Dyker occupying the second place. The special section was a good one, Mr. P. McLauchlan and Mr. J. Alexander being respectively first and second for the best arranged table of plants, open to gardeners. Messrs. D. and W. Croll had the best twenty-four Rose blooms, Mr. Hugh Dickson the best twenty-four Cactus Dahlias, Mr. John Downie the best vases of Carnations, and Mr. J. Phillips was first for a table of miscellaneous plants. The amateurs showed remarkably well in the classes confined to themselves, and a few distinguished themselves in the open ones.

ABERDEEN ROYAL HORTICULTURAL SOCIETY.

THE annual three days' show of this society was held in the Duthie Park, Aberdeen, on the 18th, 19th, and 20th ult., the entries numbering upwards of 1,700, a slight decrease upon those of last year. There was no falling off of quality, and in several departments a number of the exhibits showed a considerable advance. The better weather conditions of the season rendered the cut flower section unusually fine. Pot plants were weaker in point of numbers, but the exhibits were in many cases of exceptional excellence. Fruit was much better than last year, and vegetables were a remarkably equal and meritorious class. A noticeable feature in the classes for professional gardeners was that for a table of Begonias, Palms, and Ferns arranged for effect, Begonias to be the leading feature. The first prize was won by Mr. H. Skene, Garthdee House, with a table tastefully arranged and remarkable for the high quality of the Begonias. Mr. A. Grigor, Fairfield, made a good second. The other leading exhibitors in the classes for pot plants were Mr. W. Scourie, Springhill; Mr. A. Duacan, Albyn Place; Mr. A. Grigor, Fairfield; and Mr. J. M. Simpson, Yarrill Bank. In the cut flower classes the prizes were widely distributed, and space will not permit of full detail. Mr. J. Anderson, Mealmarket Street, had the first prize for twenty-four Rose blooms, Mr. McLeenan, Fetteresso Castle, being first for twelve blooms. Florist's flowers were, as a rule, excellent, and the prizes well competed for. Sweet Peas were also well shown, Mr. Grigor taking the first prize. Bouquets and sprays were generally in exquisite taste, Mrs. Strachan, Mr. Grigor, and Mr. A. Douglas being the most successful in these classes. Mrs. Strachan had the best basket of flowers. In the fruit classes Mr. A. Howie, Drumtochty, had the first prize for a collection of fruit and for a collection of hardy fruit. Mr. Petrie, Crathes Castle, was the most successful competitor with Grapes. The vegetables were very fine, the prize for the collection being won by Mr. F. Kinnaird, Broomhill Farm, with a splendid lot. Mr. J. Yule, Faemewell, was first

for a basket of salads. The classes for nurserymen and florists drew out some splendid exhibits, notable being the wreaths, bouquets, and sprays, Messrs. Knowles and Sons carrying off the leading prizes. Mr. W. A. Dustan won with Cactus Dahlias, and Messrs. D. and W. Croll were awarded the first prizes for thirty-six Roses and for twenty-four Tea Roses. Amateurs showed capital in their respective classes. The non-competitive exhibits were, as usual at this show, a great attraction. Of special merit were the herbaceous plants, Roses, floral designs; and Sweet Peas from Messrs. Cocker and Son, Aberdeen; the Lilliums and other pot plants, cut flowers, and floral designs from Messrs. Ben Reid and Co., Limited; the fine display of Dahlias and other flowers of Messrs. Dobbie and Co. of Rothsay; Mr. W. A. Dustan's Roses; and Messrs. W. Smith and Sons' exhibit of flower designs, pot plants, and cut flowers. Mr. J. B. Rennet, the secretary, and his assistants had made excellent arrangements, and the takings at the gate amounted for the three days to £255, an increase of £37 over those of last year.

PRUDHOE JUBILEE EXHIBITION.

THE fiftieth annual show of the Prudhoe and West Wylam Floral and Horticultural Society was held on Saturday, the 20th ult. This being the Jubilee year of the society special interest has been paid to the prize list, the list of specials this year being as follows: The Tradesmen's Jubilee Challenge Cup, the Society's Silver Jubilee Cup, the Laing Silver Jubilee Cup, all offered in the open class. The entries in classes for greenhouse and stove plants were more numerous than in previous years. Mr. T. Suffield of Darlington made his first appearance at this show, and in this class he was very successful; the handsome Silver Challenge Cup, Gold Medal, and £6 in cash were taken by him. Other principal prize-takers in this class were: J. Jordon, Shotley Bridge; W. Anderson, Earnley Grange; J. Ellison and J. Harris of Cramlington; J. Campbell, West Wylam; J. Dixon, Addison, &c.

OPEN CLASS.—CUT BLOOMS.

The Society's Silver Jubilee Cup for twelve Dahlias, eight dissimilar: First, R. Teasdale, Prudhoe; second, J. Arkless, Gateshead; third, T. Battensby, Blaydon.

Six show Dahlias: First, J. Arkless, Gateshead; second, T. Battensby, Blaydon; third, Messrs. Harkness and Sons, Bedale, Yorks.

Six tipped or fancy Dahlias: First, J. Arkless, Gateshead; second, Messrs. Harkness and Sons, Bedale, Yorks; third, T. Battensby, Blaydon.

Twelve Cactus Dahlias: First, A. Urwin, Corbridge; second, Messrs. Harkness and Sons, Bedale, Yorks; third, G. Welsh.

Twelve Pompon Dahlias: First, A. Urwin, Corbridge; second, J. Arkless; third, J. Marshall.

Six bunches of Poppies: First, A. Urwin, Corbridge; second, Miss Burns, Styford.

Twelve single Dahlias: First, A. Urwin, Corbridge; second, J. Arkless, Gateshead; third, J. Gardner, Whickham.

The Laing Silver Jubilee Cup for twenty-four Roses: First, Messrs. Harkness and Sons, Bedale, Yorks; second, J. Gardner, Whickham; third, E. Taylor, Whickham.

Twelve Roses, eight dissimilar: First, Messrs. Harkness and Sons, Bedale, Yorks; second, J. Arkless, Gateshead; third, A. Urwin, Corbridge.

Six Tea Roses: First, Messrs. Harkness and Sons, Bedale, Yorks; second, E. Taylor, Whickham; third, G. Welsh.

TABLE DECORATIONS.

Basket of cut flowers: First, T. Battensby, Blaydon; second, W. Telford, West Wylam.

Eperguez: First, T. Battensby.

Hand bouquet: First, T. Battensby; second, W. Telford.

Bridal bouquet: First, T. Battensby, Blaydon; second, W. Telford, West Wylam.

Lady's spray: First, W. Telford, West Wylam; second, T. Battensby, Blaydon.

Three buttonholes: First, W. Telford, West Wylam; second, T. Battensby, Blaydon.

Herbaceous flowers: First, Messrs. Harkness and Sons, Bedale, Yorks; second, Thomas Battensby, Blaydon.

Twelve spikes Gladioli: First, A. Urwin, Corbridge; second, Messrs. Harkness and Sons, Bedale, Yorks.

Six vases of Sweet Peas: First, W. Anderson; second, Miss Burns, Styford.

A special feature of the show was a beautiful stand of Orchids sent by N. C. Cookson, Esq., of Oakwood Hall, Wylam.

Messrs. W. Fell and Co., Hexham, had also a stand of Sweet Peas, herbaceous plants, &c. Prudhoe show has a reputation for vegetables second to none in the kingdom, and exhibits in this class were enormous.

READING GARDENERS' ASSOCIATION.

VISIT TO TWO FAMOUS GARDENS.

THE members of the above society have recently held two most enjoyable outings. The first was to Tynley Hall, Winchfield, by kind permission of Mr. and Mrs. Lionel Phillips. The party, numbering forty, journeyed from Reading by brakes, and a most delightful drive was experienced. On arrival the excursionists were received by Mr. Foster, the head gardener, and at once proceeded to the vegetable quarters, where good crops were the rule. Having been joined by the president (Mr. Leonard Sutton), the party made a move to the park, where luncheon was provided. After lunch the members inspected the glass houses, twenty in all, the flower gardens, the pleasure grounds, Lily ponds, and the Italian garden. This was a most delightful spot, the beds filled with standard Heliotropes, Begonias, Ivy-leaved Geraniums, and Fuchsias provided a sight not easily forgotten. The fruit trees in pots also claimed special attention; these had been grown under glass and then placed out of doors under netting to colour. The trees were carrying some excellent specimens. A unique room in the establishment was the seed-room. This contained a handsome suite

of drawers, each having a number. In the centre of the set was a large framed slate having numbers corresponding with those on the drawers, and a vacant space was left after each number to give the sort of seed contained in the drawers. The buildings connected with the garden have been erected on the most approved style and regardless of expense. Needless to say the vote of thanks proposed by the president to Mr. and Mrs. Phillips for their kindness was unanimously carried.

The second was to Wokefield Park, the residence of Mr. and Mrs. Alfred Palmer, and this had been looked forward to with the greatest of interest not only from a horticultural point of view, but from the fact that Mr. J. Woolford, so well known in horticultural circles in the district, and at one time honorary secretary of the association, is head gardener here. Between seventy and eighty members took part in the outing, and on reaching Wokefield were met by Mr. Alfred Palmer and Mr. Woolford, who conducted the party to the terrace garden, where the beds were gay with Cannas, Abutilons, Begonias, Fuchsias, and a splendid variety of Heliotrope, which, although growing in a rampant condition, was flowering profusely. The greenhouses were then visited. Special mention must be made of one containing zonal Pelargoniums, Lilliums, &c., which in combination gave a wonderful bright effect. The corridor also calls for comment on account of the beautiful appearance of the various creepers, such as Tacsonias, Alsmandas, Bougainvilleas, &c. Streptocarpuses were doing well, the whites being of large size and superb form. The Tomato house contained some excellent crops of Sutton's Princess of Wales and Up-to-Date. Then came the vineries, and particular attention was created in these, as Mr. Woolford is well known amongst the members as a great advocate in growing Grapes in small borders. The whole proved an object-lesson as to his theory, for the vines were in the healthiest condition, the bunches of fruit were of large size, and the berries beautifully coloured. In one border 3 feet wide one could see rods carrying eight exhibition bunches to the rod. The varieties chiefly grown were Foster's Seedling, Madresfield Court, and Lady Downe's. Peaches were also excellent. Space will not permit to give in detail the various crops out of doors, but there is every prospect that the fruit crops this year will be exceptionally good. Great credit is due to Mr. Woolford and to his able foreman (Mr. Blake) in the transforming of this garden in such a short space of time. Mr. and Mrs. Palmer not only added to the enjoyment of the outing by their presence, but they kindly provided tea, which was much appreciated. The feelings of the members were suitably voiced by Mr. Arthur W. Sutton in proposing a most hearty vote of thanks to Mr. and Mrs. Palmer for their kindness.

DUMFRIESHIRE AND GALLOWAY.

BUT for the unsatisfactory attendance of the public the two days' show of the Dumfriesshire and Galloway Horticultural Society, which was opened by the Countess of Cassilis in Cresswell Park, Dumfries, on the 26th ult., would have been most successful. The show itself was the most extensive ever held in Dumfries, and the competition in many of the classes was very keen. The tables of plants, of which there were three, caused much interest, and the prizes were awarded as follows: First (the Dumfries Burgh Cup, with £5), Messrs. James Service and Sons, Maxwelltown, Dumfries; second, Mr. J. M. Stewart, Mollance; third, Mr. J. Houston, Crichton Royal Institution. The tables were very tasteful, and there was little to choose between the first and second. The contest for the first prize for a circular group lay between Mr. W. Muir (Summerville) and Mr. C. McIver (Lincluden), the prize going to the former, though, here again, the contest was a close one. Seven tables were arranged for dinner table decorations, the first prize going to Miss Pinfold, Netherwood Bank, for a tasteful arrangement of Montbretias with Asparagus. Miss L. Rutherford was second with a pretty table, Miss Service being third. Roses were good considering the character of the weather recently. Messrs. Palmer and Son, Limited, Annan, being first for twenty-four and Mr. K. Mackenzie first for eighteen Teas. Herbaceous flowers were well shown, Messrs. T. Kennedy and Co., Dumfries, being first and Messrs. Middleton and Son second and third for twenty-four bunches. Sweet Peas were excellent throughout the show, though hardly so fine in colour as last year. Florists' work in the shape of baskets, bouquets, &c., was generally superior to that shown last year, the leading prizes going to Mr. J. Kerr (Dumfries), Mr. W. Evers (Dumfries), Mr. J. Henderson (Elmbank), W. Middleton and Son, and Miss L. Rutherford. In the gardeners' classes the pot plants as a whole formed the weakest feature of the show, but Mr. J. M. Stewart, Mollance, who carried off most of the first prizes, had some good specimens, and Mr. McIver fine Violets.

In cut flowers the competition was unusually great, and many stands were of high quality. Some amateurs competed successfully against gardeners in certain classes, the most successful gardeners being Mr. K. Mackenzie, Mr. W. Ross, Mr. J. M. Stewart, Mr. J. Duff, Mr. R. A. Grigor, Mr. R. Young, and Mr. J. Henderson. The fruit classes were well contested, Grapes being well shown, though some bunches were not sufficiently ripe.

Mr. J. M. Stewart was first for the best collection of fruit, Mr. J. Duff making a good second. Mr. J. Henderson won with Black Hamburg Grapes; Mr. W. Thomson, Cally, with black Grapes, Hamburg excluded; Mr. J. Duff, Threave, with Muscats; Mr. J. M. Stewart with white Grapes, Muscat excluded; Mr. R. A. Grigor for Grapes with best bloom; and Mr. J. M. Stewart for those with best flavour. Mr. W. Currie, Drumchlyer, had the best Peaches, Mr. C. McIver the best Melons, and Mr. J. M. Stewart led with Plums, dessert Apples, cooking Apples, and dessert Pears.

Vegetables were, as a rule, exceedingly good, and the competition in many classes large.

Mention must be made of the non-competitive exhibits. A number of fine Cockscorns were staged by Mr. W. McGuffog, gardener to the Countess of Selkirk, Balmac.

Messrs. Dobbie and Co., Rothessay, had a large stand of cut flowers of high quality, and staged in a most attractive manner. Messrs. James Service and Sons, Messrs. T. Kennedy and Co., Mr. James Kennedy, Messrs. Fotheringham and King, Dumfries, and Messrs. Little and Ballantyne, Carlisle, had fine stands of cut flowers and plants. Messrs. T. Smith and Sons, Stranraer, and Messrs. Palmer and Son, Limited, Annan, showed Roses.

REIGATE, REDHILL, AND DISTRICT GARDENERS' SOCIETY.

THIS society held its annual outing on the 10th ult., the place selected being Messrs. Sutton and Sons, Reading. About eighty members availed themselves of the opportunity of looking over the world-famous seed establishment. After arriving at Reading, about 2 p.m., they were met by Messrs. Cox and Dean on behalf of Messrs. Sutton, who, unfortunately, were unable to be present that afternoon. The party was conducted to the trial-grounds and glass departments, after which the whole party was entertained to tea by the firm.

ABERDARE FLOWER SHOW.

ON the 25th ult. a really good show from every point of view, and exceeding in importance anything that has previously been held by the society, took place in the Public Park, Aberdare. The groups of miscellaneous plants, ornamental foliage plants, dinner-table plants, exotic Ferns, Roses, Dahlias, Sweet Peas, fruits (especially those of Grapes), and, not the least, vegetables of all kinds were particularly of a high order of merit. Situated as this thriving town is, in the very midst of one of the most extensive and important coal districts, a show of such all-round excellence as this reflects great credit upon its promoters, supporters, and especially upon the persevering secretary, Mr. A. E. Jones.

PLANTS.

Ornamental foliage plants were splendidly shown. In an open class for four specimens Messrs. Cypher and Sons of Cheltenham took a decided lead; Mr. Garrish, gardener to Sir W. J. Lewis, The Hardy, Aberdare, was second, and Mr. Carpenter, gardener to W. J. Buckley, Esq., Penyfar, Llanelly, was placed third. In another class Mr. Carpenter was placed first with a good Kentia belmoreana, Latania borbonica, Cycas revoluta, and Croton angustifolium, the second place being taken by Mr. Reed, gardener to F. M. Mander, Esq., Aberdare.

Ferns were beautifully grown, and for six exotic varieties Mr. Lawrence, gardener to W. T. Rees, Esq., Maesfynffon, secured first honours, the second place being taken by Mr. Edwards, gardener to R. J. Rhys, Esq., Plasnewydd, Aberdare. For six dinner-table plants Mr. Collier, gardener to Dr. J. Tatham Thompson, The Elms, Cardiff, who had highly coloured Crotons and Dracaenas, with Arslia, Pandanus, &c., was first, Mr. Carpenter being second.

GROUPS.

These were undoubtedly the most beautiful feature of the show, and attracted much notice. A class for one in a space of 80 square feet attracted four exhibitors, who arranged their plants with great taste. Especially good, as might be expected, was the leading one from Messrs. Cypher and Sons, who employed very choice, well-cultivated plants, Mr. Carpenter taking the second place. A group in 40 square feet, open only to private gardeners and amateurs, was also a good class, and here Mr. Carpenter was placed first, followed by Mr. Edwards.

Cut flowers, Roses especially when the season of the year is taken into account, were remarkably good, being highly coloured and fresh, but, of course, not so large as they are usually seen earlier in the year. In a class for twelve varieties, three blooms of each, composed of six Hybrid Perpetuals and six Hybrid Teas, Mr. Stephen Treseder, The Nurseries, Cardiff, was first. Mr. Crossling, The Nurseries, Penarth, was a good second, and staged similar varieties.

With twelve Teas or Noisettes, three blooms of each, Mr. Stephen Treseder was again placed first.

Sweet Peas were well and extensively staged, and in the chief class for twelve vases there were six entries, the best coming from J. M. Herbert, Esq., Aberdare, who had the Hon. Mrs. Kenyon, Scarlet Gem, Mr. W. Wright, Dorothy Eckford, Miss Willmott, Black Knight, Chas. Spencer, Lord Rosebery, Lady G. Hamilton, Duke of Westminster, Prima Donna, and Coccinea in splendid condition. Mr. Garrish was placed second, and Mr. Poston third.

Dahlias were largely shown, and the leading exhibitors had perfect blooms. In a class for twelve blooms Mr. William Treseder, Cardiff, staged six show varieties and six Cactus. Mr. L. Williams, Gwan-n-Cwm, Dinas Powis, was placed second, and Mr. Eran Havard, Llandaff, third.

For twelve Cactus Dahlias, for which Mr. W. Treseder offered special prizes, there was keen competition, Mr. Malpass, gardener to Dr. Lynn Thomas, Green Lawn, Cardiff, taking leading honours with beautiful blooms.

Fruit was well shown and in great quantity. A collection of six varieties brought, however, only two exhibitors. Mr. Thomas, Aberant Gardens, Aberdare, was placed first with good Black Hamburg and Foster's Seedling Grapes, a seedling Melon, Peaches, Pine-apple Nectarines, &c.; Mr. Collier was placed second. In a class for three bunches of Black Hamburg Grapes, Mr. Davis, gardener to E. M. Hann, Esq., Oaklands, Abernham, was first with finely finished fruits; second, Mr. C. Curtis, gardener to G. Cartwright, Esq. Mr. Thomas was first for Muscat of Alexandria, and was followed by Mr. Lawrence, who was first for any other white variety with well-finished Foster's Seedling. Mr. Thomas coming second with Golden Champion. For any other black, except Black Hamburg, Mr. Thomas was again first with good bunches of Madresfield Court, Mr. Curtis being a good second with the same kind.

Non-competitive exhibits were leading features. Of these Mr. William Treseder staged a fine collection of herbaceous flowers, Dahlias (both Cactus, show, and Pompon varieties), bouquets, wreaths, crosses, baskets of flowers, stove and greenhouse plants, &c., for which he was awarded a silver medal.

Mr. F. W. Evans, Llanishen, was awarded a bronze medal for a splendid collection of herbaceous flowers. Mr. Stephen Treseder staged an excellent collection of Roses, plants, and cut shrubs; Messrs. Ellis and Sons, Cardiff, a beautiful miscellaneous collection of plants and Ferns; Mr. Baggeseo had a pretty exhibit of greenhouse plants, wreaths, crosses &c.; and Mr. Farmer, gardener to the Marquis of Bute Cardiff Castle, a fine group of stove plants.

TROWBRIDGE HORTICULTURAL SOCIETY.

A SOCIETY which can hold an annual exhibition for the uninterrupted space of fifty-five years has some elements of vitality and permanence about it. The fifty-fifth exhibition of the above society was held at Trowbridge on the 17th ult. The society is fortunate in being the owners of a field close to the railway station, in which the show is held, and there is a reserve fund of several hundreds of pounds. The day was, unfortunately, very wet, but with such a nest egg and a good subscription list the loss will scarcely be felt. The president, Mr. A. P. Slancom, J.P., said at the luncheon to the judges that he had attended fifty-three out of the fifty-five shows which had been held, while Mr. George Snailum, the hon. secretary, stated that he had attended all but one.

The Trowbridge show is remarkable for one fact, that the majority of the exhibits are grown locally. There were three collections of nine stove and greenhouse plants in flower, and good specimens, too, all grown in the neighbourhood. The specimen Fuchsias also, the like of which are not seen out of Trowbridge, are all grown in the immediate district. Some of the fruit comes from a little further afield, and some of the cut flowers, but the main portion of them—and cut flowers at Trowbridge are a very fine feature—are locally grown, while vegetables are always very good, from cottagers especially, there being many, all of merit, and cottage gardens.

Fuchsias, which head the schedule of prizes, are tall cone-shaped plants caused by the branches being tied in quite close, but they are generally grandly grown and bloomed, averaging from 7 feet to 8 feet in height. It would be difficult to find such plants outside the district; the best six specimens were from Mr. E. T. D. Foxcroft, Hinton, Charterhouse (Mr. Chislett, gardener), the varieties mainly locally raised; Mr. H. Pocock was second, and Mr. G. Tucker third, both local nurserymen. With four specimens Mr. Chislett was again first, Mr. Tucker second, and Mr. H. Pocock third. If some of these plants could be produced at one of the meetings of the Royal Horticultural Society they would create a sensation. Excellent Fuchsias were also shown by working men.

The best nine specimens of stove and greenhouse plants were staged by Mr. George Tucker, who had very good examples of Bougainvilleas Cypheri and Glabra, Ixora Fraseri, Dipladenia brearleyana (very good), Allamanda nobilis, &c. Mr. W. J. Mann, Trowbridge (Mr. H. Matthews, gardener), was second. Mr. H. Matthews had much the best six specimens, among them a fine piece of Erica; Mr. E. H. Atcherley was second. There was a class for three specimens also, in which Mr. G. Tucker was first. Specimen foliage and flowering plants were also shown. Rarely are better specimen zonal Pelargoniums shown elsewhere than at Trowbridge. Six from Mr. H. Pocock were very fine. Begonias, both single and double, were remarkably good.

There were two classes for groups. In both cases Messrs. G. Cray and Son, Frome, were placed first with finished arrangements. Messrs. J. Stokes and Son, Trowbridge, had the best twelve Ferns, showing very good specimens. Mr. Strungnell, Rood Ashton Gardens, had the best of specimen foliaged plants. Good Caladiums and Colons were also shown. Plants were also shown in several classes by working men. Cut flowers are numerous and finely shown at Trowbridge. Asters were shown in three classes, all very fine indeed; the quilled and comet types were very fine, and they came as a surprise, as they were so poorly shown at Tannton a few days previously. Roses were also an excellent feature. Mr. J. Mattock, Oxford, had the best twelve trebles, showing capital blooms. Messrs. J. Jefferies and Son, Cirencester, were first with thirty-six blooms, and also with twenty-four; and again with twelve and twenty-four Tea-scented, showing in each case remarkably good blooms for the time of year. Mr. J. Mattock was first with eighteen bunches of garden Roses, making a very fine display. Stove and greenhouse cut flowers were admirably shown, and hardy flowers in collections of twenty-four bunches were a good feature, as also were hardy annuals in bunches. Dahlias of all types were in excellent character, so were Gladioli, Sweet Peas, and zonal Pelargoniums.

Floral decoration consisted of artistic epergnes shown in three classes; bouquets and prettily arranged dinner-table, Mrs. Colston Hale taking the first prize, and Messrs. E. Cole and Son, Bath, the second.

Fruit was in good character. Mr. Strungnell was first with a collection of ten dishes, having Black Hamburg and Foster's Seedling Grapes, Royal George Peaches, Stanwick Elrange Nectarines, Plums, Apples, Melons, &c. Mr. W. Oliver, The Gardens, Littleton, Panell, was second. With six dishes, Mr. J. W. Fleming, Romsey (gardener, Mr. W. Mitchell), was first, and Mr. Strungnell second. Mr. Mitchell had the best two bunches of Black Grapes, having fine Gros Maroc, also two bunches of white, staging Foster's Seedling, and two bunches of Black Muscats, showing Madresfield Court. Mr. A. Bailey, Bath (gardener, Mr. A. Taylor), was first with two bunches of White Muscats, having Muscat of Alexandria. Melons were shown in two classes. Greengate Plums were of good character. There were also excellent Apricots, Cherries, Peaches, and Nectarines. The two best dessert Apples were Beauty of Bath and Gladstone; Beauty of Bath and Lady Sudeley took the second prize. The two best culinary Apples were Peasgood's Nonsuch and Hants Seedling, the latter in the way of Blenheim Orange; the second prize went to Peasgood and The Queen.

Some good collections of vegetables were shown in competition for the special prizes offered by Messrs. Sutton and Sons and Toogood and Sons, and also in several other classes. The cottagers' productions were specially interesting.

DEATH OF THE DEAN OF ROCHESTER.

THE death of the Very Rev. Samuel Reynolds Hole, Dean of Rochester, although, owing to his late precarious state of health and advanced age, not altogether unexpected, yet comes with the painful shock of sincere grief to the many who knew and loved him, and to the many more who knew his name and fame, not only as a distinguished ecclesiastic, but as a keen and true-hearted gardener.

THE GARDEN owes him a heavy debt of gratitude from its very earliest days, for it was largely owing to his sympathy, encouragement, and practical help that its inception became a fact, and that its founder, Mr. William Robinson, put it forth with courageous confidence and the sure conviction of the need of that horticultural teaching that he, almost alone, could then put into it—a confidence that has been so fully justified by the undoubted fact that the pages of THE GARDEN, supplemented by Mr. Robinson's books, have been the means of bringing all England into close touch with, and accurate knowledge of, all that is best in hardy gardening.

It was a good half century ago that the late Dean, then a young clergyman, curate, and afterwards vicar of the parish of Cauntton in Nottinghamshire, in which his father was the squire of Cauntton Manor, was first attracted by the beauty of flowers, and especially of Roses. Quickly his love of Roses increased, until he became the acknowledged chief among their amateur growers. The National Rose Society, of which he has been for many years president, owes much to his constant support and leadership. His addresses at the annual meetings were always eagerly looked forward to, for the celebrated preacher was also a ready speaker, and his speeches, manly, elevating, inspiring, and humanly touching, went straight to the hearts of his hearers, there evoking all that was most in sympathy with his own lofty ideals and with his humbly grateful acknowledgment of the happiness that awaits the good gardener.

Such utterances also found expression in his books, and such a one from "The Six of Spades" may well be quoted here:

"For it is the wisdom and goodness of gardening which makes it such a deep and enduring happiness. It is thankfulness, reverence and love, which make our gardens dear to us from childhood to old age, for

'Love is like the ocean, ever fresh and strong
Which the world surrounding, keeps it green and young.'

"Yes, it is because we cannot really love the beautiful flowers without loving Him 'Whose breath perfumes them, and Whose pencil paints;'

it is because there lies deep in the heart of man a yearning to recover Paradise, and to rest once more upon the Mount of God; it is because the wisest of men, such as were Bacon and Newton, were happiest in their gardens, and spake of gardening, from a glad experience, as 'the purest of human pleasures;'; it is because men, such as was Wordsworth, have bequeathed to us the certain confidence that 'Nature never did betray the heart that loved her;'; it is for these reasons, and many another as true and

contact with him without being the better for the knowing of a splendid Englishman.

His dear life-partner, the widow who survives him, herself one of the best of gardeners, will have the sympathy of all the readers of THE GARDEN in this sad week which lays the Dean to rest in the churchyard of his old Nottinghamshire home, the scene of the full thirty-years of his earlier ministry.

"A BOOK ABOUT ROSES," published as long ago as 1869, the "Book About the Garden" (1892), "Our Gardens" (1899), "A Little Tour in Ireland," "Memories," "More Memories," "Now and Then," and the delightful "Six of Spades" are the most important of his contributions to horticultural literature.

He was, as already mentioned, one of the founders of the National Rose Society, and the Rev. H. D'ombain, whose years almost number those of the Dean's, told in THE GARDEN of July 6, 1901, the story of the beginning of this beneficent association:

When in the autumn of 1876 it occurred to me that we ought to have a National Rose Society, I looked at the question from all points of view; I saw at once that it was a question of some magnitude, and that there were many difficulties surrounding it, and I asked myself could these difficulties be surmounted, and should we be able to establish a society worthy of the Queen of flowers? The conversations which I had with many rosarians very much encouraged me; some took up the question enthusiastically and were ready to promise substantial help, and so I ventured to summon a meeting. The next question was where should that meeting be held, and I was able to answer this satisfactorily, for the year before I had been able to found the Horticultural Club, and our first domicile was in the Adelphi Terrace. The rooms were small and low pitched, but still, as it would save the expense of hiring, I was enabled as secretary to invite rosarians to attend there and see what could be done. Well, it was an anxious time, and the day I had named for the meeting (December 6) was about as bad a one as could be imagined. The rain came down in torrents, and as we looked out on the leaden sky and the dull grey river I almost felt that I was sorry that I had

commenced the undertaking; but as one well known rosarian after another trooped into the room my spirits revived, and when I saw the portly form of my excellent friend the Dean of Rochester, then Canon Hole, enter the room I felt that if he would join in the undertaking the thing was half done. He very kindly took the chair. I was asked to act as secretary, which I agreed to do on condition that I had nothing to do with the finance. A subscription list was at once started, a few rules were drawn up, those rosarians present were formed into

gracious, that the pleasures of gardening are so great and lasting"

Those who had the happiness of the late Dean's friendship knew well how staunch and trusty a friend he was, how tenderly kind, how sympathetic, how encouraging. His very presence, with its radiant dignity; his 6 feet 4 inches of stalwart manhood; the kindly smile and gracious speech, were as a burst of sunlight in any assemblage; none could come into

THE LATE DEAN OF ROCHESTER.

THE LATE DEAN AMONGST THE ROSES AT CAUNTON.

a committee, and we committed ourselves to an undertaking of which none of us knew the real bearing, and so commenced the National Rose Society.

And whenever he was enabled to attend the meetings and shows of the society how sincere the welcome extended to this prince of rosarians, and well we remember his delight when at the Rose Society's exhibition in 1901 he had the honour of receiving Queen Alexandra.

The story of his devotion to the culture of Roses has been told many times in the pages of *THE GARDEN*, and a short series of articles, the beginning of which we publish to-day, were written not long ago, and are among the last of this great rosarian's contributions to the literature of the flower he loved so well.

The Dean died at twenty minutes past three on Saturday morning last, in the presence of Mrs. Hole. The first part of the funeral was held in the cathedral on Tuesday afternoon, and on Thursday in the churchyard of Caunton the solemn rites were concluded amidst a large gathering of personal friends and working men, to whom his messages of helpful counsel were not unheeded. Many a life was cheered by this large-hearted Churchman—the friend of rich and poor.

The following extracts are from the *Times* of Monday last:

The Very Rev. Samuel Reynolds Hole, D.D., was the son of the late Mr. Samuel Hole of Caunton Manor, Newark, where his ancestors had held property since the days of Queen Elizabeth, and was born in December, 1819. He was educated at Newark Grammar School, and as a schoolboy could remember Mr. Gladstone's candidature for his first seat in Parliament, the two men being friends in later life in spite of Mr. Hole's utter disagreement with Gladstonian politics. From the Grammar School he proceeded to Brasenose College, Oxford, where he graduated in 1841. He at once submitted himself for deacon's orders to the Bishop of Lincoln (Dr. Kaye), then the diocesan of Nottinghamshire, and undertook the curacy of his ancestral parish of Caunton, where he was to labour for the long space

of forty-three years. He became vicar of the parish in 1850, and was a parish priest of the best sort, knowing the circumstances and needs of his people, especially the working men. His position as squire of Caunton, to which he succeeded in 1868 on his father's death, gave him opportunity of indulging his taste for field sports, and he could hunt and shoot with the best, but this never involved any neglect of his work as the parson; he had daily services, and he paid his daily visit to the parish school. It was also at Caunton that he established himself as an authority, perhaps the authority, on Rose culture.

But his delight in the pleasures of a country life were only one side of a delightful character. In 1858 he published, in conjunction with his friend John Leech, "A Little Tour in Ireland," and he had been at one time a not infrequent contributor to *Punch*. The volumes of "Memories" (1892) and "More Memories" (1894) are full of good stories, new and old, which show the Dean's well-known skill as a raconteur. And he carried these gits to the highest uses. . . . In his native diocese he held many offices. He became rural dean of Southwell in 1873, prebendary of North Kelsey in Lincoln Cathedral on the nomination of Bishop Christopher Wordsworth in 1875, and he was Proctor in Convocation, first for Lincoln diocese in 1883, and, on the division of the diocese, for the clergy of the archdeaconry of Southwell in 1884.

He resigned all these on his nomination by Lord Salisbury to the Deanery of Rochester, in succession to Dr. Scott, in 1887. At the time of Dean Scott's death Mr. Hole was staying at Rochester with Canon Jelf, and he has recorded in one of his books that an inward conviction came to him that he would be Dean of Rochester. He was as faithful in his care of the cathedral as he had been of his country parish, and considerable improvements were effected under his direction. For instance, he made the Sunday evening services in the nave a permanent institution, and often preached at them. In 1893, at the age of seventy-six, he undertook a lecturing tour in the United States, with the intention of devoting the proceeds to the restoration of the cathedral tower. He brought back a great many stories, but only enough in the way of proceeds to carry out some minor improvements. In the following year he received from some

Masonic friends whom he met in America a present of a processional cross for the cathedral, and in 1899, to his great gratification—for he had been a Freemason for over half a century—certain members of the Craft provided stained glass windows for the clerestory in memory of the Dean's appointment as Grand Chaplain. The Dean was very popular in Rochester, and he took a great interest in charitable and educational work in the city. In December, 1901, he was presented with a gold watch by the clergy of the cathedral and district in commemoration of his eighty-second birthday, and in the same month he received at the Deanery the freedom of the Tin Plate Workers' Company of London, of which he was honorary chaplain. He became chaplain to the Archbishop of Canterbury (Dr. Benson) in 1883, and was granted the Lambeth degree of D.D. in 1887.

We may well recall his words in *THE GARDEN* of July 14, 1900, page 23, when in response to our wishes he spoke of his own life and love of flowers.

I have passed eighty milestones on the journey of my life, being now, as the old gardener described himself, "an octogenerianum." I have travelled on high mountains and in lowly vales. I have dined in a royal palace with the best of queens that ever sat upon a throne, and I have taken tea (they said it was tea) with paupers in cottages of mud. I have had famous men for my friends, statesmen, judges, generals, admirals, authors, artists (there is no art to compare with his who beautifies the land on which he lives), and I have tried to be a friend to the infamous. With peers and peasants, millionaires and mechanics, with all sorts and conditions of men I have lived my life.

I have loved a garden always. That love is innate in all the children of "the grand old gardener and his wife." It is suppressed, it is annihilated by the cares and more exciting pleasures of this life—but it is an instinct born within us—to seek the Violet on the bank, the Primrose in the wood, and the Cowslip in the mead. And I affirm that this love of the beautiful, maintained and developed in horticulture, is the surest, purest, healthiest, happiest of all our recreations; and because it is so, it is, or it should be, in some form or other a common enjoyment; it is meant, like pure light, pure air, pure water, for us all. And like Love itself, like Charity, it never fails. Age cannot wither it nor custom stale its infinite variety.

The time comes to the horseman when he deviates from the stiff timber and the flowing brook and makes for the gate and lane; when the erratic snipe, the humble coney, the partridge, and the pheasant, driven by the wind, elude the gunner's aim, when the pury batsman is run out breathless, and enquiries are made as to the price of butter to the fieldsman who has missed the catch; but the joy of flowers, like Tennyson's brook, goes on for ever; from the baby who tries to pull the flowers from nurse's cap to the old man with snow on his head but with summer always in his heart.

Every gardener will join me in a general thanksgiving for the happiness which it has brought into our lives, and for the special mercies which have been vouchsafed to us of the present generation.

Not only is the love of trees and flowers expanding around us, but there is the manifestation of a desire for their more graceful arrangement by a return to the English or natural system. If this should be denounced as a retrograde movement I should maintain that it was the return of a belated traveller, and should not hesitate to affirm that our gardens sixty years ago were, speaking generally, more deserving of that title than now.

I do not deprecate the judicious introduction of half-hardy plants, the combination of flowers with balustrades and copings and statues. These are stately and appropriate surroundings of the palace and the castle, but they do not constitute a garden. My idea of a garden is a place in which a man collects the most beautiful trees, shrubs, and flowers which he can procure, which are suitable for the site and for the soil, and so disposes them that they give you the idea of being at home and happy; and this garden should be, so far as he can make it, secluded and suggestive, not only of admiration, but of meditation, rest, and peace.

Only one more consideration, but it is the most important and interesting to those who desire, as we all should desire, the perfect happiness of the greatest number. I mean the noble efforts which are being made by our landed proprietors and county councillors to induce the working classes to cultivate cottage gardens and allotments. I would only say that if you could persuade a working man to try horticulture, and prove to him that he can supply himself with things pleasant to the eye and good for food, and show his wife how the latter should be cooked, you will do more to keep him from the public-house than by any other process hitherto applied.

I am thankful for the sympathy which in our brotherhood never fails, and in grateful acknow-

ledgment I wish to everyone that which has been given to me—the long and happy life of a gardener.

“He wanders away and away,
With Nature the dear old nurse,
And she sings to him night and day
The hymns of the universe.
And whenever his way seems long
And his heart begins to fail,
She sings a yet more wonderful song
Or tells a more wonderful tale.

S. REYNOLDS HOLE.

Several illustrations are given of the Dean's Cauntun home, and in that portraying a corner of his Rose garden we see the striking figure that, alas! has gone from us full of years and honour. The Dean was one of the original sixty Victoria Medallists of Honour, and a keen supporter of the Gardeners' Royal Benevolent Institution. He presided on one occasion at the annual dinner, and years before his friend, Charles Dickens, occupied a similar position.

THE death of the Dean of Rochester will call forth many letters of regret. If you will allow me space to offer a small tribute to the memory of this great rosarian I shall be glad. To read his book is a keen pleasure to the enthusiastic Rose lover, and it is brimming

over with pleasant wit and wise remarks. I remember meeting Dr. Hole at Chiswick when the Rose conference was held there in 1887. My father had long enjoyed the honour of his acquaintance, and he introduced me to the Dean. After a few enquiring remarks, he went on to speak of our employment, and he said, with that merry twinkle of the eye, he supposed if we ever embarked in commercial life the style of the firm would not be as was usual in days of yore, namely, Smith and Son, but instead Smith and Father, which was the modern manner of description.

Every rosarian must feel indebted to Dean Hole for the encouragement which a perusal of his book has afforded, and his loss will be keenly felt by both small and large growers of Roses.

I am sure we are also deeply grateful that a man with his rich knowledge could find time to give to the study of the Queen of Flowers. What could be more caustic than his remarks upon “soils.” After describing the position of the Rose garden, he goes on to say that Roses may be grown to perfection in the ordinary garden soil, if that soil is *cultivated*. Then he says: “I don't mean occasionally

HARDY FLOWERS AT CAUNTUN MANOR.

scratched with a rake and tickled with a hoe or sprinkled with manure from a pepper-box."

No: Dean Hole knew from personal experience the art of cultivating the soil, and in his writings he was ever anxious to impart that knowledge to his readers.

The Rose world will grieve for his loss, and we may possibly never look upon his like again.

I am glad that Messrs. A. Dickson and Sons have named a really grand Rose after him. May it long be cultivated to keep his memory green: I have heard my father speak of the time when someone named a very inferior Rose after Dean Hole, and his old gardener was so indignant that he said, "What, name such a thin papery thing after *my* master!" I do not imagine anyone will call the novelty of this year "thin" or "papery," albeit, it may prove to be too much like Maman Cochet: but we shall see.

W. EASLEA.

MANY a one will be ready to say that by the death of Dean Hole a notable light has gone out from amongst us. It is not in our province here to speak of his work as an ecclesiastic. Others have told of it in fitting place and

Hole, throughout his long life as parson, squire, and high dignitary of the Church had always a kindly word for gentle and simple—a jest without a sting wherewith to soothe the ruffled spirit of a disappointed exhibitor, a ready wit to raise a laugh and avert the annoyance which might be threatening.

Connected with THE GARDEN from its inception, his well-known features appear in the second volume, published more than thirty years ago, as a distinguished horticulturist to whom it was most natural and appropriate to do honour. Articles signed by his familiar initials were heartily welcomed by editor and reader alike, and his advice on all matters horticultural, more especially on Roses, was respectfully listened to and attentively studied. His cheery books—and these not only on his favourite theme—have long been household words in every home. His arrival was hailed with delight by everyone concerned at all the most important gatherings of gardening associations, and it was only so lately as the last annual exhibition of the National Rose Society that the absence, through serious illness, of the venerable president who had

Mr. J. WRIGHT, V.M.H., kindly sends a copy of a letter in his possession which was written by the Dean of Rochester on February 7, 1867, when he was Vicar of Cauntton, to Mr. Henry Curtis, at that time a great rosarian at Torquay, afflicted with blindness.

To H. C.

Oh friend, for friend thou art, altho'
Our hands have never met,
Believe me, in thine hour of woe,
Mine is a true regret.

What! from thy little day so soon
The sun withdraws his light?
Falls on thy manhood's afternoon
Old age's dismal night?

Those eyes, which to the Rose, their Queen,
Such reverent homage paid,
From them must all her loyal sheen
And all her glory fade?

Not so, not so! tho' all beyond
Be dimness and be gloom,
Within thine heart, so true and fond,
The Rose shall ever bloom.

And there the Faith, in sorrow dear,
Which soothes our sad unrest,
And softly whispers, "Never fear,
Whate'er GOD does is best."

Shall tell thee of an Eden fair,
In which a SAVIOUR kind,
Who, in our likeness, heard our prayer
Of the poor helpless blind.

All cares, all tears, shall banish in
That day which has no night,
And all that's dark shall vanish in
His Everlasting Light.

S. R. H.

Cauntton Manor, Newark, February 7, 1867.

THE FUNERAL.

THE first part of the funeral service took place in Rochester Cathedral on Tuesday afternoon last, when a large gathering was present, including the Mayor and Corporation, the Earl of Darnley, Mr. C. Tuff, M.P., Lieutenant-General Sir Charles Warren, Major-General Sir R. Hart, V.C. (commanding the Thames District), Rear-Admiral R. W. Craigie (Superintendent of Chatham Dockyard), Colonel-Commandant C. G. Gordon, R.M.L.I., Colonel Barter (Chief Staff Officer), Engineer Rear-Admiral W. H. Davis, and a large number of the local clergy and principal citizens.

The Bishop of Rochester, who is in Italy, was represented by his chaplain. The principal mourners were Mrs. Hole, Mrs. Burnaby-Atkins (sister-in-law), and Mr. Edward Franklin (brother-in-law). Mr. Hugh Hole, the only son, was unable to return from Norway in time to be present. The service was fully choral, and the hymn "Hail, gladdening light, of His pure glory pour'd." The inscription on the coffin was: "Samuel Reynolds Hole, born December 5, 1819; died August 27, 1904." After the service the body was removed to the Lady Chapel, the flowers, chiefly Roses, being placed on and around the coffin.

Many friends of the late Dean assembled in the churchyard of Cauntton on Thursday last, when the National Rose Society, of which Dean Hole was the first president, an office which he continued to hold until his death, was represented by Mr. H. V. Machin, one of the vice-presidents, and Mr. Edward Mawley, the hon. secretary. Roses filled the air with their fragrance, for most of the floral tributes were of the Queen of Flowers, which from his boyhood days was the delight of the Squire of Cauntton. Such a wealth of Roses would have been impossible a few years ago, when the beautiful Teas and Hybrid Teas were yet unborn.

CAUNTTON MANOR.

words. We think of him as the "devout lover" of horticulture in general, and the keen rosarian in particular—a cult which he never thought fit to separate as incongruous from that other more serious work of his life. By us his memory will ever be cherished as the able and genial helper in the first Rose show, and as the kindly friend, and wise and sympathetic counsellor of all gardeners, and not least of the artisan, whose lot in life, through long years, he strove to brighten, and whose tastes he desired to raise by doing all in his power to bring within his reach the same refining art which had been his own chief joy and life-long refreshment. We may not mourn unduly that at the ripe age of eighty-four the light of this long and honoured career should have burnt low and gently expired, but his genial presence will be sadly missed by many who are in very diverse ranks of life.

We look about us and it is borne in upon our minds that cheerfulness is one of the rarest as it is one of the most beneficent of human attributes, for it is seldom other than the sign of inward peace and wholesome content. Most of us are too self-centred and too little at leisure from ourselves to be cheery, but Dean

been one of its pioneers and most loyal supporters cast a gloom over an occasion which otherwise would have been a red-letter day in Rose annals. Alas! that his place as its revered head will know him no more.

Quite lately we have seen it deplored in print that the country parson should, in too many instances, be given over to the cultivation of his Roses rather than to the cure of souls. In Dean Hole we have had an eminent pattern to copy of one who was exemplary in his vocation, yet at the same time made his hobby go hand in hand with sacred duty, ministering by its aid to the human side of those with whom he was called to deal, and by its means, handled in his own happy and inimitable fashion, helping many a one out of the dregs of earthliness, and lifting them higher towards the garden of God.

The light that we loved, alas! has gone out, but not before, let us be sure, that other sparks have been kindled by its fire to brighten some of the darkened corners of this lower world, which need not be so gloomy if each of us did our little part, if not so brilliantly, yet to the best of our ability, to carry good cheer as he did wherever we may go.

K. L. D.

THE GARDEN

No. 1712.—VOL. LXVI.

[SEPTEMBER 10, 1904.]

DAMSONS IN 1904.

STONE fruits generally seem to have acted in rather a spasmodic way this year, for though the bloom was good everywhere the crops appear to be patchy. In some parts of the country Plums are by no means a heavy crop, but in the west of England the trees are loaded with fruit, and at the moment of writing Victorias are so plentiful that growers are at a loss to know how to dispose of them at a profit. We do not anticipate any such trouble regarding Damsons, as this useful fruit is by no means over-abundant. A few years ago there was a perfect glut of Damsons, but since then we have never had even a moderately heavy crop, and last season this fruit failed, in common with most others. It is not easy to understand why the Damson crop is so light, considering the heavy bloom; but this, above all other members of the Plum family, is the most liable to blight, and here may probably be found the key to the problem. The present year will long be remembered as a season of blight, and in the early days of the summer, when the young Damsons promised a good crop, the aphid legions attacked the trees, curled up the leaves, and distorted the young shoots. Under such an attack it was hardly to be expected that the fruits could go on satisfactorily, and after appearing to stand still for some days, they changed to a yellow, sickly hue, and then dropped wholesale. What would have been the result if the trees had been sprayed with some insecticide as soon as the aphid appeared is another matter; but the Damson, useful and valuable fruit as it is, does not often receive such attention.

There can be only one opinion as to the usefulness of the Damson for cooking and preserving. A glut of Plums there may be, but it does not affect the demand for Damsons, which come in when the former are over, and supply a most useful finish to the stone fruit crops of the year. It is doubtful either whether any other fruit receives so little attention from growers. Very often Damson trees are planted on the outskirts of orchards, where they form a profitable means of protection for other trees. They need no pruning, and sometimes, but not often, is it considered necessary to feed them at all. The Damson, however, like other hardy fruit, will show the results of feeding, and a grower of our acquaintance was puzzled to know why one particular Damson tree in his orchard produced much finer fruit than any of the

others. He overlooked the fact that this particular tree stood close to the pig pen, from which the rich brown liquid trickled and soaked into the ground over the roots of the Damson, and this, of course, accounted for the fine fruit.

The homely Damson, accommodating though it is, has its likes and dislikes as regards situation, and it appears as though it has settled itself in colonies in certain localities. Cheshire is a great county for Damsons, and in one part of North Staffordshire this fruit is grown almost exclusively on an extensive scale. We hear sometimes about the advantages of growing fruit in hedgerows, and in the locality under notice there is no novelty about the system, if such it can be called, for the hedgerows on many of the farm homesteads are full of Damson trees. There is no order about their arrangement, and it is questionable whether they were planted in the first instance, but probably established themselves from seedlings or suckers. In the district referred to, which is situated on the rising ground from the valley of the river Dove, the soil is mostly stiff and retentive, and the Damsons are quite at home in it. No other fruit is grown to any extent, but on every farm and cottage homestead there is a Damson orchard, and in addition trees are dotted freely about the meadows and pastures. The crop is more or less a lucrative one, just according to its proportions, and whereas in some seasons it helps considerably to pay the rent in others the fruit barely pays for picking. It may be observed that Damsons have a habit of going to extremes in the way of cropping, and after being laden to breaking point one season the trees will go a few years and return next to nothing.

Just as Damsons seem to be naturalised in certain localities, so also do varieties appear to belong to their own districts. In the fruit plantations of Kent Damsons are extensively grown, but the Kentish Damson is a poor thing compared to that of Cheshire and Staffordshire. It is a heavy cropper, but the fruits are small and dry, and the trees do not attain to any great size. Generally speaking the latter are grown on land under cultivation, but we think that Damsons do better when grown on grass land. We are not aware whether any attempt has been made to introduce the variety of the Midlands into the southern counties, but if it would succeed it would prove an acquisition.

The Damson grown on the rich dairy farming lands in the Midlands is large, of excellent

flavour, and oval in shape. The finest fruits are obtained where the soil is deep and rich, and a marked difference can be seen in samples grown on such land and those obtained from trees growing in thin shallow soil. It may be said of the Midland farmer that he does not profess to be much of a fruit grower, and he is by no means directly responsible for the presence of the Damson orchard on his holding. He received it, in most cases, as a legacy from his predecessor, and the ball is kept rolling, so to speak, by putting in a young tree here and there to take the place of one which has dropped out. The fact that the trees continue to grow and bear without any cultural attention speaks well for the accommodating character of the Damson in districts naturally adapted for it, and this appears to account for the colonies of the fruit which are to be found in various counties.

The methods of distribution are certainly not so good as they might be, because the Damson is such a popular fruit that there would doubtless be ample consumers for the supply, even in seasons of plenty, if buyers and sellers were only in closer touch with each other. Things are certainly better than they used to be, but even in recent years we have seen farmers taking their Damsons to market in all kinds of receptacles, ranging from a clothes basket to a milk churn.

In September and the early part of October is the Damson harvest, and this year there are no anxieties about over supply. In some districts the crop is light, and in others there is a moderate sprinkling of fruit on the trees, which, bearing in mind the shortage of last year, can hardly fail to be remunerative.

ORNAMENTAL GOURDS.

GOURDS that are grown for decorative effect, as distinct from those planted for their economic value, do not hold that position in our gardens that their merits as attractive climbing plants deserve. This fact was brought to mind by the several displays of ornamental Gourds at the exhibition of the Royal Horticultural Society in their new hall on Tuesday last, and by the interesting and instructive lecture respecting them given by Mr. W. Odell, who also sent a most representative collection of species and varieties, some seventy or eighty altogether. Many of the Gourds are plants of bold and distinct appearance, and all produce an unusual and often quaint effect in the garden landscape. It is safe to say that with no other climbing plants can such remarkable results be obtained in so short a time, for the

Gourds must be treated as annuals. Mr. Odell showed numerous illustrations of Gourd-covered pergolas that were most quaint and picturesque, while possessing a certain beauty, too, by reason of their bold handsome foliage and multi-coloured fruits. These plants have an added value in that they are at their best during the months of September and October, a period when the flower garden loses, to a considerable extent, its beauty and interest.

For covering pergolas, rustic poles, tree stumps, forming screens to block out unsightly buildings, to give life and colour to the unpleasing rubbish heap that often is an eyesore in gardens, they are eminently suited. Often one has to complain of the monotony of outline of plants in the herbaceous border, and here the Gourd may be used with great advantage. A few rough cut poles placed along the border at intervals and clothed with some of the more attractive Gourds add a feature of much interest, and destroy the regularity of outline, a fault that will detract from the effect of a border planted to the most approved colour scheme. Gourds are also eminently suited to the beautifying of the kitchen garden. Mr. Odell showed pictures of a simply constructed pergola of rough wooden poles, erected over a long path in a vegetable garden. In April it was seen to be absolutely bare, in September smothered in luxuriant leafage, hiding brilliantly-coloured fruits of many forms.

A curious point about the Gourds is their mimicry: there is hardly a fruit that has not its counterpart among the Gourds—the Lemon, Pear, Apple, and Gooseberry at once come to mind—and there are numerous other shapes besides. The resemblance of some of them to the real thing is remarkable, the Gooseberry, for instance; at a short distance it would be almost impossible to detect any difference. Mr. Odell recommended the seed to be sown in April, in frames, growing on the plants and gradually hardening them off for planting out in June. It is not necessary, however, to raise the seedlings under glass. The seeds may be sown out of doors in rich soil where the plants are to remain. The only difference in the result will be that the fruits will not form and develop so early. A rich soil is essential to the successful cultivation of these plants, and also, we must add, a sunny season. In cold, wet, sunless summers the Gourds have no chance of showing their possibilities—they are essentially hot weather plants. Thus in 1900, and again this year, they have done remarkably well.

H. H. T.

RECENT PLANT PORTRAITS.

The second number of the *Revue Horticole* for August figures

Gurania crinita, a native of Peru, whence it was introduced in 1903 by a Portuguese amateur named Carvalho Monteiro. It is a most curious and beautiful trailer, a member of the Cucurbit family, and produces on long, pendulous stems balls of singularly shaped orange-red flowers. For its successful cultivation it requires the temperature of a stove.

The September number of the *Botanical Magazine* contains portraits of

Rosa gigantea.—Native of Eastern India, North Borneo, and Western China, also known as *R. macrocarpa*. This is an extremely fine single-flowered Rose, first discovered by Sir George Watt in Manipur in 1882. The large flowers are white, and sometimes 15 inches in circumference. Seeds were sent to Kew in 1888 by Sir Henry Collett, which germinated freely, and the plants grew most luxuriantly, but refused to bloom, notwithstanding every effort made to induce them to do so. The specimen figured bloomed in 1903 in the

Duchess of Northumberland's garden at Albury Park, near Guildford.

Dyschoriste Hildebrandtii.—Native of East tropical Africa, also known as *Calophanes Hildebrandtii*. This is a rather pretty little stove shrub with bluish grey flowers, which bloomed in the tropical Nymphaea house at Kew.

Dendrobium Williamsoni.—Native of North-Eastern India. This is a pretty Orchid with medium-sized, creamy white flowers, which have a deep orange ring round their throat.

Pyrus nirsretskyana.—Native of Central Asia. This is a remarkably distinct and beautiful flowering Apple. The flowers, which are profusely produced, are a beautiful, clear, deep rose colour, and very remarkable and showy. With the exception of the leaves, all parts of this Apple are red—bark, wood, flowers, and fruit, and the leaves turn red in autumn. Even the flesh of the nice tasting fruit is of a deep rosy red. It is hardy at Kew.

Morua Thomsoni.—Native of Eastern tropical Africa. This is a rather pretty but not very highly coloured Irid, with bluish grey flowers, in shape resembling those of a large *Triteleia*.

The *Revue de l'Horticulture Belge* for September contains a fine double plate portrait of a new *Cypripedium* (or *Paphiopedilum*) *glaucophyllum*, which is a native of the island of Java, and was introduced as recently as July of this year by M. Kimstad, who also is responsible for its portrait. It is said to be almost a perpetual bloomer, so should be extremely useful as a parent and seed bearer to hybridisers of Orchids.

W. E. GUMBLETON.

THE EDITOR'S TABLE.

WE invite our readers to send us anything of special beauty and interest for our table, as by this means many rare and interesting plants become more widely known. We hope, too, that a short cultural note will accompany the flower, so as to make a notice of it more instructive to those who may wish to grow it. We welcome anything from the garden, whether fruit, tree, shrub, Orchid, or hardy flower, and they should be addressed to The Editor, 3, Southampton Street, Strand, London.

JASMINUM GRANDIFLORUM.

To those who are unacquainted with this deliciously-scented and handsome-flowered Jasmine I would strongly recommend its cultivation. It is usually described as a warm greenhouse plant, but I find it thrives well and flowers abundantly in a cool greenhouse. It was given to my gardener several years ago by an amateur who did not know its nature and had treated it as a hardy outdoor shrub, a treatment which it resented, but on removal to my cool greenhouse it thrived immediately and will be a joy for ever. The scent is so powerful and the flowers are so handsome that a spray will adorn and perfume a large room. It is a native of sub-tropical North-Western Himalaya, where it grows wild at an elevation of from 2,000 feet to 5,000 feet. It flowers from June to October.

FREDERICK TOWNSEND.

MAURANDYA BARCLAYANA.

Mrs. Cracroft, Hackthorn Hall, Lincoln, sends flowers of this beautiful plant, with the intimation that they were gathered from a plant not protected during the winter, the position sheltered, and aspect south.

LILIUM SPECIOSUM MELPOMENE.

"S. W. J." sends some blooms of this, the most handsome of all the varieties of *Lilium speciosum*, the blooms heavily marked with rich rosy red. Our correspondent comments upon the deep green colour of the leaves, which are remarkably broad and of leather-like substance, and writes that not only are the flowers very beautiful but the plants grow vigorously and flower freely. In company

with this variety are the pure white flowers of *Lilium speciosum Krætzleri*, which are freely produced, although the plants do not grow so strongly as *Melpomene*. "S. W. J." also sends a bunch of Tiger Lilies, including the double form, which, however, is not so attractive as *L. t. splendens* or *L. t. Fortunei*, both of which give valuable colour in the garden at the present time.

LOBELIA CARDINALIS QUEEN VICTORIA.

The flowers of this, received from Mr. H. J. Lawson, Oxon, remind us of its great value during the month of September. The rich red flowers and bronze foliage associate admirably, and give a charming note of colour. The individual blooms last a long time, and as they are produced in succession for several weeks, this *Lobelia* deserves to be in every garden. Firefly is another very good variety. *Lobelia syphilitica*, which is quite hardy, while *L. cardinalis* is not, has given rise to many beautiful forms in the hands of the hybridist during recent years, and varieties of such shades as purple, pink, rose-red, and white may now be obtained.

SEEDLING GLADIOLI.

Mr. W. C. Bull, Rathlin, Ramsgate, writes: "Herewith a few spikes of my seedling Gladioli. The white is one of my best, though the spike is not of its usual size. The colour and texture are, however, I think you will agree, both good, and when cut with three or four buds expanded it retains its purity to the end. In the full glare of the sun it gets very slightly flecked with a few streaks of purple, as it passes out of bloom. The sulphur yellow is a lovely cut flower, with medium-sized flowers, well spaced, and the petals strong and crisp. We have had the worst drought I ever remember, ten weeks, unbroken by any rain of the slightest use, and literally thousands of my seedlings have had their spikes ruined. Those sent are from a block I gave two soakings of water early in August."

The seedling Gladioli sent by Mr. Bull are very beautiful. The flowers are of good form and delicate colouring.

ROUND ABOUT A GARDEN.

AUTUMN'S SEEDLING WEEDS.

AS autumn comes round it is always amazing to see the army corps of seedling weeds which are attempting to occupy the whole garden. Where the ground has been carefully cultivated for many years, or in enclosed town gardens, the weeds are a subdued and furtive community, seeming to evade notice and only casually flourishing for a while by pretending to be something better. But in a country garden, with ungoverned tribes of wild weeds always on the war-path round its frontiers—especially where the gardener is more of a handy man than a horticulturist—their profligate exuberance in reproducing their species where they are not wanted is astounding. It seems scarcely a week or two ago that the hoed rows of Potatoes looked as neat and clean as a girls' school going to church, and now the gardener who is forking up the tubers appears to be wading in a sea of flowering and fruiting weedstuff to find the drooping haulms. Look at the gravel path by the Privet hedge in the knuckle-end of the garden: there are more than a dozen seedling weeds, on the average, already contesting possession of each square inch of trodden stones.

GARDEN PLANTS, WILD PLANTS, AND WEEDS.

When, year after year, one sees the weeds behaving in this rampantly aggressive manner, while so many of our cherished flowers refuse to flourish properly in spite of all one's care,

one begins mentally to divide vegetation at large into three classes: First, there are the garden plants; secondly, wild plants, sometimes almost deserving a place in the flower garden; and, thirdly, weeds. It is this habit of mind which has probably prevented any serious attempt being made to tackle the weed problem. It has often been said that the weeds of one country are the garden flowers of another; but we do not sufficiently recognise that the qualities which constitute a successful weed are simply its faculties for occupying the ground where it chances to get a foothold, at any rate for a time. For there are other more enduring qualities which weeds do not as a rule possess: and when land has been abandoned to Nature for many years it becomes occupied with a permanent population of respectable wild plants, amid which the weeds of cultivation have a very poor show. Dig up a piece of ground and sow it and plant it with selected garden flowers from the best catalogues, and leave it alone for a year or two. You will find it a tangled wilderness of rank weeds. Come again twenty years later, and it may have become a charming nook of woodland scenery.

WEED-RESISTING PLANTS.

What we want is, it seems to me, a class of plants which combine the beauty of the garden flower with the pushfulness of the weed and the enduring persistence of the wild plant. We have devoted our energies too exclusively to the improvement of the blooms of cultivated plants, and the result is a coddled multitude of garden things which are as much at the mercy of invaders from outside, unless they are carefully and constantly protected, as the fat, soft races of the Bengal plains used to be before British rule intervened to hold back the tribes on the frontiers. And in India we have trained the best of the native races themselves to do the work of protection, because it would have been scarcely possible, and much too costly, to use only imported British troops unsuited to the climate and conditions of the country. Why have we not attempted to achieve a permanent success on similar lines with the acres that we annex for pleasure grounds?

MATERIALS FOR A WILD GARDEN.

There must be plenty of plants suited for the purpose. Almost all of the handsomest plants which are occasionally found growing wild in England are marked in the botany-books as "doubtfully indigenous"; yet they hold their own against the wild plants in those localities where they chance to have gained a foothold; and in our gardens there are scores of aggressive perennials and self-seeding annuals which have to be kept severely in order to prevent them from overrunning the whole place. From year to year our shrubberies and woodlands are becoming more filled with charming plants and trees which flourish where they have been placed without further assistance; and in Norfolk recently I saw a fine wood dominated by magnificent conifers, the parent of which came there in a flower-pot and had cost £5. Such successes are almost haphazard and accidental; yet, if we had bestowed a hundredth part of the care and thought, which we have given to producing beautiful varieties of tender flowers, to the education and cultivation of our hardy plants, to hold their own against all comers, we should now be able to plant and sow a new-dug piece of ground in such wise that it would remain for ever filled only with the things which we put there.

A TASK WORTH ACCOMPLISHING.

The idea may seem Utopian at the first glance, but we never know what we can do

until we try, and in many other directions we have succeeded in performing similar feats. We might not find all that we want growing wild already in other lands or established in our gardens; but everything that we cultivate becomes plastic in our hands. We can exaggerate or eliminate at will any quality which it possesses, and, although we have hitherto confined our efforts to producing such obvious improvements as enhancement of the beauty of a flower or enlargement of a fruit or vegetable, we could just as easily work equal wonders with any other of a plant's qualities. Every weed and every wild plant succeed in establishing or maintaining its foothold against our cultivated treasures by the possession of certain definite qualities. In the case of most of our commonest weeds these qualities are merely speed of growth and adaptability to all soils and seasons. Whenever the soil is left vacant they are ready to colonise it at a moment's notice, and they generally manage to set and scatter their seed before they are interfered with. Yet, if we had given our minds to it in the past, we could certainly have produced quicker, more prolific and hardier flowers, which would beat the Groundsel and Chickweed and Shepherd's Purse at their own game. Plants like Furze and Broom and Hawthorn show that a splendid wealth of bloom is not incompatible even in a wild state with perfect ability to occupy and hold untended ground against all comers. With cultivation we could produce an immense range of plants similarly equipped to fill our grounds with beauty. We could still have our flower-beds for our tender things; but when one wanders round about a garden in autumn and sees the army corps of seedling weeds assembling to invade the territory of the flowers, one cannot help wishing that the gardeners of the past had devoted more of their energies to producing flowers which would, contrariwise, overrun the weeds and hunt them across your garden frontier, as in India our tame Sikhs and Gurkhas hunt the wild Pathan.

E. K. R.

NOTES OF THE WEEK.

FORTHCOMING EVENTS.

September 14.—Royal Caledonian Horticultural Society's Show, Edinburgh (two days).

September 20.—Royal Horticultural Society's Committee; National Rose Society's Autumn Show.

October 5.—National Chrysanthemum Society's Show at Crystal Palace (two days).

October 12.—Royal Botanic Society's Show.

October 25.—Croydon Chrysanthemum Society's Show (two days).

November 1.—Bournemouth Chrysanthemum Show (two days); Brighton Chrysanthemum Show (two days).

November 2.—National Chrysanthemum Society's Show at Crystal Palace (three days); Southampton Royal Horticultural Society's Show (two days); Highgate Chrysanthemum Show (three days); Lowestoft Chrysanthemum Show (two days); Portsmouth Chrysanthemum Show (three days).

November 3.—Weybridge Chrysanthemum Show; Colchester Chrysanthemum Show; Forest Gate Chrysanthemum Show (three days).

November 4.—Windsor and Eton Chrysanthemum Show; Battersea, Clapham, and Wandsworth Chrysanthemum Show (two days); Hinckley Chrysanthemum Show (two days).

November 5.—Batley and District Chrysanthemum Show; Loughborough Chrysanthemum Show; Penarth Chrysanthemum Show; North Lonsdale Chrysanthemum Show.

November 8.—Ipswich Chrysanthemum Show (two days); Dulwich Chrysanthemum Show (two days); Sevenoaks Chrysanthemum Show (two days); Southend Chrysanthemum Show (two days); Stoke Newington Chrysanthemum Show (two days).

Rose Duchesse Marie Salviati.—It is remarkable that this Rose is not grown in this country. The pink flower is not at all full, but rather of the character of G. Nabonnand, yet perfectly distinct from that well-known Rose. It is quite true that the most commonplace Tea Rose looks well in the cool, moist, autumnal days, but there is a distinct charm about the variety under notice; the pink tint fades to a silvery whiteness towards the edges of the petals. I have long heard of the variety as being a good one on the Continent, and it was only this year that I had an opportunity of seeing it. Duchesse Marie Salviati is one of the parents of Reichsgraaf E. von Kesseltalt, and the two varieties are well worth adding to any collection.—P.

Apple Miller's Seedling.—This is a second early variety. Very handsome; skin transparent greenish-yellow, much splashed with red on three sides, flesh solid; small, but the fruit seen was not the largest. Mr. R. Webb of Beenharn, a well-known fruitcultivator near Reading, stated that he had 90 trees of it, all cropping well, but each third year the yield is very large; the tree is a good grower. It is supposed to have been raised by a Mr. Miller, hence its name. It is somewhat of a coincidence that at the Bath Flower Show a few days later Mr. George Cooling had a seedling partaking very much of the shape, character, and marking of Miller's Seedling, but larger. I do not say they are identical, but in general character they nearly approach each other.—R. D.

Mme. Cornelisen Fuchsia.—This is quite an old Fuchsia, which appears to have slumbered for forty years or so, and then to have put in an appearance once more. Mr. Burbidge puts the year of its introduction as 1860, but I have a strong impression it was grown at the Royal Nursery, Slough, in 1855 and 1856, and was the first of the white coralled varieties. It was distributed by Messrs. Thibaut et Keteleer of Paris, and I seem to have a lively recollection of how anxiously we looked for its flowering—the first variety with a red tube and sepals and a white corolla. If it be correct, as Mr. Burbidge alleges, that it was not distributed until 1860, then the first Fuchsia with a white corolla and red tube and sepals must have been Mr. W. H. Story's Queen Victoria, which was figured in the *Florist* for 1855, and put into commerce by Messrs. E. G. Henderson and Son, then of the Wellington Road Nursery, St. John's Wood, which is now a part of Lord's Cricket Ground.—R. D.

The Fig as an ornamental tree.—

From time to time notes occur in THE GARDEN dealing with the Fig regarded solely from a fruiting point of view, but in addition to this its ornamental qualities are of such a high order that from this standpoint alone it merits far more attention than is generally bestowed upon it. The different authorities do not attempt to give the date of its introduction, and according to Loudon it has been cultivated in Britain from time immemorial. It is claimed for a very ancient specimen in the famous Fig gardens at Tarring, near Worthing, that it was planted by Thomas A'Beckett, but this may well be questioned. Other trees in the same garden serve to show the picturesque habit of the Fig when old, and I know of nothing more suggestive of sunny climes than these groves of Figs, clothed with their large, dark green lobed leaves of a firm leathery texture. They cast a particularly deep shadow, and an avenue there well shows the play of sunshine and shade. It is, however, by no means at Worthing alone that the Fig displays its ornamental qualities, for all along our southern coasts in proximity to the sea it does well, and, strange to say, very few shrubs or trees thrive within the smoke-laden area of London as well as this; in fact, Fig trees may often be seen in forecourts and back gardens, and that, too, in a condition which shows that they are at least fairly comfortable in their quarters. In any selection of trees and shrubs for London the Fig is undoubtedly entitled to a foremost place, for, in addition to its other features, the rate of growth is by no means slow, and it also stands out as the only hardy representative of a most interesting genus of plants.—H. P.

The Vilmorin testimonial.—The *Revue Horticole* remarks upon the success of the subscription list for a memorial to the late M. Vilmorin. The last lists published are remarkable for the number of amounts, both large and small, received from admirers in France and abroad of the work of M. Vilmorin. The total amount received so far is nearly 15,000 francs (£600), and the number of subscribers 1,386.

A new Crimson Rambler hybrid.—A Massachusetts nurseryman, Mr. H. Walsh, recently exhibited before the American Floricultural Society a new Rose named Arcadia, said to be the result of a cross between Crimson Rambler and General Jacqueminot. The flowers are large, double, and of bright scarlet-crimson colour, disposed in bunches like those of Crimson Rambler. The plant is hardy and vigorous. In mentioning this the *Revue Horticole* says that Crimson Rambler seems to be proving an excellent parent, and one that will be of great service to those who raise seedling Roses. Its remarkable floriferousness and hardiness are reproduced in its offspring, and one may hope to obtain from it a new race of Roses of great garden value.

Cyclamen neapolitanum flowering without soil.—Mr. H. M. H. Waile of Naples records in the *Deutsche Gartner-Zeitung* the pleasing decorative effect that it is possible to obtain by cultivating this Cyclamen without using any soil, simply suspending it in the greenhouse or room by means of wires. Thus treated, the corms produce a quantity of their rosy carmine flowers in September and October. After the blooms are over the corms should be placed in pots or in the open ground, for they will pass through fairly severe frosts unharmed providing that they are put several inches below the soil and are protected by a covering of dead leaves.

Pear Vicar of Winkfield.—When I came here twenty-two years ago I found two trees of the above on a wall 15 feet high facing north-east. My first thought was to cut them down and graft, but consideration suggested the advisability of planting better sorts on a more favourable aspect and retaining Vicar of Winkfield for stewing purposes. They were full of old spurs, some of them quite 18 inches from the wall, but these were gradually worked out and new growth substituted, with the result that for several seasons they have supplied us with a quantity of large fruits for stewing, and occasionally, when thoroughly ripened, a late dish for dessert. These two large trees cover 1,200 square feet of wall space.—E. C. B., *Claremont, Esher.*

A cottage show at Great Warley. Once a year in the grounds of Warley Place, Great Warley, the home of Miss Willmott, there are a cottage show and country revels and games. Unfortunately, the weather was unkind, but the success of the exhibition, and the desire that everyone should enjoy themselves by those responsible for this pleasant celebration, made the happy throng forget the leaden sky and pelting rain of the forenoon. It was the best display that has been held as yet. Instilling into the hearts of the cottagers a love of horticulture and the desire to beat one's neighbour in the tournament of flowers has a wholesome, refining influence on the lives of parent and child. Miss Willmott works unflaggingly to make the cottagers at Warley earnest gardeners, and the wives are encouraged by handsome prizes to compete in classes for bread and cake making, needlework, and the various duties that make the home bright, comfortable, and prosperous. There are prizes also for farm produce, and the whole show is so well managed that the competition in many of the classes was remarkably keen and the exhibits of rare excellence. A few miscellaneous exhibits gave bright colouring to the circular tent, for here Messrs. Wallace and Co., Kilnfield Gardens, Colchester, showed Gladioli, Lilies, hybrid Tritomas, the pretty *Watsonia rosea*, and the new Poppy (*Glaucium flavum tricolor*). Messrs. John Laing and Sons of Forest Hill had a bank of tuberous Begonias, and Messrs. Russell of Richmond, Surrey, trees and shrubs. This was the sixth show that has taken place, and we were glad to see that as the years go by the cottagers' interest

in the various competitions deepens considerably, and we wish that in every parish there was the same guiding hand in furthering the welfare of the people. The work of arranging such a show as this is exacting, and only by the most careful attention to every detail is success possible. Miss Willmott, the president, is helped by the energetic hon. secretary and treasurer, Colonel Whittington, C.B., Codham Hall, and Mr. Preece, Warley Place Gardens, the assistant secretary. The band of the 4th Battalion Essex Regiment played during the sports, which Mr. F. V. Berkeley superintended.

Canada and the schools.—With a wise insistence the Canadian Government continue to press upon the school teachers in the Mother Country the need of a fuller knowledge of the geography and resources of this the greatest of the self-governing States of the Empire, and they are prepared to give practical assistance in this direction by the distribution of a useful geography among the schools. The progress nowadays in Canada is so real and so rapid that the ordinary textbooks, despite the activity of our publishers, become rapidly out of date, and the geography now so generously offered should fill a distinct want, and be warmly welcomed throughout the country. The publication is suitably illustrated with maps, views, and diagrams, admirably adapted for fixing in the minds of the children the facts and lessons which it is so desirable that the rising generation should have of the resources and importance of the British possessions beyond the seas. Head teachers of schools interested should communicate their requirements to the Canadian Government Emigration Offices, 11-12, Charing Cross, London.

Yucca recurvifolia at Broxbourne.—I enclose a photograph of *Yucca recurvifolia*, which may be of service to you for reproduction. It is, as you will see, a rather fine specimen. Its height is 10 feet 2 inches from ground level. This is the third time within ten years it has flowered, but this is the first time two heads of flowers have appeared.—J. PULHAM, *Broxbourne.*

Scottish railway station gardens. The awards in the usual competition for the best-kept station gardens and borders on the Glasgow and South-Western Railway Company's system have just been issued, and the prize-takers are to be congratulated on their success. Some of these gardens and borders have already been favourably noticed by the local Press in their respective districts. One of the first prizes has gone to Ruthwell, where the fine display of Tulips, made by Mr. Macdonald, the stationmaster, was much admired in May.

Eucryphia pinnatifida.—Mr. Bulkeley-Owen sends from Tedsmore Hall, Oswestry, a photograph of a plant of *Eucryphia pinnatifida* that is covered with flowers this year. The shrub is about 13 feet high.

Begonia Mrs. Bertram Currie.—The semperflorens type of Begonia to which this belongs is among the most useful and free-flowering for summer bedding. The variety under notice is one of the best with red flowers. Worth growing for its free-flowering habit alone, the beautiful bronze colour of the foliage adds greatly to its value. The foliage reminds one of the well-known Crimson Gem, but it is not so strong in growth, and more compact and of freer habit. It is readily propagated by division in spring from plants lifted and potted up in autumn. *B. semperflorens alba* and *rosea* are two other good sorts to grow if variety is required.—A. OSBORN.

Discovery of a yellow Snowdrop.—It has just transpired that a Snowdrop with yellow segments appeared in a northern district last season, and that the solitary bulb which produced the flower is being cared for in the expectation that a yellow flower will be again produced next season. It is remarkable that this Snowdrop

YUCCA RECURVIFOLIA IN MR. PULHAM'S GARDEN AT BROXBORNE.

should have been found in the same district as that in which *Galanthus lutescens* and *G. flavescens* were found. As many are aware, these Snowdrops have the markings, ovaries, and scapes coloured yellow instead of green. That which has been found this year has the segments entirely yellow, so that it is quite a remarkable flower, and its future will be looked forward to with great interest. Such a Snowdrop might have been expected to appear, and its existence was less improbable than that of the pink Snowdrop of which there is at least a tradition. My information has come from one of our most experienced specialists in the Snowdrop, and, unless he has been misinformed, which I think hardly likely, the yellow Snowdrop probably will be seen next season.—S. ARNOTT, *Carschoorn, by Dumfries, N.B.*

Preservation of Apples by cold storage.—In a bulletin issued recently by the New York Agricultural Experimental Station was published a report of experiments made in the preservation of Apples by cold storage. It was found that the degree of preservation varied considerably according to the variety of Apple used. It was stated to be most important to handle the fruits with great care. It was further observed that unusually large fruits of a certain variety did not keep so well as those of ordinary size and thicker skin. Most varieties ought to be placed in the cold chamber as soon as gathered. There are, however, some exceptions, for instance, Hubbardston. This Apple is said to keep better, or at all events to keep its appearance better, if two or three weeks are allowed to elapse between gathering and cold storing. Providing that they are healthy, Apples keep better in a slightly moist atmosphere than when the air is quite dry. For this reason the temperature ought never to fall quite to freezing point. It goes without saying that if the fruits were already diseased moisture would tend to hasten their decay.

Diseased Potentillas.—Mr. G. S. Saunders reported as follows on some specimens submitted to him at a meeting of the Royal Horticultural Society: "The diseased blossoms of a Potentilla, exhibited by Mr. Bowles at the last meeting, were attacked by eelworms, and probably by the species which is the cause of the 'Cauliflower disease' in the cultivated Strawberry (*Aphelenchus fragariae*), a disease that has been known to ruin nearly half the crop by rendering the flowers abortive. I am afraid that there is no real cure for this infestation, and that the best thing to do is to burn the affected plants and the soil round their roots. If the plant be a valuable one, it might be of use to cut away all the parts which show any sign of being infested, and to remove as much as possible of the soil round the roots. The following dressings have been found very useful in the case of Clover which was attacked by the 'stem eelworm' (*Tylenchus devastatrix*)—three parts of sulphate of potash, and one of sulphate of ammonia or sulphate of iron."

Hardy Fuchsia Bouquet.—Every now and again, as autumn advances, we see the hardy Fuchsias taken notice of, and their undoubted beauties praised. It may, therefore, not be unsuitable to mention a little hardy Fuchsia which seems to be little known, but which might well be grown in the choicest rock garden. This is a little hybrid called Bouquet, raised originally, I believe, by Messrs. V. Lemoine et fils, Nancy, France, but which I received from Mr. T. Smith, of Newry, eight or ten years ago, and which has since its arrival been grown in the open without any protection. One of its parents is *F. myrtifolia*, and it reminds one somewhat of *F. pumila*, though more erect than that plant. With me it has never attained a foot high, and on the rockery is very pleasing with its small foliage and its drooping coral red sepals and purple corolla. It has proved quite hardy, although generally killed to the ground every winter, and many who have seen it have been greatly attracted by this Fuchsia. I prefer to grow it in a light soil. There are several others of the same parentage, also raised by Messrs. Lemoine, but this is the only one I have cultivated. —S. ARNOTT, *Carsethorn, by Dumfries, N.B.*

A Crystal Palace Rose show.—All lovers of Roses will welcome the announcement that the directors of the Crystal Palace intend holding a Rose show in that building in 1905. Never have there been such Rose shows as were held there in the sixties, and it is to be hoped that all exhibitors will join in making this display a real success. Let them frame their schedule on a broad, unbiassed basis, striving to assist the culture of all types of the Rose and welcoming all exhibitors, both small and great. I would suggest that all such rules as "jars must rest on the staging," and also as to which varieties are admissible as garden Roses, be omitted from the schedule. I am persuaded if the directors offer substantial prizes and medals for the best arranged groups, providing, as they are quite able to do, abundant room so as to avoid the baneful "hunching" now so apparent, they will obtain a good show. As the National Rose Society

select Wednesday for their exhibition, Saturday would be a good day for the Crystal Palace show. This is a very popular day for the majority of individuals, and it would give the small growers an opportunity of seeing a good Rose show which they cannot always obtain if the "Society" day of Wednesday be selected. A supply of suitable vessels, Bamboo frames, &c., should be provided by the Crystal Palace Company, so that the expense to exhibitors of taking such articles about with them would be reduced. As an old exhibitor I wish the company every success.—P.

Pelargonium Black Vesuvius.—I have not met with this singular bedding zonal Pelargonium in catalogues, but it is presumably offered by some one. I do not know of its origin, but doubtless it is a sport from the well-known green-leaved Vesuvius. I saw Black Vesuvius just recently in the Forbury Gardens, Reading, where it is used with good effect by Messrs. Phippen in small masses. The foliage is very dark, hence the appellation. Growth is dwarfer than it is with the old form, and yet the flowers are the same and borne in remarkable profusion. It was by far the most effective bedding plant in the Forbury Gardens, and makes a fine companion plant to that best of all bedding Begonias the double crimson Lafayette. But the practice of crowding bedding plants is wrong and should be avoided. Far more effective and pleasing are nice rounded plants put quite thinly into beds that have a carpet of some dwarf creeping plant.—A. D.

A SKETCH.

There the most dainty Paradise on ground
Itself doth offer to his sober eye,
In which all pleasures plenteously abound,
And none does other's happiness envy;
The painted flowers, the trees upshooting hie,
The dais for shade, the hills for breathing space,
The trembling groves, the chrystal running by,
And that which all faire workes doth most agrace,
The art which all that wrought appeared in no place.

One would have thought (so cunningly the rude
And scorned parts were mingled with the fine)
That Nature had for wantonnesse ensue
Art, and that Art at Nature did repine;
So striving each the other to undermine,
Each did the other's worke more beautify;
So differing bothe in wills agreed in fine;
So all agreed, through sweete diversity,
This garden to adorn with all variety.
—"Faerie Queene," ii., 12.

SPENSER.

Fruit growing in Queensland.—Bananas: There was a considerably greater area under Bananas in 1903 than in 1902, namely, 6,577 acres, against 5,266 acres, an increase of 1,311 acres. There were 47,437 fewer bunches obtained from the greater area however, namely, 1,112,578 bunches in 1903, and 1,160,015 bunches in the previous year, an average per acre of 169 bunches in the former, and of 220 bunches in the latter year. Mourilyan is the chief centre of Banana cultivation, 3,553 acres or 54 per cent. of the total area, and 746,945 bunches, or 67 per cent. of the total production being returned from that district, the average yield in this district being 210 bunches to each acre. Of the additional area in 1903, 1,075 acres, or 82 per cent., were planted at Mourilyan. Cairns was the district of next largest production, but the acreage there was practically the same in both years; from the 1,070 acres under crop there in 1903, 156,977 bunches of Bananas were obtained, an average return to each acre of 147 bunches. Pine-apples: This fruit, which would appear to be less affected by drought than many plants, showed an increase both in acreage and production in 1903. Pine-apples would appear to offer greater possibilities in the way of export than many other varieties of fruit. Packed under ordinary conditions, if care in gathering and casing be taken, it will carry for considerable distances, and arrive in good order. Beyond this, however, the results of experiments would appear to justify the belief that if carried in chilled chambers, under certain conditions, it is not improbable that the fruit may be successfully conveyed to Europe, and thus

become another article of commercial export on a large scale. The experiments in this direction are being continued by officers of the Department of Agriculture. There were 1,493 acres under Pine-apples in 1903, against 1,101 acres in the previous year, an increase of 392 acres. The production last year was 340,832 dozen, and in 1902 it was 260,444 dozen, an increase of 80,388 dozen. The average yield per acre each year was 228 dozen and 237 dozen respectively. Brisbane petty session district embraces nearly half the Pine-apple cultivation and production of the State; from the 601 acres planted there, 155,370 dozen were marketed. A large export trade in Pine-apples with the Southern States obtains.

Southern Counties Carnation Show.—We are pleased to hear from the Secretary (Mr. C. S. Fudge) that the arrangements by which this show is now managed by the Southampton Royal Horticultural Society has worked remarkably well financially and otherwise, the accounts for the late exhibition on the Pier showing a balance of over £19.

Caladium argyrites.—Although during the past thirty years many fine varieties of Caladiums have been raised, the subject of the present notice is still one of the most useful of the family. Being of such a dwarf, compact habit, it can be used where the tall growing kinds are inadmissible. A good many years ago I employed it as an edging in a winter garden, where it had a fine appearance, showing up well against the Selaginellas and Ferns which came into the front rank. An important point in its culture is to get the plants into a fairly root-bound condition before they are used for room decoration. Very nice specimens can be had in 6-inch pots, and where jardinières have to be furnished the decorator will find plants in 2½-inch pots very handy.—J. CORNHILL.

An "American" Balsam.—When at the Peel Institute Flower Show, Clerkenwell, a few days ago, I was informed there was to be seen on one of the floors of a flat plants of an American Balsam, and the cultivator had expressed a desire it should be inspected by the judge as it could not be taken to the show. I found in a back window overlooking a well-like court a box containing three plants or so of *Impatiens noli me tangere*, the strongest of which had produced some blossoms, naturally pale coloured in such a position. But I found it very difficult to disabuse the mind of the cultivator of the idea that he possessed a plant of very great novelty, probably unknown in London. It had been so well cared for and so strongly grown that I awarded it a special prize, which it deserved.—R. D.

THE ALPINE GARDEN CONGRESS AT NAYE.

ON the 16th and 17th ult. some fifty botanists and horticulturists met together on the summit of the Rochers de Naye (Switzerland), at an altitude of over 6,000 feet, to discuss the question of botanical alpine gardens. The garden of La Ram-bertia took the initiative, calling together the representatives of the following: The three alpine botanic gardens of Lautaret, Villard, and Champrousse, maintained by the university of Grenoble; the alpine garden of Pont-de-Naut, maintained by that of Lausanne; the garden of La Chanousia at the Little St. Bernard (in Italy); of Plan-Gorret at Courmayeur (in Italy); of La Rostania in the Alpes Vaudoises du Piémont by Pinerolo; of L'Allionia on the Monte dei Cappucini, near Turin; of La Cantonnièra in the Alps of Bergamo; of La Daphnæa, near Lecco; of L'Aigonal in the Cévennes, maintained by the university of Montpellier; of the Pic-du-Midi (Pyrenees), belonging to the Marchand Observatory; of Etna, belonging to the university of

Catania; of Chasseral in the Jura; of St. Martin-Vesulie in the Maritime Alps, maintained by the French Alpine Club of Nice; of Ballon-d'Alsace, maintained by the Alpine Club of Belfort; of the Vosges, by the university of Nancy; of Gschnittthal, of Schachen, of the Raxalp, and of Neurent—these four by the German and Austrian Associations for the Protection and Cultivation of Alpine Plants, and sustained from the scientific point of view by the universities of Vienna and Munich; finally by those of the Righi and Mt. Pilatus, in course of formation, and the alpine gardens of La Linnaea and La Rambertia, whose president and director, the writer of these lines, undertook the inauguration of this botanical meeting.

Prince Roland Bonaparte, the president, in opening the congress, emphasised the importance, both scientific and esthetic, of alpine gardens. Each delegate of the sixteen gardens spoke, much interesting matter, though needless for reproduction here, being touched upon; but, it should be noted, the garden of L'Aigonal in the Cévennes, whose state was described by Professor Flabault of Montpellier, its founder and director, proves to be the best established of any from the strictly scientific point of view; while that of La Linnaea without doubt shows the best effect from that of artistic and picturesque horticultural beauty.

At L'Aigonal, at an altitude of nearly 5,000 feet, Professor Flabault has taken in some six acres of alpine ground, which he has transformed into a botanic garden. It has been put at the disposal of the university of Montpellier, which keeps up a laboratory upon the ground. One acre is of peat and sphagnum, where already forty species of Ericaceae are acclimatised. Trials of Pines and forest trees, of vegetables, and pasture plants are also in prospect.

There was an extremely interesting discussion among the representatives of the different alpine gardens. It was decided that in future lists of seeds for exchange should be published, and that the present congress should be followed by others, of which the initiative should be taken by Switzerland.

This international conference was ended by Prince Roland Bonaparte thanking the organiser of this, the first congress on alpine gardens. The garden of La Rambertia at the Rochers de Naye was then visited, and the following day that of La Linnaea at Bourg St. Pierre.

HENRY CORREVON.

THE CLEMATISES.

(Continued from page 154.)

SOME of the best varieties of the patens and florida groups are:

PATENS VARIETIES.

Edouard Desfossé, mauve; Fair Rosamond, white, with red bar; Lady Londesborough, silvery grey; Marcel Moser, white, pink bar; Miss Bateman, white, red anthers; Mrs. George Jackman, white; Mrs. Quilter, white; Sir Garnet Wolseley, pale blue; and The Queen, lavender.

FLORIDA VARIETIES.

Belle of Woking, double, grey; Countess of Lovelace, bluish lilac; Duchess of Edinburgh, double, white; Enchantress, double, white; John Gould Veitch, double, lavender-blue; and Venus Victria, double, lavender.

LANUGINOSA GROUP.

C. lanuginosa is one of the most striking of all the Clematises. It is a native of China,

and was introduced to this country in 1851, quickly becoming popular. It is a strong grower, with very often large, simple leaves and fine flowers. Individual flowers measure as much as 6 inches or 8 inches across, and in some of the varieties more than that. It will grow to a height of 14 feet or so, and flowers freely from July until October. The sepals are from six to eight in number, and in the type lavender in colour. The following is a selection of varieties: Alba Magna, white; Beauty of Worcester, rich bluish violet, very free; Blue Gem, pale blue; Enchantress, double, white, flushed rose; Excelsior, double, mauve; Fairy Queen, flesh, with pink bar; Grand Duchess, white, flushed rose; Imperatrice Eugene, white, very fine; Lady Caroline Neville, white, mauve bars; La France, violet-purple; lanuginosa alba, white; lawsoniana, rosy purple; Lord Neville, dark plum; Marie Lefebvre, mauve; and Princess of Wales, bluish mauve.

VITICELLA GROUP.

C. viticella is found in limestone districts of Southern Europe, where it grows in hedges to a height of 12 feet or 15 feet. It has been in cultivation since 1569, and it or its varieties are often found in gardens. The flowers of the type are blue or purple in colour, from 2 inches to 3 inches across, and composed of four sepals. It is a fairly fast grower and free flowerer, blossoming from July until October. Varieties with blue, red, pink, and white flowers are grown, as follows: Ascotiensis, blue; kermesiana, red; Mme. Grange, crimson-violet; Mar-morata, mauve; M. Koster, reddish purple; Viticella alba, white; Viticella rubra grandiflora, red; Thomas Moore, violet; and venosa, reddish purple. C. Hendersoni has blue bell-shaped flowers, and is a cross between C. Viticella and C. integrifolia.

JACKMANI GROUP.

This beautiful and popular group originated through the crossing of C. lanuginosa and C. Viticella by Mr. Jackman of Woking. The first hybrid was a free-flowering purple, and this he called C. Jackmani. Since the production of this numerous varieties have been raised, which show a great variation in colour. C. Jackmani is a strong grower and profuse flowerer, the flowers being 4 inches or more across, and borne from July until October. Good varieties are Alexandra, reddish violet; Gipsy Queen, dark purple, very free; Guiding Star, purple; Jackmani alba, white; Jackmani superba, deep purple; Mme. Edouard Andre, bright red; magnifica, reddish purple; Mrs. Cholmondeley, light blue; rubella, rich claret-purple; Snow White, white; Star of India, reddish; and velutina purpurea, very dark plum. C. Jackmani has four sepals, but some varieties of it have more.

COCCINEA HYBRIDS.

Within recent years a very pretty race has originated through crossing the scarlet, tubular-flowered C. coccinea of herbaceous habit with other forms, the result being strong-growing, free-flowering hybrids, which die to the ground each winter. The flowers are very pretty and semi-tubular. The varieties are as follows: Countess of Onslow, bell-shaped, violet-purple flowers; Duchess of Albany, bright pink, bell-shaped; Duchess of York, delicate blush pink; Grace Darling, rosy carmine, star-shaped; and Sir Trevor Lawrence, bright crimson, campanulate.

The following are some of the more important hardy shrubby Clematises which have not already been mentioned:

C. athusifolia is an elegant-habited plant with thin shoots, finely divided leaves, and

small, cylindrical, white flowers. The flowering period is July. A variety known as latisepta is grown which differs from the type by reason of its larger lobed leaves. Both are natives of Amurland and North China, and quickly make fine plants.

C. alpina.—At one time this was placed in another genus, Atragene, on account of its producing both petals and sepals. It is now, however, considered to be rightly placed in Clematis. It is a very distinct and commendable plant, as it grows and flowers well and blossoms during April and May. It was introduced in 1792 from the limestone districts of North Europe, and grows to a height of 8 feet or 10 feet. The flowers are borne singly on long, slender stalks, and are 2 inches to 3 inches across and pale blue in colour. Forms with white and almost pink blossoms are grown, and all are very pretty.

C. apiifolia is a very strong-growing climber from China and Japan, in habit very like C. Vitalba. The flowers are small and borne in large panicles during August and September. It is a good plant for a semi-wild position.

C. aromatica.—The fragrance of this species alone warrants it a place in the garden. It is a hybrid between C. integrifolia and C. recta, grows 12 feet or so high, and bears small purple flowers in profusion during July and August.

W. DALLINORE.

(To be continued.)

THE FERN GARDEN.

THE OAK FERN.

(POLYPODIUM DRYOPTERIS.)

OF the four native species of Polypodies with deciduous foliage, the Polypodium Dryopteris, or, as it is popularly called, the Oak Fern, for which appellation there is no reason, unless it be that it is so named from being sometimes found among the moss about the roots of Oak trees, is undoubtedly the one most generally known, as it also is the one growing most abundantly in a less restricted habitat. On account of the peculiarly bright Pea green colour of its short triangular fronds, which seldom exceed 10 inches in height, and also of its compact and close habit, it is much admired and generally used for forming in the hardy fernery edgings which all the summer possess a freshness looked for in vain among any other Ferns of dwarf habit. These fronds have, when only partially developed, a very peculiar aspect, as the pinnae on each branch are rolled up, resembling so many small Green Peas; they are, like the fronds of all the other Polypodies, produced on slender, creeping rhizomes, which, contrary to those of the evergreen species and varieties, are strictly underground. The Oak Fern is always found in perfectly cool, sheltered, moist places, where the temperature is subjected to very little variation during the summer. In planting the Oak Fern, a spot where moisture and shade can always be depended upon should, if possible, be selected, and a shallow bed made of a compost of two parts of fibrous peat, one part of leaf-mould, and a free admixture of silver sand, or, better still, of broken sandstone. If grown in pots for a cool frame or the greenhouse, where it makes a most pleasing object, the above mixture will be found equally suitable; but in either case avoid putting in too much soil; a depth of from 3 inches to 4 inches is quite sufficient. It is also indispensable that thorough good drainage should be secured, for, although the growing plant delights in an abundant supply of water, yet water remaining about its roots is very injurious to it. In planting, great care must also be taken to prevent the rhizomes being buried too deeply, in which case they seldom grow; they must be only just below the surface of the soil, which should only cover them lightly, and through which it is

advisable to let the tips protrude. After the planting—which should take place about April—is done a moderate watering must follow, after which the soil requires to be kept constantly moist until the new fronds begin to unfold, when, as they increase in size, a fresh supply of water will be necessary to keep the atmosphere always moist about the plants. This Polypody is readily increased by division. Although totally deprived of foliage during four or five months of the year, the Oak Fern should never be allowed to get dry at any time, for the rhizomes soon shrivel up and the spring growth then only produces small or deformed fronds, and the plants are very much weakened. It is also advisable to give plants grown in pots a slight covering during the winter, though not requiring the same attention when planted out. This species does not appear to have produced any constant variations. Several multifid and other curious forms of it have from time to time been noticed, but none of these remained constant under cultivation.

NELUMBIUM SPECIOSUM.

ONE of the most noble of aquatic plants, the genus *Nelumbium*, contains only two species, *N. speciosum* of Asia and tropical Africa, and *N. luteum* of the West Indies and Southern United States. The latter, although accorded specific rank, is probably only a geographical variety, differing little from *speciosum*. Upwards of a dozen specific names have been given to forms, which have since proved to be varieties of *speciosum*, differing from it chiefly in the colour of the flower. To our Continental neighbours we are indebted for most of the beautiful varieties now in cultivation. Formerly considered as hot-house plants exclusively, they are now cultivated outside, not only in heated tanks, but also in sheltered spots, protected from north and east winds, and where the full benefit of the sun can be obtained. A mixture of rich loam and well-decayed manure is the most suitable compost in which to grow them. Under glass their cultivation is easy. Planted a few inches below the surface of the water, when once started growth is very rapid. When commencing their cultivation outside the rhizomes should be started under glass, in pots or tubs submerged a few inches below the surface in a tank. When growth begins, if the weather is suitable, say towards the end of May or early in June, the tubs should be transferred to their summer quarters or planted out if that is the method of growth intended. Protection should be given at first if the nights are cold. If planted permanently outside they should be covered by at least a foot of water. When growing in tubs arrangements can be made for lowering them in the water, or transferring to a house in winter. Should the position permit of it, a frame may be placed over and covered with leaves; where the tanks or ponds are heated these precautions are, of course, unnecessary. Still, water is by far the most suitable. Positions near springs should be especially avoided, the water being much colder. *Nelumbiums* are well worth cultivating for their foliage alone. The leaves are peltate, glaucous green in colour, borne on slender stalks 4 feet to 6 feet in height. Rising well above the foliage the flowers are produced on separate stalks. They vary in colour from white to deep pink and are beautifully scented. Long

known as the Egyptian or Sacred Bean, both the rhizomes and seeds are eaten by the natives in the East.

A. OSBORN.

THE FLOWER GARDEN.

HALF-HARDY ANNUALS IN 1904.

IT adds much to the interest of amateur gardening not only to try each season some of the lesser-known annuals, whether hardy or half-hardy, but to attempt different modes of growing them. They come in most usefully either for pot or basket culture, or as single plants or groups to fill vacant spaces in the perennial borders, with this great advantage, that they may be cleared away without compunction the moment their presence becomes undesirable. That capital South African annual, *Arctotis grandis*, which has been commended before now in the pages of *THE GARDEN*, has flowered even more freely this season than last, showing that a dry summer

them up so quickly that it proved to be scarcely worth while to provide pot room for them during winter, when space is precious.

Seed came to me from South Africa of a blue-flowered annual which proved to be *Wahlenbergia capensis*. Like several of the *Campanulas* and their allies it evidently prefers shade and resented exposure to full sunshine out of doors. It is not showy, yet its blue salver-shaped flowers, curiously tinged with green, with touches of black, are interesting and uncommon-looking, and as it seeds freely it might be worth taking in hand by the hybridist for the sake of novelty and improvement. The place for it would seem to be either a hanging basket under glass, or a semi-shaded wall where the long flower-stems might droop at will and turn up their ends to the light. While there are many better-known plants of greater merit, it was distinctly pretty in the spring in a cold greenhouse, but is useless for the ordinary flower border.

A half-hardy annual seldom seen, but of distinct character—*Statice Suworowi*—has done well this year in spite of the dry season. It

NELUMBIUM SPECIOSUM IN THE BARRAGE GARDENS IN EGYPT.

does not disagree with it, which might fairly be foreseen. One strong point in its favour is the length of time during which it lasts in vigour, continuing to flower until late autumn. The long stems make it also useful for cutting, though, like many composites, the flowers close during part of the day. The somewhat straggling and brittle branches make staking necessary, as they are liable to get broken or twisted in a strong wind, but this detracts little, when precaution is taken, from its value in the mixed border, yet it seems to be only gradually making its advance into public favour, as it is new to most visitors to my garden. The experiment of autumn sowing was tried last year with this *Arctotis* in hopes of getting it into flower early under glass, but, though they thrived well, the spring-sown seedlings caught

begins to flower at a very early stage, and, on first making its acquaintance, one might very easily be inclined to pull it up in disappointment to make room for something better. Wait a bit, however, and by and by, when its pretty tapering plumes of minute pale pink flowers are fully developed, it will be found well worth the space it occupies. A figure of this Central Asian *Statice* is given in "Nicholson's Dictionary of Gardening," but it does scant justice to its slim elegant growth. It is summer flowering, and therefore makes way by the end of August for any plants kept in reserve for filling vacancies.

Alonsoa Warscewiczii, a slender-growing Chilean Linariad with many branching stems, is very fine during August, and will last well into autumn. It is probably herbaceous, but succeeds

admirably treated as a half-hardy annual, and cuttings strike easily. The peculiar rosy scarlet shade of its shield-shaped flowers is very taking, and the long spikes are light and graceful. A well-grown mass of this *Alonsoa* is exceedingly bright and handsome when care is taken to group it effectively. The colour naturally harmonises ill with strong orange and yellow tints.

A word should be said in praise of the very fine form of *Tropeolum lobbianum* Princess Louise Victoria, which is well worth a special place in the outdoor garden, and also to grow for winter flowering in the conservatory. It stands, besides, the ordeal of being brought into and kept in warm rooms better than many plants. It varies a trifle from seed, but, in the best form, the foliage is dark and makes an excellent foil to the pale sulphur-coloured flowers, each petal having a small but vivid scarlet blotch and the beauty of the whole plant being greatly enhanced by the deep scarlet calyx and spur of the flowers. A seedling plant growing over a stump out of doors last summer was so decorative that it was thought worth while to root a cutting to preserve the identical form. This was trained up a stick, and with drooping branchlets grew into a shapely pot plant. Given a post of honour on a carved Oak pedestal in the drawing-room no one recognised it as a "mere *Nasturtium*," and it was greatly admired. After doing duty through the earlier part of the year in the house and conservatory it was planted out in the open border, where it took a new lease of life and so covered itself with flowers once more that a neighbour exclaimed on seeing it: "What is that very beautiful flower?" An untoward accident soon after put an end to its existence, but fortunately both growing cuttings and seeds are still extant. Garden beauty lies very near us sometimes while we sigh for costly exotics. No Orchid could be more perfect than this *Tropeolum* in its own special way, and any one can grow it with the minimum of pains and care at the cost of a threepenny packet of seed. It is quite possible that a plant propagated by a cutting may be more short-jointed and better suited to pot culture than a seedling, but it can easily be tried in both ways, and a note should certainly be made of T. Princess Louise Victoria, that it may not be omitted from one's list of spring seeds. K. L. D.

AGAPANTHUS UMBELLATUS IN THE FLOWER GARDEN.

This fine plant is certainly worthy of more attention than it often gets. Where it is grown well it is certainly most effective. It is very beautiful in the gardens of His Grace the Duke of Devonshire, at Compton Place, Eastbourne. Grown in large tubs, the plants have grand umbels of rich deep flowers well set off by strong healthy foliage. A number of large plants were standing round the flower garden in front of the house and formed a nice contrast to the other flowers in the beds. Although a plant which will live under almost any conditions, it well repays for a little care. Plants are often left to get too much crowded with growths, but when divided and given plenty of pot or tub room they make larger leaves and finer heads of bloom. The white variety is also very pretty, but not so vigorous in growth. The variegated variety is also worth attention. I believe there are several different varieties of the blue. Those at Eastbourne were of the richest blue, with large heads of bloom, probably the variety known as *giganteus*. H.

PELARGONIUM PAUL CRAMPÉL.

This *Pelargonium* well merits all that is said in its favour on page 119; indeed, as a bedding plant it stands head and shoulders above its fellows—not

in height, it is true, but in attractiveness. Various ways of spelling the name are to be met with, but the above is the correct one. This variety was distributed by that well-known hybridist, M. Lemoine of Nancy, in the year 1892, but some time elapsed before its merits were fully recognised. Now, however, its cultivation is very general, as it is one of the recognised varieties largely taken into Covent Garden Market during the season and universally used for bedding, at least in the London district. It is by no means the only popular variety that took some time to attain the position it merited from the first, for the double-flowered scarlet F. V. Raspail was first sent out as long ago as the spring of 1878, but it was almost lost till a few years after it attracted the attention of some of our market growers, and it then became popular at once. Like the variety Paul Crampel, this also emanated from the far-famed establishment at Nancy, the birthplace of so many plants of all sorts now universally popular. In passing through Hyde Park on the evening of the 22nd ult., after a heavy thunderstorm, a bed of Paul Crampel was little the worse, while all the other sorts were considerably damaged. T.

This is undoubtedly one of the finest introductions of late years, and is likely to last as long in favour as such sorts as Raspail, Jacoby, West Brighton Gem, and others. It is inclined to make extra strong growth if the soil is very good, but the extraordinary size of truss makes up for a little deficiency in freedom of flowering. A wonderfully bright bit of colour is furnished this year by a combination of this *Pelargonium* facing and between clumps of white *Marguerites*, which in their turn are backed by well-coloured bushes of *Prunus Pissardi*. E. L. BURRELL.

KOCHIA SCOPARIA.

I HAVE always entered a protest against the use of things of somewhat stiff and formal habit in the flower garden, but must make an exception in favour of the above, probably one of the most unique half-hardy plants we have. Sown the third week in March and planted out early in June the plants are now 30 inches high and about 15 inches in diameter. The flower is quite insignificant, reminding one, strange to say, a little of the tiny blooms that appear in early spring on either side of the pendant flower-stalk of *Pterocarya caucasica*. I was somewhat puzzled how to use the *Kochia*, and decided to do so as a dot plant on carpets respectively of *Begonia Lafayette*, the variegated *Mesembryanthemum*, and a very dwarf *Ageratum*, and in either case the effect is very pleasing. This *Ageratum*, by the way, seems very little known. It only grows 3 inches in height, and is the best dwarf blue bedding plant we have apart, perhaps, from the blue forms of *Tufted Pansy*, but it possesses the advantage over the latter of flowering right away till October irrespective of the driest weather. E. L. BURRELL.

OUR BOTANIC GARDENS.

BOTANIC GARDENS, BELFAST.

ALTHOUGH only of small area—seventeen acres—these gardens are full of interest. They were opened by a company in 1820, and were purchased by the Corporation in 1895 at a cost of £10,500; since then, at a considerable outlay, their attractiveness and usefulness have greatly increased. The department that has been planted expressly for the use of students of botany has been perfected. The glass is not extensive, but Mr. C. W. McKimm, the superintendent, has got together a choice collection of plants. The show range contains Palms and other ornamental plants. One wing devoted to stove and temperate plants is full of interest by reason of the many flowering plants there; for instance, *Aristolochia elegans*, *A. ornithocephala*, *Passiflora cerulea*, *P. macrocarpa*, *P. quadrangularis*, *Clerodendrons* in

variety, *Bougainvillea Cypheri*, *Gloriosa superba*, *Tecoma jasminoides*, *Strelitzia Regina*, and many others; *Lygodium scandens* filled a large amount of root-space. The other wing is devoted to greenhouse plants, and was bright with *Begonias*, *Geraniums*, *Fuchsias*, &c., while at each end were masses of blue and white *Plumbago capensis*. The fernery is about 140 feet long and 70 feet wide, and differs from most structures of this kind; it is in the form of a river bed, and the visitor views the same from galleries running along each side some 30 feet from the base: this gives one a view of the tops of the largest plants. The Ferns are planted in irregular mounds upon a groundwork of *Selaginellas*, *Fittonias*, small Ferns, &c. Among notable plants are *Dicksonia antarctica*, *Cyathea dealbata*, *Cibotium Schiedeii*, *Musa Enseti*, *Ficus* of sorts, *Clethra arborea*, *Latania borbonica*, *Cycas revoluta*, *Phenix dactylifera*, *Cocos nucifera*, *Nepenthes hookeriana*, *N. mastersiana*, *N. coccinea*, &c. At one end of the house there is a tank in which *Victoria Regia* grows splendidly, the largest leaf measuring 7 feet in diameter. At the time of our visit a flower was open.

In the grounds the grass is beautifully green; the bedding consists largely of foliage plants, making most effective beds, while clumps of *Bamboos* some 8 feet or 10 feet high add not a little to the effect. The Rose and water gardens are of much interest; the former is about to be extended, when it is the intention of Mr. McKimm to introduce pergolas, arches, &c., in addition to the usual beds and borders. Some six parks, in all 300 acres, are under the care of the superintendent, and it is safe to suppose that all are as well cared for as the Botanic Gardens. W.

NOTES ON HARDY PLANTS.

FAILURES WITH SWEET PEAS.

SWEET PEAS were a subject for discussion at the August meeting of the National Amateur Gardeners' Association, the chief point being their habit of failing just when they should be at their best. It was pointed out that the plants quite unexpectedly began to turn yellow, and upon close inspection a "plant rust" seemed to have settled on them. No one was able to suggest a definite remedy for the disease, and the recommendation from a well-known seedsman of an application of sulphate of copper to the roots was not regarded with favour. It was suggested that it would be well in the early summer to anticipate the failure of the plants, and if possible apply an insecticide of some sort as an antidote. By these means the plants might be saved from the "rust." Planting in clumps *versus* planting in rows was freely commented on, and the feeling of the meeting appeared to favour the former way. One member suggested using the twigs of Birch brooms, with which to stake the young plants, either in pots or after planting them outdoors. He recommended this as a cheap and satisfactory method of staking when the plants were young. Another member, an experienced and successful cultivator, said there was no better material for staking the young plants than the old stems of the *Michaelmas Daisies*. Most of these are branching—just what the tightly clinging tendrils need. Subsequently the plants would be supported with long and branching stakes, which the smaller ones so well lead up to. D. B. C.

CAMPANULA PYRAMIDALIS.

This plant receives special attention at Compton Place, Eastbourne. Over the portico was a wealth of pink Ivy *Pelargoniums*, and at the back of these *Campanulas*, both blue and white, with dense spikes of bloom 4 feet to 5 feet high. The plants represented a carefully-selected strain, the flowers being of great size, and those of the blue a very clear shade of colour. I have found in growing this *Campanula* that its chief requirements are plenty of pot room, a rich loamy compost, firm potting, and a light airy position, with just

sufficient warmth to keep off frost in winter. After the pots are well filled with roots mature water may be given freely. It will be hardly possible to treat them too liberally. After the flowers begin to open a slightly shady position will lengthen the time of flowering. They are best when treated as biennials. Seeds sown early in the season make good plants for the following year.

A. HEMSLEY.

THE PARNASSIAS, OR GRASS OF PARNASSUS.

IN many of our moist heaths and bogs the Marsh Parnassia (*P. palustris*) is not unfrequently met with, and a very pretty plant it is—quite handsome enough to cultivate, particularly in gardens in which there is a suitable moist spot where it could grow as in its native haunts. There are, however, three other species, natives of North America, that are quite as showy as our native species, and the newest kind (*P. fimbriata*) is even more attractive, as it has larger flowers, with peculiar fringe-like appendages to the petals. It has kidney-shaped root leaves, resembling those of *P. asarifolia*, another hardy species, which grows about 9 inches high, bears similar white flowers, but without the singular fringes to the petals. The Carolina Grass of Parnassus is the other species, and this only differs from *P. asarifolia* in the leaves being oval or heart-shaped; it also flowers about the same time, which is usually from the beginning of July till the end of August. These Parnassias thrive best in a moist, peaty soil or spongy bog, such as exists by the sides of streams or pools, and, being all perfectly hardy, give no trouble after being once planted. W.

DWARF PURPLE SCABIOUS IN POTS.

THE cultivation of hardy and half-hardy annuals in pots for conservatory decoration is not practised to the extent it should be, or as it profitably might

be, for they are extremely useful in autumn and winter when but few other plants are available. Few prettier subjects can be grown than the purple Scabious, especially the dwarf strain lately introduced.

The plants, being dwarf and compact in growth, are well suited for pot culture, and they produce an abundance of flowers for several months in succession. For cutting purposes, too, the flowers are very desirable, as they last a long time in perfection in a cut state. The colour varies from the deepest crimson-shaded maroon to pale pink, so that in a packet of seeds many intermediate shades may be obtained. We have never seen this dwarf Scabious so well grown as at Gunnersbury Park, it being a special favourite with Mr. Roberts, who grows it extensively. He grows it in the open air in summer for cutting purposes, and in pots for conservatory decoration and cutting in the autumn and winter, and he thus obtains an uninterrupted supply of flowers for several months. For flowering in the open air the seeds may be sown in spring in the ordinary way. For flowering in pots the seeds should be sown at intervals in spring and summer in heat or otherwise, and the seedlings either grown on in pots or planted out, but in either case they should receive no check, but should be grown freely on till they are placed in the pots in which they are to flower. Thus treated they cannot fail to give satisfaction, and will be found extremely useful. W.

THE MOURNING IRIS (*I. SUSIANA*).

IRIS *SUSIANA*, represented in the accompanying illustration, has always been a favourite of mine, and there can be no question as to the greater vigour and freedom of growth compared with the majority of *Oncocyclus* Irises, and the flowers are by far the largest in this beautiful group. In colour they are a silvery grey, so closely set with dark lines that the flowers appear sombre tinted, yet showing wonderful gradations of colouring in

the standards under the different degrees of light. I think this Iris can be grown well in any deep yet dryish soil. Mr. Morris of Wretham Hall, Norfolk, who kindly furnished me with the photograph here reproduced, grows them on a warm rockery slope, and the soil was not specially prepared for them, as so often advised. The dozen roots I sent him were not specially selected from the bulk, yet all flowered well the first season of planting, and appear likely to go on for several seasons. I think the amateur may

look upon *I. susiana* as a plant he can grow almost anywhere, requiring none of the skill necessary for the others.

Colchester.

R. W. WALLACE.

THE VIOLET CRESS.

(*IONOPSIDIUM ACAULE*.)

ONE of the most interesting plants in a flower garden in spring is this charming little Portuguese annual, whose dense tufts, not 2 inches high, of violet flowers spring up in all directions where plants of it have existed the previous season, for, like a common weed, it sows itself, thereby possessing all the advantages of a hardy perennial and causing no trouble whatever after being once introduced. Its peculiar beauty adapts it for various purposes and positions. On rockeries, associated with even the choicest of alpine plants, it holds its own as regards beauty, and it never overruns or otherwise harms its neighbours. It is particularly suitable for sowing near pathways, rugged steps, or similar positions, places in which it grows freely; indeed, it would even flourish on a hard gravel walk, so freely does it grow. It also makes a pretty plant for the greenhouse or window, as it thrives well in pots, either sown in them or lifted in flakes from the open ground and placed in them. It flowers in a couple of months after sowing, and often produces a second crop of blossoms in the autumn. W.

TREES AND SHRUBS.

LAWN TREES.

MANY admirable trees for small lawns can be found in those that combine sufficient density of foliage to afford a welcome shade with a fine display of flower and serviceable fruit. Strong-growing varieties of Apples, for instance, that make shapely trees, of which Cornish Aromatic, Scarlet Nonpareil, Beauty of Kent, Hambledon deux Ans, Blenheim Orange, and Brownlee's Russet are half-a-dozen examples, may be planted with advantage, and so may the Mulberry, the Medlar, and the Siberian Crab. Recent notes on Magnolias may tend to popularise these highly ornamental trees and lead to their occasional planting in situations where they would look remarkably well; some of them are very handsome and different to anything else we get in English gardens. They attain very fair proportions. *Paulownia imperialis* and *Zelkova acuminata* may also be named as small trees with handsome deciduous foliage. The plea for greater variety in planting (and is it not needed?) so far as the smaller trees are concerned, which was the object of this note, might safely be extended to trees of larger size. No one would wish to debar our stately specimens of Oak, Beech, and Chestnut, but a walk through many pleasure grounds shows that the rarer deciduous trees, often with highly ornamental foliage, are seldom met with. Fine old specimens of the Tulip Tree are to be found in many gardens, but younger trees are seldom met with, an omission which if not speedily rectified will leave the majority of our gardens without any decent examples of this handsome tree when the old ones have died out. The foliage peculiar severally to such trees as *Ailanthus glandulosa*, *Gymnocladus canadensis*, *Magnolia acuminata*, and *Pyrus Sorbus* should secure them a place in all large collections, and all grow into handsome trees averaging from 50 feet to 70 feet in height. I must not forget a good word for the deciduous conifer *Taxodium distichum*, a very handsome tree, but, unfortunately, tender when young; the leader is very apt to be crippled in severe winters, and all side growths die back. This is, I imagine, the reason why nice shapely young plants of this *Taxodium* are not easily obtainable. E.

BERBERIS DARWINI.

WHAT a fine thing this is when seen at its best! In low-lying situations, where the soil is retentive,

A GROUP OF IRIS *SUSIANA* (THE MOURNING IRIS) AT COLCHESTER.

it is by no means happy, but where the natural staple is light and well drained there should be no difficulty in inducing this charming flowering shrub to take on perennial vigour and beauty. There is probably no fairer garden picture than a well-developed specimen when in full bloom, the habit being graceful, and the bright orange blossom contrasting so finely with the deep green foliage. Some years ago a plant in the cutting stage was placed in a narrow border at the east end of a glass house. Soil and position have evidently suited it, but the principal factor in its welfare is undoubtedly the good drainage, for it happens that this is one of the driest spots in my place. Every season this plant is a perfect picture; it is simply smothered with bloom, and the foliage is perfect down to the ground. In heavy soils a top-dressing of peat or leaf-soil now and then will prove beneficial.

J. CORNHILL.

BOLD WATERSIDE PLANTS

PLANTS that grow by the waterside, so much admired in natural scenery, are seldom taken advantage of for cultivating as they might be, otherwise the bare water edges so often found in connexion with lakes and other ornamental water would be of less frequent occurrence than they are. With the vast resources of suitable plants at our service, if appropriately employed, the margins of artificial water might be made to surpass even the choicest examples of natural riverside vegetation. In the majority of cases, if the edges of artificial water are clothed at all, they have a monotonous appearance on account of the continuous fringes of plants of a commonplace type used, whereas if a greater variety of kinds of varied height, habit, and flower were employed and disposed in bold irregular groups—some close to the margins, others at a distance from them, and some even partly submerged—some of the most charming effects could thereby be obtained. The principal consideration is a knowledge of the positions in which the plants thrive best, the degree of moisture in which they will flourish; then grouping them effectively is easily accomplished. The following enumeration consists wholly of vigorous growing plants that when once planted can take care of themselves. Our native flora affords great numbers of really handsome waterside plants, many of which are in no way inferior to exotic kinds. Amongst the showiest are the

WILLOW HERBS (*Epilobium*).—These, being well known, need but little description. Of the former *E. angustifolium* is the finest. In rich, moist soil it grows 5 feet or 6 feet high, and in summer is covered with a profusion of showy purple-red flowers. There is a white variety which is even

more effective than the type, as the colour is so uncommon among water plants. The great Willow Herb, or *Codlins and Cream* (*E. hirsutum*), is a true water plant, and though not showy as the preceding, should never be omitted. Also of the Purple Loosetrife (*Lythrum Salicaria*) there are now some extremely fine varieties; one, named *superbum*, may be said to be the finest of all hardy flowers, and all the *Epilobiums* are excellent companions for our beautiful native Meadow Sweets (*Spiraea*).

Many of the Grasses of the larger type flourish better in moist places near water than elsewhere. One of the handsomest is the

GREAT REED GRASS (*Arundo Donax*), which grows 10 feet and even 15 feet in height when planted near the margins of water where the roots are continually moist. It requires, however, a rather sheltered position, as it is apt to be injured by severe cold or cutting winds. A bold, isolated group of this noble Grass is one of the fairest types of hardy vegetation which we possess, yet, singular as it may appear, it is often overlooked.

THE NEW ZEALAND REED GRASS (*Arundo conspicua*), as well as the *Pampas Grass* (*Cyperium*

5 feet, with broad leaves and handsome plumes from 6 inches to 8 inches in length—all interesting when properly planted. There is a variety of this with variegated leaves called the *Ribbon Grass* or *Gardener's Garters*. Among the choicer exotic Grasses of large growth are *Eulalia japonica* (5 feet high), *Gymnothrix latifolia*, *Erianthus Ravennae*, *Stipa gigantea*, *Sorghum halepense*, and *Andropogon strictus*, all of which delight in moist situations.

BAMBOOS.—There is no other type of hardy plants from which such beautiful effects can be produced by water margins as from the various kinds of Bamboos which thrive so finely in our climate. Planted by the side of a running stream, or near the margin of a lake or pool, they succeed better than in any other place, and soon attain a great height.

SEDGES AND RUSHES.—The majority of the former are essentially water plants, and many of them form beautiful objects when planted in bold groups. For this purpose some of the finest and most suitable are, among *Carexes*, *C. paniculata*, a native species, which grows into luxuriant tufts as high as 4 feet if planted in wet, boggy places in

which little else will grow. Then there is the extremely graceful *C. pendula*, one of the largest of our native *Carexes*, with its long, catkin-like spikelets, produced in early summer on plants 3 feet high. The *Fox Carex*, as well as *C. acuta*, are likewise well adapted for wet places, each attaining 2 feet or 3 feet in height, and of *C. acuta* there is a handsome variety with variegated foliage. There is also a variegated-leaved variety of *C. riparia*, which is very handsome and retains its character well, even in water.

One of our handsomest native water-loving plants is the *Galingale* (*Cyperus longus*), whose stout stems, terminated by singular tufts of leaves, attain a height of even 4 feet or 5 feet. As it flourishes best when its lower part is wholly submerged, it is a

capital subject for planting in shallow water at a little distance from the margin. When disposed in bold groups, and these not repeated too often, it greatly relieves the somewhat monotonous appearance of an even fringe along the water's edge. Another fine *Cyperus* is *vegetus*, which has wider leaves than the last and lighter green in colour, but it does not grow so tall. Nearly allied to the *Cyperuses* are the

CLUB RUSHES (*Scirpus*).—*S. triquetus* (3 feet high), *S. lacustris* (from 4 feet to 8 feet high), and *S. Holoschoenus* (a stiff Rush-like plant some 3 feet high) are all excellent waterside plants. Of similar growth is the *Prickly Twig Rush* (*Cladium Mariscus*), which is useful for planting in poor and wet soil where little else would thrive.

IRISES.—In addition to the common yellow *Flags* (*I. Pseudacorus* and *foetidissima*) several of the other kinds make good water plants, particularly

THE BEAUTIFUL SPIRÆA GIGANTEA.

(This is one of the noblest of the *Spiræas*, 7 feet or more in height, and the flowers are in creamy clusters. From a photograph by Miss Willmott.)

argenteum), flourish by water far better than in other positions, provided there is not an excessive amount of stagnant moisture about the roots. One or two kinds of *Lyme Grass* (*Elymus*) are excellent for planting in wet places where choicer plants would not flourish, the most suitable being *E. giganteus*, which grows some 4 feet or 5 feet high; *E. virginicus* and *canadensis*, both North American species of tall, vigorous growth. Some of our British Grasses of noble aspect look well if planted in distinct groups and not allowed to run in a monotonous fringe. The best of these are the common Reed (*Arundo Phragmites*), which abounds in many parts in wet ditches; the *Wood Small Reed* (*Calamagrostis Epegeios*), which grows from 3 feet to 4 feet high and flourishes as well in open, wet places as in woods and thickets; *Purple Small Reed* (*C. lanceolata*), taller than the last; the *Reed Grass* (*Diglyphis arundinacea*), from 3 feet to

I. sibirica, a tall-growing kind with glossy foliage and flowers either of a rich purple or white. The beautiful Kämpfer's Iris, too, though not of large size, must be included in our list, as it flourishes best in wet places, and if such a position could be allotted to it where the water now and then could be made to flow over the soil for 1 inch or so in depth, it would, if planted in a peaty soil, flourish far better than in an ordinary border.

Among plants remarkable for fine leafage few excel the large Water Dock (*Rumex Hydrolapathum*), the leaves of which grow nearly 3 feet long, and they are nearly 1 foot across, reminding one of a Banana plant in miniature. In some situations it grows as much as 5 feet high, and forms a bold plant close to the water's edge, where the roots would be continually submerged.

THE GREAT SPEARWORT (*Ranunculus Lingua*) is another of our bold foliage native plants which grow from 3 feet to 4 feet high, and has long, broad leaves of a pale green colour. Its flowers are showy, being of a bright shining yellow, and more than 1 inch across. A position similar to that recommended for the last suits it best. W.

(To be continued.)

ROSES—PAST, PRESENT, AND FUTURE.

BY THE LATE DEAN HOLE.

FOR many years after the institution of Rose shows (it was my privilege to suggest and to organise the first of them, in the year 1858) the zealous rosarian restricted his attentions almost exclusively to those varieties which won the prizes as being the largest and most compact. Irregularity of outline, confusion or paucity of petals, seemed to shock his sense of propriety and to bring him positive pain. He regarded them with mingled feelings of disgust and pity, as though they had been Barnum's "freaks." Nevertheless, the love of that which is really beautiful, in whatever form or degree it comes, has always a growth in grace; it educates the understanding, refines the taste, opens the eyes, and enlarges the heart until there is room in it for every flower, whether it be the magnificent specimen, in its zinc tube, embedded in moss, at the show, or Little Dot in the border, or the wild Rose in the hedge. The proofs of this expansion are manifest, not only in the comprehensive collections of the true rosarian who has the power to add to their numbers, but in the special prizes offered by the National Society for "garden Roses," which had been so long ignored. There is, indeed, a more general interest in these less-pretentious flowers, which will grow in any garden, and do not require a large outlay or an elaborate preparation, as with Roses intended for show; but I pity the spectator who does not admire them all. One star differeth from another star in glory, but all are glorious; and just as

"The floor of Heaven

Is thick inlaid with patines of bright gold," so here below in our English gardens we have our splendid display of Roses, infinite in their variety of colour, fragrance, and form.

It is not within the compass or intention of this article to give

complete lists or elaborate descriptions, but a few brief annotations with reference to the *élite* may be acceptable to those who have not the writer's experience. Never had poet such a vision of beauty, such a "Dream of Fair Women," as this presence of ladies in Queen Rosa's Court. Never were such complexions seen at a Drawing-Room as these, which no art can copy on the canvas or on the cheek. Never were diamonds so brilliant as these dewdrops, glittering in the sun. All the bloom, all the foliage, is their own.

When I was asked to name the twelve Roses which during my cult of half a century have

evoked on their first appearance in our gardens the greatest delight and admiration, I selected—

General Jacqueminot	raised by	Roussel	in	1853.
Gloire de Dijon	"	Jacotot	"	1853.
Charles Lefebvre	"	Lacharme	"	1861.
Marie Baumann	"	Baumann	"	1863.
Maréchal Niel	"	Pradel	"	1864.
La France	"	Guillot	"	1867.
Catherine Mermet	"	Guillot	"	1869.
Comtesse de Nadaillac	"	Guillot	"	1871.
Marie van Houtte	"	Ducher	"	1871.
Her Majesty	"	Bennett	"	1885.
Mrs. John Laing	"	Bennett	"	1887.
Crimson Rambler	"	Turner	"	1893.

And when curiosity proceeded to enquire

AN ENGLISH WATERSIDE—SPIRÆA GIGANTEA BOLDLY GROUPED IN THE DISTANCE.

(From a photograph by Miss Willmott.)

"If you might have only four, which would you choose?" I replied, "Regarding quantity as well as quality, I should prefer Gloire de Dijon, La France, Mrs. Laing, and Marie van Houtte." But when my insatiate examiner requested me to imagine myself in the awful position of a man permitted only to possess one Rose, and to name my choice, I could only tell him that reason would fail under such an ordeal, and that burying my head in a bush of La France, I should

"Die of a Rose in aromatic pain."

Video meliora proboque: it will be more agreeable to retain those which I possess, and to extend rather than diminish my commendations. Beginning accordingly with those Roses which are most conspicuous in our gardens, covering our walls, arbours, pergolas, pillars, and fences, my memory takes me to a time when our examples were a prosperous but limited company. The most charming of all the climbing Roses, Chromatella or Cloth of Gold, was in existence, but only flourished in a few favoured spots. The Banksian, white and yellow, were abundant on sunny walls, and pleased those who had not seen them in more congenial climes with their scanty efflorescence. Fortune's Yellow, so abundant and attractive under glass, eked out a precarious existence *al fresco*. It assumed the appearance of green and yellow melancholy, which may be observed in politicians out of office, anxious but unable to get in.
